Optical Properties General: Other values of refractive index have been reported [60]. Optical rotation has been reported [60]. Oxyluminescence curve has been reported [37]. Birefringence value for Ultradur B4500 has been reported [36]
Refractive Index:

No.	Value	Note
1	1.411	α-form
2	1.713	α-form
3	1.76	α-form

4	1.398	β-form [85]
5	1.708	β-form [85]
6	1.768	β-form [85]

Transmission and Spectra: Ir [13,30,64,66,73,84], uv [64], Raman [16,66], fluorescence [70], mass [17,29,34,42,48], XPES [90] and C-13 nmr [18,20,32,35,44] spectral data have been reported
Molar Refraction: dn/dC 0.236 (23°, hexafluoroisopropanol) [27]
Total Internal Reflection: Birefringence 0.183 [11], 0.00145 [38]. Intrinsic birefringence (c axis) 0.153 (α-form), 0.215 (β-form) [85]

Polymer Stability:

Decomposition Details: Decomposition temp. 400° [42]. Thermal degradation details have been reported [17,29,34,42,48,59]
Environmental Stress: Photolysis, photooxidation [64,84] and weathering have been reported [72,93]
Chemical Stability: Solvent resistance has been reported [73]. Resistant to ketones, alcohols, glycols, ethers, aliphatic hydrocarbons, chlorinated aliphatic hydrocarbons, petrol, oil, transmission and brake fluids [93], CCl_4 and detergents [94]
Hydrolytic Stability: Stable to H_2O and dilute acids and alkalis
Recyclability: Details on recyclability have been reported [86]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification of dimethyl phthalate with 1,4-butanediol using titanium catalysts followed by melt polycondensation using titanium catalysts at 240° under vacuum [5,15,42]. Processed by injection moulding, extrusion and foam moulding (thermoforming with difficulty). Dried at 121° for 4h to optimise props. It is important not to overheat. A melt temp. of 249–271° (480–520°F) should be sufficient. Mould temps. of 37–121° (100–250°F) are commonly used
Mould Shrinkage (%):

No.	Value	Note
1	1.7%	unreinforced, 3 mm sample, parallel flow
2	0.2%	glass filled, 3 mm sample, parallel flow
3	2.3%	unreinforced, 3 mm sample, perpendicular to flow
4	0.6%	glass filled, 3 mm sample, perpendicular to flow

Applications: Used in iron and toaster housings, cooker/fryer handles, hair dryer nozzles, food processor blades. Used for exterior and under bonnet parts of cars. Used in the electrical industry for bobbins, connectors, switches, relays, terminal boards, motor bush holders, TV tuners, fuse cases, ie. carriers and sockets, and belts. Other industrial uses include, pump housings, impellers, valves, brackets, water meter components, tool housings, castings; in drapery hardware, pen barrels, zippers, hair dryers and calculators

Poly(butylene terephthalate-co-butylene ether glycol terephthalate) P-104

Synonyms: *PBT-poly(oxytetramethylene) copolymer. Poly(butylene terephthalate-co-tetrahydrofuran). Poly(butylene terephthalate-co-butylene oxide). PBT-PTMEG. PBT-PEE. Poly(tetramethylene terephthalate-co-tetramethylene oxide)*
Related Polymers: Polybutylene terephthalate, PBT - Injection moulding, Glass fibre filled, PBT - Flame retardant, PBT - High Impact, Impact modified, PBT - Fibres, PBT - Films/Sheets, PBT - Mineral filled, PBT - Carbon fibre filled, PBT - Structural foam, PBT - PTFE lubricated, PBT - Silicone lubricated, PBT - Uv stabilised, PBT - Phenoxy blends, PBT - Polyethylene terephthalate blends
Monomers: 1,4-Butanediol, Terephthalic acid
Material class: Copolymers
Polymer Type: PBT and copolymers
CAS Number:

CAS Reg. No.	Note
37282-12-5	
9078-71-1	from dimethyl terephthalate
106159-00-6	block

Molecular Formula: $[(C_{12}H_{12}O_4)_x(C_8H_4O_3)_y(C_4H_8O)_z]_n$
Fragments: $C_{12}H_{12}O_4$ $C_8H_4O_3$ C_4H_8O
Molecular Weight: M_n 25000–30000
Additives: Aromatic secondary amines used as stabilisers. Phenolic or amine-containing compounds used as antioxidants. Flame retardants. Carbon black. Polycarbodiimide added as a moisture stabiliser
Morphology: Thin films containing 73% PBT have single cryst. lamellae [30]. Has spherulitic struct. over a wide range of compositions [6,7]. Melt spinning prod. filaments with a two-phase struct. [36]. The morphology of blends with liq. cryst. polymer has been reported [39]. Other morphological studies have been reported [9,10].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15 g/cm^3	Hytrel 4055 [14]
2	d 1.189 g/cm^3	60% PBT [19]
3	d 1.152 g/cm^3	Hytrel 4055 [21]
4	d 1.204 g/cm^3	Hytrel 5556 [32]
5	d 1.13–1.25 g/cm^3	
6	d 1.19 g/cm^3	57% PBT [39]
7	d 1.17 g/cm^3	50% PBT, ASTM D792 [55]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.000172 K^{-1}	57% PBT [39]	L

Thermodynamic Properties General: Melting behaviour has been reported [34]
Latent Heat Crystallization: ΔH_f 10 J g^{-1} (23% PBT) [1], 32.7 J g^{-1} (7.8 cal g^{-1} 50% PBT) [7],12.31 kJ mol^{-1} (2.94 kcal mol^{-1} 60% PBT) [29]. Activation energy for conduction 77 kJ mol^{-1} (60% PBT) [19].

Entropy of diffusion 17.2 J mol^{-1} K^{-1} (34.5% PBT). Activation energy of diffusion of *p*-nitroaniline 56.38 kJ mol^{-1} (34.5% PBT) [26]

Melting Temperature:

No.	Value	Note
1	198°C	58% PBT [3]
2	176°C	33.1% PBT [4]
3	189°C	50% PBT [7,12]
4	177°C	44% PBT [8]
5	212°C	76% PBT [25]
6	202°C	58% PBT [25]
7	165–227°C	ASTM D3418 [35]
8	203°C	57% PBT, Hytrel 5556 [36]
9	145°C	50% PBT, ASTM D3418 [55]
10	242°C	[27]
11	171–248°C	[56]
12	219°C	10% PTHF [22]
13	240°C	10% PTHF [22]
14	117–200°C	[29]

Glass-Transition Temperature:

No.	Value	Note
1	-78°C	23% PBT [1]
2	-30°C	58% PBT [3]
3	-78°C	33.1% PBT [4]
4	-59°C	50% PBT [7]
5	-65°C	44% PBT [8]
6	-32°C	Hytrel 4055 [11]
7	-48°C	60% PBT [19]
8	-53°C	58% PBT [25]
9	-43°C	57% PBT [39]
10	-57–-42°C	[29]
11	-70–20°C	[55]
12	50°C	10% PTHF [22]

Transition Temperature General: Other values of T_g and T_m have been reported [5]

Deflection Temperature:

No.	Value	Note
1	52°C	1.82 MPa, 57% PBT [39]
2	54°C	0.46 MPa, 50% PBT, ASTM D648 [55]

Vicat Softening Point:

No.	Value	Note
1	110–220°C	Shore D32–D63, ASTM D1525 [35]
2	112°C	50% PBT, ASTM D1525 [55]
3	107°C	Shore D35, ASTM D1525 [57]
4	136°C	Shore D40, ASTM D1525
5	181°C	Shore D55, ASTM D1525
6	204°C	Shore D72, ASTM D1525 [57]

Brittleness Temperature:

No.	Value	Note
1	>-70°C	min., 33.1% PBT [4]
2	-60°C	76% PBT, ASTM D746 [5]
3	<-70°C	max., 58% PBT [25]
4	-70°C	58% PBT [55]

Transition Temperature:

No.	Value	Note	Type
1	-110°C	23% PBT [1]	T_β
2	-111°C	Hytrel 4055 [11]	T_β
3	-42°C	34% PBT	T_β
4	27°C	84% PBT [24]	T_β
5	224°C	51% PBT	T_m
6	229°C	65% PBT	T_m
7	233°C	80% PBT [2]	T_m
8	242°C	[27]	T_m
9	246°C	60% PBT [29]	T_m
10	-76°C	33.1% PBT [4]	Softening temp.
11	152°C	86% wt PBT, annealed [18]	T_α
12	42–48°C	86% wt PBT, annealed [18]	T_β
13	-76°C	86% wt PBT, annealed [18]	T_γ

Surface Properties & Solubility:

Solubility Properties General: Miscible with bisphenol A polycarbonate [40]. Immiscible with PBT [2]. Mixing Hytrel 4056 with PVC, gives a dispersion of PVC within a continuous Hytrel phase [16]. Compatible with PVC at Hytrel levels of 25–50%. Incompatible at Hytrel level of 80% [11]. Hytrel 4055 is partially miscible with chlorosulfonated polyethylene [20]. Some mixing between Hytrel 4055 and nitrile rubber occurs [21]

Cohesive Energy Density Solubility Parameters: δ 18.62–22.1 $J^{1/2}$ $cm^{-3/2}$ (9.1–10.8 $cal^{1/2}$ $cm^{-3/2}$) (0–100% PBT) [2]

Solvents/Non-solvents: Sol. phenol, $CHCl_3$, tetrachloroethane, *m*-cresol [5]. Insol. most solvents [5]

Transport Properties:

Transport Properties General: Melt flow index [4,56] for Hytrel [28] has been reported

Melt Flow Index:

No.	Value	Note
1	5.8 g/10 min	58% PBT [25,55]

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.18 dl g^{-1} (30°, *m*-cresol, 50% PBT) [12]. [η] 1.52 dl g^{-1} (30°, *m*-cresol, 58% PBT) [25]. $[\eta]_{inh}$ 2.5 dl g^{-1} (25°, *o*-chlorophenol, 57% PBT) [39]

Polymer Melts: Melt viscosity of material containing 58% PBT and its variation with polymerisation time has been reported [4]

Permeability of Gases: Gas permeability data have been reported [45]

Permeability of Liquids: Diffusion coefficient of *p*-nitroaniline 75.9×10^{-7}-37.1×10^{-6} (67.1–95°, 34.5% PBT) [26]

Water Absorption:

No.	Value	Note
1	0.6 %	24h, 50% PBT, ASTM D570 [55]

Mechanical Properties:

Mechanical Properties General: Variation of dynamic tensile storage and loss moduli with temp. has been reported [7,10,18,29]. Tensile modulus and tenacity of filaments increase with an increase in hard segment content, whereas elongation at break decreases [36]. Variation of tensile modulus with temp. has been reported [32]. Compression set 52% (22h, 70°, 50% PBT, ASTM D395B) [12], 40% (58% PBT, ASTM D395B) [25], 27% (22h, 73°, 9.3 MPa, 50% PBT, ASTM D395A [55]. Other values of flexural modulus have been reported [56]. Other mechanical props. have been reported [9,35,56]. The variation of dynamic storage modulus with temp. for Hytrel 4055 has been reported [11]. The fibre denier and its relation to spinning temp. has been reported [23]. Variation of dynamic tensile storage modulus with temp. has been reported [6]. Compression strain 40% (33.1% PBT, ASTM D395B) [4], compression set 54% (22h, 70°, 50% PBT, ASTM D395-55B) [5]. Tensile creep modulus has been reported [56]. Other values of torsional modulus have been reported [12]. Other values of bulk modulus have been reported [32]

Tensile (Young's) Modulus:

No.	Value	Note
1	1040 MPa	0°, Hytrel 5556 [32]
2	138.3 MPa	1410 kg cm^{-2}, 58% PBT, ASTM D638 [4]
3	84–1250 MPa	depending upon method of synth. [38]

Flexural Modulus:

No.	Value	Note
1	48 MPa	50% PBT, ASTM D790 [55]
2	84.8–2370 MPa	-40°, ASTM D790 [57]
3	210 MPa	57% PBT [39]
4	55–585 MPa	22°, ASTM D790 [55]
5	13.8–2070 MPa	[56]
6	62–1040 MPa	depending upon method of synth. [38]

Tensile Strength Break:

No.	Value	Note	Elongation
1	20 MPa	44% PBT [8]	755%
2	48.4 MPa	50% PBT [12]	755%
3	44.1 MPa	-25°, 58% PBT [25,55]	650%
4	47.6 MPa	25°, 76% PBT	510%
5	24.7 MPa	150°, 76% PBT	530%
6	21.2 MPa	175°, 76% PBT	505%
7	13.7 MPa	200°, 76% PBT [25]	525%
8	18 MPa	25°, Hytrel 40D, ASTM D412-80 [54]	950%
9	39.2 MPa	400 kg cm^{-2}, 25°, 33.1% PBT [4]	810%
10	51 MPa	7.4 kpsi, 50% PBT, ASTM D412 [5]	780%
11	42 MPa	57% PBT [39]	940%
12	30 MPa	50% PBT, ASTM D638 [55]	560%
13	13.2–29.2 MPa	[57]	470–300%
14	18.6 MPa	100°, 4 weeks, H_2O [25]	95%
15	15–44 MPa	[35]	

Flexural Strength at Break:

No.	Value	Note
1	11 MPa	57% PBT [39]

Compressive Modulus:

No.	Value	Note
1	86.3 MPa	880 kg cm^{-2}, 58% PBT, ASTM D695 [4]

Poisson's Ratio:

No.	Value	Note
1	0.45	50% PBT [55]

Miscellaneous Moduli:

No.	Value	Note	Type
1	206.9 MPa	2110 kg cm^{-2}, 58% PBT, ASTM D797 [4]	Bending modulus
2	26 MPa	50% PBT, ASTM D1043	Torsional modulus (Clash Berg) T_{10000}
3	71 MPa	4°, 58% PBT [25]	Torsional modulus
4	190 MPa	-140°, 58% PBT [25]	Torsional modulus
5	3510 MPa	Hytrel 5556 [32]	Bulk modulus
6	116 MPa	25°, 75% PBT	Torsional modulus
7	310 MPa	-40°, 75% PBT [55]	Torsional modulus

Impact Strength: Drop weight impact failure has been reported [56]
Viscoelastic Behaviour: Longitudinal sonic velocity 0.28 km s^{-1} (20°, Hytrel 4055) [11]. Acoustic impedance 30000 g cm^{-2} s^{-1} (20°, Hytrel 4055) [11]. Stress-strain curves (58% PBT) have been reported [4]; other stress-strain curves have been reported [5,7,8,36]. Tensile creep 8.0% (6.9 MPa, 23°, Hytrel 5556). Compressive creep 0.6%, 1.3% (6.9 MPa, 50°, Hytrel 5556) [56]. Creep resistance may be improved by improving the compression set [44]. Creep behaviour has been reported [55]
Mechanical Properties Miscellaneous: Resilience 62% (50% PBT, Bashore) [55]
Hardness: Shore D55 (58% PBT, ASTM D2240) [55], D35–D72 [55], D50–D80 [38], A92 (Hytrel 40D, ASTM D2240-80) [54], A92 (33.1% PBT) [4], D49 (50% PBT, ASTM D2240) [5], D48 (50% PBT, ASTM D2240) [12], D63 (76% PBT) [25], D55 (58% PBT) [25], D35-D82 [35], D40 (50% PBT, ASTM D2240) [55]
Failure Properties General: Shear strength 24 MPa (50% PBT, ASTM D732) [55]. Tear strength 110 kN m^{-1} (50% PBT, ASTM D624 die B), 102.77 kN m^{-1} (Hytrel 40D, ASTM D624-81) [54], 122 kN m^{-1} (die C) [55], 48 KnM^{-1} (50% PBT, ASTM D1938) [12]. Resistance to flex-cut growth Ross, pierced 1000000 cycles (min., 50% PBT, ASTM D1052); unpierced 1000000 (min.); DeMatia, pierced 1000000 cycles (min., ASTM D813) [55], 72000 cycles (22°, ASTM D813), 18000 cycles (121°, ASTM D813) [4]. Resistance to flex-cut growth 300000 (min., 23°, Hytrel, Shore D55, Ross flex, ASTM D1052), 12 (min.) (-40°, Hytrel, Shore D55, Ross flex, ASTM D1052) [56]. Split tear 16 kg cm^{-1} (33.1% PBT, ASTM D1938) [4], 70.6 kN m^{-1} (58% PBT, ASTM D1938) [25]. Tear resistance 290 pli (50% PBT, ASTM D1938) [5]
Fracture Mechanical Properties: Fatigue limit 6.9 MPa (Hytrel 5556, 2.5 million cycles without failure) [56]
Friction Abrasion and Resistance: Abrasion resistance 700% (33.1% PBT, ASTM D1630) [4]. Taber abrasion resistance 90 mg $(1000 \text{ cycles})^{-1}$ (58% PBT, ASTM D1044) [25], 5 mg $(1000 \text{ cycles})^{-1}$ (CS-17 wheel, ASTM D1044), 64 mg $(1000 \text{ cycles})^{-1}$ (H-18 wheel, ASTM D1044) [56]. NBS abrasion index 3540% (ASTM D1630) [56]. Abrasion loss 0.182 cm^3 h^{-1} (Hytrel 40D) [54]

Izod Notch:

No.	Value	Notch	Break	Note
1	1270 J/m	Y		-40°, 58% PBT [25]
2	2040 J/m	N		min., 58% PBT [25]
3		Y	no break	-40°, ASTM D256 [57]

Electrical Properties:

Electrical Properties General: Variation of dissipation factor with temp. has been reported [1,3,6,10,18,35]. Dielectric props. of soln. blends of Hytrel 5526 with PVC have been reported [17]. Other dielectric constants have been reported [3]. The apparent dielectric constant increases with decreasing temp. at temps. below -100° [24].

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4.6		Hytrel 5556 [56]
2	4.4		25°, 60% PBT [19]
3	4.8		Hytrel 4056 [56]
4	5.146	10 Hz	34% PBT [24]

Dielectric Strength:

No.	Value	Note
1	0.39 $kV.mm^{-1}$	Hytrel 4056, 0.075" thick [56]
2	0.4 $kV.mm^{-1}$	Hytrel 5556, ASTM D149 [56]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.006	100 Hz	Hytrel 5556, ASTM D150 [56]

Optical Properties:

Transmission and Spectra: Ir [7,8,51], C-13 nmr [13,15,16,31,42], H-1 nmr [22,38,42], esr [33], mass [37] and x-ray [37] spectral data have been reported

Total Internal Reflection: Birefringence of filaments increases with an increase in hard segment content [36]

Volume Properties/Surface Properties: Colour off-white [32]

Polymer Stability:

Polymer Stability General: May be used from -55–150° [35,55,56]

Thermal Stability General: Heat resistance has been reported [56]. Details of thermal stability have been reported [25]

Upper Use Temperature:

No.	Value	Note
1	150°C	[35]
2	150°C	[55]
3	148°C	[56]

Decomposition Details: Thermal degradation data have been reported [49]

Flammability: Flammability rating HB (UL94) [56]

Environmental Stress: Weathering data have been reported [48]. Weathering in the Panama jungle rain forest over 5 years causes Hytrel 4056 to lose 105% of its original tensile strength [56]. Undergoes photo-thermal oxidation to yield hydroperoxides [53]

Chemical Stability: Swollen by oil and AcOH [4,25]. Resistant to oil, butyl alcohol, isooctane, isobutyl methyl ketone, xylene, hydraulic fluid, Freon 113, perchloroethylene, trichloroethylene, aniline, dibutyl phthalate, DMF, ethylene glycol, Skydrol 500A [35], acoustic coupling fluids [50]. Resistance to chemicals [25] and fuels [52] has been reported. Has excellent resistance to ASTM oils nos. 1 and 3, ASTM fuels A and C, EtOH, 2-propanol, 2-butanone, mineral oil, Skydrol 500B, soap soln., zinc chloride soln.; has good resistance to Me_2CO, formic acid, 10% nitric acid; has poor resistance to 30% nitric acid [57]. Has excellent resistance to oils, aliphatic hydrocarbons, petrol, ethylene glycol, fluorinated hydrocarbons, weak acids, salt solns. Good to moderate resistance to alcohols, ketones, and poor resistance to phenols [56]. Swollen by ASTM oil no. 3 and ASTM fuel B [44]

Hydrolytic Stability: Swollen by H_2O [4,55]. Hydrolytic stability in water and seawater of Hytrel 7246 has been reported [50]. Has excellent resistance to seawater [56,57] and boiling H_2O [57]

Biological Stability: Biodegradation study has been reported [41]

Recyclability: Details of recycling have been reported [43]

Stability Miscellaneous: Radiation lifetime 150 Cm^{-2} (100 keV, 23°, 73% PBT) [30]. Resistance to radiation has been reported [56]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by a two-stage melt transesterification of dimethyl terephthalate, poly(oxytetramethylene glycol) and 1,4-butanediol at 160–250° with a titanate catalyst to form a prepolymer. The prepolymer is polycondensed at 250° under vacuum. The process is carried out under nitrogen in the presence of an antioxidant [2,4,5,38,55]

Mould Shrinkage (%):

No.	Value	Note
1	0.4–1.8%	Hytrel range, ASTM D955 [56]

Applications: Used in telephone insulation cords; in low pressure tyres, cable jacketing, hose applications, protective coatings, power transmission belts, diaphragms, gaskets, seals and plugs. Other uses in headphones, railcar diaphragms, railcar couplers, medical films, wire clamps and automotive shock absorbers. Blends have uses in automobile fascias, wheel covers, air-bag housings, wire insulation, electrical switches, sealed electrical connectors, electromechanical parts, machine gears, car spoilers, car grilles, car side mouldings, footwear, military holsters, straps, footballs, sports clothing, motorcycle face masks, hoses, tubes, power drive belts, fibre optic coatings, petrol caps, seat belt locking devices, bottle caps, air rifle parts, textile spinning wheels, car door latch covers

Trade name	Details	Supplier
Arnitel		Akzo
Bexloy V	PBT blend	DuPont
Hytrel		DuPont
Kopel		Kolon Ltd.
Lomod		General Electric
Pelprene		Toyo Boseki
Riteflex		Hoechst Celanese
Vandar	PBT blend	Hoechst Celanese

Polybutylene terephthalate, Fibres P-105

Related Polymers: Polybutylene terephthalate, Polybutylene terephthalate, Injection Moulding Glass fibre filled, Polybutylene terephthalate, High Impact, Polybutylene terephthalate, Films/Sheets, Polybutylene terephthalate, Flame Retardant, Polybutylene terephthalate, Injection Moulding Mineral filled, Polybutylene terephthalate, Injection Moulding Carbon fibre filled, Polybutylene terephthalate, Polyethylene terephthalate blends, Polybutylene terephthalate, Phenoxy blends
Monomers: 1,4-Butanediol, Terephthalic acid
Material class: Thermoplastic
Polymer Type: PBT and copolymers
CAS Number:

CAS Reg. No.	Note
26062-94-2	
24968-12-5	repeating unit
30965-26-5	from dimethyl terephthalate
59822-52-5	from terephthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$
Morphology: Cryst. struct. of Celanex 2000 varies with the melt spin speed a 4.785, b 5.905, c 12 (spin speed 1500 m min^{-1}); a 4.745, b 5.878, c 11.84 (4500 m min^{-1}) [4]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Density increases with the melt-spin take up velocity [4]
Glass-Transition Temperature:

No.	Value	Note
1	98°C	[2]

Transition Temperature:

No.	Value	Note	Type
1	214°C	0.2 g den^{-1} loading [1]	Flow point

Mechanical Properties:

Mechanical Properties General: The breaking load of PBT yarn increases with increasing heat-setting temp. up to 140°, when it then decreases [5]. Elongation at break 20–107% depending on draw ratio [2]. Tenacity and elongation of Celanex 2000 to break increase with increase in both take-up velocity and MW [4]. Young's modulus of Celanex 2000 increases with an increase in both take-up velocity and MW [4]
Tensile Strength Break:

No.	Value	Note
1	325 MPa	22°, draw ratio 4
2	278 MPa	90°, draw ratio 4 [3]
3	240–490 MPa	[2]

Miscellaneous Moduli:

No.	Value	Note
1	2200–2600 MPa	2% secant modulus [2]

Viscoelastic Behaviour: Stress-strain curves have been reported [2,3,4]

Optical Properties:

Total Internal Reflection: Birefringence 0.146–0.158 (depending on draw ratio) [2]

Applications/Commercial Products:

Trade name	Supplier
Fortrell II	Fibre Industries Inc.

