APPENDIX**(Nonmandatory Information)****X1. RESISTIVITY**

X1.1 “Resistivity” is used in place of “conductivity.” The value of $0.153\,28\,\Omega\cdot\text{g}/\text{m}^2$ at 20°C (68°F) is the international standard for the resistivity of annealed copper equal to 100 % conductivity. This term means that a wire 1 m in length and weighing 1 g would have a resistance of $0.153\,28\,\Omega$. This is equivalent to a resistivity value of $875.20\,\Omega\cdot\text{lb}/\text{mile}^2$, which signifies the resistance of a wire 1 mile in length weighing 1 lb. It is also equivalent, for example, to $1.7241\,\mu\Omega/\text{cm}$ of length of a bar $1\,\text{cm}^2$ in cross section. A complete discussion of this

subject is contained in *NBS Handbook 100* of the National Institute of Standards Technology.⁶ Relationships that may be useful in connection with the values of resistivity prescribed in this specification are as shown in **Table X1.1**, each column containing equivalent expressions at 20°C (68°F):
