

Standard Classification System for Nylon Injection and Extrusion Materials (PA)¹

This standard is issued under the fixed designation D4066; the number immediately following the designation indicates the year of original adoption or, in the case of revision, the year of last revision. A number in parentheses indicates the year of last reapproval. A superscript epsilon (ε) indicates an editorial change since the last revision or reapproval.

This standard has been approved for use by agencies of the Department of Defense.

INTRODUCTION

This standard is maintained in order to support products that must utilize ASTM D4066 in the product definition. This is necessary because there are some differences between the material property test requirements of ASTM D4066 and ASTM D6779, Standard Classification System for and Basis of Specification for Polyamide Molding and Extrusion Materials (PA). There are also differences between the two specifications in some of the Group/Class/Grade callouts. Designers of new products are urged to use ASTM D6779 rather than ASTM D4066.

1. Scope*

1.1 This classification system covers nylon materials suitable for injection molding and extrusion. Some of these compositions are also suitable for compression molding and application from solution.

1.2 The properties included in this classification system are those required to identify the compositions covered. There may be other requirements necessary to identify particular characteristics important to specialized applications. These may be specified by using the suffixes as given in Section 5.

1.3 This classification system and subsequent line call-out (specification) are intended to provide a means of calling out plastic materials used in the fabrication of end items or parts. It is not intended for the selection of materials. Material selection should be made by those having expertise in the plastic field after careful consideration of the design and the performance required of the part, the environment to which it will be exposed, the fabrication process to be employed, the costs involved, and the inherent properties of the material other than those covered by this classification system.

1.4 The values stated in SI units are to be regarded as the standard.

1.5 The following precautionary caveat pertains only to the test methods portion, Section 11, of this classification system. *This standard does not purport to address all of the safety concerns, if any, associated with its use. It is the responsibility*

of the user of this standard to establish appropriate safety and health practices and determine the applicability of regulatory limitations prior to use.

NOTE 1—There is no known ISO equivalent to this standard.

NOTE 2—This classification system is being revised to include international 4-mm specimens and test procedures as the standard for compliance. The 3.2-mm specimens; test methods; and Tables PA, A, and B are included in Appendix X3 as a reference for those wishing to use them. It is recommended that the material manufacturer be consulted on all call-outs against this classification system.

ISO 3167 Plastics, Multipurpose Test Specimens

ISO 3451-4:1994 Plastics—Determination of Ash—Part 4: Polyamides

3. Terminology

3.1 The terminology used in this classification system is in accordance with Terminologies **D883** and **D1600**.

4. Classification

4.1 Nylon materials are classified into groups according to their composition. These groups are subdivided into classes and grades as shown in the Basic Property Table (Table PA).

NOTE 3—An example of this classification system for unreinforced nylon is given as follows: The designation PA0123 indicates the following:

PA	=	polyamide (nylon) as found in Terminology D1600 ,
01 (group)	=	66 nylon,
2 (class)	=	heat stabilized, and
3 (grade)	=	with a minimum viscosity number of 210 and the requirements given in Table PA.

NOTE 4—An example of this classification system for reinforced nylon is given as follows: The designation PA012G35 indicates the following:

PA	=	polyamide (nylon) as found in Terminology D1600 ,
01 (group)	=	66 nylon,
2 (class)	=	heat stabilized, and
G35 (grade)	=	nominal 35 % glass with the requirements given in Table PA.

