

# Standard Specification for Compact Round Concentric-Lay-Stranded Aluminum 1350 Conductors<sup>1</sup>

This standard is issued under the fixed designation B 400; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon ( $\epsilon$ ) indicates an editorial change since the last revision or reapproval.

## 1. Scope

1.1 This specification covers aluminum 1350-H19 (extra hard), 1350-H16 or -H26 ([n]hard), 1350-H14 or -H24 ( $\frac{1}{2}$  hard) and 1350-H142 or -H242 ( $\frac{1}{2}$  hard) bare compact-round concentric-lay-stranded conductors made from round or shaped wires for use as uninsulated electrical conductors or in covered or insulated electrical conductors. These conductors shall be composed of a central core surrounded by one or more roller or die compacted layers of helically applied wires (Explanatory Note 1 and Note 2).

1.2 The values stated in either SI units or inch-pound units are to be regarded separately as standard. The values stated in each system may not be exact equivalents; therefore, each system shall be used independently of the other. Combining values from the two systems may result in non-conformance with the standard.

NOTE 1—Prior to 1975, aluminum 1350 was designated as EC aluminum.

NOTE 2—The aluminum and temper designations conform to ANSI Standard H35.1. Aluminum 1350 corresponds to Unified Numbering System A91350 in accordance with Practice E 527.

## 3. Classification

3.1 For the purpose of this specification, conductors are classified as follows:

3.1.1 **Class AA**—For bare conductors usually used in overhead lines.

3.1.2 **Class A**—For conductors to be covered with weather-resistant materials, and for bare conductors where greater flexibility than is afforded by Class AA is required. Conductors indicated for further fabrication into tree wire or to be insulated and laid helically with or around aluminum or ACSR messengers, shall be regarded as Class A conductors with respect to direction of lay only (see 6.3).

3.1.3 **Class B**—For conductors to be insulated with various materials such as rubber, paper, varnished cloth, and so forth, and for the conductors indicated under Class A where greater flexibility is required.

## 4. Ordering Information

4.1 Orders for material under this specification shall include the following information:

4.1.1 Quantity of each size and class (Table 1),

4.1.2 Conductor size; circular-mil area or AWG (Section 7),

4.1.3 Class (Section 3),

4.1.4 Temper (Section 13),

4.1.5 Lay direction if nonstandard (see 6.3 and 6.4), reversed or unidirectional (see 6.4) or special (see 6.5),

4.1.6 Special tension test, if required (see 17.2),

4.1.7 Place of inspection (Section 18), and

<sup>A</sup> 1 lb/1000 ft = 1.488 kg/km.

<sup>B</sup> 58 wires minimum.

<sup>C</sup> 18 wires minimum.

<sup>D</sup> 35 wires minimum.

#### 4.1.8 Packaging and Package Marking (Section 19).

### 5. Joints

#### 5.1 1350-H19 Conductors for Use in Bare Overhead Lines:

5.1.1 Joints may be made in the six outer wires of seven-strand conductors by cold-pressure welding or by electric-butt, cold-upset welding, but not by electric-butt welding. Joints are not permitted in the finished center wire of seven-stranded conductors.

5.1.2 Joints may be made in any of the wires in conductors of 18 or more wires by electric-butt welding, cold-pressure welding, or electric butt, cold-upset welding.

5.1.3 The minimum distance between a wire joint and another joint either in the same wire or in other wires of the completed conductor shall be 50 ft (15 m).

#### 5.2 Conductors of All Tempers to Be Insulated or Covered:

5.2.1 Joints may be made in any of the wires of any stranding by electric-butt welding, cold-pressure welding, or electric-butt, cold-upset welding.

5.2.2 Joints in the individual wires in a finished conductor shall be not closer together than 1 ft (0.3 m) for conductors of 19 wires or less, or closer than 1 ft in a layer for conductors of more than 19 wires.

5.3 No joint or splice shall be made in a stranded conductor as a whole.

### 6. Lay

6.1 The length of lay or each layer for Classes AA and A shall be not less than 11 nor more than 17.5 times the outside diameter of that layer.