CAS Reg. No.	Note
26062-94-2	
24968-12-5	repeating unit
30965-26-5	from dimethyl terephthalate
59822-52-5	from terephthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$
Molecular Weight: M_n 31000
Morphology: Ultradur a 4.82, b 5.93, c 11.74, α 100.0°, β 115.5°, γ 111.0° (cryst. temp. 220°C) [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{23} 1.289 g/cm^3	dry [2]
2	d 1.283 g/cm^3	Ultradur B2550 [5]
3	d 1.31 g/cm^3	[9]

Volumetric Properties General: The mean square density of Ultradur increases with increasing macroscopic density [1]

Melting Temperature:

No.	Value	Note
1	224.5°C	VFR 4716 [4]
2	224°C	30% glass fibre [4]

Glass-Transition Temperature:

No.	Value	Note
1	44°C	VFR 4716 [4]

Transition Temperature:

No.	Value	Note	Type
1	206°C	air cooled or liq. N_2 quenched	α
2	60°C	[4]	β
3	-85°C	[4]	γ

Transport Properties:

Polymer Solutions Dilute: [η] 0.53 dl g^{-1} (tetrachloroethane/phenol 60/40, Ultradur) [1], [η] 0.8 dl g^{-1} (phenol/tetrachloroethane 60/40, VFR 4716) [4], [η] 2.2 dl g^{-1} (25°, 2-chlorophenol) [3]
Permeability of Gases: The permeability of Ultradur B2550 to He, Ne, Ar and CO_2 increases with increasing temp. [5]
Water Absorption:

No.	Value	Note
1	0.48 %	24h, 20°, 90% relative humidity [2]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	5.91 cm^3 mm/(m^2 day atm)	15 cm^3 mil 100 in^{-2} day^{-1} atm^{-1}
2	O_2	1.57 cm^3 mm/(m^2 day atm)	4 cm^3 mil 100 in^{-2} day^{-1} atm^{-1}
3	H_2O	1.18 cm^3 mm/(m^2 day atm)	3 cm^3 mil 100 in^{-2} day^{-1} atm^{-1} [9]

Mechanical Properties:

Mechanical Properties General: The dynamic storage and loss moduli decrease with increasing temp. [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	2340 MPa	[9]

Tensile Strength Break:

No.	Value	Note
1	72 MPa	[9]

Viscoelastic Behaviour: Stress-strain curves have been reported [3]
Failure Properties General: Tear strength 1970 g mm^{-1} [9]

Electrical Properties:

Electrical Properties General: The dielectric constant and dielectric loss both increase with an increase in the amount of absorbed water [2]
Static Electrification: Electrical conductivity increases with increasing temp. [6]. Activation energy for electrical conduction 0.74 eV [6]. Field strength 26.6 MV m^{-1} [6]

Optical Properties:
Transmission and Spectra: Ir [7,8], uv [7] and x-ray [4] spectral data have been reported

Polymer Stability:
Upper Use Temperature:

No.	Value	Note
1	165°C	[9]

Environmental Stress: The presence of 30% glass fibre has no influence on the mechanism of photolysis or photooxidation, and the reinforced material yields the same products as PBT [7]

Applications/Commercial Products:

Trade name	Details	Supplier
Duranex	Used to refer to other materials	Polyplastics
Tenite	Used to refer to other materials	Eastman Chemical Company

Polybutylene terephthalate, Phenoxy blends P-109

Synonyms: *Polybutylene terephthalate poly(hydroxy ether) of bisphenol A blends. PBT - PHE*

Related Polymers: Polybutylene terephthalate, Polybutylene terephthalate, Injection Moulding Glass fibre filled, Polybutylene terephthalate, Flame Retardant, Polybutylene terephthalate, High Impact, Impact Modified, Polybutylene terephthalate, fibres, Polybutylene terephthalate, films/sheets, Polybutylene terephthalate, Mineral filled, Polybutylene terephthalate, Carbon fibre filled, Polybutylene terephthalate, Structural foam, Polybutylene terephthalate, PTFE lubricated, Polybutylene terephthalate, Silicone lubricated, Polybutylene terephthalate, Uv stabilised, Polybutylene terephthalate, Polyethylene terephthalate blends, Poly(butylene terephthalate-*co*-butylene ether glycol terephthalate)

Monomers: 1,4-Butanediol, Terephthalic acid, Epichlorohydrin, Bisphenol A
Material class: Blends
Polymer Type: PBT and copolymers

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.24 g/cm^3	50% PBT, annealed [1]

Volumetric Properties General: Other density values have been reported [7]
Latent Heat Crystallization: ΔH_f 24.3 J g^{-1} (5.8 cal g^{-1}, 50% PBT) [1]
Melting Temperature:

No.	Value	Note
1	220°C	50% PBT [1]

Glass-Transition Temperature:

No.	Value	Note
1	51°C	50% PBT [2]
2	59°C	50% PBT [1]

Transition Temperature General: Other values of T_m have been reported [5]. T_m of blends is lower than that of pure PBT [3]. T_g is dependent upon blend composition [3]
Transition Temperature:

No.	Value	Note
1	-140°C	50% PBT
2	-80°C	50% PBT [1]

Surface Properties & Solubility:

Solubility Properties General: Interaction energy -11.7 J cm^{-3} (-2.8 cal cm^{-3}) [5]
Wettability/Surface Energy and Interfacial Tension: Surface free energy data have been reported [5]

Transport Properties:

Polymer Melts: The variation of melt viscosity with time at 250° shows an initial fall owing to melt plasticisation. After a time melt viscosity increases due to occurrence of transesterification reactions. Ultimately, melt failure occurs with subsequent decrease in melt viscosity [1]

Mechanical Properties:

Mechanical Properties General: Mechanical props. have been reported [7]. The variation in secant and shear moduli with temp. has been reported. Secant modulus decreases with increasing temp. [1]
Flexural Modulus:

No.	Value	Note
1	2549 MPa	26000 kg cm^{-2}, 97% PBT [4]

Tensile Strength Break:

No.	Value	Note
1	54.6 MPa	557 kg cm^{-2}, 97% PBT [4]

Flexural Strength at Break:

No.	Value	Note
1	82.8 MPa	844 kg cm^{-2}, 97% PBT [4]

Polybutylene terephthalate-polyethylene terephthalate blends P-110

Synonyms: *PBT/PET blends*
Related Polymers: Polybutylene terephthalate, Poly(ethylene terephthalate), PBT-phenoxy blends, Poly(butylene terephthalate-*co*-butylene ether glycol terephthalate)
Material class: Blends
Polymer Type: PBT and copolymers, PET and copolymers
Additives: Tetrabromophthalic anhydride, triphenyl phosphite, antimony trioxide (flame retardant)
Morphology: Blending of the individual components disorders their spherulitic struct., which may be lost as the amount of either component in the blend is increased [3]. Other morphological studies have been reported [8]

Volumetric & Calorimetric Properties:

Volumetric Properties General: The variation of density with time has been reported [3]
Latent Heat Crystallization: ΔH 0.04 J (0.0096 cal) [1]. ΔH_f 87 J g^{-1} (PBT, 50% PBT), 54 J g^{-1} (PET, 50% PBT) [5]. Other enthalpies of formation have been reported [2,18]. Enthalpy of mixing has been reported [1,8]. ΔH_{cryst} 54.85 J g^{-1} (13.1 cal g^{-1}) (fibres, 97% PET) [30]. ΔH_{fusion} 61.97 J g^{-1} (14.8 cal g^{-1}) (fibres, 97% PET) [30]
Melting Temperature:

No.	Value	Note
1	263–264°C	10% PBT [2]
2	220°C	PBT, 50% PBT [5]
3	254°C	PET, 50% PBT [5]
4	266°C	fibres, 97% PBT [30]

Glass-Transition Temperature:

No.	Value	Note
1	36°C	50% PET [3]
2	47°C	50% PBT [5]
3	69°C	fibres, 97% PET [30]

Transition Temperature General: Other values for T_m [17,18] and other transition temps. [14] have been reported. T_g increases with increasing PET content [3]
Deflection Temperature:

No.	Value	Note
1	66°C	1.8 MPa, 18.5 kg cm^{-2}, 50% PBT [19]

Transition Temperature:

No.	Value	Note	Type
1	115°C	fibres, 97% PET [30]	crystallisation temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Interaction parameter is at a minimum when the weight fraction of PBT is 0.2–0.8 [1]. Interaction parameter -0.064 (220°, Scott equation) [11]. Other interaction and solubility parameter data have been reported [8]
Solvents/Non-solvents: Sol. trifluoroacetic acid [33]

Transport Properties:

Transport Properties General: Melt flow index has been reported [10]
Polymer Melts: [η] 0.59 dl g^{-1} [3]. Other [η] values have been reported [14,17]

Mechanical Properties:

Mechanical Properties General: Tensile modulus of fibres decreases with increasing PBT content [6]. Sonic modulus 126 g den^{-1} (fibres, 97% PET) [30]. Elongation at break of the fibres decreases with increasing PBT content [6]. Tenacity 2.5 g den^{-1} (fibres, 97% PET) [30]. Elongation at break 48% (fibres, 97% PET) [30], 400% (50% PBT) [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	8400 MPa	film, 50% PBT [4]

Flexural Modulus:

No.	Value	Note
1	2912 MPa	29700 kg cm^{-2}, 23°, 50% PBT [20]
2	2020 MPa	20600 kg cm^{-2}, 80° [20]

Tensile Strength Break:

No.	Value	Note	Elongation
1	244 MPa	film, 50% PBT [4]	26%
2	50.2 MPa	573 kg cm^{-2}, 50% PBT [19]	5.5%
3	245 MPa	25 kg mm^{-2}, 12 μm film, 25% PBT [22]	130%
4	220–248 MPa	50% PBT [31]	5–20%

Flexural Strength at Break:

No.	Value	Note
1	94.9 MPa	968 kg cm^{-2}, 50% PBT [19]

Elastic Modulus:

No.	Value	Note
1	1540 MPa	50% PBT [5]
2	4000–5540 MPa	50% PBT [31]
3	1800–2400 MPa	fibres, various moulding conditions [7,16]

Viscoelastic Behaviour: Viscoelastic props. have been reported [8,10]
Mechanical Properties Miscellaneous: Dynamic modulus values have been reported [14]. Warp 1 mm (max.) initially, 20 mm (max.) (177 °, 3 min., 60% PBT) [25]
Fracture Mechanical Properties: The toughness is governed by competition between shear yielding and crazing in the matrix [13]
Friction Abrasion and Resistance: Static friction coefficient 0.33 (12 μm film, 25% PBT) [22]. Dynamic friction coefficient 0.3 (12 μm film, 25% PBT) [22]

Izod Notch:

No.	Value	Notch	Note
1	27 J/m	Y	60% PBT [25]
2	600 J/m	N	60% PBT [25]
3	30.3 J/m	Y	0.03 kg m cm^{-1}, 50% PBT [19]
4	123–240 J/m	Y	fibres, various moulding conditions, ASTM D256 [7,16]

Electrical Properties:

Arc Resistance:

No.	Value	Note
1	182s	6 d, H20, 23°, ASTM D495, 29.6% PBT, 10% PET, 20% glass fibre, 30% talc [26]

Optical Properties:

Transmission and Spectra: Ir [3,9,24,28], H-1 nmr [9], C-13 nmr [9,27,33] and photoacoustic [28] spectral data have been reported
Volume Properties/Surface Properties: Haze 3.2% (12 μm film, 25% PBT) [22]

Polymer Stability:

Decomposition Details: Thermal degradation [9,12] studies have been reported. Max. decomposition temp. 522° (fibres, 97% PET). Thermal stability decreases with increasing PBT content [30]
Flammability: Flammability rating V0 (44.17% PBT, 44.17% PET, 0.02% antimony trioxide, 11.67% halogenated bisphenol A - type epoxy resin, UL 94) [29]. Limiting oxygen index 32% [21]
Environmental Stress: Films with densities less than 1.39 g cm^{-3} have good weathering resistance [23]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymers are coextruded at 271° [3], 280° [4] and 310° [5]
Mould Shrinkage (%):

No.	Value	Note
1	1.65%	80% PBT [20]

Applications: Applications include electrical and electronic usage and as brake and fuel lines

Polybutylene terephthalate, PTFE lubricated P-111

Related Polymers: Polybutylene terephthalate, Polybutylene terephthalate, Injection moulding, glass fibre filled, Polybutylene terephthalate, Flame retardant, Polybutylene terephthalate, High impact, Polybutylene terephthalate, Fibres, Polybutylene terephthalate, Films/Sheets, Polybutylene terephthalate, Injection moulding, Mineral filled, Polybutylene terephthalate, Injection moulding, Carbon fibre filled, Polybutylene terephthalate, Polyethylene terephthalate blends, Polybutylene terephthalate, Phenoxy blends, Polybutylene terephthalate, Structural foam, Polybutylene terephthalate, Silicone lubricated, Polybutylene terephthalate, Uv stabilisted, Poly(butylene terephthalate-*co*-butylene ether glycol terephthalate)
Monomers: 1,4-Butanediol, Terephthalic acid
Material class: Thermoplastic
Polymer Type: PBT and copolymers
CAS Number:

CAS Reg. No.	Note
26062-94-2	
24968-12-5	repeating unit
30965-26-5	from dimethyl terephthalate
59822-52-5	from terephthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.42 g/cm^3	ASTM D792 [1]
2	d 1.43 g/cm^3	20% PTFE, ASTM D792 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001 K^{-1}	ASTM D696 [1]	V
2	9×10^{-5} K^{-1}	20% PTFE, ASTM D696 [2]	L

Thermal Conductivity:

No.	Value	Note
1	0.23 W/mK	20% PTFE, ASTM C177 [2]

Deflection Temperature:

No.	Value	Note
1	190°C	0.45 MPa, ASTM D645
2	80°C	1.8 MPa, ASTM D645 [1]
3	60°C	1.81 MPa, 20% PTFE, ASTM D648 [2]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.05 %	24h, ASTM D570 [1]
2	0.08 %	24h, 20% PTFE, ASTM D570 [2]
3	0.45 %	saturation, 20% PTFE, ASTM D570 [2]

Mechanical Properties:

Flexural Modulus:

No.	Value	Note
1	1700 MPa	ASTM D790 [1]
2	2300 MPa	20% PTFE, ASTM D790 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	40 MPa	20% PTFE, ASTM D638 [2]	10–15%

Flexural Strength at Break:

No.	Value	Note
1	70 MPa	20% PTFE, ASTM D790

Tensile Strength Yield:

No.	Value	Note
1	42 MPa	ASTM D638 [1]

Compressive Strength:

No.	Value	Note
1	45 MPa	20% PTFE, ASTM D695 [2]

Hardness: Rockwell M70 (ASTM D785) [1], M80 (ASTM D785) [2]
Failure Properties General: Shear strength 20 MPa (20% PTFE, ASTM D732) [2]
Friction Abrasion and Resistance: Wear factor 15 (20% PTFE, LNP SOP) [2]. Coefficient of friction 0.09 (static), 0.17 (dynamic) (20% PTFE, LNP SOP) [2]

Izod Notch:

No.	Value	Notch	Note
1	50 J/m	Y	23°, ASTM D256 A [1]
2	40 J/m	Y	20% PTFE, ASTM D256 [2]
3	300 J/m	N	20% PTFE, ASTM D256 [2]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
3	0.1×10^{15} Ω.cm	20% PTFE, ASTM D257 [2]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	60 Hz	20% PTFE, ASTM D150 [2]
2	2.8	1 MHz	20% PTFE, ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	ASTM D149 [1,2]

Static Electrification: Tracking resistance KC 600 (DIN IEC 112) [2]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	60 Hz	20% PTFE, ASTM D150 [2]
2	0.018	1 MHz	20% PTFE, ASTM D150 [2]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	120°C	[1]
2	140°C	continuous service, 20% PTFE, UL 746 B [2]

Flammability: Flammability rating HB (3.2 mm thick, 20% PTFE, UL 94) [1,2]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	2%	ASTM D955 [1]
2	1.2–1.8%	20% PTFE, 3 mm section, ASTM D955 [2]

Poly(butylethylsilane) P-115

Synonyms: *Poly(butylethylsilylene). Poly(ethyl-n-butylsilylene). PBES. PEBS*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
132230-58-1

Molecular Formula: $(C_6H_{14}Si)n$
Fragments: $C_6H_{14}Si$
Molecular Weight: $2.0 \times 10^4 - 1.4 \times 10^6$ [2]
Morphology: Adopts a hexagonal columnar liquid crystalline structure at room temperature and below. Crystallinity is less than that of the polylsilylenes having symmetrical side-chains. Conformations and packings have been proposed on the basis of experimental and theoretical X-ray diffraction patterns. The Si backbone of the polymer has a helical 7/3 conformation, whereas the backbones of poly(PrMesilane) and poly(iso-PrMesilane) have *all-trans* conformations.
Unit cell parameters a=1.0865, b=1.0865, c=1.3880nm and γ=60° [1,2,5,6]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	106°C	low MW [2]
2	185°C	high MW [2]

Transport Properties:

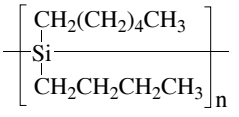
Transport Properties General: Flow properties have been investigated as a function of molecular weight [2].

Optical Properties:

Optical Properties General: Two successive thermochromic transitions observed in the UV, one near the first-order exothermic transition and one near the -20°C transition [2].
Transmission and Spectra: Uv-vis [2] spectra reported.

Polymer Stability:

Thermal Stability General: Undergoes a weak endothermic transition at -20°C and a first-order phase transition to a nematic liquid crystalline form at 90°C for the low and 170°C for the high MW fraction [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synthesised by Na coupling of ethyl-*n*-butyldichorosilane, into two fractions with differing molecular weights [2].
Applications: Electrophotographic photoreceptor having polysilane-containing excellent charge-transport layer and gives a low residual potential [3,4].

Poly(butylhexylsilane) P-116

Synonyms: *Poly(butylhexylsilylene). n-Butylhexyldichlorosilane homopolymer. PBHS*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
125121-32-6

Molecular Formula: $(C_{10}H_{22}Si)n$
Fragments: $C_{10}H_{22}Si$
Molecular Weight: $2x10^6$ [1,2,8].
General Information: Atactic. Crystallises with difficulty [2]. Properties widely different from corresponding dibutyl or dihexyl polymers [1].
Morphology: Rubbery solid at room temperature. Exists at high temperature as a hexagonal columnar mesophase (hcm) and undergoes a complicated first-order phase transition on cooling. The process of the phase transformation begins at *ca.* -23°C and continues down to *ca.* -63°C. Depending on the mode of cooling in the temperature interval from -23°C to -33°C, this transformation can proceed differently, but it necessarily involves a transformation of the hcm into a 7/3 helical form with simultaneous appearance of a phase with the planar zigzag *all-trans* backbone conformation. The *all-trans* form does not appear directly from the hcm. The process of nucleation and growth of the form within the helical form is kinetically limited and does not take place to completion but ceases at the point of a quasi-second-completion order phase transition of a glassification type. Even at -246°C, the polymer exists as a frozen mixture of at least two forms [1,2].
Identification: Calculated: C, 70.6; H, 12.9; Si, 16.5. Found: C, 69.9; H, 12.4: Si. 16.6.

Volumetric & Calorimetric Properties:

Volumetric Properties General: Oxidation Potential: Eonset 1.00V. Epeak 1.14V. λ_{max} approx. 317nm
Glass-Transition Temperature:

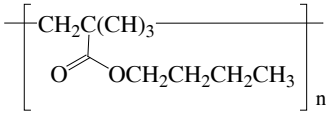
No.	Value	Note
1	-40°C	[1,2]

Optical Properties:

Optical Properties General: Thin films show a broad UV absorption band at 320 nm above 25°C. When cooled, λ_{max} shifts hypsochromically to 312nm at approx. -25°C, and at still lower temperatures (approx. -40°C), a new band is seen at 345nm, suggesting two different phase transitions occur below 0°C [1,2].
Transmission and Spectra: Ir [2,6], Raman [2,6], uv [1,2,6,7] and nmr [1] spectra reported.

Polymer Stability:

Thermal Stability General: DSC shows a second-order discontinuity due to a probable glass-transition at -40°C and an endotherm with ΔH=4.6cal/g from a first-order melting-type transition at -22°C. A weak tan delta peak accompanied by a sharp decrease in loss modulus is observed near -45°C, and a rapid increase in tan delta and further decrease in modulus are found near -20°C, at the first-order transition. The phase transition at -20°C appears to represent a partial crystallisation, perhaps due to locking-in of motion of the side chains, as has been observed for PDHS. The second-order transition at -45°C may be associated with loss of motion of the main chain [1].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared from *n*-butyl-*n*-hexyldichlorosilylene by condensation with Na metal in toluene at 110°C, by the usual Wurtz-type reaction [1].
Applications: Optical functional device [4]. Electrophotographic photoreceptor [6].