4.1.1 Grades of reinforced or filled versions, or both, of the basic materials are identified by a single letter that indicates the reinforcement or filler used and two digits, in multiples of 5, that indicate the nominal quantity in percent by weight. Thus, a letter designation G for glass reinforced and 35 for percent or reinforcement, G35, specifies a material with a nominal glass level of 35 %. The reinforcement letter designations and associated tolerance levels are shown as follows:

Symbol	Material	Tolerance (Based on the Total Mass)
C	carbon- and graphite-fiber-reinforced	±2 %
G	glass-reinforced	±2 %
L	lubricants (such as PTFE, graphite, silicone, and molybdenum disulfide)	Depends upon material and process—to be specified.
M	mineral-reinforced	±2 %
R	combinations of reinforcements or fillers, or both	±3 %

NOTE 5—This part of the classification system uses percent of reinforcements or additives, or both, in the call-out of the modified basic material. The types and percentages of reinforcements and additives should be shown on the supplier's technical data sheet unless they are proprietary in nature. If necessary, additional control of these reinforcements and additives can be accomplished by use of the suffix part of the system (see Section 5).

NOTE 6—Materials containing reinforcements or fillers, or both, at nominal levels not in multiples of 5 are included in the nearest PA grade designation. For example, a material with a nominal material level of 28 % is included with Grade M30.

³ The last approved version of this historical standard is referenced on www.astm.org.

⁴ Available from Standardization Documents Order Desk, DODSSP, Bldg. 4, Section D, 700 Robbins Ave., Philadelphia, PA 19111-5098, <http://www.dodssp.daps.mil>.

⁵ Available from American National Standards Institute (ANSI), 25 W. 43rd St., 4th Floor, New York, NY 10036, <http://www.ansi.org>.

NOTE 7—An example of this classification system for a 33 % glass-reinforced nylon is given as follows. The designation PA011G35 indicates the following:

01 (group) = 66 nylon,
1 (class) = general purpose, and
G35 (grade) = with requirements given in Table PA.

NOTE 8—Ash content of filled or reinforced materials may be determined using Test Method D5630.

PA = polyamide (nylon) as found in Terminology D1600,

^AData on 4-mm test specimens may be limited, and the minimum values may be changed in a later revision after a statistical data base of sufficient size is generated.

^BRefer to 9.1 for source of test pieces.

^CNo descriptions are listed unless needed to describe a special grade under the class. All other grades are listed by requirements.

^DCrosshead speed shall be 50 mm/min ± 10 % unless the specimen exhibits brittle failure (no yield point) and strain at break of <10 % in which case crosshead speed shall be 5 mm/min ± 25 %.

^EDeflection temperature shall be determined with the specimen in the flatwise position (Method A₁).

^FWeatherable nylon typically contains 1.90 to 2.25 % carbon black as determined in accordance with methods found in Test Method D6260. It is possible that materials incorporating other pigments or soluble stabilizers, or both may prove adequate for particular applications.

^GRelative Viscosities for Group 03 were generated from a correlation with Test Method D789, utilizing an Ubbelohde viscometer, and m-Cresol as the solvent. Refer to Table X3.1, Note B for more specific information.

4.2 Variations of nylon materials that are not in Table PA are classified in accordance with Tables PA and A or B. Table PA is used to specify the group of nylon and Table A or B is used to specify property requirements.

4.2.1 Specific requirements for variations of nylon materials shall be shown by a six-character designator. The designation

will consist of the letter “A” or “B” and the five digits comprising the cell numbers for the property requirements in the order as they appear in Tables A and B.

4.2.1.1 Although the values listed are necessary to include the range of properties available in existing material, users should not infer that every possible combination of the properties exists or can be obtained.

4.2.2 When the grade of the basic material is not known or is not important, the use of “0” grade classification shall be used for reinforced materials in this classification system.

NOTE 9—An example of this classification system for a reinforced nylon material is given as follows. The designation PA0110G30A22450 would indicate the following material requirements:

PA0110 = 66 nylon, from Table PA,
 G30 = glass reinforced at 30 % nominal,
 A = Table A property requirements,
 2 = 70-MPa tensile strength, min,
 2 = 4 500-MPa flexural modulus, min,
 4 = 10.0-kJ/m² Izod impact, min,
 5 = 160°C deflection temperature at 1.82 MPa, min, and
 0 = unspecified.