6.2 The length of lay of the outer layer for Class B shall be not less than 8 nor more than 16 times the outside diameter of the completed conductor, except that for sizes No. 2 AWG (33.6 mm<sup>2</sup>) and smaller, the maximum length of lay shall be not more than 17.5 times the outside diameter of the completed conductor.

6.3 The direction of lay of the outer layer shall be right-hand for Classes AA and A, and it shall be reversed in successive layers. For Class A stranding where the conductors are to be insulated and laid helically with or around aluminum or ACSR messengers, the stranding lay direction may be unidirectional or unilay in successive layers.

6.4 The direction of lay of the outer layer shall be left-hand for Class B, and it shall be reversed in successive layers, unidirectional, or unilay.

6.5 Other lay requirements may be furnished by special agreement between the manufacturer and the purchaser.

## 7. Construction

7.1 The construction of the conductors shall be as shown in [Table 1](#) as to number of wires and cross-sectional area of the completed conductor, and the lay shall be in accordance with [Section 6](#).

7.2 Wire used in the fabrication of conductor shall be of such dimensions as to produce a finished conductor having a nominal cross-sectional area and diameter as prescribed in [Table 1](#).

## 8. Rated Strength of Conductor

8.1 The rated strength of 1350-H19 conductors shall be taken as the percentage, indicated in [Table 2](#), of the sum of the strengths of the component wires, calculated on the basis of the nominal wire diameter for the corresponding noncompacted construction given in [Specification B 231/B 231M](#) and the specified minimum average tensile strength given in [Specification B 230/B 230M](#) for 1350-H19 wire. A value of 0.1343 (3.41 mm) shall be used for the nominal wire diameter for the 1100 kcmil compacted construction.

8.2 Calculations for rated strengths of 1350-H16, -H26, -H14, -H24, -H142, and -H242 conductors shall be made on the basis of the strengths of the component wires using the nominal wire diameter for the noncompacted construction given in [Specification B 231/B 231M](#) and the specified maximum and minimum tensile strengths for the appropriate temper of the respective component wires given in [Specification B 609](#). The minimum rated strengths of the conductors shall be taken as the sum of the calculated minimum strengths of the

component wires multiplied by the rating factor given in [Table 2](#). The maximum rated strength of the conductors shall be taken as the sum of the calculated maximum strengths of the component wires. A value of 0.1343 (3.41 mm) shall be used for the nominal wire diameter for the 1100 kcmil compacted construction.

8.3 Rated-strength and breaking-strength values shall be rounded to three significant figures, in the final value only, in accordance with the rounding method of [Practice E 29](#).

8.4 Rated strengths of conductors are given in [Table 3](#).

## 9. Density

9.1 For the purpose of calculating mass, linear density, cross sections, and so forth, the density of aluminum 1350 shall be taken as 2705 kg/m<sup>3</sup> (0.0975 lb/in.<sup>3</sup>) at 20°C.

## 10. Mass and Electrical Resistance

10.1 The mass and electrical resistance of a unit length of stranded conductor are a function of the length of lay. The approximate mass and electrical resistance may be determined using an increment of 2 %. When greater accuracy is desired, the increment based on the specific lay of the conductor may be calculated ([Explanatory Note 1](#)).

10.2 The maximum electrical resistance of a unit length of stranded conductor shall not exceed the nominal dc resistance ([Table 1](#)) +2 % ([Explanatory Note 1](#)).

10.2.1 When the dc resistance is measured at other than 20°C, it is to be corrected by using the multiplying factor given in [Table 4](#).

10.3 For conductors to be used in covered or insulated wires or cables, direct current (DC) resistance measurement may be used instead of the method outlined in [Section 14](#) to determine compliance with this specification.