Solvents/Non-solvents: Sol. hexane, cyclohexane, gasoline, Nujol (hot), turpentine, castor oil (hot), linseed oil (hot), CCl_4, EtOH (hot), isopropanol (>23.7°), Et_2O, Me_2CO. Insol. formic acid, EtOH (cold) [24]

Surface Tension:

No.	Value	Note
1	31.2 mN/m	20°, MV 37000
2	32 mN/m	critical surface tension [27]

Transport Properties:

Polymer Solutions Dilute: Theta temps. [29,30,31,32], 10.7° (isobutanol), 84.8° (*n*-decane), 23.6° (DMF), 101° (*n*-dodecane), 119.8° (hexadecane), 87.9° (methyl carbitol), 59.6° (methyl cellosolve), 68.9° (*n*-octane), 20.9° (isopropanol), 21.5° (isopropanol), 23.7° (isopropanol), 25° (isopropanol). Polymer-liq. interaction parameters [33], 0.78 (hexane), 0.62 (2-butanone), 1.4 (acetonitrile), 0.1 ($CHCl_3$). 1.01 (*n*-propanol), 0.93 (Me_2CO), 0.67 (EtOAc)

Permeability of Liquids: Diffusion coefficients [EtOAc] 0.145–0.174 × 10^{-7} cm^2 s^{-1} (20°, MW 254000); [THF] 0.181–0.191 × 10^{-7} (MW 340000–380000); [H_2O] 11.4 × 10^{-7} (37°) [26,34]

Water Absorption:

No.	Value	Note
1	0.9%	max. [26]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	6.9 MPa	[35,36]	230%
2	3.4 MPa	23° [2]	300%

Viscoelastic Behaviour: Williams-Landel-Ferry constants for temp. superposition [16,37]; and Vogel parameters [37] have been reported. Other viscoelastic props. have been reported [41]

Hardness: Knoop number

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.5–3.1	[9]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.483	[9,38]

Total Internal Reflection: Intrinsic segmental anisotropy, -14 × 10^{-25} cm^3 (atactic, C_6H_6), -2 × 10^{-25} cm^3 (isotactic, C_6H_6)

Polymer Stability:

Polymer Stability General: Large doses of ionising radiation cause brittleness, strength loss and general loss of desirable props. Polymethacrylates exhibit predominantly main-chain fracture during irradiation and the deterioration of props is due to lowering of MW

Decomposition Details: Decomposition at 250° yields 40% monomer and traces of 1-butene; at 170° with 253.7 nm radiation decomposition yields 100% monomer [40]

Stability Miscellaneous: Undergoes shear-induced degradation in soln. in poor solvents [41]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy 40100 J mol^{-1} [2]; 17 $J^{1/2}$ $cm^{-3/2}$ [2,10] 39.3 $J^{1/2}$ $cm^{-3/2}$ (9.4 $cal^{1/2}$ $cm^{-3/2}$) [11]; 36.2 $J^{1/2}$ $cm^{-3/2}$ (8.65 $cal^{1/2}$ $cm^{-3/2}$) [12]
Wettability/Surface Energy and Interfacial Tension: $d\gamma/dT$) 0.059 mN m^{-1} K^{-1} [14]. Contact angle 72° (advancing, H_2O) [15]. Interfacial tension 5.9 mN m^{-1} (polyethylene, branched; 20°) [14]; 3 mN m^{-1} (PMMA; 20°) [14]; 3.6 mN m^{-1} (polyoxydimethylsiloxane; 20°) [14]
Surface Tension:

No.	Value	Note
1	30.5 mN/m	20°, MV 6000 [14]

Transport Properties:

Polymer Solutions Dilute: Theta temps 64° (*n*-heptane, high syndiotactic content) [16]. 5° (cyclohexane). [14] Intrinsic viscosity varies with MW [16] η 0.13 dl g^{-1} (30°, THF), 0.124 dl g^{-1} (25°, butanone), 0.106 dl g^{-1} (10°, cyclohexane), 0.088 dl g^{-1} (64°, *n*-heptane)
Permeability of Liquids: Diffusion coefficient [H_2O] 10.3 × 10^{-8} cm^2 s^{-1} (37°) [15]
Water Absorption:

No.	Value	Note
1	0.5%	max. [15]

Mechanical Properties:

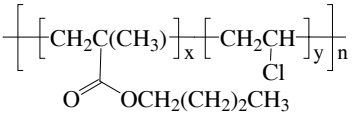
Hardness: Vickers 15 (5 kg load) [9]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.4638	20° [2]

Total Internal Reflection: Intrinsic segmental anisotropy 2.1 × 10^{-25} cm^3 (atactic; C_6H_6) [18]; 19.3 × 10^{-25} cm^3 (isotactic; C_6H_6) [18]



Polymer Stability:

Polymer Stability General: Large doses of ionising radiation cause brittleness, loss of strength and general loss of desirable props. Irradiation causes main-chain fracture, deterioration of props. is due to lowering of MW.
Thermal Stability General: Changes to the anhydride via the acid on heating [5]
Decomposition Details: Decomposition at 180–200° yields high levels of isobutylene and water, low levels of monomer, traces of methacrylic acid and a residue of polymethacrylic anhydride [19,20]. Decomposition below 180° with irradiation at 253.7 nm yields 100% monomer [9,19]

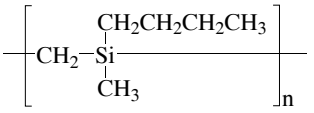
Poly(butyl methacrylate-*co*-vinyl chloride) P-120

Related Polymers: Polymethacrylates, General, Poly(butyl methacrylate), Poly(vinyl chloride)
Monomers: Butyl methacrylate, Vinyl chloride
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_8H_{14}O_2)_x (C_2H_3Cl)_y]_n$
Fragments: $C_8H_{14}O_2$ C_2H_3Cl

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:



No.	Value	Note
1	18–100°C	[1]

Transition Temperature General: T_g varies with the percentage content of methacrylate [1]

Transport Properties:
Polymer Solutions Dilute: Intrinsic viscosity varies with percentage content of methacrylate. η 0.34–0.59 dl g^{-1} [1]

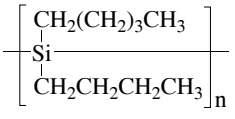
Poly[(butylmethylsilane)methylene] P-121

Synonyms: *Poly[(butylmethylsilylene)methylene]. PMBSM*
Related Polymers: Polycarbosilanes
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
198066-89-6

Molecular Formula: $(C_6H_{14}Si)n$
Fragments: $C_6H_{14}Si$
Molecular Weight: 73,600 [1]
General Information: Atactic configuration due to polymerisation with racemic monomer [1].
Morphology: Amorphous solid [1].
Identification: Found: C, 63.47%; H, 12.68%; Calculated: C, 63.71%; H, 12.39%.

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:



No.	Value	Note
1	-63°C	[1]

Optical Properties:
Transmission and Spectra: Nmr [7] spectra reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by ring-opening polymerisation of 1,3-dibutyl-1,3-dimethyl-1,3-disilacyclobutane [1].
Applications:

[1] Shen, Q.H. and Interrante, L.V., J. Polym. Sci., *Part A,* 1997, **35,** 3193

Poly(butylpentylsilane) P-122

Synonyms: *Poly(butylpentylsilylene). Dichlorobutylpentylsilane homopolymer, sru. PBPS. C4–C5*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
132230-79-6

Molecular Formula: $(C_9H_{20}Si)n$
Fragments: $C_9H_{20}Si$
Molecular Weight: $1x10^6$ [1,8]
General Information: Strongest of the poly(*n*-pentyl-*n*-alkylsilanes); Only member of the series with an order-disorder transition temperature >25°C [2]
Tacticity: Forms a strong, tough, but flexible film that feels similar to low-density polyethylene.
The film is not brittle and shows superior fracture toughness when compared with symmetric poly(di-n-alkylsilanes) [1].
Morphology: Has a 7/3 helical backbone conformation at 25°C for film or normal spherulites, as has been observed for poly(dibutylsilane) and poly(dipentylsilane). The X-ray diffraction pattern of a uniaxially oriented film of PBPS may be indexed with an orthorhombic unit cell containing hexagonally packed chains with a = 1.323 nm., b = 2.292 nm, and c = 1.388 nm. At 45°C a sharp first order phase transition to a hexagonal, columnar structure with lattice parameter a=b=13.4Å is observed [1,9].
Miscellaneous: Large polysilane spherulites have been observed. The spherulites were prepared by controlling the removal rate of solvents from PBPS under a xylene atmosphere. The diameter of the spherulites was greater than 0.1mm [8].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	45–50°C	[1,2,8,9]

Transport Properties:
Transport Properties General: Anomalous transition observed [5].

Mechanical Properties:
Mechanical Properties General: Films can be stretched to moderately high draw ratios. A film with a draw ratio of 4 was obtained for X-ray diffraction [1].

Tensile (Young's) Modulus:

No.	Value	Note
1	296 MPa	at 23°C [2]
2	50 MPa	at 100°C [2]

Miscellaneous Moduli:

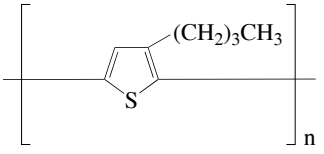
No.	Value	Note
1	3.07 MPa	Yield stress [1]

Failure Properties General: The average crosshead displacement at which fracture initiated was 0.91 ± 0.08 mm. Little or no dependence of this value on the initial crack length was found. Using an Instron tensile testing machine and specimens in the single edge notch (SEN) geometry yielded plane stress J1c (critical value for J for fracture initiation) of 1745 ± 305J/m^2 [2].
Fracture Mechanical Properties: Average fracture strain of 85% for defect-free specimens at 23°C [2].

Optical Properties:
Optical Properties General: At 25°C the sample gives a relatively sharp absorption maximum at 314nm, which lies in the range (305–326nm) usually characteristic of a helical or disordered conformation of the silicon backbone. When cooled to -45°C, a very small shoulder appears at 338nm, but the intensity of the 314nm band does not diminish as the temperature is lowered further. Upon warming, the shoulder disappears [1,8].
Transmission and Spectra: Ir [4], Raman[3], uv [1,4,8] and nmr [3] spectra reported.

Polymer Stability:
Thermal Stability General: A second-order transition is observed at -44°C, followed by a sharp endotherm at 45°C possessing a heat of transition of 2.5cal g^{-1}. This sharp endotherm corresponds to a solid-state disordering transition seen in poly(dialkylsilanes) with side chains longer than three carbon atoms. It is seen that the

asymmetry of PBPS lowers the temperature of the disordering transition relative to those of other alkylpentylsilylenes [1,9].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared via the dichlorosilane and then by the usual Wurtz condensation reaction with Na in toluene at 110°C [1,2,8].
Applications: Evaporated film for electroluminescent devices [6]. An electrophotographic photoreceptor; a binder resin for a single photosensitive layer in which a charge-generating substance and a charge-transporting substance are mixed [7].

Poly(3-butylthiophene) P-123

Synonyms: *P3BT. Poly(3-butyl-2,5-thiophenediyl)*
Monomers: 3-Butylthiophene
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.	Note
98837-51-5	
189102-88-3	Poly(3-butyl-2,5-thiophenediyl)

Molecular Formula: $(C_8H_{10}S)_n$
Fragments: $C_8H_{10}S$
Additives: Dopants such as hexafluorophosphate [1], perchlorate [2], I_2 and $FeCl_3$ are added to increase conductivity.
General Information: Conductive polymer which exhibits thermochromism [3] and has greater solubility and processability than polythiophene.
Morphology: Orthorhombic unit cell, a=13.18, b=7.52, c=7.77Å [4]. Polymorphic with two crystal phases and a nematic mesophase [5].

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	222–243°C	[5]

Glass-Transition Temperature:

No.	Value	Note
1	58.7–75.4°C	Glass-transition temperature increases with addition of $FeCl_3$ dopant [6,7]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, toluene [8,9], limited sol. THF [3].

Electrical Properties:

Electrical Properties General: Conductivity is dependent on polymer structure, nature and concentration of dopant and temperature, with typical values for polymer film from electrochemical synth. of 40 S cm^{-1} (perchlorate dopant) [2] and 110 S cm^{-1} (hexafluorophosphate dopant) [1].

Optical Properties:

Transmission and Spectra: Pmr [3,10], cmr [3], ir [3], uv [2,3] and x-ray [4] spectra have been reported.
Volume Properties/Surface Properties: Polymer has red or brown colour [3] with thermochromic changes on heating.

Polymer Stability:

Polymer Stability General: Photochemical degradation of polymer has been reported [9].
Decomposition Details: Decomposition temperature of polymer produced by chemical oxidation process 357.8°C [8].

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by chemical or electrochemical oxidative polymerisation of monomer with different catalysts [2,3,8,9] to produce mostly regiorandom (head-to-head/head-to-tail) polymers or by catalytic polymerisation of 2-bromo-5-(bromomagnesio)-3-dodecylthiophene [11,12] or 2-bromo-5-(bromozincio)-3-dodecylthiophene [3] to produce regioregular (head-to-tail) polymers.
Applications: Potential applications in photovoltaic devices, light-emitting diodes, rechargeable batteries, field-effect transistors and chemical and optical sensors [13].

Trade name	Details	Supplier
Rieke	regioregular and regiorandom polymers	Rieke Metals

Total Internal Reflection: $[M]_D^{25}$ +200 (Me_2CO, *S*-form), +272 (Me_2CO, Et_2O) [10], +312 (Et_2O) [10]

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerised using a tri-isopropyl aluminium(*III*) catalyst in H_2SO_4 [3]. May also be polymerised at low temp. [5]

Poly(*tert*-butyl vinyl) ether P-126

Synonyms: *PtBVE. PTBVE. PtBuVE. Poly(2,2-dimethylpropyl vinyl) ether. Poly(tert-butoxyethene). Poly(tert-butyl vinyl ether). Poly(vinyl 2,2-dimethylpropyl ether)*
Related Polymers: Poly(vinyl ethers)
Monomers: *tert*-Butyl vinyl ether
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
25655-00-9	homopolymer
52079-39-7	syndiotactic homopolymer
25654-99-3	isotactic homopolymer

Molecular Formula: $(C_6H_{12}O)_n$
Fragments: $C_6H_{12}O$
Tacticity: Atactic, isotactic and syndiotactic forms known
Morphology: Isotactic form, tetragonal $I4_1/a$. a = b 18.84Å, c 7.65Å with 4/1 helix [3]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.94 g/cm^3	[3]

Thermodynamic Properties General: Thermodynamic props. have been reported [6]
Melting Temperature:

No.	Value	Note
1	240–260°C	[1]
2	160°C	isotactic form [3]

Glass-Transition Temperature:

No.	Value	Note
1	88°C	[14]

Transition Temperature General: B. p. 77–80° [3]
Vicat Softening Point:

No.	Value	Note
1	68–79°C	[2]

Surface Properties & Solubility:
Solvents/Non-solvents: Very sol. *n*-heptane, C_6H_6 [3]. Mod. sol. Et_2O (hot); sol. Me_2CO, 2-butanone [15]. Isotactic form prac. insol. MeOH, Me_2CO, 2-propanol, Et_2O (cold). Insol. heptane, C_6H_6 [1]

Transport Properties:
Polymer Solutions Dilute: η_{inh} 0.37 dl g^{-1} [2]. η_{sp} 0.08 dl g^{-1} (c, 0.5 g dl^{-1}, C_6H_6, 30°) [16]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	5.52 MPa	800 psi [2]

Elastic Modulus:

No.	Value	Note
1	4.02×10^{-5} MPa	[17]

Hardness: Shore A95 [2]. Rockwell 95 [14]

Optical Properties:

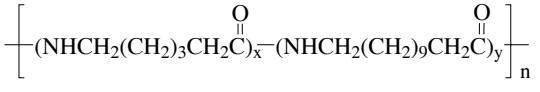
Refractive Index:

No.	Value	Note
1	1.3969	20° [2]

Transmission and Spectra: Critical ir bands 736, 722 cm^{-1} [4,9]. C-13 nmr [8], ir [9] and H-1 nmr [10] spectral data have been reported

Polymer Stability:

Polymer Stability General: Very susceptible to degradation by γ-radiation, much more so than the other lower polyvinyl ethers [6]



Applications/Commercial Products:

Processing & Manufacturing Routes: High degree of polymerisation using Friedel-Crafts catalysts (BF_3, $AlCl_3$, $SnCl_4$ or their complexes) [3], especially for isotactic form [12,13]. May also be prepared cationically [4,5], by radiation - induced polymerisation [7] or by the use of fluorides [11]
Applications: Uses include adhesives, lubricants, greases and surface coatings

Poly(caprolactam-*co*-laurolactam) P-127

Synonyms: *Nylon 6.12 copolyamide*
Related Polymers: Nylon 6, Nylon 12, Nylon 6.12
Monomers: ϵ Caprolactam, Laurolactam
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
Molecular Formula: $[(C_6H_{11}NO)_x(C_{12}H_{23}NO)_y]_n$
Fragments: $C_6H_{11}NO$ $C_{12}H_{23}NO$
General Information: Degree of crystallinity is a minimum for copolymers with 70:30–40:60 caprolactam:laurolactam ratio [1]. Composite crystallinity has been reported [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.0098 g/cm^3	25% caprolactam, 75% laurolactam [2]
2	d 1.0414 g/cm^3	50% caprolactam, 50% laurolactam [2]

Thermodynamic Properties General: Heat of fusion 22.95 J g^{-1} (50% caprolactam, 50% laurolactam), 25.54 J g^{-1} (40% caprolactam, 60% laurolactam) [1]. Coefficient of linear thermal expansion is highest for 70:30 and 50:50 mole ratios of caprolactam:laurolactam [1]. Heat of melting 47.8 J g^{-1} (25% caprolactam, 75% laurolactam), 34.3 J g^{-1} (50% caprolactam, 50% laurolactam) [2]
Melting Temperature:

No.	Value	Note
1	132–138°C	50% caprolactam, 50% laurolactam [1]
2	146.2°C	[2]
3	158.3°C	25% caprolactam, 75% laurolactam [2]

Glass-Transition Temperature:

No.	Value	Note
1	26–30°C	70% caprolactam, 30% laurolactam, cryst.
2	16–20°C	[1]
3	23.4°C	50% caprolactam, 50% laurolactam, cryst. [2]
4	20–24°C	40% caprolactam, 60% laurolactam, cryst. [1]
5	31.8°C	25% caprolactam, 75% laurolactam [2]

Transition Temperature General: Min. T_m and T_g occur at 1:1 molar ratio of comonomers [1]

Transport Properties:

Water Content: Water absorption decreases with increasing content of laurolactam [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	630 MPa	70% caprolactam, 30% laurolactam, ASTM D638-82
2	500 MPa	50% caprolactam, 50% laurolactam, ASTM D638-82 [1,2]
3	550 MPa	40% caprolactam, 60% laurolactam, ASTM D638-82 [1]
4	800 MPa	25% caprolactam, 75% laurolactam [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	51 MPa	70% caprolactam, 30% laurolactam, ASTM D638-82	580%

2	50 MPa	50% caprolactam, 50% laurolactam, ASTM D638-82	560%
3	43 MPa	40% caprolactam, 60% laurolactam, ASTM D638-82 [1]	500%

Tensile Strength Yield:

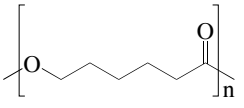
No.	Value	Note
1	13.2 MPa	25% caprolactam, 75% laurolactam [2]
2	8.9 MPa	50% caprolactam, 50% laurolactam [2]

Compressive Strength:

No.	Value	Note
1	47.5 MPa	25% caprolactam, 75% laurolactam [2]
2	30 MPa	50% caprolactam, 50% laurolactam [2]

Izod Notch:

No.	Value	Notch	Break	Note
1	700 J/m	Y		70% caprolactam, 30% laurolactam, ASTM D256-81, method A [1]
2		N	Nobreak	50% caprolactam, 50% laurolactam, ASTM D256-81, method A [1]
3		N	Nobreak	40% caprolactam, 60% laurolactam, ASTM D256-81, method A [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. from caprolactam and laurolactam at 145° [1]. Addition of 1–2 mol % laurolactam decreases the time taken to reach max. reaction rate [3]
Applications: Studied as means of reducing time required for reaction and crystallisation to occur in reaction injection moulding [3]

Poly(caprolactone) P-128

Synonyms: *Poly(ϵ-caprolactone). PCL*
Material class: Thermoplastic
Polymer Type: polyester
CAS Number:

CAS Reg. No.
24980-41-4

Molecular Formula: $(C_6H_{10}O_2)n$
Fragments: $C_6H_{10}O_2$
Molecular Weight: 2000–80000

Additives: Available with mineral fillers.
General Information: A biodegradable, linear polyester available in liquid, powder, granular and fibre forms. Capable of producing hard crystalline polymers with low melt low temperatures (58–60°C) and very good hot melt adhesive characteristics.
Morphology: Semicrystalline, degree of crystallinity around 50% [11]. Crystal structure reported [13].

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Some thermal parameters only slightly influenced by cross-linking [4].
Melting Temperature:

No.	Value	Note
1	58–60°C	MW 50,000 to 80,000 [1]
2	51.9°C	MW 2,000 [10]

Glass-Transition Temperature:

No.	Value	Note
1	-60°C	[11,12]

Surface Properties & Solubility:

Solubility Properties General: Data including specific retention volume and Flory-Huggins parameters reported for various solvents at a range of temperatures [2].
Cohesive Energy Density Solubility Parameters: Solubility parameter: 9.34–9.43 $(cal/cm^3)^{1/2}$[1].
Surface and Interfacial Properties General: Surface energy parameters determined at 160 and 180°C [5]. Contact angle, surface morphology of cast films reported with information on adhesion and proliferation of fibroblasts by direct contact [8].

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	3–7 g/10 min	2.16 kg, 1″ PVC die, 160°C MW 50,000–80,000 [1]

Water Content: <1% [1]

Mechanical Properties:

Mechanical Properties General: The PCL chain is flexible with high elongation at break and low modulus [11]. Transient shear and elongational properties have been reported [14].

Tensile (Young's) Modulus:

No.	Value	Note
1	90–150 MPa	Electrospun fibre [9]

Tensile Strength Break:

No.	Value	Note	Elongation
1	30–50 MPa	Electrospun fibre [9]	100–300%

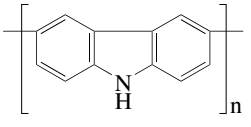
Tensile Strength Yield:

No.	Value	Elongation	Note
1	6–20 MPa	10–30%	Electrospun fibre [9]

Mechanical Properties Miscellaneous: The effect of crystallinity on dynamic mechanical relaxation behaviour (flexural storage modulus and loss tangent) has been studied [7].

Optical Properties:
Transmission and Spectra: Ir and pmr spectra reported with images [10].

Polymer Stability:
Polymer Stability General: Crosslinking can diminish ability to biodegrade [4].
Biological Stability: Biodegradation has been investigated with caprolactone, 6-hydroxyhexanoic acid, cyclic dimer and cyclic trimer identified as products. Degradation begins in amorphous regions, crystalline regions degrading later [6]. Details of biotic degradation of PCL reported [11,12].



Applications/Commercial Products:
Processing & Manufacturing Routes: PCL is manufactured by ring-opening polymerisation of ϵ-caprolactone. The use of mixtures of CO_2 and N_2 as blowing agents in the foaming of PCL has been reported [3]. PCL can be processed without significant molecular weight reduction, e.g. filmblowing, injection moulding and sheet extrusion [11].
Applications: Hot melt and laminate adhesives, blown films, moulding materials freely transformable using hot air or hot water, medical materials, plastic modifiers, ceramic binders, meta-mould binders, biodegradable plastics, heat-transfer inks, fluid modifiers for resin moulding, refractive-index regulators and polyurethane production.

Polycarbazole P-129

Synonyms: *9H-Carbazole homopolymer*
Monomers: Carbazole
Material class: Thermoplastic
Polymer Type: polycarbazole
CAS Number:

CAS Reg. No.
51555-21-6

Molecular Formula: $(C_{12}H_7N)n$
Fragments: $C_{12}H_7N$
Additives: Polymer is usually prepared in doped form, containing perchlorate or tetrafluoroborate ions.
General Information: Conductive electrochromic polymer, usually prod. as film or powder with yellow colour in reduced form. Carbazole units in the polymer are connected via 3- and 6-positions [1].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. DMSO; poorly sol. CH_2Cl_2, THF [2].

Electrical Properties:
Electrical Properties General: Polymer in reduced (de-doped) form has low conductivity, while with dopant, when polymer is partly present in form of radical cations, conductivity can reach 7.5×10^{-3} S cm^{-1} (with boron trifluoride diethyl etherate) [2], 10^{-3} to 10^{-4} S cm^{-1} (with tetrafluoroborate) [3], or 10^{-4} S cm^{-1} (with perchlorate) [4]. Post-doping of polymer with iodine gave a maximum conductivity of 1.5×10^{-4} S cm^{-1} [5]. Electrochemical oxidation of monomer at voltages above the oxidation potential of carbazole results in a loss of conductivity [6]. The band gap in reduced form is *ca.* 3.5eV [7,8]. The de-doped polymer exhibits Schottky diode behaviour [8]. Electroluminescence has been reported for the polymer as the emissive layer in an OLED device [9].

Optical Properties:
Optical Properties General: Films in reduced form exhibit uv absorption at shorter wavelength, while oxidised forms exhibit absorption bands at longer wavelength (λ_{max} *ca.* 385, 715–735nm) [2,4,7,10]. Photoluminescence bands in the blue region (420–440nm) have been reported for polymer as solid and in soln. [2,9]. The polymer exhibits electrochromic behaviour, having a yellow colour in the reduced form and changing to green and blue in oxidised forms [4,10,11].
Transmission and Spectra: Ir [1,2,3,4,12,13,17], esr [5,6], uv [1,2,4,9,10], photoluminescence [2,9], electroluminescence [9] and XPS [5,7] spectral data have been reported.