If no properties are specified, the designation would be PA0110G30A00000.

NOTE 10—When a grade of polyamide is not fully identified by a standard callout, it is possible to specify all table properties by the use of an addition of Classification **D4000** suffixes. Suffix values will override the PA table values.

An example of an unreinforced nylon material is given as follows: PA0212UM023. This example is a general purpose, low viscosity nylon 6 material where U denotes flexural modulus. M denotes ISO 178 as the test

method, and 023 denotes a value of 2300 MPa. This value for flexural modulus overrides the normal table value.

This example can be applied to replace all table values, that is, tensile stress, notched Izod impact, and heat deflection temperature.

4.3 To facilitate the specification of special materials where the basic property table does not reflect the properties required, Table B has been incorporated into this classification system. This table will be used in a manner similar to Table A.

NOTE 11—Pigmented or colored nylons can differ significantly from the natural polymers in mechanical properties depending on the choice of colorants and concentrations. The main property affected is ductility, as illustrated by a reduction in Izod impact and elongation values. In a typical white pigmented nylon, elongation losses of up to 50 % and Izod impact losses of up to 30 % are common. If specific properties of pigmented materials are necessary, Table B may be employed to specify property requirements.

NOTE 12—An example of a special material using this classification system is as follows: The designation PA0220B54220 would indicate the following material requirements from Table B:

PA0220 = 6 nylon, heat stabilized, from Table PA,
 B = Table B property requirements,
 5 = 70-MPa tensile strength, min,
 4 = 2400-MPa flexural modulus, min,
 2 = 4.0-kJ/m² Izod impact, min,
 2 = 55°C deflection temperature at 1.82 MPa, min, and
 0 = unspecified.

TABLE A Detail Requirements^{A,B} Reinforced Nylons

Designation Order No.	Property	0	1	2	3	4	5	6	7	8	9
1	Tensile strength, ISO 527, min, MPa ^C	unspecified	35	70	105	140	175	210	245	280	specify ^D value
2	Flexural modulus, ISO 178, min, MPa	unspecified	1 500	4 500	7 500	10 500	13 500	16 500	19 500	22 500	specify ^D value
3	Izod impact, ISO 180/1A, min, kJ/m ²	unspecified	2.5	5.0	7.5	10.0	12.5	15.0	22.5	30.0	specify ^D value
4	Deflection temperature, ISO 75, Method A, 1.82 MPa, min, °C ^E	unspecified	50	85	110	135	160	185	200	235	specify ^D value
5	To be determined	unspecified	...	...	...	...	...	...	...	...	...

^AIt is recognized that detailed test values, particularly Izod impact, may not predict nor even correlate with performance of parts molded of these materials.

^BRefer to 9.1 for source of test specimens.

^CCrosshead speed shall be 50 mm/min ± 10 % unless the specimen exhibits brittle failure (no yield point) and a strain at break of <10 % in which case crosshead speed shall be 5 mm/min ± 25 %.

^DIf a specific value is required, it must appear on the drawing or contract, or both.

^EDeflection temperature shall be determined with the specimen in the flatwise position (Method A_T).

TABLE B Detail Requirements^{A,B} Unreinforced Nylons

Designation Order No.	Property	0	1	2	3	4	5	6	7	8	9
1	Tensile strength, ISO 527, min, MPa ^C	unspecified	10	25	40	55	70	85	100	115	specify ^D value

5	To be determined	unspecified	...	...	...	...	...	...	...	...	...

^AIt is recognized that detailed test values, particularly Izod impact, may not predict nor even correlate with performance of parts molded of these materials.

^BRefer to 9.1 for source of test specimens.

^CCrosshead speed shall be 50 mm/min ± 10 % unless the specimen exhibits brittle failure (no yield point) and a strain at break of <10 % in which case crosshead speed shall be 5 mm/min ± 25 %.

^DIf a specific value is required, it must appear on the drawing or contract, or both.