## 11. Mechanical and Electrical Tests of Conductors

### Fabricated from Wires other than 1350-H26, -H24, or -H242 and Annealed after Stranding to Meet 1350-H26, -H24, or -H242 Requirements

11.1 The completed conductor shall be tested as a unit. The minimum breaking strength of bare conductors shall be not less than minimum rated strength if failure occurs in the free length at least 1 in. (25 mm) beyond the end of either gripping device, or shall be not less than 95 % of the minimum rated strength if failure occurs inside, or within 1 in. of the end of either gripping device. The maximum breaking strength of 1350-H26, -H24, or -H242 conductors shall be not greater than their maximum rated strengths. The free length between grips of the test specimen shall be not less than 24 in. (600 mm), and care shall be taken to ensure that the wires in the conductor are evenly gripped during the test ([Section 8](#) and [Explanatory Note 3](#)).

## 12. Workmanship, Finish, and Appearance

12.1 The conductor shall be clean and free from imperfections not consistent with good commercial practice.

## 13. Requirements of Wires

13.1 Before stranding and compacting, the round wire used shall meet the requirements of [Specifications B 230/B 230M](#) or [B 609](#), whichever is applicable.

**TABLE 2 Rating Factors**

| Stranding                    |                  |                  |

<sup>A</sup> 58 wires minimum.

<sup>B</sup> 18 wires minimum.

<sup>C</sup> 35 wires minimum.

13.2 Wire shaped before stranding shall meet the requirements of the appropriate specification listed in 13.1 except for tensile and elongation requirements and diameter tolerance. For 1350-H19 temper, the minimum tensile and elongation requirements shall be 96 % of those for round wire of the same nominal area, provided the completed conductor is capable of meeting the requirements of Sections 8 and 17. For 1350-H16 or -H26, 1350-H14 or -H24, and 1350-H142 or -H242, the tensile requirements shall be the same as those for round wires of equal nominal area. The area tolerances for shaped wire of all tempers shall be such that the finished conductor conforms to Section 14.

#### 14. Variation in Area

14.1 The cross-sectional area of the conductor shall be not less than 98 % of the cross-sectional area as specified in Column 1 of Table 1.

14.2 The manufacturer shall determine the cross-sectional area by Test Method B 263. In applying this method, the increment in weight resulting from stranding may be the applicable value specified in 10.1 or it may be calculated from the measured dimensions of the sample under test. In case of question regarding area compliance, the actual mass increment due to stranding shall be calculated.

**TABLE 4 Temperature Correction Factors for Conductor Resistance**

| Temperature, °C | Multiplying Factor for Conversion to 20°C |
|-----------------|-------------------------------------------|
| 0               | 1.088                                     |
| 5               | 1.064                                     |
| 10              | 1.042                                     |
| 15              | 1.020                                     |
| 20              | 1.000                                     |
| 25              | 0.980                                     |
| 30              | 0.961                                     |
| 35              | 0.943                                     |
| 40              | 0.925                                     |
| 45              | 0.908                                     |

| 75              | 0.818                                     |
| 80              | 0.805                                     |
| 85              | 0.792                                     |
| 90              | 0.780                                     |

## 15. Variation in Diameter

15.1 The average diameter of the conductor shall vary by not more than  $+1-2\%$  from the diameter specified in [Table 1](#) except that sizes 0 (53.5 mm<sup>2</sup>) through 0000 (107 mm<sup>2</sup>) shall vary by not more than  $+1\frac{1}{2}-2\frac{1}{2}\%$  from the average diameter specified in [Table 1](#).

## 16. Sampling

16.1 The aluminum cross-sectional area ([Section 14](#)) and the diameter ([Section 15](#)) shall be measured on a sample of completed conductor. At least one sample shall be tested on each size of conductor on each order of quantities from 5000 to 100 000 ft (1500 to 30 000 m), and one additional sample tested from each 100 000 ft thereafter.

## 17. Mechanical and Electrical Tests of Conductors with 1350-H19 Wire and Conductors Fabricated from 1350-H16 or -H26, 1350-H14 or -H24, or 1350-H142 or -H242 Wire and Not Annealed After Stranding

17.1 Tests for the mechanical and electrical properties of wire composing the conductor shall be made before, but not after stranding, unless otherwise agreed by the manufacturer and the purchaser as provided in [17.2](#) ([Explanatory Note 2](#)).