Polymer Stability:
Thermal Stability General: Perchlorate-doped polymer exhibits weight loss due to dopant (up to 35%) between 70 and 400°C on heating in air. Decomposition of polymer backbone starts at 450°C [15,16]. The de-doped polymer in air loses 10% weight below 450°C, then undergoes rapid decomposition with 50% weight loss at 660°C (747°C in nitrogen) [16].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. electrochemically by anodic oxidation of carbazole in non-aqueous solvents such as boron trifluoride etherate, acetonitrile, CH_2Cl_2 or DMF [2,3,13,17,18] with a supporting electrolyte such as tetraalkylammonium perchlorate or in an aqueous methanolic soln. of perchloric acid [1,4,10]. Films have been reported to be of better quality in aqueous media [4]. Carbazole monomer can also be deposited by vacuum evaporation or coating on to a suitable anode and then oxidised electrochemically [11,14]. Doped films can be de-doped in water or aqueous KCl [8,17]
Applications: Polymer films have been tested for potential application in an ammonia gas sensor [19]

Polycarbonate, Carbon fibre reinforced, PTFE lubricated P-131

Related Polymers: Polycarbonate, carbon fibre reinforced, Bisphenol A polycarbonate, PTFE lubricated, Bisphenol A polycarbonate
Material class: Thermoplastic, Composites
Polymer Type: polycarbonates (miscellaneous)
Molecular Formula: $(C_{16}H_{14}O_3)_n$
Fragments: $C_{16}H_{14}O_3$
Additives: Contains carbon fibre (15–30%) and PTFE (15–20%)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.36 g/cm^3	15% PTFE, 15% carbon fibre [1]
2	d 1.37 g/cm^3	15% PTFE, 20% carbon fibre [1]
3	d 1.465 g/cm^3	20% PTFE, 30% carbon fibre [1]
4	d 1.41 g/cm^3	15% PTFE, 25% carbon fibre, ASTM D792 [2]
5	d 1.35 g/cm^3	

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.85×10^{-5} K^{-1}	15% PTFE, 25% carbon fibre, ASTM D696 [2]	L

Thermal Conductivity:

Polycarbonate/polybutylene terephthalate alloy P-135

Synonyms: *Polycarbonate/polybutylene terephthalate blend. PC/PBT blend*

Related Polymers: Polybutylene terephthalate, Poly[2,2-propane-bis(4-phenyl)carbonate], Polycarbonate/polyester alloys, Glass fibre reinforced polycarbonate/polybutylene terephthalate alloy

Monomers: Bisphenol A, Carbonic dichloride, 1,4-Benzenedicarboxylic acid, 1,4-Butanediol

Material class: Blends

Polymer Type: PBT and copolymers, polycarbonate alloy blends-bisphenol A polyesters

Additives: Commercial blends contain low levels of stabiliser such as organic phosphites. MMA-styrene (3:2) copolymer as an impact modifier. Impact modifiers (3–30%)

General Information: Impact modified version available. Structural foam version available. PC/PBT blends form complicated systems, the props. of which depend not only on the composition and any additives used, but also on the preparation, processing and subsequent exploitation. [1,2,3,4,5,6]. Transesterification, phase separation, crystallisation. and degradation processes can all occur as a result of thermal treatment, and the relative degrees of these processes depend on various factors including: the melt processing temp. and the duration of extrusion [1]; the number of times the material is extruded (i.e. reprocessed) [7]; the moulding process [1,8]; annealing of the material after processing, which facilitates crystallisation and phase separation [1,2,8]. Depending on conditions, transesterification reactions may also occur at high temps. (270°) [9]. Commercial blends generally contain PC and PBT in approx. equal proportions, with added impact modifier (3–30%) [5,7,10,11,12,13,14]

Morphology: Solid PC/PBT blends show partial miscibility and comprise two amorph. phases (one PC-rich, the other PBT-rich) and a crystalline PBT phase. [2,4,5,6,9,15,16] The mass fraction of PBT in the PC-rich phase is higher than the mass fraction of PC in the PBT-rich phase (suggesting greater solubility of PBT in the PC-rich phase). This is the case for both melt-extruded and soln. cast blends. [6,16] For blends with less than 60% PC, the PBT-rich phase forms the continuous phase and the PC-rich phase the dispersed phase [5,14]. As the proportion of PC increases, the dispersed phase becomes highly interconnected, and, for blends containing 60% PC, an interpenetrating network is formed [5,14]. Above 60% PC the PC-rich phase forms the continuous phase. [5,16] When a core-shell impact modifier is included, it becomes located exclusively in the PC-rich phase at all PC concentrations. [5,14,17]. The morphology of the solid is affected by composition; for blends melt extruded at 250°, phase separation is more pronounced for 60 or 70% PC than for 10, 20 or 90% PC [6]; the method of blend preparation; blends formed by casting from soln. at 25° show distinct phases for all compositions, and compatibility is less than for extruded blends [6,16,27]. Blends formed in the melt which are subsequently dissolved in solvent and cast from soln. show phase separation characteristic of the solvent cast blends, rather than the melt extruded blends. [16,27] In the melt, blends may form one or two phases depending on temp. and composition. [2,4,6,15] Depending on the cooling method, some of the morphology of the melt is preserved in the solid state [8,18]. This is maximised for samples which are rapidly cooled (quenched) from the melt. PBT forms a crystalline phase in PC/PBT blends. However, its rate of crystallisation in the blend is slower than in the pure component. [15,18] The crystallinity of the blend depends on post-processing conditions, such as the rate of cooling from the melt and any annealing. Crystallisation may also occur during thermal measurements [2]. Annealing (e.g. at 130–160°) and slow cooling give rise to phase separation [8,14,18], which leads to an increase in the crystallinity of the blend [2,5,8,18], and to changes in the amorph. phases [8,18]. The crystalline phase increases in volume on heating, using PBT crystallised from both amorph. phases [2,3,15] As the PC content increases from 10–90% the degree of crystallinity decreses from 18.4–0.7% - both as a percentage of the total blend and of the PBT component alone [2,3]. At a given PC content, annealed material is more crystalline than the unannealed material [2,3]

20	100–101°C	Xenoy CL-100, unannealed [9]
21	47–100°C	Xenoy CL-100, conditioned 250°, 20 min [9]
22	46–47°C	Xenoy CL-100, conditioned, 270°, 5–15 min [9]
23	100–101°C	Xenoy CL-100, conditioned, 270°, 5–15 min [9]
24	99°C	Xenoy CL-100, conditioned, 270°, 20 min [9]

Transition Temperature General: T_g varies with prior thermal history, including the method of blending (melt mixing or solution blending), the temp. and duration of melt mixing, any annealing, even the methor of measurement [4,6,8]. It is therefore difficult to discuss trends. However, for a given series, the upper T_g increases with percentage PC content, while the lower T_g decreases
Deflection Temperature:

No.	Value	Note
1	80°C	1.81 MPa, DIN 53 461, Makroblend PR 52 [21]
2	108°C	0.45 MPa, DIN 53 461, Makroblend PR 52 [21,25]
3	98°C	50% PC, 1.82 MPa, ASTM D648 [23]
4	96–121°C	1.82 MPa, Xenoy, various grades, all impact modified [22]

Vicat Softening Point:

Permeability of Liquids: Diffusivity [H_2O] 6.64×10^{-8} cm_2 s^{-1} (21°) [24]; 3.84×10^{-8} cm_2 s^{-1} [24]. Activation energy for diffusivity of H_2O 46.9 kJ mol^{-1} (11.2 kcal mol^{-1}, 21–98°) [24]

Water Absorption:

No.	Value	Note
1	0.12–0.14 %	Xenoy, various grades, all impact modified [22]

Mechanical Properties:

Mechanical Properties General: Poisson's ratio of a 50% PC blend increases after 10 h annealing and decreases after 100 h. Stress transfer across the phases is one of the critical factors determining the load bearing capacity and the impact behaviour of the material [10]. The degree of crystallisation has a great influence on the phase behaviour, which in turn affects the mechanical props. [2] The degree of crystallinity is affected by processing and post-processing conditions. PC/PBT blends combine the toughness of polycarbonate with the chemical and stress cracking resistance of PBT. Tensile strength at break has a minimum at 30% PC content. Elongation at break decreases with increasing PC content [2]. Tensile strength at yield increases with increasing PC content [2]. Young's modulus shows a maximum at 80% PC content, indicating synergism in the blend. [2] The variation of loss tangent with temp. for blends containing 50% [24] and 80% PC [2] and for commercial blends (Xenoy CL-100) [7,9] has been reported. The variation of tensile storage and tensile loss moduli with temp. for blends containing 60% [15] and 80% PC [15] and for commercial blends (Xenoy CL-100) [7,9] has been reported. Flexural strength decreases on exposure to H_2O at elevated temps. [24]

Tensile (Young's) Modulus:

No.	Value	Note
1	1970–2070 MPa	20% PC, unannealed [2]
2	2200–2360 MPa	50% PC, unannealed [2]
3	2160 MPa	22000 kg cm^{-2}, 50% PC [23]
4	2460–2500 MPa	80% PC, unannealed [2]
5	2360–2460 MPa	90% PC, unannealed [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	55–57.4 MPa	10% PC, unannealed [2]	299–363%
2	52.3–56.4 MPa	20% PC, unannealed [2]	228–257%
3	54.3–59.2 MPa	50% PC, unannealed [2]	116–138%
4	63.9–67.2 MPa	80% PC, unannealed [2]	77–96%
5	43.79–44.26 MPa	Xenoy CL-100 [7]	29.9–48.5%

Flexural Strength at Break:

No.	Value	Note
1	130 MPa	50% PC [24]

Poisson's Ratio:

No.	Value	Note
1	0.4	50% PC [10]
2	0.42	50% PC, annealed 10h [10]
3	0.39	50% PC, annealed 100 h [10]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	34.7–38.7 MPa		10% PC, unannealed [2]
2	40.6–43.9 MPa		20% PC, unannealed [2]
3	46.5–50.3 MPa		50% PC, unannealed [2]
4	54.9 MPa		560 kg cm^{-2}, 50% PC, unannealed, ASTM D638 [23]
5	54.3 MPa		80% PC, unannealed [2]
6	57.9 MPa		90% PC, unannealed [2]
7	55.2–55.7 MPa	14.2%	Xenoy CL-100 [7]

Flexural Strength Yield:

No.	Value	Note
1	94.1 MPa	960 kg cm^{-2}, 50% PC, ISO R178 [23]

Impact Strength: Low temp. impact strength decreases with increasing number of extrusion cycles. [7] Tensile impact strength 245 kJ m^{-2} (250 kg cm cm^{-2}, 50% PC, ASTM D1822). [23] Commercial blends usually have impact modifiers added; the impact strength of the blend depends on their nature and level. Impact energies decrease drastically on exposure to H_2O at elevated temps., and are found to vary with sample thickness [24], temp. and time of H_2O immersion. For example, immersion at 80° for 12 d gives brittle fracture (ductile before immersion, flexural impact testing) [24]. Impact energies/unit volume 4.4 J cm^{-3} (unnotched, as moulded) [24]; 4.1 J cm^{-3} (unnotched, 21°, 90 d) [24]; 3.9 J cm^{-3} (unnotched, 55°, 7 d) [24]; 0.93 J cm^{-3} (unnotched, 80°, 7 d) [24]; 0.05 J cm^{-3} (unnotched, 98°, 7 d) [24]; 0.5 J cm^{-3} (unnotched, 98°, 3 d) [24]; 3.9 J cm^{-3} (unnotched, 98°, 1 d) [24]

Viscoelastic Behaviour: The load-bearing props. of a 50% PC blend (as illustrated by creep) are affected very little after 10 h annealing at 160°. [10] Volumetric strain-creep time curves for stress levels of 20–50 MPa for blends containing 50% PC have been reported. The blend shows cooperative behaviour, with props. of PBT dominating at low stresses and those of PC dominating at higher stresses [10]

Hardness: Ball indentation hardness H30 (100 MPa, Makroblend PR 52, DIN 53 456) [21,25]; Rockwell R112–R115 (Xenoy, various grades, all impact modified) [22]

Failure Properties General: Failure stress 53–55 MPa (1000s creep time). [10] Activation energy of embrittlement 92 kJ mol^{-1} (22 kcal mol_{-1}, H_2O immersion, 55–98°) [24]

Fracture Mechanical Properties: Annealing results in significant embrittlement [1,8,24], with a reduction in fracture energy. Fracture energy, G_{Ic} annealed/G_{Ic} unannealed 0.9 (annealed 80°, 100h, Xenoy CL-100), 0.55 (annealed, 130°, 100 h, Xenoy CL-100) [1]; G_{Ic} annealed/G_{Ic} unannealed 0.64 (130°, 10 h, Makroblend PR 52); 0.42 (130°, 100 h). [1] In notched impact tests at -30°–25°, 55% PC/45% PBT blends show brittle failure [20]; 45% PC/40% PBT/15% core shell impact modified blend shows ductile failure [20]. Lower levels of impact modifier and PC give temp. dependent failure props. For example, 15% PC/70% PBT/ 15% impact modified blends show semi-brittle failure (-30°–-20°) [20], and ductile failure (-20°–25°). [20] At low temps. (-70°) Xenoy CL-100 displays brittle failure [7], whereas at 25° the specimens are completely ductile (Xenoy 1102, impact modified). [28] The fracture energy, G_{Ic}, increases smoothly with increasing

testing temp. (i.e. no sharp ductile-brittle transition) [1]. G_{Ic} 4.1 kJ m^{-2} (-27°, Makroblend PR 52) [1]; 5.3 kJ m^{-2} (10° Makroblend PR 52). [1] At temps. above 10°, the samples (Makroblend PR 52) do not break.[1] Impact fracture energy of compression-moulded samples is lower than that of injection-moulded samples [1,8]. Processing affects fracture energy, which is significantly reduced at higher temps: G_{Ic} 3.9 kJ m^{-2} (260°, Xenoy CL-100), 4.5 kJ m^{-2} (280°, Xenoy CL-100, 3.1 kJ m^{-2} (300°, Xenoy CL-100) [1]

Izod Notch:

Electrical Properties:

Electrical Properties General: Contour maps of ϵ' and dissipation factor (-180°–200°, 0.1 Hz–3MHz) for PC:PBT (5:4) have been reported

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.93–3.6	100 Hz	Xenoy, various grades [22]

Dielectric Strength:

No.	Value	Note
1	28–29 kV.mm^{-1}	3.2 mm, Xenoy, various grades [22]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [4,9]

Volume Properties/Surface Properties: Films containing more than 75% PC are transparent or sometimes hazy [9,15], whereas blends with less than 75% PC are not fully transparent/opaque because of the crystallinity of PBT [2,9,15]. Films cast from soln. are slightly opaque. [6] The appearance of the melt at 250° varies from transparent (25% and 90% PC), through a satiny, opaque state (50% and 80% PC) to a light brown, translucent opaque state (60% and 70% PC) [15]. At 280° the melt is transparent at all compositions [2]

Polymer Stability:

Polymer Stability General: PC/PBT blends have excellent chemical stability. However, they are hydrolysed at elevated temps., and heating at moderate temps. (130–175°, >10 h depending on temp.) leads to embrittlement

Thermal Stability General: The props. of PC/PBT blends are affected by processing conditions and subsequent treatment. [4,5,6,9,10,18,23] Parts manufactured from PC/PBT alloys are known to undergo changes in their props., especially during service at elevated temps. These changes include a considerable embrittlement during long term use, which is significantly worse than found in the pure components. [8] Changes can be attributed to ester interchange reactions, degradation of the polymers, phase separation and crystallisation equilibria. [4,8,18] There is some debate concerning the existence of ester interchange reactions at high (>260°) temps., but its relative likelihood depends on the conditions. [2,4,6,9,18,23] Where observed, the extent of transesterification depends on the temp. and the composition [4,26], e.g. at higher PC content the reaction proceeds much more slowly than at lower PC content. [4,26] Over short time intervals (about 10–60 min., depending on temp.) a block copolyester is formed, whose composition becomes statistical at longer times (>40 min., depending on temp.) [4,9,19,23] It is thought that the exchange reaction proceeds when PBT degrades [4], and that residual titanium in the PBT catalyses the reaction [23,26]; low levels of organic phosphorus stabilisers (e.g. di- or triphosphites) can be added to complex with these residues thus limiting transesterification. [3,5,14,23] During melt processing the high temps. (in excess of 240°) cause degradation, transesterification and miscibility changes to occur, which affect the physical props. Such changes depend on the temp. and duration of processing [1,4]

Decomposition Details: Usually unstable above 230° [23]. Blends containing 50% PC evolve CO_2 at temps. above 260° [23]

Flammability: Flammability rating HB (0.081–1.57 mm, Xenoy, various impact-modified grades) [22]

Chemical Stability: Xenoy has excellent chemical resistance [22]. Elongation to break is unaffected by immersion in automotive fuels for 5 min. under load [21]. Waxing and dewaxing also have no effect [21]

Hydrolytic Stability: Immersion of Xenoy CL-100 samples in warm (40°) deionised water increases melt flow index, significantly decreases low temp. impact strength but has little effect on tensile props. [7] Immersion of a 50% PC blend in H_2O at elevated temps. (98°, 10 d) results in very fragile specimens, with pitted and dull surfaces [24]. It is thought that hydrolytic chain scission at the ester linkage occurs on immersion in H_2O [7,24] resulting in a decrease in MW [24]

Recyclability: Reprocessing (the number of times the material is extruded) increases melt flow index and tensile strength (yield and break), and decreases the low temp. impact strength [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Drying prior to processing (at 100–110°) is required. Melt temps. should not exceed 270–290°. Prepared by melt mixing or by combining two solns. and then removing the solvent. In melt mixing, the two components are first dried (mixed or separately) in an air circulating oven or under vacuum to prevent hydrol. (120°, 4–48 h) [2,5,7,9,10,23]; (80°, vacuum, 48 h). [6] The polymers are then combined in the melt by extrusion [5,6,10,18] or by mechanical mixing. [2,5,15,19,23] The temp. should be kept above 232°, i.e. melting point of PBT. [15] The extrudate can be ground in a pelletiser; moisture absorption is prevented by keeping the material in a closed container. [10] In soln. blending each of the two polymers is dissolved in solvent (e.g. hot tetrachloroethane), mixed and
then the solvent is evaporated. The blend is then dried at 120° for 12 h [9]

Mould Shrinkage (%):

No.	Value
1	0.8–1%

Applications: Automotive (e.g. bumpers), electrical, mechanical and sport, medical products, fluid handling equipment, lightweight lawnmower casings

Polycarbonate/polybutylene terephthalate alloy, Glass reinforced P-136

Related Polymers: Polycarbonate/polybutylene terephthalate blend
Monomers: Bisphenol A, Carbonic dichloride, 1,4-Benzenedicarboxylic acid, 1,4-Butanediol
Material class: Blends
Polymer Type: PBT and copolymers, polycarbonate alloy blends
Additives: Impact modifiers are added

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value
1	0.4–0.9%

Trade name	Details	Supplier
Xenoy 6240	10%, impact modified	General Electric Plastics
Xenoy 6370	30%, impact modified	General Electric Plastics
Xenoy 6380	30%, impact modified	General Electric Plastics

Polycarbonate/polyester alloys P-137

Synonyms: *Polycarbonate/polyester blend*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polycarbonate/polybutylene terephthalate alloy, Polycarbonate/polyethylene terephthalate alloy
Material class: Blends
General Information: High impact and flame retardant versions available

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	0.5–1.1%	depending on composition

Trade name	Details	Supplier
Makroblend	PR 52, UT400, UT1018	Mobay
PC/Polyester	1400	Engineered Polymer
Sabre	1628, 1647, 1664	Dow
Ultrablend	2230	BASF
Vybex	40004 NAFC, 40001 NA	Ferro Corporation
Xenoy		General Electric Plastics
		Bayer Inc.

Polycarbonate/polyethylene alloy P-138

Synonyms: *Polycarbonate/polyethylene blend*
Related Polymers: Polyethylene, Poly[2,2-propanebis(4-phenyl)-carbonate]
Monomers: Bisphenol A, Ethylene
Material class: Blends
Polymer Type: polyethylene, polycarbonate alloy blends
Molecular Formula: $[(C_6H_{14}O_3).(C_2H_4)]_n$
Fragments: $C_6H_{14}O_3$ C_2H_4
General Information: Polycarbonate/polyethylene blends are tougher than polycarbonate alone. They exhibit less stress-cracking andd have a higher resistance to some chemicals [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.19 g/cm^3	ASTM D792 [1]

Deflection Temperature:

No.	Value	Note
1	132°C	1.82 MPa, ASTM D648 [1]

Vicat Softening Point:

No.	Value	Note

2	0.34 %	long term, ASTM D570 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2300 MPa	ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	2200 MPa	ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	59 MPa	ASTM D638 [1]	115%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	59 MPa	8%	ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	86 MPa	ASTM D790 [1]

Compressive Strength:

No.	Value	Note
1	69 MPa	yield, strain 9%, ASTM D695 [1]

Impact Strength: 640–800 J m^{-1} (3.2 mm thick, ASTM D256) [1], 480–640 J m^{-1} (6.4 mm thick, ASTM D256) [1]
Hardness: Rockwell A115-A118 (ASTM D785) [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	>16 kV.mm^{-1}	min., 3.2 mm thick, ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	10–12s	stainless-steel electrodes, ASTM D495 [1]
2	30–70s	tungsten electrodes, ASTM D495 [1]

Optical Properties:

Volume Properties/Surface Properties: Clarity opaque [1]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	121°C	intermittent use [1]
2	121°C	continuous use, no load [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed at the temp. usually employed for Bisphenol A polycarbonate
Mould Shrinkage (%):

No.	Value	Note
1	0.6–0.8%	ASTM D955 [1]

Applications: Protective headgear, sporting goods, bobbins for the textile industry, automobile bumpers

Trade name	Supplier
Makrolan T7700	Bayer Inc.

Polycarbonate/polyethylene terephthalate alloy P-139

Synonyms: *PET/PC blends. PC/PET blends. Polycarbonate/polyethylene terephthalate blend*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polycarbonate/polyester alloys, PET, Glass fibre reinforced polycarbonate/polyethylene terephthalate alloy
Monomers: Bisphenol A, Carbonic dichloride, 1,4-Benzenedicarboxylic acid, 1,2-Ethanediol
Material class: Blends
Polymer Type: PET and copolymers, polycarbonate alloy blends
General Information: PC/PET blends form complicated systems, the props. of which depend not only on the composition and any additives used, but also on the synth., processing and subsequent exploitation. [1,2,3,4,5,6,7,8] Transesterification, phase separation, crystallisation and degradation processes can all occur as a result of thermal treatment during processing or annealing at lower temps. (125–200°) during post-processing. There is some debate over whether the blends form one or two phases, especially at lower PC levels, and this feature is influenced by the above processes
Morphology: The phase morphology of PC/PET blends depends on various factors, including the composition, the method of mixing, the temp. and duration of mixing and the presence of additives. [4,5] Above 50% PC two phases are formed, one PC-rich, the other PET-rich [7]. The mass fraction of PET in the PC-

rich phase is higher than the mass fraction of PC in the PET-rich phase (suggesting PET dissolves more in the PC-rich phase than PC does in the PET-rich phase). This is the case for both melt-extruded and soln. cast blends. [7] Below 50% PC the components are less compatible [7], and phase separation is more pronounced at higher PC levels (60 and 80%) than at lower levels (10 and 30%) [7]. There is some dispute over the number of phases present. Some reports have found more than one phase present (as indicated by T_g measurement and phase-contrast microscopy) [4,6], others only one [2,5]. Another report concludes the blends are compatible but not microscopically miscible [7]. An additional complication is that the method of measurement of T_g may influence the conclusions [5,6]. This may be a consequence of different thermal treatments during measurement, [6] e.g. DSC measurement of a 20% PC blend shows a single T_g while DMTA shows two. [6] One proposed explanation for the differences in morphology observed is transesterification [4], although this, too, is disputed [5]. Transesterification initially gives rise to block copolymer formation, which homogenises the separate phases, eventually leading to a single phase [4]; blends with 20% or less PC appear to homogenise more quickly. [4] Soln. cast blends form distinct phases at all compositions. [4,7] PET can crystallise in the blend, and the extent of this is increased by annealing [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.2737 g/cm^3	50% PC, unannealed, ASTM D792 [1]

35	95–144°C	90% PC, melt processed, 290–300°, 8–10 min [5]

Transition Temperature General: The melting point of the PET component varies with composition and also with prior thermal history. [2,5] T_g varies with prior thermal history, e.g. processing time and temp., and, to a lesser extent, with any post-processing such as annealing. It can even depend on the method of measurement [5,6]

Deflection Temperature:

No.	Value	Note
1	120°C	1.82 MPa, Makroblend UT 400 [11]
2	88°C	1.82 MPa, Makroblend UT 1018 [11]

6	122 °C	1.82 MPa, Makroblend UT 640 G, 20% glass fibre [11]

Surface Properties & Solubility:

Solubility Properties General: The 50:50 blend is miscible [1]. All blends are initially immiscible, but homogenise on melt processing [4]. The two polymers have interaction parameters that suggest immiscibility over the whole composition range [9]

Cohesive Energy Density Solubility Parameters: The Flory Huggins interaction parameter, χ_{12}, increases with percentage PC content. 0.037–0.04 (30% PC, extruder blended) [7]; 0.040–0.043 (30% PC, soln. cast) [7]; 0.050–0.054 (70% PC, extruder blended) [7]; 0.054–0.058 (70% PC, soln. cast) [7]