^EDeflection temperature shall be determined with the specimen in the flatwise position (Method A_T).

5. Suffixes

5.1 When additional requirements are needed that are not covered by the basic requirements or cell-table requirements, they shall be indicated through the use of suffixes.

5.1.1 When using the callout for the materials covered by this classification system, the following suffixes may be used for specific requirements for the material for the application intended. In general, the suffix letter gives the general requirements needed and the first number (digit) gives the test condition, with the second number (digit) giving the specific requirement.

Suffixes:

E = Electrical requirements as designated by the following digits:

First Digit

- 0 = to be specified by user.
- 1 = specimens tested dry-as-molded.
- 2 = specimens tested conditions 96 h at 23°C and 50 % relative humidity.

Second Digit

- 0 = to be specified by user.
- 1 = insulation resistance, dielectric strength, dielectric constant, and dissipation factor meet property limits as shown in **Table 1**. These are electrical limits applied to unreinforced nylons when control of their electrical properties is required.
- 2 = dielectric strength, dielectric constant, and dissipation factor meet property limits as shown in **Table 2**. These are electrical limits applied to reinforced nylons when control of their electrical properties is required.
- Z = Other special requirement characteristics, that is, color, not covered by existing call-out capabilities may be assigned by the user. These will be spelled out in detail and identified in sequence, that is, 01, 02, 03, etc.

NOTE 13—A further list of suffixes can be found in Classification **D4000** and may be used for additional requirements as appropriate.

5.2 A list of suffixes can be found in Classification System **D4000** (Table 3) and may be used for additional requirements as appropriate. Additional suffixes will be added to that classification system as test methods and requirements are developed and requested.

NOTE 14—As modified by the following: Electrodes shall be American Standard No. 3 tapered pins 3 in. (76.2 mm) long having a diameter at the large end of 5.56 mm and tapering 6.35 mm/305 mm. The specimen shall be of sufficient size so that two 4.75-mm diameter holes centrally located, 25.4 mm apart, center-to-center, and perpendicular to the faces of the

TABLE 1 Electrical Properties of Unreinforced Nylons

	ASTM Test Method	Requirement
Insulation resistance, min, MΩ	D257 (Note 13)	5×10^6
Dielectric strength step-by-step test, min, kV/mm	D149 (Note 14)	14.8 (Note 20)
Dielectric constant at 1 MHz, max	D150 (Note 15)	4.0
Dissipation factor at 1 MHz, max	D150 (Note 15)	0.11

TABLE 2 Electrical Properties of Reinforced Nylons

	ASTM Test Method	Requirement
Dielectric strength step-by-step test, min, kV/mm	D149 (Note 14)	14.8 (Note 20)
Dielectric constant at 1 MHz, max	D150 (Note 15)	4.2
Dissipation factor at 1 MHz, max	D150 (Note 15)	0.025

specimen, may be drilled. The holes shall be drilled as above and then reamed, using a standard-tapered pin reamer, to a sufficient depth to allow the pins to extend approximately 31.75 mm beyond the small end of the hole. The electrodes shall be inserted after the specimens have been conditioned. These specimens shall be tested.

NOTE 15—As modified by the following: The test specimen shall be a disk 101.6 mm in diameter and 3.18 mm thick. Step-by-step testing shall be done after a short-time test where voltage is increased uniformly at the rate of 500 V/s. Voltage increments for the step-by-step test shall be determined from short-time test results as follows:

Breakdown by short-time test, kV	Increment for step-by-step test, kV
12.5 or less	0.5
Over 12.5 to 25, incl	1.0
Over 25 to 50, incl	2.5
Over 50 to 100, incl	5.0
Over 100	10.0

Dielectric strength testing shall be run under oil conforming to Federal Specification VV-I-530 at a frequency not exceeding 100 Hz. Step-by-step testing shall be carried out using five test specimens.