17.2 At the option of the purchaser, at the time of placing the order, tension and elongation tests of wire before stranding may be waived, and the completed conductor may be tested as a unit. The minimum breaking strength of conductors so tested shall be not less than the rated strength of 1350-H19 conduc-

tors or the minimum rated strength of 1350-H16, -H26, -H14, -H24, -H142, and -H242 conductors if failure occurs in the free length at least 1 in. (25 mm) beyond the end of either gripping device, or shall be not less than 95 % of the rated or minimum rated strength if failure occurs inside, or within 1 in. of the end of either gripping device. The maximum breaking strength of 1350-H16, -H26, -H14, -H24, -H142, and -H242 conductors shall be not greater than their maximum rated strengths. The free length between grips of the test specimen shall be not less than 24 in. (600 mm) and care shall be taken to ensure that the wires in the conductor are evenly gripped during the test ([Section 8](#) and [Explanatory Note 3](#)).

## 18. Inspection

18.1 Unless otherwise specified in the contract or purchase order, the manufacturer shall be responsible for the performance of all inspection and test requirements specified.

18.2 All inspections and tests shall be made at the place of manufacture unless otherwise especially agreed to between the manufacturer and the purchaser at the time of the purchase.

18.3 The manufacturer shall afford the inspector representing the purchaser all reasonable facilities to satisfy him that the material is being furnished in accordance with this specification.

## 19. Packaging and Package Marking

19.1 Package sizes for conductors shall be agreed upon by the manufacturer and the purchaser in the placing of individual orders.

19.2 The conductors shall be protected against damage in ordinary handling and shipping.

19.3 There shall be only one length of conductor on a reel unless otherwise agreed upon by the manufacturer and purchaser at time of placing order.

19.4 The net mass, length (and number of lengths, if more than one length is included in the package), size, kind of conductor, purchase order number, and any other marks required by the purchase order shall be marked on a tag attached to the end of the conductor inside of the package. The same information, together with the manufacturer's serial number (if any) and all shipping marks required by the purchaser, shall appear on the outside of each package.

## 20. Keywords

20.1 aluminum conductors; aluminum electrical conductor; compact round stranded conductors; concentric-lay-stranded conductors; electrical conductor; electrical conductor-aluminum; stranded conductors

## EXPLANATORY NOTES

NOTE 1—In this specification only compact round concentric-lay-stranded conductor constructions are specifically designated. Constructions not included in this specification should be specifically agreed upon by the manufacturer and the purchaser when placing the order.

NOTE 2—For definitions of terms relating to conductors, reference should be made to Terminology B 354.

NOTE 3—The increment of mass or electrical resistance of a completed concentric-lay-stranded conductor ( $k$ ) in percent is as follows:

$$k = 100 (m - 1)$$

where  $m$  is the stranding factor, and is also the ratio of the mass of linear density or electrical resistance of a unit length of stranded conductor to that of a solid conductor of the same cross-sectional area or of a stranded conductor with infinite length of lay, that is, all wires parallel to the conductor axis. The stranding factor  $m$  for the completed stranded conductor is the numerical average of the stranding factors for each of the individual wires in the conductor, including the straight core wire, if any (for which the stranding factor is unity). The stranding factor ( $m_{ind}$ ) for any given wire in a concentric-lay-stranded conductor is:

$$m_{ind} = \sqrt{1 + (9.8696/n^2)}$$

where  $n =$

$$\frac{\text{length of lay}}{\text{diameter of helical path of the wire}}$$

The derivation of the above as given in *NBS Handbook 100* is based on round wire constructions which are applicable to compacted wire constructions.

NOTE 4—Individual wires should not be unlaid from compact round conductors for testing purposes. Some physical properties of the individual compacted wires may be altered by the deformation brought about by compacting, unlaying, and straightening for test.

NOTE 5—To test stranded conductors for breaking strength successfully as a unit requires adequate means of gripping the ends of the test specimen without causing damage that may result in a failure below the actual strength of the conductor. Various means are available, such as compression sleeves, split sleeves, and preformed grips, but ordinary jaws or clamping devices usually are not suitable.