Solvents/Non-solvents: Sol. 1,1,1,3,3,3-hexafluoro-2-propanol [4,7], tetrachloroethane [6], 2-chlorophenol, trifluoroacetic acid [8]; insol. EtOH [10]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	12.6 g/10 min	20% PC, 270°, 2.16 kg [6]
2	14.6 g/10 min	40% PC, 270°, 2.16 kg [6]
3	15.4 g/10 min	60% PC, 270°, 2.16 kg [6]
4	17.3 g/10 min	80% PC, 270°, 2.16 kg [6]
5	8–16 g/10 min	Makroblend UT 1018 [11]

Water Absorption:

No.	Value	Note
1	0.16 %	Makroblend UT 1018 [11]

Mechanical Properties:

Mechanical Properties General: In polymer blends, stress transfer across the phases is one of the critical factors determining the load bearing capacity and the impact behaviour of the material [13]. PC/PET blends are highly ductile and show large elongations to break [2]; in the necked region whitening occurs due to stress-induced crystallisation. [2] Elongation at break 119% (10% PC), [2] 200% (min. 20–40% PC) [2], 156% (50% PC) [2], 139% (65% PC) [2], 116% (75% PC) [2], 104% (90% PC) [2], 95% (Vybex 40001 NA) [11], 283 % (Vybex 40004 NAFC) [11]. Annealing (125–200°, 1–24 h) gives a significant increase in tensile strength and modulus, whilst the elongation at break decreases [1,6]

Tensile (Young's) Modulus:

No.	Value	Note
1	2080 MPa	50% PC, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	1240 MPa	50% PC, ASTM D790 [1]

3	59.71 MPa	12.6%	60% PC, unannealed, BS 2782 [6]
4	71.55 MPa	13.9%	60% PC, annealed 125°, 18h, BS 2782 [6]

5	47 MPa		Vybex 40001 NA [11]
6	54 MPa		Vybex 40004 NAFC [11]

Flexural Strength Yield:

No.	Value	Note
1	95.9 MPa	50% PC, ASTM D790 [1]

Complex Moduli: The variation of loss tangent and tensile storage modulus with temp. (-110°–160°, 1 Hz) has been reported [6]
Impact Strength: The impact strength for PC/PET blends depends on several factors, including the notch size and any annealing. The impact strength of a PC/PET/impact modified blend increases with increasing MW of the PET component; little change is found when the MW of the PC component is increased. [14] PC/PET blends remain ductile after annealing, but the notched impact strength can deteriorate on heating [1,6]
Hardness: Rockwell R114 (Makroblend UT 1018) [11]; R118 (Vybex 40004 NAFC) [11]
Izod Notch:

No.	Value	Notch	Note
1	70 J/m	Y	7.1 kg cm cm^{-1}, 50% PC, ASTM D256 [1]

Electrical Properties:

Electrical Properties General: Volume resistivity 4.82×10^8 Ω cm (Vybex 40004 NAFC/Vybex 40001 NA) [11]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.96	60 Hz	Makroblend UT 1018 [11]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [4,6,8]

Polymer Stability:

Thermal Stability General: PC/PET blends are less stable in a N_2 atmosphere than PC or PET. They have lower initial decomposition temps. [10], and do not form the same decomposition products as are generated in the pyrolysis of PC or PET alone. [10] This is because of intermolecular exchange reactions occurring between 250° and 300°, which give compounds that are less stable than the starting materials [4,10]
Decomposition Details: PC/PET blends are found to have a broad decomposition range in a N_2 atmosphere, with several maxima in the decomposition rate between 380 and 500°. These maxima occur at 380° and 450° (25% PC) [10]; 410°, 460° and 500° (50% PC) [10]; 42°, 460° and 500° (75% PC). [10] PC/PET blends (0–75% PC) heated at 290° for at least 20 mins become amber to dark brown, indicating some thermal degradation. [2] For blends containing 50% PC the decomposition occurs in three stages; intermolecular exchange reactions; [4,10] evolution of pyrolysis products [10]; formation of a cyclic oligomer [10]
Flammability: Flammability rating HB (Makroblend UT 400/UT 1018, $\frac{1}{16}$" thick); [11] HB (Makroblend UT 620 G, 10% glass fibre, $\frac{1}{16}$" in thick) [11]; HB (Makroblend UT 640 G, 20% glass fibre, $\frac{1}{16}$" in thick) [11]
Chemical Stability: Makroblend UT 1018 is resistant to gasoline and a variety of chemicals, including motor oils, antifreeze, trichloroethylene, xylene and Me_2CO [12]. It has limited resistance to 40% sulfuric acid [12]

Applications/Commercial Products:

Processing & Manufacturing Routes: Drying (at 100–110°) prior to processing is required. Melt temps. should not exceed 270–290°. Blends are prepared by melt mixing or by combining two solns. and then removing the solvent. In melt mixing, the two dry components [2,5] are combined in the melt by extrusion [1,2,6,14] or by mechanical mixing. [5,8] The temp. should be kept above the melting point of PET, i.e. 260°. [1] In soln. mixing, the polymers are dissolved and mixed in a suitable solvent, e.g. 1,1,1,3,3,3-hexafluoro-2-propanol at room temp. [4,7], or tetrachloroethane [6]. Films are then cast from soln., and subsequently dried at 60° for 1 d, then at room temp. for a few weeks [4,6,7]. In soln. precipitation the polymers are dissolved in solvent, e.g. phenol:1,1,2,2-tetrachloroethane (60:40) at 120° [10] and the hot soln. added dropwise to EtOH, from which the solid precipitates [10]
Mould Shrinkage (%):

No.	Value
1	0.4–0.9%

Applications: Automotive, electrical-electronics, mechanical and sport applications, including vacuum cleaner housings and nozzles, protective face guards, tractor parts, instrument housings and speaker grilles

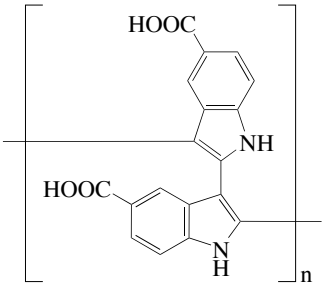
Polycarbosilanes P-143

R_1, R_2 and R_3 = alkyl or aryl groups



Related Polymers: Polymethylphenylsilylenemethylene, Poly[(phenylsilylene)methylene]
Polymer Type: polycarbosilanes

Polymer Stability:
Polymer Stability General: Stable under extreme conditions providing air and oxidising agents are excluded [1,2]
Hydrolytic Stability: Extremely resistant to hydrol. [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. varies widely with precise chemical composition of polymer. See specific polycarbosilanes for more detailed information. Main methods include Wurtz coupling, hydrosilation and ring opening polymerisations [1]
Applications: Thermolysis at temps. of >800° produces silicon carbide ceramic fibres. May have value as resistant elastomer at high temp. in the absence of oxygen

Poly(5-carboxyindole) P-144

Synonyms: *1H-Indole-5-carboxylic acid homopolymer*
Monomers: 1*H*-Indole-5-carboxylic acid
Material class: Thermoplastic
Polymer Type: polyindole
CAS Number:

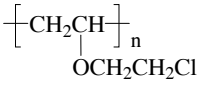
CAS Reg. No.
91201-83-1

Molecular Formula: $(C_9H_5NO_2)_n$
Fragments: $C_9H_5NO_2$
Additives: Film can contain dopant ions such as perchlorate or tetrafluoroborate after electrolysis
General Information: Conductive electrochromic polymer. According to the most widely proposed model, the polymer exists as indole units linked via the 2,3-positions [1,2]. In another model, the polymer consists of linked indole trimer units [3].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. DMSO; insol. DMF (indole trimer model) [3].

Electrical Properties:
Electrical Properties General: Conductivity of 3 to 6×10^{-3} S cm^{-1} reported for 'self-doped' polymer [4,5]. The polymer exists in a reduced insulating form, a half-oxidised conducting form with a delocalised benzenoid-quinoid structure and a fully oxidised insulating form [1,2,7].

Optical Properties:
Optical Properties General: Polymer films oxidised electrochemically change colour from yellow (reduced form) via green to black (oxidised form) [1]. In the reduced state, absorption occurs in the UV region with λ_{max} *ca.* 350nm, while on oxidation a band centred at 774nm increases and then disappears in the fully oxidised form [1]. Fluorescence with a band centred at *ca.* 540nm has been reported for the polymer based on the indole trimer model [9].
Transmission and Spectra: FT-IR [2,3,5,6,7], Raman [1] and uv [1,3,5,9] spectra reported.



Polymer Stability:
Thermal Stability General: Initial weight loss above 117°C is due to loss of carbon dioxide in side chain. Thermal decomposition of backbone starts at *ca.* 400°C, with 25% weight loss at 424°C [8]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. mainly electrolytically by anodic oxidation of 5-carboxyindole in acetonitrile with lithium perchlorate or tetraalkylammonium tetrafluoroborate as supporting electrolyte [1,3,5,6,7,10]

Poly(2-chloroethyl vinyl ether-*co*-isobutylene-*co*-butyl acrylate) P-146

Related Polymers: General information
Monomers: Vinyl 2-chloroethyl ether, Isobutylene, Butyl acrylate
Material class: Thermoplastic, Copolymers
Polymer Type: polyolefins, acrylicpolyvinyls
CAS Number:

CAS Reg. No.
31049-61-3

Molecular Formula: $[(C_4H_7ClO).(C_4H_8).(C_7H_{12}O_2)]_n$
Fragments: C_4H_7ClO C_4H_8 $C_7H_{12}O_2$
General Information: Is a white amorph. solid. Introduction of 2-chloroethyl vinyl ether into the polymer allows the copolymer to be cured using polyamides to give greater mechanical strength [1]

Transport Properties:
Polymer Solutions Dilute: Intrinsic viscosity 3.55 dl g^{-1} (C_6H_6, 30°) [2]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note	Elongation
1	10 MPa	102 kg cm,p1>-2, 43.2 mol% isobutylene, 50.9 mol% butyl acrylate, 5.9 mol% 2-chloroethyl vinyl ether, polyamine cured [1]	370%

Miscellaneous Moduli:

No.	Value	Note	Type
1	6.6 MPa	67 kg cm^{-2}, 43.2 mol% isobutylene, 50.9 mol% butyl acrylate, 5.9 mol% 2-chloroethyl vinyl ether, polyamine cured [1]	300% modulus

Hardness: Shore A72 (43.2 mol% isobutylene, 50.9 mol% butyl acrylate, 5.9 mol% 2-chloroethyl vinyl ether, polyamine-cured) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical initiated copolymerisation

Poly(2-chloroethyl vinyl ether-*co*-tetracyanoquinodimethane) P-147

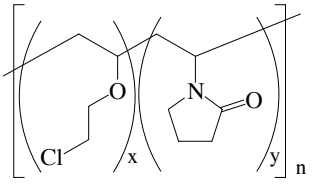
Synonyms: *Poly[(2-chloroethoxy)ethene-co-2,2′-(2,5-cyclohexadiene-1,4-diylidene)bispropanedinitrile]*
Related Polymers: General information
Monomers: 2-Chloroethyl vinyl ether, Tetracyanoquinodimethane
Material class: Thermoplastic, Copolymers

Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
78747-51-0

Molecular Formula: $[(C_4H_7ClO).(C_9H_4N_4)]_n$
Fragments: C_4H_7ClO $C_9H_4N_4$
General Information: Is a pale brown powder [1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. MeCN, Me_2CO, DMF, DMSO [1]



Transport Properties:
Polymer Solutions Dilute: Viscosity 0.449 dl g^{-1} (MeCN, 30°, approx. 50/50 copolymer) [1]

Optical Properties:
Transmission and Spectra: Ir and H-1 nmr spectral data have been reported [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: An alternating copolymer may be synth. by free-radical copolymerisation (50–60°, MeCN) using azobis(isobutyronitrile) as initiator. Polymerisation may be carried out without AIBN but yields are lower. The use of alternative solvents has been reported [1]

Polychloroprene P-149

Synonyms: *Unvulcanised polychloroprene. Polychloroprene, Unvulcanised. Chloroprene rubber. CR. Poly(2-chloro-1,3-butadiene)*
Related Polymers: Polychloroprene, Vulcanised
Monomers: Chloroprene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9010-98-4

Molecular Formula: $(C_4H_5Cl)_n$
Fragments: C_4H_5Cl
Molecular Weight: High monomer reactivity leads to high MW
General Information: First introduced in 1932 as Du Prene by DuPont; first commercial successful synthetic elastomer. Chlorine substituent in monomer increases reactivity, restricts incorporation of other monomers. Gel formation results from the formation of branching and cross-linking, controlled by temp. and addition of free-radical inhibitors. Commercial polymer is mainly 1,4-*trans*; regularity decreases with increasing temp. of polymerisation and crystallinity is highest when formed at low temp. Vulcanisation increases mechanical props.; see polychloroprene, vulcanised. Available in dry and latex forms
Morphology: Consists of 1,4-*trans*, 1,2-, 1,4-*cis* and other isomerised variations in varying proportions. Free-radical emulsion polymerisation yields mainly 1,4-*trans* polymer, composition increases at low polymerisation temp. and with the use of catalysts. Highly ordered polymer is crystalline [117]

Volumetric & Calorimetric Properties:

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameter 18.9 $J^{1/2}$ $cm^{-3/2}$ [35]. 18.42 $J^{1/2}$ $cm^{-3/2}$ [84], 19.19 $J^{1/2}$ $cm^{-3/2}$ (calc.) [85], 17.6 $J^{1/2}$ $cm^{-3/2}$ (swelling) [86]
Solvents/Non-solvents: The dispersibility of polychloroprene in solvents depends on polymerisation temp. At 10–40° dispersion is complete; at 50° dispersion is partial and at 100° swelling occurs [47]. Sol. C_6H_6, EtOAc, pyridine, chlorinated hydrocarbons, toluene. Insol. alcohols, aliphatic hydrocarbons
Surface Tension:

No.	Value	Note
1	40.5 mN/m	liq., 50° [25]
2	28 mN/m	liq., 200° [25]
3	43.6 mN/m	liq./vapour, 20° [91]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink-Sakurada constants have been reported for linear monodisperse and branched polychloroprenes in theta solvents [74]. Mark-Houwink constants have been reported [17,18,19,20]. Polymer/solvent interaction parameter χ has been reported for a wide range of solvents. Values range from 0.06 (THF), 2.27 (EtOH), 0.1 (chlorobenzene), 0.14 (toluene) to 1.61 (butanol) [80]. Theta temp. θ 25° (2-butanone) [81,82]; 45.5 (cyclohexane) [81]; 56.3 (cyclopentane) [81]

Permeability of Gases: Other permeability data for polychloroprene at 17–50° have been reported for H_2, He, N_2, O_2, CO_2 and CH_4 [92]
Gas Permeability:

No.	Gas	Value	Note
1	H_2	889 cm^3 mm/(m^2 day atm)	1.03 × 10^{-8} cm^2 $(s\ atm)^{-1}$, 25° [35]
2	H_2	2462 cm^3 mm/(m^2 day atm)	2.85 × 10^{-7} cm^2 $(s\ atm)^{-1}$, 50° [35]
3	N_2	77.7 cm^3 mm/(m^2 day atm)	9 × 10^{-9} cm^2 $(s\ atm)^{-1}$, 25° [35]
4	N_2	311 cm^3 mm/(m^2 day atm)	3.6 × 10^{-8} cm^2 $(s\ atm)^{-1}$, 50° [35]
5	O_2	259 cm^3 mm/(m^2 day atm)	3 × 10^{-8} cm^2 $(s\ atm)^{-1}$, 25° [35]
6	O_2	872 cm^3 mm/(m^2 day atm)	1.01 × 10^{-7} cm^2 $(s\ atm)^{-1}$, 50° [35]
7	CO_2	1685 cm^3 mm/(m^2 day atm)	1.95 × 10^{-7} cm^2 $(s\ atm)^{-1}$, 25° [35]
8	CO_2	4881 cm^3 mm/(m^2 day atm)	5.65 × 10^{-7} cm^2 $(s\ atm)^{-1}$, 50° [35]

Mechanical Properties:

Mechanical Properties General: Tensile strength decreases with increasing polymerisation temp. [47]. Compressibility has been reported [8,9]
Tensile Strength Break:

No.	Value	Note	Elongation
1	493 MPa	polymerisation temp. 10° [47]	530%
2	278 MPa	polymerisation temp. 40° [47]	510%
3	232 MPa	polymerisation temp. 100° [47]	430%

Mechanical Properties Miscellaneous: Capillary rheometer data for Neoprene W have been reported as shear stress vs shear rate plots [33]
Hardness: Polymerised at 100° remains soft and flexible indefinitely, at 55° requires months for hardening, 40° takes days and at 10° hardening occurs in hours [47]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.558	[7]

Transmission and Spectra: Raman [24], ir [102], nmr [116] and epr [112] spectral data have been reported

Polymer Stability:

Decomposition Details: The initial stages of the thermal degradation of polychloroprene have been reported [79]. Pyrolysis of polychloroprene yields 2% of monomer, 70% of the chlorine is released as HCl [97]. Initial decomposition temp. 170° [90]. The rate of heat and smoke release from polychloroprene has been reported [105]. Weight loss occurs slowly 230° (volatiles and CO), faster at 275–375° (rapid loss of HCl) and gradually lessens at 700° (combustion of residual carbon). Degradation characteristics have been reported for commercial Neoprenes. Initial weight loss (4%) 265–280° with fastest weight loss at 380°. Carbonaceous residue at 550° 21–23% [111]
Flammability: Flame retardation and smoke suppression of polychloroprene by tin additives have been reported [75]
Environmental Stress: The ageing and degradation of polychloroprene and its blends with ethylene/propylene rubber have been

reported [70]. The effect of water absorption, with and without salts present, on resistance to tearing has been reported [113]. The presence of $FeCl_3$ accelerates tearing

Stability Miscellaneous: Ozone degradation of polychloroprene has been found to give acid chloride groups, partially ozonised polychloroprene is less stable than partially ozonised 1,4-*cis*-polybutadiene, [69]. Blends of polychloroprene (10–40%) have been reported with respect to thermal stability, light resistance, storage modulus and flammability [72]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by free-radical emulsion polymerisation; 1,4 addition is thermodynamically favoured. Increase in temp decreases regularity of polymer. Soft enough to be processed without plasticisers

Applications: Mainly used as vulcanised form. Applications include use in mechanical and automotive components, belts, hoses, mouldings, footwear and cables

Trade name	Details	Supplier
Aquastik	adhesive	DuPont
Baypren	various grades	Bayer Inc.
Baypren		Miles
Butachlor		Rhone-Poulenc
Daubond		Daubert
Neoprene	various grades	DuPont
Skyprene		Tosoh

Polychloroprene, Vulcanised P-150

Synonyms: *Poly(2-chloro-1,3-butadiene), Vulcanised. Chloroprene rubber, Vulcanised. Vulcanised polychloroprene*
Related Polymers: Polychloroprene
Monomers: Chloroprene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
Additives: Vulcanised by zinc oxide, thiourea, magnesium oxides, sulfur. Antimony trioxide, zinc borate and aluminium trihydrate as flame retardants
General Information: Vulcanisation increases tear strength and adhesion to fabrics, and gives high tensile strength and low gas permeability

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.32 g/cm^3	unfilled [99]
2	d 1.42 g/cm^3	50 phv carbon black [99]
3	d 1.32 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0144 K^{-1}	-203–24° [98]	L
2	0.00013 K^{-1}	rubbery [98]	V
3	0.00061–0.00072 K^{-1}	[1,2,11,57]	V
4	0.00035 K^{-1}	glass [98]	V

Thermodynamic Properties General: The effect of stretching on thermal conductivity has been reported [104]
Latent Heat Crystallization: Rates of crystallisation have been reported for different degrees of vulcanisation, carbon black loadings and plasticiser levels for temps. ranging from 0–-20° [96]
Thermal Conductivity:

No.	Value	Note
1	0.21 W/mK	50 phv carbon black [2,99]
2	0.19 W/mK	[26]
3	0.192 W/mK	unfilled [3,99]

Specific Heat Capacity:

No.	Value	Note	Type
1	2.1–2.2 kJ/kg.C	unfilled [3]	P
2	2.175 kJ/kg.C	[26]	P
3	1.7 kJ/kg.C	[57]	P
4	1.7–1.8 kJ/kg.C	50 phv carbon black [3,99]	P

Glass-Transition Temperature:

No.	Value	Note
1	-41°C	[4,12,99]
2	-40°C	[4,58]
3	-50°C	[35]

Brittleness Temperature:

No.	Value	Note
1	-40°C	[57]
2	-43°C	0 phv butyl oleate [35]
3	-68°C	35 phv butyl oleate [35]

Transport Properties:

Permeability and Diffusion General: The penetration of oils into polychloroprene rubber has been reported [78]

Mechanical Properties:

Mechanical Properties General: Effect of heat ageing on mechanical props. has been reported [45,103]. Cross-linking increases hardness and tensile strength [22]. The effect of carbon

black on Poisson's ratio has been reported [106]. The ratio decreases from 0.4997 at 0 phv carbon to 0.4945 at 120 phv carbon black. Tensile strength decreases with temp. [48]. Effects of filling with carbon black have been reported [7]. Other values for tensile strength have been reported [45]. Complex dynamic Young's moduli for neoprene have been reported over the temp. range -60–100° [44]. Young's modulus has been measured for various oil and carbon black loadings over a range of temps. [46]. Compressibility measurements have been reported [8,9,36]. Ultimate elongation 800–1000% [14,15]

Tensile (Young's) Modulus:

No.	Value	Note
1	1–3 MPa	unfilled, vulcanised [87]
2	3–5 MPa	50 pph carbon black filled, vulcanised [87]

Tensile Strength Break:

No.	Value	Note	Elongation
1	22–170 MPa	[57]	200–600%
2	13–22 MPa	unfilled, vulcanised [87]	800–1000%
3	23–25 MPa	50 pph carbon black filled, vulcanised [87]	200–450%
4	48 MPa	0° [48]	750%
5	25 MPa	80° [34,48]	750%
6	33 MPa	0°, 30 pph carbon black [48]	350%
7	6 MPa	80°, 30 pph carbon black [48]	
8	60 MPa	0° [34]	
9	7–17 MPa	[35]	200–600%
10	21 MPa	[27]	
11	22 MPa	[58]	600%
12	14.5 MPa	27° [50]	
13	2 MPa	127° [50]	

Miscellaneous Moduli:

No.	Value	Note	Type
1	1.2 MPa	20° [35]	Torsional rigidity modulus
2	3.5 MPa	-30° [35]	Torsional rigidity modulus
3	70 MPa	-40° [5]	Torsional rigidity modulus
4	2270 MPa	[8]	Isothermal bulk modulus

Complex Moduli: Storage modulus 0.65 MPa (unfilled), 2.8 (50 phv carbon black). Loss modulus 0.11 MPa (unfilled), 0.5 (50 phv carbon black)
Viscoelastic Behaviour: Longitudinal speed of sound 1730 m s^{-1} (carbon black filled) [46,93]. Compression set 15–35% [57]. The dependence of stiffness and creep on proportion of carbon black has been reported [37]. Creep measurements have been made in shear deformation as a function of degree of vulcanisation, preconditioning and composition for up to 4 years [38,39]. Resistance 60–65% (unfilled) [15,101], 48% (50 phv carbon black) [10]
Mechanical Properties Miscellaneous: Thermo-mechanical analysis of vulcanised polychloroprene has been reported, showing crystalline transition at 42° and 47° [110]. Filaments have been subjected to oscillations in the range 0.5–4 kHz at temps. in the range 0–40° and at a strain of 300% to give the dependence of dynamic modulus on strain and to compare with static moduli [43]
Hardness: Shore A40–A95 [27,57]. Other values of hardness have been reported [45]. Typically hardness for compounded polymer ranges from 40–95 IRHD [35]
Failure Properties General: The effect of the rate of tearing and of temp. on the tear strength and tensile strength of neoprene compounds has been reported [113]. Fracture energy and tensile strength were measured from 0–150°. The tear strength of Neoprene WRT has been reported for threshold conditions which minimise viscoelastic and other dissipative processes [114] for different kinds of cross-linking. Flex-cracking and crack growth for Neoprene GN has been (36 pph carbon black) compared with other rubbers from 4–100°. The rate of crack growth becomes faster as the temp. rises from 40–100° [51]. Compression set measurements have been reported for different forms of polychloroprene under compressive stress at -10° (1–300h) [32]

Electrical Properties:

Electrical Properties General: Dielectric constant values have been reported
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	6.5–8.1	1 kHz	[13]

Complex Permittivity and Electroactive Polymers: The electrical conduction of carbon fibre-filled polychloroprene has been reported [67]. The dependence of electrical conductivity on carbon black particle size distribution has been investigated. Specific conductivity 0.0001 S cm^{-1} (20 phv carbon black); 0.01 S cm^{-1} (20 phv carbon black) [109]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.031–0.086	1 kHz	[13]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.56	[57]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	82–93°C	[57]
2	80°C	VDE 0304 [56]
3	100°C	[89]
4	120°C	[27]

Decomposition Details: Thermal degradation studies show three stages of volatilisation [115]. HCl released by neoprene on heating is absorbed by carbon black. Oxygen accelerates decomposition [40]. Decomposes at high temp. yielding CO_2, H_2O, HCl [56]
Flammability: The effect of antipyrene additives on the thermal behaviour and flammability of polychloroprene compositions has been investigated [73]. The chlorine content in polychloroprene (40%) and a tendency to form char results in more resistance to burning than for hydrocarbon rubbers. The main weight loss occurs between 290–400°, all of the chlorine is lost as HCl. Limiting oxygen index 26.3–40 [88]; 26–31 (unfilled) [108]; 41 [107]. Polychloroprene is 56% combustible; heat of combustion 22.6 kJ g^{-1} [107]. Inherently flame retardant
Environmental Stress: The effect of carbon black and cross-linking on the photo and thermal ageing of polychloroprene has been reported [59]. Accelerated thermal ageing has been reported by measuring residual deformation under constant deformation in air

[76]. The effect of fillers and other additives (including accelerators, plasticisers, softeners, extenders, tackifiers and antioxidants) on the ozone resistance of neoprene GN, W, FR for different cure times at constant strain and at constant load has been reported [52]. The effect of ozone on crack propagation [94] and flex resistance [95] for different additives has been reported. Rain erosion rate 2 μm min^{-1} (whirling arm, 25 mm h^{-1} rain) [23]

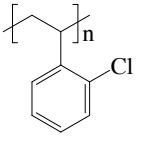
Chemical Stability: Medium resistance to oils; good resistance to paraffinic/naphthalenic oil and hydraulic fluids. Limited resistance to aromatic fuels [56]. Resistance to H_2O and oil has been reported [41]. Effect of carbon black on swelling and resistance to hydrocarbon oil has been reported [64,68]

Biological Stability: Contact with soil for long periods results in attack by soil bacteria and fungi; resistance to microorganisms in soil is higher than for hydrocarbon rubbers [56]

Stability Miscellaneous: Exposure of lightly cross-linked polychloroprene to high energy radiation (γ rays) has been found to increase hardness (Shore D17-D70), increase tensile strength and reduce elongation at break as a result of cross-linking [22]

Applications/Commercial Products:

Processing & Manufacturing Routes: Vulcanisation is carried out using metal oxides (e.g. zinc or magnesium oxide) and with sulfur and mercaptan transfer agents - the latter are produced in highest quantity



Applications: Used in mechanical and automotive components such as belts, hoses, gaskets; footwear, electrical cable covering. Higher crystallinity grades used in adhesives

Poly(2-chlorostyrene) P-151

Synonyms: *Poly(o-chlorostyrene). Poly(1-chloro-2-ethenylbenzene). Poly(1-(2-chlorophenyl)-1,2-ethanediyl)*
Related Polymers: Poly(3-chlorostyrene), Poly(4-chlorostyrene)
Monomers: 2-Chlorostyrene
Material class: Thermoplastic
Polymer Type: styrenes
CAS Number:

CAS Reg. No.
26125-41-7

Molecular Formula: $(C_8H_7Cl)_n$
Fragments: C_8H_7Cl

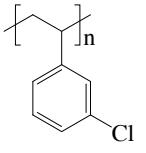
Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d^{25} 1.25 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	119°C	[6]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: δ 9.22 ($CHCl_3$) [4], δ 9.201 (CH_2Cl_2) [4], δ_p 8.9 [5]
Solvents/Non-solvents: Sol. CCl_4, toluene, *o*-xylene, C_6H_6, 2-butanone, chlorobenzene, CH_2Cl_2, methyl isopropyl ketone, *o*-dichlorobenzene, cyclopentanone, pyridine, *o*-toluidine [5]. Insol. Freon-215, isopentane, isooctane, pentane, hexane, octane, methylcyclohexane, cyclohexane, Me_2CO, amyl alcohol, pentyl alcohol, EtOH, MeOH



Transport Properties:
Polymer Solutions Dilute: [η] 0.445–1.418 dl g^{-1} (30°, toluene) [3]. Theta temp. Θ 23–27° (butanone) [1]

Optical Properties:
Molar Refraction: dη/dC 0.204 (25°, butanone) [1], 0.118 (35°, toluene), 0.211 (30°, butanone) [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by cationic polymerisation with Lewis acid catalysts

Poly(3-chlorostyrene) P-152

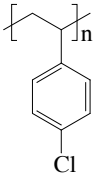
Synonyms: *Poly(m-chlorostyrene). Poly(1-chloro-3-ethenylbenzene). Poly(1-(3-chlorophenyl)-1,2-ethanediyl). Poly (1-chloro-3-vinylbenzene)*
Related Polymers: Poly(2-chlorostyrene), Poly(4-chlorostyrene)
Monomers: 3-Chlorostyrene
Material class: Thermoplastic
Polymer Type: styrenes
CAS Number:

CAS Reg. No.	Note
26100-04-9	
116002-24-5	isotactic
107830-48-8	syndiotactic

Molecular Formula: $(C_8H_7Cl)_n$
Fragments: C_8H_7Cl

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.241 g/cm^3	[1]



Glass-Transition Temperature:

No.	Value	Note
1	90°C	[2]

Molecular Formula: $(C_8H_7Cl)_n$
Fragments: C_8H_7Cl

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.229 g/cm^3	25° [3]
2	d 1.246 g/cm^3	[7]

Thermodynamic Properties General: ΔC_p 31.1 J K^{-1} mol^{-1} [2]
Glass-Transition Temperature:

No.	Value	Note
1	129°C	[1]
2	133°C	[2]
3	125°C	[5]
4	126°C	[7]

Transition Temperature General: Boils at 56–57° (3 mmHg)

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Solubility and solubility parameters for polymer in 97 solvents have been reported [9]

Transport Properties:
Polymer Solutions Dilute: Mark-Houwink constants have been reported [8]. Theta temp. θ -14.7° (ethylbenzene), 59.0° (isopropylbenzene), 50.7° (CCl_4), 44.4° (tetrachloroethylene), 64.6° (methyl chloroacetate), -1.8° (ethyl chloroacetate) [9]. Other values have been reported [9]
Permeability of Gases: [He] 16.4 × 10^{-10}; [CH_4] 0.26 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [7]

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.95	[1]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5662	[6]

Transmission and Spectra: Ir spectral data have been reported [4]

Polymer Stability:
Decomposition Details: In the decomposition of the polymer, random scissions reduce the chain length of the polymer and depolymerisation reactions cause weight loss [5]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by cationic polymerisation with Lewis acid catalysts

Polychlorotrifluoroethylene P-154

Synonyms: *PCTFE. Polychlorotrifluoroethene. CTFE*
Related Polymers: Poly(chlorotrifluoroethylene-*co*-ethylene)
Monomers: Chlorotrifluoroethylene
Material class: Thermoplastic
Polymer Type: PCTFE, polyhaloolefins
CAS Number:

CAS Reg. No.
9002-83-9

Molecular Formula: $(C_2ClF_3)_n$
Fragments: C_2ClF_3
Molecular Weight: M_n 70000–400000
Morphology: Polymer chain is helical, with an average of 16.8 monomer units in one turn of the helix. Crystallinity ranges from 40–80% depending on MW and thermal history

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2.14 g/cm^3	Kel-F81 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8×10^{-5} K^{-1}	[3]	L
2	7×10^{-5} K^{-1}	30–-30° [4]	L
3	5.1×10^{-5} K^{-1}	-30–-100° [4]	L
4	3.6×10^{-5} K^{-1}	-100–-190° [4]	L

Thermodynamic Properties General: Heat of formation ΔH_f 656.8 kJ mol^{-1}. Heat of combustion ΔH_c 130.6 kJ mol^{-1} [4]
Thermal Conductivity:

No.	Value	Note
1	1.195 W/mK	ASTM C177 [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.77 kJ/kg.C	91.8 J mol^{-1} K^{-1}, -3° [6]	P
2	0.73 kJ/kg.C	87.5 J mol^{-1} K^{-1}, -3° [6,7]	V

Melting Temperature:

2	211–216°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	50°C	[2]
2	71–99°C	[1]

Deflection Temperature:

No.	Value	Note
1	126°C	0.46 MPa, ASTM D648 [4]
2	70°C	1.82 MPa, ASTM D648 [4]

Brittleness Temperature:

No.	Value	Note
1	-240°C	[1]

Transition Temperature:

No.	Value	Note	Type
1	150°C	1 Hz [4]	α transition (relaxation)
2	90°C	1 Hz [4]	β transition (relaxation)
3	-37°C	1 Hz [4]	γ transition (relaxation)

Surface Properties & Solubility:

Solvents/Non-solvents: Highly fluorinated or chlorinated solvents swell the polymer but do not degrade it [4]. Sol. 2,5-dichlorobenzotrifluoride (135°) [4]
Wettability/Surface Energy and Interfacial Tension: Critical surface tension 31 mN m^{-1} [4]

Transport Properties:

Transport Properties General: PCTFE has the lowest water-vapour permeability of all known gases [4]
Polymer Melts: Melt viscosity 114000 Pa s [4]
Permeability of Gases: [O_2] 0.47 m^3 mm m^{-2} h^{-1} MPa^{-1} (1 mm thick film); [N_2] 0.17 m^3 mm m^{-2} h^{-1} MPa^{-1} (1 mm thick film); [CO_2] 1.1 m^3 mm m^{-2} h^{-1} MPa^{-1} (1 mm thick film) [4]
Water Content: 0%
Water Absorption:

No.	Value	Note
1	0 %	24h [8]

Mechanical Properties:

Mechanical Properties General: Has good resistance to creep and cold flow; has good rigidity and good low temp. toughness

Tensile (Young's) Modulus:

No.	Value	Note
1	1180–1450 MPa	ASTM D638 [4]

Flexural Modulus:

No.	Value	Note
1	1340–1820 MPa	ASTM D790 [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	40 MPa	ASTM D638, KEL-F 81 6050 [4]	100–400%
2	150 MPa	-129°	9%
3	200 MPa	-252° [1]	5%

Compressive Modulus:

No.	Value	Note
1	1350 MPa	KEL-F 81 6050

Tensile Strength Yield:

No.	Value	Note
1	32–39 MPa	ASTM D638 [4]

Flexural Strength Yield:

No.	Value	Note
1	65–71 MPa	ASTM D790 [4]

Compressive Strength:

No.	Value	Note
1	36–43 MPa	0.2% offset, ASTM D695 [4]
2	11–13 MPa	1% strain, ASTM D695 [4]
3	380 MPa	[1]

Miscellaneous Moduli:

No.	Value	Note
1	1200–1600 MPa	compressive modulus of elasticity, ASTM D695 [4]

Viscoelastic Behaviour: Deformation under load 0.2% (7 MPa, 24h, 25°, ASTM D621); 1.4–1.9% (7 MPa, 24h, 80°, ASTM D621); 5.0–9.0% (7 MPa, 24h, 100°, ASTM D621) [4]
Hardness: Shore D75-D85 (ASTM D1706) [4]
Friction Abrasion and Resistance: Abrasion resistance 5 mg (1000 cycles)$^{-1}$ (low crystallinity, Taber abrader, CS-10 wheel); 12 mg (1000 cycles)$^{-1}$ (high crystallinity Taber abrader, CS-10 wheel)
Izod Notch:

No.	Value	Notch	Note
1	133–187 J/m	Y	ASTM D256 [4]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
2	1×10^{15} Ω.cm	ASTM D257 [4]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.3–2.7	1 kHz	ASTM D150 [4]
2	2.3–2.5	1 MHz	ASTM D150 [4]

Dielectric Strength:

No.	Value	Note
1	25.4 kV.mm^{-1}	1.5 mm, short time, ASTM D149 [4]
2	25.6 kV.mm^{-1}	1.5 mm, step by step, ASTM D149 [4]
3	120 kV.mm^{-1}	100 μm, short time, ASTM D149 [4]

Arc Resistance:

No.	Value	Note
1	360s	ASTM D495 [4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.025	10 kHz	[4]
2	0.01	10 MHz	[4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.425	20° [4]

Transmission and Spectra: Light transmittance 90% (ASTM D1003, KEL-F 81 6050)
Volume Properties/Surface Properties: Clarity transparent to opaque. Haze 4.0% (ASTM D1003, KEL-F 81 6050) [8]

Polymer Stability:

Polymer Stability General: Has good thermal and chemical stability
Thermal Stability General: Thermally stable up to 250° [1]
Upper Use Temperature:

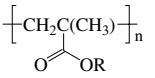
No.	Value	Note
1	205°C	[1]

Decomposition Details: Thermal decomposition at 350–370° yields 26% chlorotrifluoroethylene monomer. The remainder is a mixture of halocarbon waxes of M_n 904 [4]
Flammability: Non-flammable. Limiting oxygen index 95% (ASTM D2863). Vertical burn rating VEO (UL 94) [4]
Environmental Stress: Has good uv resistance. Vacuum degassing at 130–0.013 mPa under uv radiation up to 30 kJ cm^{-3} shows no significant changes in MW, or tensile props. [4]
Chemical Stability: Resistant to attack by most industrial chemicals, including strong acids and alkalis, over a wide range of temps. and concentrations [4]. Attacked by alkali metal complexes and certain organic amines [4]
Stability Miscellaneous: Has good radiation resistance (better than PTFE). The G-value for scission with γ radiation is 0.67 [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed using compression moulding, injection moulding, extrusion, fluidised bed coating techniques. Manufactured by free radical bulk, suspension or aq. emulsion techniques
Mould Shrinkage (%):

No.	Value	Note
1	0.01–0.015%	[4]



Applications: Cryogenic applications, high performance packaging, seals, gaskets, valve parts, pipe, laboratory ware and medical equipment

Trade name	Supplier
Daiflon	Daikin Kogyo
Halon	Allied Chemical
Hostaflon C2	Hoechst Celanese
Kel-F81	3M Industrial Chemical Products

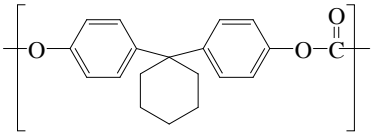
Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5858	25° [1]



Transmission and Spectra: Ir spectral data have been reported [2]
Volume Properties/Surface Properties: Transparent [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: The main synthetic routes are, phosgenation and transesterification. The most widely used approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [2]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. MeCl). Catalysts are used to achieve high MWs [1,2]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2, with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,2]

4	N_2	6.92 cm^3 mm/(m^2 day atm)	7.9 × 10^{-15} cm^2 (s Pa)$^{-1}$, 35°, 10 atm, calc. [6]
5	He	656 cm^3 mm/(m^2 day atm)	7.5 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [6]
6	H_2	595 cm^3 mm/(m^2 day atm)	6.8 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 10 atm, calc. [6]

Mechanical Properties:

Mechanical Properties General: The general shape of the tensile stress-strain curve consists of a viscoelastic region up to the yield point, followed by a stress drop and then some necking behaviour (at approx. constant stress); finally the stress increases to the break point [14]

Tensile (Young's) Modulus:

No.	Value	Note
1	2350 MPa	24000 kg cm^{-2}, amorph. [14]

Tensile Strength Break:

No.	Value	Note	Elongation
1	79.8 MPa	814 kg cm^{-2} [4]	56%
2	82 MPa	8.4 kg mm^{-2} [14]	62%

Tensile Strength Yield:

No.	Value	Note
1	71.6 MPa	7.3 kg mm^{-2} [14]

Complex Moduli: The variations of E′, E″ and tan δ with temp. (-150–200°, 110 Hz) have been reported [6]. Tan δ is practically independent of frequency at normal temps. [16]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until T_g [4]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	1 kHz	25–100° [4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00112	1 kHz	25–100° [4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.59	25° [4]
2	1.59	calc. [1]

Transmission and Spectra: Ir spectral data have been reported [3]

Polymer Stability:

Thermal Stability General: Stable under N_2 atmosphere up to 400° [2]. Evolution of gases starts at 320° in a vacuum [16]
Decomposition Details: Thermooxidation onset 260–270° (O_2); at 280° and 30 cmHg, O_2, CO_2, CO, MeOH, H_2O and other gases are evolved. Activation energy 73.7 kJ mol^{-1} (O_2, 260–320°) [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are, phosgenation and transesterification. The most widely used approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [3]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. MeCl). Catalysts are used to achieve high MWs [3,4]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2, with the elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [3,4]

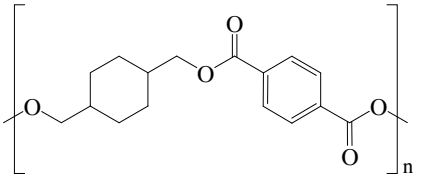
Poly[[1,1-cyclohexane bis(4-phenyl)carbonate]-*co*-[2,2-propane bis(4-phenyl)carbonate]] P-158

Synonyms: *Bisphenol Z-Bisphenol A copolycarbonates. Poly[oxycarbonyloxy-1,4-phenylenecyclohexylidene-1,4-phenyleneoxycarbonyloxy-1,4-phenylene(1-methylethylidene)-1,4-phenylene]. Poly[4,4′-(cyclohexylidene)bisphenol-co-4,4′-(1-methylethylidene)-co-diphenyl carbonate]*
Related Polymers: Poly[1,1-cyclohexanebis(4-phenyl)carbonate], Poly[2,2-propanebis(4-phenyl)carbonate]
Monomers: Bisphenol A, Bisphenol Z, Carbonic dichloride, Diphenyl carbonate
Material class: Thermoplastic, Copolymers
Polymer Type: polycarbonates (miscellaneous), bisphenol A polycarbonate
CAS Number:



CAS Reg. No.	Note
109759-89-9	
31193-48-3	source: diphenylcarbonate

Molecular Formula: $[(C_{19}H_{18}O_3).(C_{16}H_{14}O_3)]_n$
Fragments: $C_{19}H_{18}O_3$ $C_{16}H_{14}O_3$

Applications/Commercial Products:

Trade name	Details	Supplier
Apec HT KU 1-9360	Source: diphenylcarbonate	Bayer Inc.

Poly(1,4-cyclohexane dimethylene terephthalate) P-159

Synonyms: *PCHDMT. PCT. PDCT. Poly(cyclohexyl dimethylene terephthalate). PCHDT. Poly(cyclohexylene dimethylene terephthalate). Poly(oxymethylene-1,4-cyclohexylenemethyleneoxyterephthaloyl). Poly(oxyterephthaloyl oxymethylene-1,4-cyclohexylenemethylene). Poly(oxycarbonyl-1,4-phenylenecarbonyloxymethylene-1,4-cyclohexanediylmethylene)*
Monomers: 1,4-Cyclohexanedimethanol, 1,4-Benzenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
100218-60-8	*cis/trans* diol
25037-99-4	
31289-45-9	*cis* diol

Molecular Formula: $(C_{16}H_{18}O_4)_n$
Fragments: $C_{16}H_{18}O_4$
Additives: Glass fibre. Triphenyl phosphate and tris(2,3-dibromopropyl)phosphate are added as flame retardants
Morphology: *Trans*-form triclinic a 0.637, b 0.663, c 1.42, α 89.35°, β 47.11°, γ 114.36° [1]; triclinic a 0.646, b 0.665, c 1.42, α 89.4°, β 47.0°, γ 114.9° [9]. *Cis*-form triclinic a 0.602, b 0.601, c 1.37, α 89.14°, β 53.08°, γ 112.49° [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.23 g/cm^3	*trans*-form [9]
2	d 1.222 g/cm^3	[18]
3	d 1.283 g/cm^3	cryst. [17]
4	d 1.195 g/cm^3	amorph. [18]
5	d 1.196 g/cm^3	[19]
6	d 1.226 g/cm^3	film [24]
7	d 1.43 g/cm^3	30% glass fibre [35]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001 K^{-1}	[10]	V

Volumetric Properties General: Heat of combustion -27.197 kJ g^{-1} (-6.496 kcal g^{-1}) [12]. Other values of α_v [10] and α_l [29] and their variation with temp. have been reported. Density increases with melt-spin speed [16]. Other values of density have been reported [21]
Equation of State: Einstein and Debye equation of state constants have been reported [10]
Latent Heat Crystallization: ΔH_f 124.8 J g^{-1} (29.8 cal g^{-1}) [17]. Heat of combustion -27.197 kJ g^{-1} (-6.496 kcal g^{-1}) [12].
Melting Temperature:

No.	Value	Note
1	260°C	*cis*-form [1]
2	251–256°C	*cis*-form [2]
3	250°C	*cis*-form [6]
4	245°C	*cis*-form [8]
5	320°C	*trans*-form [1]
6	312–318°C	*trans*-form [2]
7	305°C	*trans*-form [6]
8	340°C	*trans*-form [8]
9	312–318°C	[4]
10	290°C	fibre [13]
11	294–295°C	[15]
12	286°C	[22]
13	260–290°C	film [24]

Glass-Transition Temperature:

No.	Value	Note
1	85°C	[3]
2	85°C	*trans*-form [6]
3	65°C	*cis*-form [6]
4	91°C	[15]
5	95°C	[19]
6	92°C	[22]

Transition Temperature General: T_m increases with increasing amounts of the *trans*-glycol [6]
Deflection Temperature:

No.	Value	Note
1	194°C	1.82 MPa, 30% glass fibre, ASTM D648 [20]
2	165°C	0.34 MPa, film, 2% distortion [24]
3	263°C	1.82 MPa, 30% glass fibre [35]

Brittleness Temperature:

No.	Value	Note
1	49°C	[36]

Transition Temperature:

No.	Value	Note	Type
1	-98°C	1 Hz, *trans*-form	T_γ
2	-73°C	1 Hz, *cis*-form [5]	T_γ
3	-60°C	110 Hz [33]	T_γ
4	-228°C	*trans*-form	T_δ
5	-225°C	*cis*-form [5]	T_δ
6	-90°C	11 Hz [33]	T_δ
7	-31°C	[15]	T_β
8	-35°C	[19]	T_β

Surface Properties & Solubility:

Solubility Properties General: Miscible with polycarbonate [15] but immiscible with poly(vinylphenol) [23]. Polymer blends with amorph., crystalline and liq. cryst. polymers give improvements in processability in extrusion processes [21]
Cohesive Energy Density Solubility Parameters: Cohesive energy density 356–440 J cm^{-3} (85–105 cal cm^{-3}) [34]
Solvents/Non-solvents: Sol. trifluoroacetic acid [20], conc. sulfuric acid [23]
Wettability/Surface Energy and Interfacial Tension: Contact angle 27.0° (aq. EtOH, advancing), 30° (aq. EtOH, receding) [27]. Surface energy 32.25 N m^{-1} (formamide/2-ethoxyethanol) [33]
Surface Tension:

No.	Value	Note
1	44.6 mN/m	[27]

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.85 dl g^{-1} (25°, phenol/tetrachloroethane (60:40), *cis*-form) [2], 0.58 dl g^{-1} (25°, phenol/tetrachloroethane (60:40), *trans*-form) [2], 0.83 dl g^{-1} (25°, phenol/tetrachloroethane (60:40)) [3], 0.33 dl g^{-1} (phenol/tetrachloroethane (60:40)) [4], 0.297 dl g^{-1} (25°, phenol/tetrachloroethane (60:40), *cis*-form) [8], 0.203 dl g^{-1} (25°, phenol/tetrachloroethane (60:40), *trans*-form) [8]. [η] 0.89 dl g^{-1} [21]. Other viscosity values have been reported [8]
Permeability of Gases: Other gas permeability data have been reported [31]
Water Absorption:

No.	Value	Note
1	0.3%	24h, room temp., film [24]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	15.94 cm^3 mm/(m^2 day atm)	40.5 cm^3 mil 100 in^{-2} day^{-1} atm^{-1} 2.5 mm film [19]