NOTE 16—As modified by the following: The test specimen is a disk 50.8 or 101.6 mm in diameter by 3.18 mm thick. The dissipation factor is the cotangent of the dielectric phase angle or the tangent of the dielectric loss angle. Five specimens shall be tested. After the humidity conditioning specified by the first digit following the E suffix, test specimens are immersed in distilled water at 50°C for 48 h followed by immersion in distilled water at 23°C for ½ h. Start the test within 2 min after removing the specimen and wiping with a dry cloth.

NOTE 17— $\text{kV/mm} \times 25.4 = \text{V/mil}$.

6. General Requirements

6.1 Basic requirements from the property tables or cell tables are always in effect unless superseded by specific suffix requirements, which always take precedence.

6.2 The plastics composition shall be uniform and shall conform to the requirements specified herein.

7. Detail Requirements

7.1 The material shall conform to the requirements prescribed in Tables PA, A, and B, and suffix requirements as they apply.

7.2 For purposes of determining conformance, all specified limits for classification (line callout based on this classification system are *absolute limits*, as defined in Practice **E29**).

7.2.1 With the absolute method, an observed value or a calculated value is not rounded, but is to be compared directly with the specified limiting value. Conformance or nonconformance is based on this comparison.

8. Sampling

8.1 Sampling shall be statistically adequate to satisfy the requirements of **12.4**.

8.2 A batch or lot shall be constituted as a unit of manufacture as prepared for shipment, and may consist of a blend of two or more “production runs.”

9. Specimen Preparation

9.1 Test pieces for relevant test methods shall be based on the injection molded ISO 3167 type multipurpose test specimen. All tests shall be conducted on as-molded (not annealed) specimens conditioned dry-as-molded. The following pieces are to be used for the listed relevant test methods:

Test Piece	Relevant Test Method
ISO 3167 Type 1A bar	tensile strength by ISO 527
80 ± 2 mm by 10 ± 9.2 mm by 4 ± 0.2 mm cut from the center portion of ISO 3167 Type 1A bar	flexural modulus by ISO 178.
	Izod impact resistance by ISO 180/1A
	deflection temperature by ISO 75/Method A _f
Specimen approximately 10 by 10 by 4 mm cut from center of ISO 3167 Type 1A bar	Density by ISO 1183

9.2 The test specimens shall be prepared by an injection molding process as specified in ISO 294 and Practice D3641. Recommended processing temperatures are shown in Table 3.

NOTE 18—Test specimens of PA 6 and PA 66 copolymers and blends may be prepared at the same process temperatures as specified for their homopolymers, without significant property loss. Selection of process temperature is made based on the major polymer component.

NOTE 19—Consult ISO 1874-2.2, Table 1, for a more comprehensive listing of the Conditions for Injection Moulding of Test Specimens.

9.3 Molding material-granules of the molding material used in preparation of test specimens shall contain no more than 0.2 % moisture, with the exception of PA 46 which will contain no more than 0.05 % moisture.

NOTE 20—If the moisture content exceeds the limits stated above, the material may be dried by a variety of methods such as, a temperature of 80 to 100°C in vacuum or a stream, or both, of dry nitrogen or a desiccant bed dryer, or both, until the moisture content is within stated limits.

10. Conditioning

10.1 *Conditioning*—Test data shall be obtained using dry-as-molded specimens, defined as those specimens that immediately upon removal from mold are sealed in containers that

are impermeable to water vapor. Maximum moisture content of specimens shall be 0.2 %. No moisture shall be intentionally added to reach this level. Condition specimens a minimum of 24 h in sealed containers at 23 ± 2°C.

NOTE 21—Physical properties of most nylon resins are highly dependent upon the moisture content of the molded item. The user is referred to the manufacturer’s literature for details.

10.2 *Test Conditions*—Conduct tests, other than solution viscosity or those tests conducted at elevated temperature, in the standard laboratory atmosphere of 23 ± 2°C and 50 ± 5 % relative humidity. Individual specimens shall not be removed from sealed containers until immediately before testing.