Mechanical Properties:

Mechanical Properties General: Mechanical props have been reported [33]. The variation of storage and loss moduli with temp. has been reported [15]. Variation of mechanical props. with temp. and melt-spin speed has been reported [16]. Other values of tensile strength and modulus have been reported [21]

Tensile (Young's) Modulus:

No.	Value	Note
1	7720 MPa	30% glass fibre, ASTM D638 [20]

2	2800 MPa	400 kpsi, film [24]
3	1600 MPa	[34]

Flexural Modulus:

No.	Value	Note
1	7240 MPa	30% glass fibre, ASTM D648 [20]
2	8300 MPa	30% glass fibre [35]

Tensile Strength Break:

No.	Value	Note	Elongation
1	101 MPa	30% glass fibre, ASTM D638 [20]	2.1%
2	117 MPa	17 kpsi, film [4]	45%
3	130 MPa	30% glass fibre [35]	2.6%

Flexural Strength at Break:

No.	Value	Note
1	138 MPa	2.2% elongation, 30% glass fibre, ASTM D648 [20]
2	192 MPa	30% glass fibre [35]

Elastic Modulus:

No.	Value	Note
1	1000 MPa	[34]
2	2200 MPa	[34]

Tensile Strength Yield:

No.	Value	Note
1	69 MPa	10 kpsi, film [24]

Mechanical Properties Miscellaneous: T-Peel strength 18 kg m^{-1} (1 lb in^{-1}) (23°, ASTM D1876-61T) [3]
Failure Properties General: Elmendorf tear strength 6 g mm^{-1} (film) [24]. MIT folding endurance 60000 cycles (min., film) [24]. Mullen burst strength 0.19 MPa (28 psi, film) [24]
Fracture Mechanical Properties: Tensile shear strength 13.8 MPa (2000 psi, 23°), 6.2 MPa (900 psi, 70°, ASTM D1002-64) [3]
Izod Notch:

No.	Value	Notch	Note
1	37 J/m	Y	30% glass fibre, ASTM D256 [20]
2	74.7 J/m	Y	30% glass fibre [35]

Electrical Properties:

Electrical Properties General: The dielectric props. are affected greatly by humid conditions [25]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.4	140°, film [24]

Dissipation (Power) Factor:

No.	Value	Note
1	1.6	140°, film [24]

Optical Properties:

Optical Properties General: Oxyluminescence curves have been reported [18]
Refractive Index:

No.	Value	Note
1	1.709	parallel [21]
2	1.538	perpendicular [21]

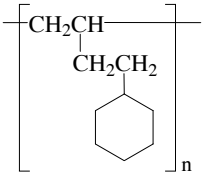
Transmission and Spectra: Ir [1,7,16,22], Raman [28], electron [14], H-1 nmr [20,33] and C-13 nm r[33] spectral data have been reported
Total Internal Reflection: Birefringence has been reported [17]. Intrinsic birefringence 0.172 [21]

Polymer Stability:

Decomposition Details: 10% Weight loss occurs at 414° and 50% weight loss at 430° [4]. Heating to 340° in oxygen causes 50% weight loss in 11 min., compared with 39 min. when heated in a N_2 atmosphere [4]
Chemical Stability: Chemical resistance of films has been reported [24]
Biological Stability: Biodegradation details have been reported [30]
Stability Miscellaneous: Stability to γ-irradiation has been reported [26]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by condensation polymerisation of dimethyl terephthalate and 1,4-cyclohexane dimethanol at 300–310° under vacuum using tetraisopropyl titanate as a catalyst [2,8]. Can undergo rapid hydrol. during melt extrusion if sample is not sufficiently dry [11]
Applications: Used as a fibre in carpets, blankets and in synthetic furs. Also used as a moulding resin in the electronic and automotive industries



Trade name	Details	Supplier

Poly(4-cyclohexyl-1-butene) P-160

Synonyms: *Poly(1-(2-cyclohexylethyl)-1,2-ethanediyl)*
Monomers: 4-Cyclohexyl-1-butene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
31325-02-7

Molecular Formula: $(C_{10}H_{18})_n$
Fragments: $C_{10}H_{18}$

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	170°C	[2,3]

Glass-Transition Temperature:

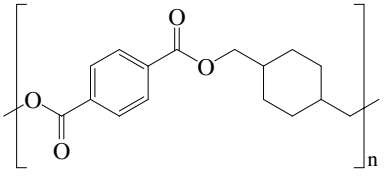
No.	Value	Note
1	40°C	[3]

Transition Temperature:

No.	Value	Note	Type
1	40°C	[2]	Softening point
2	145–147°C	[1]	Softening point

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 2.03 dl g^{-1} (tetrahydronaphthalene, 145°) [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as VCl_3-$AlEt_3$ at 50° [2], or $MoCl_5$ and butyllithium at 150° [1]

Poly(1,4-cyclohexylidene dimethylterephthalate) P-162

Synonyms: *Poly(oxycarbonyl-1,4-phenylenecarbonyloxymethylene-1,4-cyclohexanediyl methylene). Poly(cyclohexylenedimethylene terephthalate). Poly(1,4-benzenedicarboxylic acid-co-1,4-cyclohexane dimethanol)*
Monomers: Dimethyl terephthalate, 1,4-Cyclohexanedimethanol
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.
100218-60-8
28182-62-9
25037-99-4
24936-69-4

Molecular Formula: $(C_{16}H_{16}O_4)_n$
Additives: Reinforcing agents, flame retardants, heat stabilisers, uv stabilisers
General Information: Is heat-resistant and crystalline. It is available commercially in a variety of forms; reinforced, flame-retardant, chemically resistant etc., and also as a copolymer with ethylene terephthalate. *Cis/trans* isomers are possible owing to the presence of the cyclohexane ring
Morphology: *Trans*-form triclinic a 6.46Å, b 6.65Å, c 14.2Å; α 89.4°, β 47.0°, γ 114.9°, space group P1[2], triclinic, a 6.37Å, b 6.63Å, c 14.2Å; α 89.35°, β 47.11°, γ 114.36°; unit cell volume 359Å [3,10]. *Cis*-form probably triclinic, a 6.02Å, b 6.01Å, c13.7Å α 89.14°, β 53.08°, γ 112.49°; unit cell volume 349.9Å [3]. Conformational anal. has been reported [8]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.265 g/cm^3	cryst., *trans*-form [7,13]
2	d 1.19 g/cm^3	amorph., *trans*-form [7,13]
3	d 1.209 g/cm^3	amorph., *cis*-form [13]
4	d 1.303 g/cm^3	cryst., *cis*-form [13]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.4×10^{-5}–2.5×10^{-5} K^{-1}	20°, in parallel direction, varying levels of glass fibre [12]	L
2	5×10^{-5}–0.000103 K^{-1}	20°, transverse to flow, varying levels of glass fibre [12]	L

Melting Temperature:

No.	Value	Note
1	290°C	approx., [1]
2	294°C	*trans* [2]
3	312–318°C	*trans*-form [4,13]
4	251–257°C	*cis*-form [13]
5	283–287°C	varying levels of glass fibre [12]

Glass-Transition Temperature:

No.	Value	Note
1	130°C	approx. [1]
2	65°C	approx., *cis*-form
3	85°C	approx., *cis*-form
4	69–71°C	varying levels of glass fibre [12]
5	92°C	*trans*-form [13]

Transition Temperature General: T_m increases with increasing *cis* content. T_g also increases with increasing *cis* content but to lesser extent [4,5]

Deflection Temperature:

No.	Value	Note
1	260°C	1.8 MPa 30% glass fibre ASTM D648 [3]
2	227–264°C	1.8 MPa, varying levels of glass fibre [12]
3	268–280°C	0.46 MPa, varying levels of glass fibre [12]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.89 dl g^{-1} (approx., 68% *trans*-form) [9]

Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	16.63 cm^3 mm/(m^2 day atm)	0.19×10^{-13} cm^2 (s Pa)$^{-1}$, 30° [11]

Mechanical Properties:

Mechanical Properties General: The variation of mechanical props. with take-up velocity of as-spun fibres has been reported [9]. Elongation at break 20–22% (approx., as-spun fibre, varying take-up velocities; approx. 68% *trans*-form) [9]

Tensile (Young's) Modulus:

No.	Value	Note
1	1000–4000 MPa	as-spun fibre, varying take-up velocities, approx. 68% *trans*-form) [9]
2	1100–11500 MPa	in tension, 1mm min^{-1}, varying levels of glass fibre [12]

Tensile Strength Break:

No.	Value	Note	Elongation
1	96.5 MPa	14 kpsi, 30% glass fibre, ASTM D638 [3]	
2	95–129 MPa	5 mm/min., varying levels of glass fibre [12]	1.2–2.2%

Flexural Strength at Break:

No.	Value	Note
1	137.8 MPa	20 kpsi, 30% glass fibre, ASTM D790 [3]

Izod Notch:

No.	Value	Notch	Note
1	80 J/m	Y	1.5 ft Ib in^{-1}, 30% glass fibre, ASTM D256 [3]
2	261 J/m	N	4.9 ft Ib in^{-1}, 30% glass fibre, ASTM D256 [3]

Charpy:

No.	Value	Notch	Note
1	5.6–11.7	Y	varying levels of glass fibre [12]
2	6.6–10.9	Y	-30°, varying levels of glass fibre [12]
3	30.5–63.1	N	varying levels of glass fibre [12]
4	25–64.7	N	-30°, varying levels of glass fibre [12]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	16.9–17.5 kV.mm^{-1}	varying levels of glass fibre [12]

Complex Permittivity and Electroactive Polymers: Comparative tracking index 390–600 V (varying levels of glass fibre) [12]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005–0.019	1 MHz	varying levels of glass fibre [12]

Optical Properties:

Optical Properties General: The variation of optical props. with take-up velocity for as-spun fibres has been reported [9]. Molar polarisability 332.7×10^{-31} m^3 (parallel to chain axis, as-spun fibre, approx. 68% *trans*-form), 266.6×10^{-31} m^3 (perpendicular to chain axis, as-spun fibre, approx. 68% *trans*-form [9]

Refractive Index:

No.	Value	Note
1	1.709	parallel to chain axis, as-spun fibre, approx. 68% *trans* form [9]
2	1.538	perpendicular to chain axis, as-spun fibre, approx. 68% *trans*-form [9]

Transmission and Spectra: Absorption and emission spectral data have been reported [8]. Ir, H-1 nmr and C-13 nmr spectral data have been reported [6,10]
Total Internal Reflection: Intrinsic birefringence 0.172 (as-spun fibre, approx., 68% *trans*-form [9]

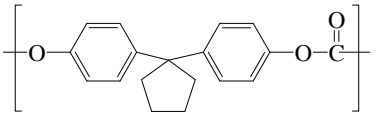
Polymer Stability:

Flammability: Flammability rating V0 (1.6 mm, UL94) [3,12]
Environmental Stress: Is more resistant to weathering than poly(ethylene terephthalate) [1]
Hydrolytic Stability: Is more resistant to water than poly(ethylene terephthalate) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be processed at 302° [12]
Mould Shrinkage (%):

No.	Value	Note
1	2–3%	parallel to flow, linear, glass/mineral or glass fibre reinforced, ASTM D255 [12]



Applications: Used in electrical and electronic applications (e.g. electrical connectors)

Trade name	Details	Supplier
Ektar		Eastman Chemical Company
Kodar	film	Eastman Chemical Company
Kodel	fibre, discontinued	Eastman Chemical Company
Thermx		Eastman Chemical Company
Thermx		Sun Koung Industry

Poly[1,1-cyclopentane bis(4-phenyl)carbonate] P-163

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylenecyclopentylidene-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-1,1-cyclopentane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxydiphenyl-1,1-cyclopentane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
31694-76-5

Molecular Formula: $(C_{18}H_{16}O_3)_n$
Fragments: $C_{18}H_{16}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.21 g/cm^3	25° [2]
2	d 1.21 g/cm^3	20°, amorph. [3]

Melting Temperature:

No.	Value	Note
1	240–250°C	[2]
2	239–248°C	amorph. [3]
3	205–215°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	155°C	[4]
2	163°C	[5]
3	166°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Very sol. chlorinated hydrocarbons [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.2 %	25°, 65% relative humidity [6]
2	0.2 %	[1]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	88.4 cm^3 mm/(m^2 day atm)	1.01 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25°, 1 atm [4]

Mechanical Properties:

Mechanical Properties General: The general shape of the tensile stress-strain curve consists of a viscoelastic region up to the yield point, followed by a stress drop and then necking behaviour (at approx. constant stress); finally the stress increases to the break point [7]

Tensile (Young's) Modulus:

No.	Value	Note
1	2350 MPa	24000 kg cm^{-2}, amorph. [7]

Tensile Strength Break:

No.	Value	Note	Elongation
1	69.4 MPa	708 kg cm^{-2} [2]	119%
2	71 MPa	7.2 kg mm^{-2} [7]	100%
3	73.5 MPa	750 kg cm^{-2} [1]	40%

Tensile Strength Yield:

No.	Value	Note
1	64.7 MPa	6.6 kg mm^{-2} [7]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until T_g [1,2]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.9	1 kHz	25–100° [2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0005	1 kHz	25–100° [2]
2	0.004		0–180° [1]

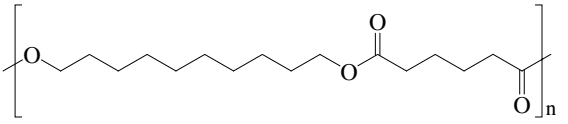
Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5993	25° [2]

Polymer Stability:

Thermal Stability General: Substantial weight loss occurs above 400°
Decomposition Details: Thermo-oxidation starts at 129°. Weight loss 7% (300°); 10% (350°); 23% (400°); 40% (450°) [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used phosgenation approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [6]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30° in an inert solvent (e.g. MeCl). Catalysts (quaternary ammonium salts and tertiary amines, especially triethylbenzylammonium chloride) are used to achieve high MWs [1,2,6]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2 with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [2,6]

Glass-Transition Temperature:

No.	Value	Note
1	-98°C	175K [12]
2	-56°C	[23]

Surface Properties & Solubility:

Solubility Properties General: Miscibility with other polymers has been reported [15]
Internal Pressure Heat Solution and Miscellaneous: Phase diagrams with toluene [18], naphthalene [18,21], methyldioxane[18], dichloroethane [18], 1,4-dioxane [18,20,21], 1,4-dichlorobenzene [18,21], tetrachlorobenzene [21], 1,4-dimethylbenzene [21], chloronitrobenzene [21], phenanthrene [21], 1,2,4,5-tetrachlorobenzene have been reported [21]

Transport Properties:

Polymer Solutions Dilute: [η] 0.246 dl g^{-1} (chlorobenzene, 25°) [1]. [η] 0.0222 dl g^{-1} (diethyl succinate, 79°) [13]. η_{inh} 0.96 dl g^{-1} (40:60 phenol/tetrachloroethane, 30°) [14]. Soln. props. have been reported [2,9]
Polymer Solutions Concentrated : Conc. soln. props. have been reported [3]
Polymer Melts: Melt viscosities have been reported [7,17]

Mechanical Properties:

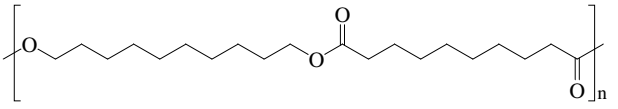
Mechanical Properties General: Tensile strength yield has been reported [22]

Electrical Properties:

Electrical Properties General: Volume resistivity has been reported in graphical form [11]

Optical Properties:

Transmission and Spectra: Ir and Raman spectral data have been reported [8]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by condensation polymerisation of 1,10-decanediol and adipoyl chloride at 200° [4,14]

Surface Properties & Solubility:

Solubility Properties General: Miscible with polyepichlorohydrin [13], styrene-allyl alcohol copolymers [14], polyvinyl chloride [15] and tetramethyl bisphenol-A polycarbonate [16]
Surface and Interfacial Properties General: Interfacial free energy 0.89 m J cm^{-2} (8.9 erg cm^{-2}, parallel) [4]. Interfacial free energy 2.04 m J cm^{-2} (20.4 erg cm^{-2}, perpendicular) [4]

Transport Properties:

Polymer Solutions Dilute: [η] 0.6 $dl.g^{-1}$ (toluene, 25°) [4]. [η] 0.28 $dl.g^{-1}$ ($CHCl_3$, 25°) [14]. Soln. props. in C_6H_6 [18], 1,4-dioxane [18], $CHCl_3$ [18], cyclohexanone [18], THF [20,21], DMF [18], toluene [20,21] and 2-butanone have been reported [20,21]. Soln. props. (a prediction of inherent viscosity), have been reported [2]. Theta temp. has been reported [21]
Polymer Melts: Studies on melt viscosity variation with M_n have been reported [10]

Mechanical Properties:

Tensile Strength Yield:

No.	Value	Note
1	6.13 MPa	890 lb in^{-2} [22]

Electrical Properties:

Dielectric Permittivity (Constant):

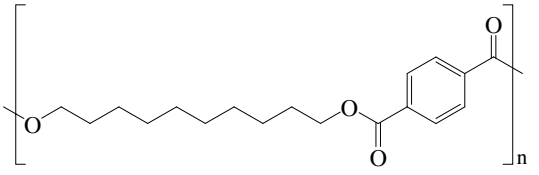
No.	Value	Note
1	3.32	[11]

Optical Properties:

Transmission and Spectra: Raman [3,12] and ir [12] spectral data have been reported

Polymer Stability:

Biological Stability: Biodegradation studies have been reported [19]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by condensation polymerisation of 1,10-decanediol and sebacoyl dichloride at 200° [5,6]

Poly(decamethylene terephthalate) P-166

Synonyms: *Poly(oxyterephthaloyloxydecamethylene). Poly(1,10-decanediol-co-1,4-benzenedicarboxylic acid)*
Monomers: 1,10-Decanediol, 1,4-Benzenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.
27043-73-8
27055-32-9

Molecular Formula: $(C_{18}H_{24}O_4)_n$
Fragments: $C_{18}H_{24}O_4$
Morphology: Morphological studies [20,22] have been reported. Triclinic, a 0.455, b 0.628, c 2.010, α 107.5°, β 96°, γ 113.5° (90K) [5]; triclinic, a 0.462, b 0.630, c 2.010, α 107.5°, β 96°, γ 113.5° (291K) [5]; triclinic, a 0.482, b 0.645, c 2.010, α 107.5°, β 96°, γ 113.5° (390K) [5]. Two polymorphic forms [17] known, form I, c 1.629 [18]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.046 g/cm^3	[4]

2	d^{150} 1.0324 g/cm^3	[6]
3	d 1.159 g/cm^3	[17]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00055 K^{-1}	138° [4]	V
2	0.0002 K^{-1}	80° [16]	L

Volumetric Properties General: C_p values have been reported [10]
Latent Heat Crystallization: ΔH_f 46.1 kJ mol^{-1} (11 kcal mol^{-1}), ΔS_f 113 J mol^{-1} K^{-1} (27 cal mol^{-1} K^{-1}) [4], ΔS_f 107.2 J mol^{-1} K^{-1} (25.6 cal mol^{-1} K^{-1}) [12], ΔH_f 18 kJ mol^{-1} (4.3 kcal mol^{-1}) [11], ΔH_f 46.1 kJ mol^{-1} [9], ΔH_f 43.5 kJ mol^{-1} (10.4 kcal mol^{-1}), 48.6 kJ mol^{-1} (11.6 kcal mol^{-1}) [12]. Enthalpies of melting have been reported. [8] Other entropy values have been reported [13]
Melting Temperature:

No.	Value	Note
1	123°C	396K [2]
2	138°C	411K [2,4,12]
3	129°C	[3,5]
4	137.5°C	[6]
5	131°C	[7]
6	125°C	398K [8]
7	110°C	[10]
8	123–127°C	[11,13]
9	134°C	[15]
10	120°C	[16]

Glass-Transition Temperature:

No.	Value	Note
1	-5°C	268K [2,7,16]
2	25°C	298K [2,5]
3	-9°C	[10]
4	-8°C	[16]

Transition Temperature General: Other T_g values have been reported [19]
Deflection Temperature:

No.	Value	Note
1	-14°C	Heat deflection temp. [16]

Vicat Softening Point:

No.	Value	Note
1	133°C	[16]

Transition Temperature:

No.	Value	Note	Type
1	-125°C	[5]	T_γ
2	20°C	[10]	$T_{\beta max}$
3	-97°C	[10]	$T_{\gamma max}$
4	95°C	[17]	T_{cryst}

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. hot diphenyl ether [7], phenol/tetrachloroethane (50:50) [9]. Insol. EtOH [9], MeOH [15]
Wettability/Surface Energy and Interfacial Tension: Lateral surface energy 5.7 erg cm^{-2} [25]

Transport Properties:
Polymer Solutions Dilute: η_{inh} 0.85 dl g^{-1} (20°, phenol/tetrachloroethane (60:40)) [7]; [η] 0.91 dl g^{-1} (25°, $CHCl_2$) [11]; [η] 1.222 dl g^{-1} (25°, phenol/tetrachloroethane (50:50)) [15]; [η] 0.71 dl g^{-1} (30°, phenol/tetrachloroethane (60:40)) [16]
Polymer Melts: Melt viscosity 740 poise (225°) [6]

Mechanical Properties:
Mechanical Properties General: Tensile storage and loss moduli, in graphical form, have been reported [10]

Tensile (Young's) Modulus:

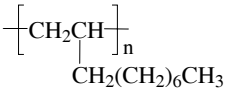
No.	Value	Note
1	0.4 MPa	[19]

Viscoelastic Behaviour: Stress relaxation modulus 200 MPa (16 s) [16]. Viscoelastic props., stress relaxation and creep have been reported [18]

Electrical Properties:
Electrical Properties General: Dielectric props. have been reported [19]
Complex Permittivity and Electroactive Polymers: Complex permittivity has been reported [24]

Optical Properties:
Transmission and Spectra: Nmr [5], esr [14] and C-13 nmr [15] spectral data have been reported

Polymer Stability:
Decomposition Details: Thermal degradation has been reported [21,23]
Stability Miscellaneous: Prolonged exposure to γ-radiation in air leads to a decrease in T_m possibly due to crosslinking and degradation [8]



Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by transesterification of dimethyl terephthalate with 1,10-decanediol at 280° under vacuum using tetraisopropyl titanate as catalyst [7,4,9,11,16,17]. Also synth. by bulk polymerisation of 1,10-decanediol and dimethyl terephthalate in the presence of tetraisopropyl titanate at 180° for 2h, followed by heating to 260° at 1 mmHg for 3h [16]

Poly(1-decene) P-167

Synonyms: *Poly(1-octylethylene). Poly(1-octyl-1,2-ethanediyl)*
Related Polymers: Poly(alpha olefin)
Monomers: 1-Decene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25189-70-2	
26746-85-0	isotactic

Molecular Formula: $(C_{10}H_{20})_n$
Fragments: $C_{10}H_{20}$
General Information: Rubbery appearance [1]
Morphology: Struct.: c 1.32 [2]. Three forms: form I monoclinic, a 0.59, b 4.77, c 1.34, β 96° [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 0.847 g/cm^3	[4]

Latent Heat Crystallization: ΔH_m 10-24 J g^{-1} [7]. ΔH_m 35 J g^{-1} (Form I) [3]. ΔH_m 5 J g^{-1} (Form III) [3]
Melting Temperature:

No.	Value	Note
1	22–27°C	[6,7,8]
2	29°C	[8]
3	31°C	[3]
4	32°C	[9]

8	-48°C	Form III [3]

Glass-Transition Temperature:

No.	Value	Note
1	-33–-26°C	[6]
2	-35°C	[1]
3	-41°C	[11]

Transition Temperature:

No.	Value	Note	Type
1	3.3–9.5°C	[6]	First T_m
2	5–7°C	[7]	First T_m
3	-160°C	590 Hz [1]	β
4	-60°C	[12]	Transition temp.
5	-170°C	[12]	Transition temp.
6	-190°C	[12]	Transition temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. CO_2 [13]

Transport Properties:

Polymer Solutions Dilute: [η] 1.6 dl g^{-1} (135°, tetrahydronaphthalene) [11]. [η] 2.76 dl g^{-1} (25°, toluene) [8]. Other viscosity values have been reported [6,14]. Theta temp. has been reported [5]
Polymer Solutions Concentrated : Conc. soln. props. have been reported [4,15]
Polymer Melts: Melt flow activation energy 58.6 kJ mol^{-1} (14 kcal mol^{-1}) [16]

Mechanical Properties:

Mechanical Properties General: Dynamic tensile storage and loss moduli have been reported in graphical form [17]

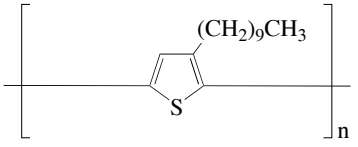
Optical Properties:

Refractive Index:

No.	Value	Note
1	1.473	[18]

Transmission and Spectra: Ir [19], Raman [20,21,22], C-13 nmr [7,22] and H-1 nmr [22] spectral data have been reported
Molar Refraction: dn/dC 0.110–0.152 (heptane), dn/dC 0.1689 (heptane) [6]
Total Internal Reflection: Stress optical coefficient -3370 [8]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $MgCl_2$ supported $TiCl_4$-$AlEt_3$ in heptane at 70° [7]

Poly(3-decylthiophene) P-168

Synonyms: *Poly(3-decyl-2,5-thiophenediyl). P3DT*
Monomers: 3-Decylthiophene
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.	Note
110851-65-5	
216000-50-9	Poly(3-decyl-2,5-thiophenediyl)

Molecular Formula: $(C_{14}H_{22}S)_n$
Fragments: $C_{14}H_{22}S$
Additives: Dopants such as hexafluorophosphate [1], $FeCl_3$, perchlorate and I_2 are added to increase conductivity.
General Information: Thermochromic conductive polymer which exhibits electroluminescence [2] and has greater solubility and processability than polythiophene.
Morphology: Orthorhombic unit cell, a=26.43, b=7.73, c=7.77 Å [3]. Polymorphic with two crystal phases and one mesophase [4].