11. Test Methods

11.1 Determine the properties enumerated in this classification system by means of the test methods referenced in Section 2.

11.1.1 The number of tests shall be consistent with the requirements of Section 8.18.2 and 12.4.

12. Inspection and Certification

12.1 Inspection and certification of the material supplied with reference to a specification based on this classification system shall be for conformance to the requirements specified herein.

12.2 Lot-acceptance inspection shall be the basis on which acceptance or rejection of the lot is made. The lot-acceptance inspection shall consist of the tests listed as they apply:

- (1) Relative viscosity, or viscosity number, or both,
- (2) Moisture content,
- (3) Reinforcement content,
- (4) Carbon black content (weather-stabilized materials), and
- (5) Heat stabilizer content (heat-stabilized materials, supplier’s test showing positive presence).

12.3 Periodic-check inspection with reference to a specific based upon this classification system shall consist of the tests specified for all requirements of the material under this classification system. Inspection frequency shall be adequate to ensure the material is certifiable in accordance with 12.4.

12.4 Certification shall be that the material was manufactured by a process in statistical control, sampled, tested, and inspected in accordance with this classification system and that the average values for the lot meet the requirements of the specification (line callout).

12.5 A report of the test results shall be furnished when requested. The report shall consist of results of the lot-acceptance inspection for the shipment and the results of the most recent periodic-check inspection.

13. Packing, Packaging, and Marking

13.1 The provisions of Practice D3892 apply to packaging, packing, and marking of containers for plastic materials.

14. Keywords

14.1 classification; classification system; line callout; plastic materials

15. History of Modifications

15.1 D4066 – 01a:

(1) Added Group 14 (PA-MXD6) to Table PA. (2) Made revisions to Table PA for Nylon 6.

15.2 D4066 – 01:

(1) Revised Note F of Table PA.

15.3 D4066 – 00a:

(1) Added Group 13 (PA 6T/66) and Group 00 to Table PA. (2) Removed reinforcement Grades G00, M00, and R00 from Table PA.

15.4 D4066 – 00:

(1) Revised Nylon 46 data in Table PA.

15.5 D4066 – 99:

(1) Table PA was expanded to include Group 03 Nylon 11 data.

15.6 D4066 – 98:

(1) A new Note 10 was added to 4.2 to explain the use of Classification D4000 suffixes, and all subsequent notes were renumbered.

15.7 D4066 – 96a:

(1) This edition includes revised Nylon 6 data in Table PA. (2) Table X3.1 was corrected to reflect Table PA of Classification System D4066 – 94b.

15.8 D4066 – 96:

(1) This edition includes the addition of international test specimens and procedures, and additional grades to Table PA; the removal of melting point, specific gravity, elongation, and moisture content from Table PA; and the addition of melting point to the appendix.

APPENDIXES

(Nonmandatory Information)

X1. VISCOSITY CONVERSION: ASTM TEST METHODS D789 and ISO 307

X1.1 The relation between relative viscosity in 90 % HCOOH (test Methods D789) and viscosity number in 96 % H₂SO₄ (ISO 307) was developed in an interlaboratory round-robin study by ISO TC-61 Subcommittee 9/Work Group 8 (Plastic Materials/Polyamides). Seven laboratories, including 3 U.S. laboratories (Allied, DuPont, and Monsanto), participated in the work. A95 ± 9 % between-laboratory confidence interval was predicted for the measurements.

X1.2 For convenience, a conversion table and graph (Fig. X1.1) are provided using the following established relationship:

$$VN = A + B \times \ln(RV) \quad (X1.1)$$

where:

VN = viscosity number (ISO 307),
RV = relative viscosity (Test Methods D789),
A = -206.52124, and
B = 90.23355.

FIG. X1.1 Nylon 6 and Nylon 66 Viscosity Correlation Relative Viscosity in 90 % HCOOH (Test Methods D789) versus Viscosity Number in 96 % H₂SO₄ (ISO 307)

X2. MELTING POINT

X2.1 The melting point range of the various polyamide polymers shown in Table PA are listed as follows:

X2.2 The melting point shall be determined using ISO 3146, Method C2, with a heating rate of 10°C/min. The melting point, T_m, is obtained from the second melting curve.

Group	Description	T _m , °C
01	66 nylon	262

Group	Description	T _m , °C
02	6 nylon	222
03	11 nylon	190
04	12 nylon	178
05	69 nylon	215
06	612 nylon	212
07	610 nylon	218
08	special	150
09	46 nylon	290

^ANo descriptions are listed unless needed to describe a special grade under the class. All other grades are listed by requirements.

^BViscosities for Groups 03, 04, 06, and 08 are measured as described as follows. Refer to Specification D789 for general directions and for the calculation of relative viscosities. Relative viscosities of Groups 03 and 04 shall be measured on 0.5 g of polymer dissolved in 99.5 g of *m*-cresol at 25.0 ± 0.1°C in a Cannon-Fenske No. 200 viscometer. Inherent viscosity of Group 06 shall be measured on 0.5 g of polymer dissolved in 100 mL of *m*-cresol at 25.0 ± 0.1°C in a Cannon-Fenske No. 200 viscometer. The inherent viscosity is calculated as follows:

$$\text{Inherent viscosity} = \frac{\ln(t_s/t_c)}{C}$$

t_s = average efflux time for sample solution,

t_c = average efflux time for solvent, and

C = concentration, g/100 mL.

Relative viscosity of Group 08 shall be measured on 9.44 g of polymer dissolved in 100 mL of *m*-cresol at 25.0 ± 0.1°C in a Cannon-Fensky No. 450 viscometer. Details of these methods will be included in a future revision of Specification D789.

^CHeating rate—10°C/min.

^DThe results of an international round robin (ISO-USA, Germany, Japan, Poland, and Italy) showed DSC melt point to be the method having the best reproducibility of results when compared to other available methods (ref. ISO 3146).

^ETensile strength and elongation shall be determined on Test Method D638 test specimens 3.2 ± 0.4 mm thick. The speed of testing shall be 50 mm/min (±10 %) unless otherwise agreed upon.

^FFlexural modulus shall be determined on Test Method D790 test specimens 3.2 by 12.7 by 127 mm with a crosshead speed of 1.3 mm/min (±50 %), Procedure A.

^GIzod impact for these materials shall be conducted on specimens with a 12.7-mm depth and a notch radius of 0.25 mm. The specimens tested are 3.17 mm in width. N/B = No Break.

^HRequirements are based on unannealed test specimens 3.17 mm in width. Annealed specimens tend to give higher results because of the elimination of the effect of molding stresses when annealed in accordance with the supplier's recommendation.

^IGroups 03 and 04 materials use Specification D789 except sample to be immersed in a heat bath for 45 min at 180 ± 2°C.

^JCarbon black content and absorbance must be 1.90 to 2.25 % and 0.230 minimum, respectively, as determined in accordance with methods found in Federal Specification L-P-410a. It is possible, by agreement between the buyer and the seller, that materials incorporating other pigments or soluble stabilizers, or both, may prove adequate for particular applications.

^KHydrolysis-resistance test. To be agreed upon between the user and the supplier.

^LIzod impact requirements for Group 04 materials based on specimens with a 12.7-mm depth, 3.17-mm width, and a notch radius of 0.25 mm.

^MDeflection temperature requirements for Group 04 materials are based on unannealed test specimens 3.17 mm in width.

^NInherent viscosities (dL/g).

^OGroup 07 nylons are presently used commercially only as reinforced materials.

^PMoisture of material^Q as received^Q shall be 0.05 % max (Test Method **D789**).

^QFor general information (not a requirement).

^RTensile strength and elongation shall be determined on Test Method **D638** test specimens 3.2 ± 0.4 mm thick. The speed of testing shall be 5 mm/min (±10 %) unless otherwise agreed upon.

^SFor specific flammability requirement use the proper suffix from Classification **D4000**, for example, FL310 = (UL 94) VO at 0.8 mm.

TABLE X3.2 Detail Requirements^A Reinforced Nylons (Table A, Specification D4066–94b)

Designation Order No.	Property	0	1	2	3	4	5	6	7	8	9
1	Tensile strength, ASTM D638 , min, MPa ^{B,C}	unspecified	35	70	105	140	175	210	245	280	Specify ^D value
2	Flexural modulus, ASTM D790 , min, MPa ^{B,E}	unspecified	1 500	4 500	7 500	10 500	13 500	16 500	19 500	22 500	Specify ^D value
3	Izod impact, ASTM D256 , min, J/m ^F	unspecified	25	50	75	100	125	150	225	300	Specify ^D value
4	Deflection temperature, ASTM D648 , 1820 kPa, °C, min ^G	unspecified	50	85	110	135	160	185	200	235	Specify ^D value
5	To be determined	unspecified	...	...	...	...	...	...	...	...	...

^AIt is recognized that detailed test values, particularly Izod impact, may not predict nor even correlate with performance of parts molded of these materials.

^BMPa × 145 = psi.

^CTensile strength and elongation shall be determined on Test Method **D638** test specimens 3.2 ± 0.4 mm thick. The speed of testing shall be 5 mm/min (±25 %) unless otherwise agreed upon.

^DIf specific value is required, it must appear on drawing or contract, or both.

^EFlexural modulus shall be determined on Test Methods **D790** test specimens 6.4 by 13 by 130 mm with a crosshead speed of 2.8 mm/min (±50 %), Procedure A.

^FJ/m × 18.73 × 10⁻³ = ft · lbf/in.

^GRequirements are based on unannealed test specimens 3.17 mm in width. Annealed specimens tend to give higher results because of the elimination of the effect of molding stresses when annealed in accordance with the supplier's recommendation.

TABLE X3.3 Detail Requirements^A Unreinforced Nylons (Table B, Specification D4066–94b)

^GRequirements are based on unannealed test specimens 3.17 mm in width. Annealed specimens tend to give higher results because of the elimination of the effect of molding stresses when annealed in accordance with the supplier's recommendation.

SUMMARY OF CHANGES

Committee D20 has identified the location of selected changes to this standard since the last issue (D4066 - 01a(2008)) that may impact the use of this standard. (July 1, 2013)

(1) Reinstated D4066 with the addition of an introduction.

(3) Updated Note 1.

(2) Added section on History of Modifications.

ASTM International takes no position respecting the validity of any patent rights asserted in connection with any item mentioned in this standard. Users of this standard are expressly advised that determination of the validity of any such patent rights, and the risk of infringement of such rights, are entirely their own responsibility.

This standard is subject to revision at any time by the responsible technical committee and must be reviewed every five years and if not revised, either reapproved or withdrawn. Your comments are invited either for revision of this standard or for additional standards and should be addressed to ASTM International Headquarters. Your comments will receive careful consideration at a meeting of the responsible technical committee, which you may attend. If you feel that your comments have not received a fair hearing you should make your views known to the ASTM Committee on Standards, at the address shown below.

This standard is copyrighted by ASTM International, 100 Barr Harbor Drive, PO Box C700, West Conshohocken, PA 19428-2959, United States. Individual reprints (single or multiple copies) of this standard may be obtained by contacting ASTM at the above address or at 610-832-9585 (phone), 610-832-9555 (fax), or service@astm.org (e-mail); or through the ASTM website (www.astm.org). Permission rights to photocopy the standard may also be secured from the ASTM website (www.astm.org/COPYRIGHT/).