Volumetric & Calorimetric Properties:
Density:

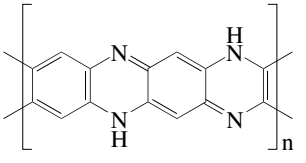
No.	Value	Note
1	d^{25} 1.02 g/cm^3	crystal [4]

Melting Temperature:

No.	Value	Note
1	85–180°C	actual max. temp. 170–180°C [4,5]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$ [6], THF [5]

Electrical Properties:
Electrical Properties General: Conductivity is dependent on polymer structure, nature and concentration of dopant and temperature, with typical values for regiorandom polymer films of 5 S cm^{-1} (hexafluorophosphate dopant) and 25 S cm^{-1} ($FeCl_3$ dopant) [1].



Optical Properties:
Transmission and Spectra: Pmr [1,5,6,7,8], cmr [5,6], ir [5,6], uv [5,6,8] and x-ray [3,4] spectra have been reported.
Volume Properties/Surface Properties: Polymer has red or brown colour [5] with thermochromic changes on heating.

Applications/Commercial Products:
Processing & Manufacturing Routes: Produced by chemical or electrochemical oxidative polymerisation of monomer with different catalysts [1,6,7,9] to give mainly regiorandom (head-to-head/head-to-tail) polymers, or by polymerisation of 2-halo-5-(halomagnesio)-3-decylthiophene [4] or 2-bromo-5-(bromozincio)-3-decylthiophene [5] to give mainly regioregular (head-to-tail) polymers.
Applications: Potential applications in photovoltaic devices, light-emitting diodes, rechargeable batteries, field-effect transistors and chemical and optical sensors [10].

Trade name	Details	Supplier
Rieke	regiorandom and regioregular polymers	Rieke Metals

Poly(1,4-diaminobenzene) P-169

Synonyms: *Poly(p-phenylenediamine). Polyaniline (emeraldine salt). Poly(p-diaminophenylene). Poly(p-aminoaniline). PPD. PPDA. p-Phenylenediamine homopolymer*
Related Polymers: Poly(aniline)
Monomers: 1,4-Benzenediamine
Polymer Type: polyaniline
CAS Number:

CAS Reg. No.
25168-37-0

Molecular Formula: $(C_6H_8N_2)_n$
Fragments: $C_6H_8N_2$
Molecular Weight: When treated with ammonium peroxodisulfate, brown polymers of Mn 10,000 soluble in DMSO are obtained [2,9].

General Information: Blue-black solid. Polymerises under oxidation with potassium persulfate to yield a polyquinoxaline, with ladder structure and in a fully oxidised state somewhat similar to that shown by pernigraniline [2].
Morphology: Structure based on the comparison of the electronic spectra of pernigraniline with that of PPD. This shows a strict analogy, consisting of alternating units of benzenoid and quinoid moieties linked together by -NH- and =N- bridges [2].
Identification: Elemental composition and product yield vary upon method of preparation [14]

Volumetric & Calorimetric Properties:
Density:

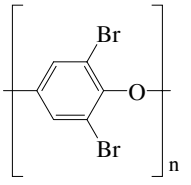
No.	Value	Note
1	d 1.34 g/cm^3	[12]

Thermodynamic Properties General: *Ab initio* study of the polymerisation mechanism of poly(*p*-phenylenediamine) with thermodynamic properties has been reported [7].

Surface Properties & Solubility:
Solubility Properties General: Displays limited solubility in organic solvents [12].

Electrical Properties:
Electrical Properties General: A compressed pellet of the polymer shows a conductivity of 6.3×10^{-6} S cm^{-1}, consistent with a low conductivity semiconductor, and with band gap of 2.37eV. The joint chemical oxidation of aniline with phenylenediamines yields products with d.c. conductivity spanning more than eleven orders of magnitude. The dependence of the conductivity on the composition of the reaction mixture has been investigated for all three co-monomers, *o*-, *m*- and *p*-phenylenediamine and the electrical properties compared [2,9,12,14]

Optical Properties:
Transmission and Spectra: FT-IR and the pmr spectra support the proposed ladder structure composed of alternating sequence of benzenoid and quinoniimine moieties linked together by -NH- and =N- bridges [2,7,14]. The uv-vis spectrum is similar to the pernigraniline spectrum with bands at 275, 344, 404 and 543 (*vs.* pernigraniline bands in DMF at 273, 340, 364 and 500 nm) [2,8,12,14].



Polymer Stability:
Thermal Stability General: The thermal stability of poly(*p*-phenylenediamine-terephthalamide) (PPT) and poly(*p*-phenylenebenzobisoxazole) (PBO) fibres has been studied [15].
Biological Stability: PPD is a regulated substance [1]. OSHA and NIOSH give a recommended exposure limit (REL) of 0.1 mg m^{-3} TWA (skin). Known health effects include skin and respiratory sensitisation and bronchial asthma.

Applications/Commercial Products:
Processing & Manufacturing Routes: Obtained from *p*-Phenylenediamine hydrochloride dissolved in HCl then treated with potassium persulfate [2,8].
Applications: Free radicals of Wurster's salts [8]. Lead determination by anodic stripping voltammetry using a *p*-phenylenediamine modified carbon paste electrode [11]. Determination of lead in wastewater samples [11]. Biosensors prepared from electrochemically-synthesised conducting polymers [13].

Poly(2,6-dibromophenylene oxide) P-170

Synonyms: *Poly[oxy(dibromophenylene)]*
Monomers: 2,4,6-Tribromophenol
Polymer Type: polyphenylene oxide
CAS Number:

CAS Reg. No.
59779-25-8
26023-27-8
74082-93-2

Molecular Formula: $(C_6H_2BrO)_n$
Fragments: C_6H_2BrO

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	110–150°C	[1]

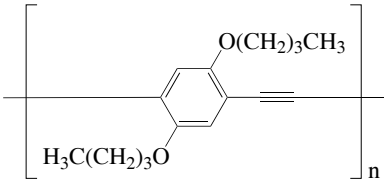
Vicat Softening Point:

No.	Value	Note
1	240–245°C	[2]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. in a range of solvents [2]

Optical Properties:
Transmission and Spectra: C-13 nmr and ir spectral data have been reported [1]

Polymer Stability:
Thermal Stability General: 50% weight loss occurs in 2h at 445° [2]



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by oxidative coupling of 2,4,6-tribromophenol with alkali
Applications: Non-migrating fire retardant

Trade name	Supplier
Firemaster TSA	Unitika Ltd.

Poly(2,5-dibutoxy-1,4-phenylene ethynylene) P-171

Synonyms: *Poly[(2,5-dibutoxy-1,4-phenylene)-1,2-ethynediyl]. 1,4-Dibutoxy-2,5-diethynylbenzene homopolymer. PDBOPA*
Material class: Thermoplastic
Polymer Type: poly(arylene ethynylene)
CAS Number:

CAS Reg. No.	Note
145130-55-8	Poly[(2,5-dibutoxy-1,4-phenylene)-1,2-ethynediyl]
128834-30-0	1,4-Dibutoxy-2,5-diethynylbenzene homopolymer

Molecular Formula: $(C_{16}H_{20}O_2)_n$
Fragments: $C_{16}H_{20}O_2$
General Information: Conductive polymer with greater solubility than poly(1,4-phenylene ethynylene). Prod. as red-brown solid.

Volumetric & Calorimetric Properties:

Transition Temperature General: Cross-linking transition at 347°C [1].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. THF, $CHCl_3$, chlorobenzene, toluene [1,2,3].

Electrical Properties:

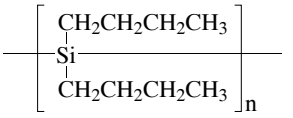
Electrical Properties General: Increase in conductivity when polymer is doped with iodine or $FeCl_3$ [1,3] or when exposed to humidity or MeOH vapour [4]. Photoconductivity 40 times higher than dark conductivity [1]. Electroluminescence has been reported [2].

Optical Properties:

Optical Properties General: Exhibits photoluminescence with relatively large Stokes shift and band gap of *ca*. 2.7 eV [5]. There is a considerable red shift in both absorption and photoluminescence on changing from solution ($CHCl_3$) to film, with luminescence λ_{max} at *ca*. 480nm ($CHCl_3$) and *ca*. 540nm (film) [6].
Transmission and Spectra: Pmr [3,7], cmr [1,7], ir [7], uv and photoluminescence [5,6] spectral data have been reported.

Polymer Stability:

Polymer Stability General: When irradiated with light at wavelength close to absorption maximum polymer is stable towards photooxidation [8].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by coupling reaction between 1,4-dibutoxy-2,5-dihalobenzene and 1,4-dibutoxy-2,5-diethynylbenzene in the presence of Pd catalyst [2,3], by reaction of 1,4-diiodo-2,5-dibutoxybenzene and tributylethynyltin [6,7], or by oxidative coupling of 1,4-dibutoxy-2,5-diethynylbenzene [1].
Applications: Potential application in gas and vapour sensors [4,9].

Poly(dibutylsilane) P-172

Synonyms: *Poly(dibutylsilylene). Dibutyldichlorosilane homopolymer. PDBS*
Monomers: Dibutyldichlorosilane
Material class: Thermoplastic
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
95999-72-7	poly(dibutylsilylene)
97036-65-2	dibutyldichlorosilane homopolymer

Molecular Formula: $(C_8H_{18}Si)n$
Fragments: $C_8H_{18}Si$
Additives: Polymer can be doped with I_2, $FeCl_3$, SbF_5, etc. to increase conductivity [1].
General Information: Conductive thermochromic polysilane exhibiting photoluminescence and electroluminescence in near-UV and visible region. Prod. as white elastomeric solid or powder.
Morphology: Exhibits polymorphism, with a 7/3 helical conformation of the polymer backbone stable at r.t. and normal pressure [2,3]. At low temperatures [3,4], by applying high pressure [4,5,6], or by controlling precipitation or solvent evaporation [7,8], a near planar *trans*-conformation is obtained.

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	-40°C	[2]

Transition Temperature General: A weak transition at 36°C [2] and a transition to a disordered mesophase at *ca*. 85°C have been reported [2,9].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hexane, toluene, $CHCl_3$, THF [10]. Hexane is theta solvent at 19°C [11]

Electrical Properties:

Electrical Properties General: Hole transport predominates in films [12]. Polymer exhibits electroluminescence in UV and in visible region (a broad band in the region of 400–450nm), and has been used as the emissive layer in LED devices with turn-on voltage of 16 V [13,14]. Ionisation potential 5.83 eV [1].

Optical Properties:

Optical Properties General: Exhibits thermochromism with a red shift in absorption on reducing the temperature in solution [2,3,4], or by increasing the pressure [4,5] on films with the absorption maximum at 315nm shifting to 355nm. This partly reversible effect is attributed to a change in backbone conformation [3,4,5]. Films on heating to 70°C exhibit a broadening of the absorption centred at *ca*. 315nm with very little shift of λ_{max} [2].

Photoluminescence is exhibited with a principal band for films in the UV region (λ_{max} 340nm) and a much weaker band in the visible region [3,13,15].
Transmission and Spectra: Pmr [10], cmr [2,10], Si-29 nmr [2,7], Raman [5], uv and photoluminescence [2,3,5,7,13,15], electroluminescence [13,14] and x-ray diffraction [2,7,8,15] spectral data have been reported.

Polymer Stability:
Polymer Stability General: Photochemical degradation occurs on prolonged exposure to UV radiation by scission of σ-bonds. The degradation and trapped products have been identified [10,16].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Wurtz dehalogenation coupling of dibutyldichlorosilane monomer with Na in a solvent such as toluene [8,10,11].
Applications:

Poly[1,1-dichloroethylene bis(4-phenyl) carbonate] P-173

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(dichloroethenylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-1,1-dichloroethylene-co-carbonic dichloride). Chloral polycarbonate*
Related Polymers: Copolymers of Bis-phenol dichloroethylene with Bisphenol A
Monomers: 4,4′-Dihydroxydiphenyl-1,1-dichloroethylene, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
31546-39-1

Molecular Formula: $(C_{15}H_8Cl_2O_3)_n$
Fragments: $C_{15}H_8Cl_2O_3$

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note

Mechanical Properties:

Mechanical Properties General: The variation of tensile storage and loss moduli and loss tangent with temp. (-150°–200°, 110 Hz) has been reported [5]. The variation of loss tangent and storage modulus with temp. (-150°–200°, 1 Hz) has been reported [11]. The variation of loss tangent with temp. (-160°–160°, 3 Hz) has been reported [17]

Tensile (Young's) Modulus:

No.	Value	Note
1	2570 MPa	[4]

Flexural Modulus:

No.	Value	Note
1	2590 MPa	376 kpsi, ASTM D790 [7]

Tensile Strength Break:

No.	Value	Note	Elongation
1	79.3 MPa	11.5 kpsi, ASTM D638 [7]	70–113%

Flexural Strength at Break:

No.	Value	Note
1	111.7 MPa	16.2 kpsi, ASTM D790 [7]

Tensile Strength Yield:

No.	Value	Note
1	69 MPa	[4]
2	76.5 MPa	11.1 kpsi, ASTM D638 [7]

Impact Strength: Gardner impact strength 30 J (min., 320 in Ib^{-1}) [7]
Failure Properties General: Critical crazing strain in air 2.0%, (23°, 20h) [4]
Izod Notch:

No.	Value	Notch	Note
1	750–850 J/m	Y	14–16 ft Ib in^{-1}, ASTM D256 [7]

Optical Properties:

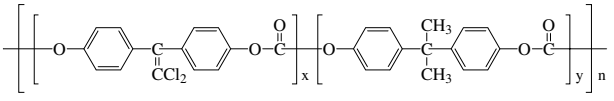
Refractive Index:

No.	Value	Note
1	1.61	25° [7]
2	1.61	calc. [1]

Polymer Stability:

Decomposition Details: Decomposition is a two step process: heating below 550° produces volatile tars and fuel gases and primary char; heating this primary char above 550° produces a carbonaceous residue, best described as a conglomerate of loosely linked small graphitic regions [18]. Thermal oxidation is a two stage process, depending on temp. At temp. up to 450°, thermo-oxidative pyrolysis occurs, with a predominance of exothermic scission reactions. At higher temps., exothermic oxidation occurs [10]. The activation energies for the two processes are 158 kJ mol^{-1} (up to 450°), 72 kJ mol^{-1} (above 450°) [10]. Maximum rate of decomposition (pyrolysis) occurs at 438° and for oxidation at 612° [10]. Decomposition in N_2 or He is a single step process [10]
Flammability: Has excellent flame resistance. Oxygen index 56 (ASTM D2863) [7]. Flammability rating 5V (UL94) [7]. Radiant panel flame spread index 0 (ASTM E162, 1/8") [7]. Smoke test NBS chamber: 67 (flaming, 1/8", NFPA No. 258), 1 (non flaming, 1/8", NFPA No.258) [7]. Arapahoe smoke chamber 0.8% smoke (based on amount burned) [7]
Chemical Stability: Tertiary amines e.g. triethylamine, catalyse conversion into trimeric cyclic carbonate [19]
Recyclability: Is relatively easily degraded by activated sewage sludge (after hydrol. of the polymer). The rate of biodegradation is greatly increased by the addition of nutrients [7]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by interfacial poly-condensation: phosgene in CH_2Cl_2 is introduced into a soln. of Bisphenol C in aq. sodium hydroxide at 20–30°. A catalyst, e.g. triethylamine, is used to achieve high MW's [7]

2	165°C	[1]
3	168°C	[8]
4	164.5°C	[11]
5	165°C	[5]
6	164°C	[12]
7	163°C	[2]

Deflection Temperature:

No.	Value	Note
1	144°C	1.8 MPa, 264 psi, ASTM D648 [8]
2	121°C	5% chloral BPA [8]
3	130°C	10% chloral BPA [8]
4	120°C	25% chloral BPA [8]
5	127°C	50% chloral BPA [8]
6	141°C	85% chloral BPA [8]

Surface Properties & Solubility:

Solubility Properties General: Compatibilities with other polymers: Chloral polycarbonate forms miscible blends with Bisphenol A polycarbonate and tetramethylpolycarbonate [1]. Blends with polymethylmethacrylate, show a lower critical soln. temp. at higher temps. [1,2]. Cloud points: 223° (10 wt % chloral polycarbonate/90% polymethylmethacrylate) [3]; 217° (35 wt % chloral polycarbonate/65% polymethylmethacrylate) [3]; 258° (90 wt % chloral polycarbonate/10% polymethylmethacrylate) [3]. Forms immiscible blends with polystyrene [1,2], and hexafluoropolycarbonate [2]
Cohesive Energy Density Solubility Parameters: Solubility parameter 23.04 J$^{1/2}$ cm$^{-3/2}$ (11.24 cal$^{1/2}$ cm$^{-3/2}$, calc.) [2,4]. Cohesive energy density 427 J m^{-3} (calc.) [5]
Solvents/Non-solvents: Sol. CH_2Cl_2, $CHCl_3$, THF [8]; insol. H_2O [8]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.8–0.9 g/10 min	ASTM D1238, procedure A, condition O [8]
2	1.8 g/10 min	85% chloral BPA, ASTM D1238, procedure A, condition O [8]

Polymer Solutions Dilute: Mark-Houwink constants have been reported. [13,14] Intrinsic viscosity for a solution of the 85% chloral BPA copolymer in THF is given by the Staudinger-Kuhn equation [8]
Permeability of Gases: Conditioning at 20 atm for 300h makes little difference to the permeability of CO_2 [17]. Gas selectivity [15,16] and diffusivity [3,15,18] have been reported
Water Absorption:

No.	Value	Note
1	0.26%	25° [8]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	490 cm^3 mm/(m^2 day atm)	5.6 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 1–2 atm [3,15]

8	850 J/m	Y	16 ft lb in^{-1}, 85% Bisphenol C [8]

Optical Properties:

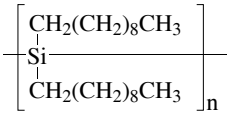
Refractive Index:

No.	Value	Note
1	1.61	25° [1,8]

Polymer Stability:

Decomposition Details: Decomposition by two step process; heating below 550° produces volatile tars and fuel gases and a primary char. Further heating above 550° produces a carbonaceous residue, a conglomerate of loosely linked small graphitic regions [20]
Flammability: Excellent flame resistance. Oxygen index 56 (ASTM D2963); 50 (85% Bisphenol C, ASTM D2863) [8]. Flammability rating 5V (85–90% Bisphenol C, UL 94) [8]. Radiant panel flame spread index (Is) 0 (ASTM E162, 1/8 in); 11 (85% Bisphenol C, 1/8 in, ASTM E162) [8]. Smoke density 67 (Flaming, 1/8 in, NFPA No. 258, NBS chamber) [8]; 1 (Nonflaming, 1/8 in, NFPA No. 258, NBS chamber); 19 (90% Bisphenol C, flaming, 1/8 in, NFPA No. 258, NBS chamber); 31 (85% Bisphenol C, flaming, 1/8 in, NFPA No. 258, NBS chamber); 10 (85% Bisphenol C, non flaming, 1/8 in, NFPA No. 258, NBS chamber) [8]. Arapahoe smoke chamber 0.8% smoke; 1.7% smoke (85% Bisphenol C, based on amount burned) [8] Smoke density rating 4.5 (85% Bisphenol C, XP-2 chamber, ASTM D2843). [8] Flame spread rating 20 (85% Bisphenol C, 1/4 in, ASTM E84, 25ft tunnel test) [8]; smoke rating 200 (85% Bisphenol C, 1/4 in, ASTM E84) [8]; fuel contribution value 0 (85% Bisphenol C, 1/4 in, ASTM E84) [8]
Chemical Stability: Thermal oxidation is a two stage process. At temps. up to 450°, thermo-oxidative pyrolysis occurs, with a predominance of exothermic scission reactions. At higher temps. exothermic oxidation takes place [11]. Max. rate of decomposition: 438° (pyrolysis, heating rate 10° min^{-1}) [11]; 612° (oxidation,

broad peak, heating rate 10° min^{-1}) [11]. With N_2 or He only one step decomposition is found [11]. Tertiary amines catalyse conversion into the trimeric cyclic carbonate *e.g.* triethylamine precipitates the cyclic trimer from a soln. in CH_2Cl_2 in 24h (room tem., N_2) [21]
Recyclability: Relatively easily degraded by activated sewage sludge (after hydrolysis of the polymer). The rate of biodegradation is greatly increased by the addition of nutrients [8]
Stability Miscellaneous: Not toxic oral route of inhalation



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by interfacial polycondensation. Phosgene is introduced into a soln. of Bisphenol C and Bisphenol A in aq. NaOH at 20–30°, in an inert solvent (CH_2Cl_2). Phenol is used as a chain stopper; triethylamine catalyst is used to achieve high MW. Isol. by steam precipitation [8]

Poly(didecylsilane) P-175

Synonyms: *Poly(didecylsilylene). Poly(di-n-decylsilane). PdDecSi. PD10S. PDDS*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane)
Polymer Type: polysilanes

CAS Number:

CAS Reg. No.
107999-69-9

Molecular Formula: $(C_{20}H_{42}Si)n$
Fragments: $C_{20}H_{42}Si$
Molecular Weight: 412,000–610,000 [2,3,7]
General Information: Five distinct ordered forms (crystalline or semicrystalline), which vary in their respective chain structure, packing and optical properties. Of these only one appears to be thermodynamically stable. One of the metastable polymorphic structures exhibits an unprecedented tripling of the basic unit cell structure [2]
Morphology: Some disagreement exists in the literature for data on PDDS [5].
It has been suggested that the Si backbone is dominated by T56 and D conformers with a TnD-Tn′D+ construction [2].
Unit cell with dimensions a=21.4Å; b=24.9Å; c=7.8Å and γ=90° [1]
Miscellaneous: There is also strong evidence indicative of a crossover in the intrachain and interchain ordering of the alkyl side chains when progressing from a hexyl to a decyl moiety. The actual thermodynamically stable form should be the low-temperature type II phase [2,4,5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.96 g/cm^3	PdDecSi I [2]
2	d 0.98 g/cm^3	PdDecSi II* [2]
3	d 0.97 g/cm^3	PdDecSi II [2]
4	d 1.02 g/cm^3	PdDecSi III [2]
5	d 0.91 g/cm^3	PdDecSi QM [2]

Thermodynamic Properties General: See [3]
Melting Temperature:

No.	Value	Note
1	7°C	Freezing temp. [7]

Electrical Properties:

Electrical Properties General: KAT 1950×10^{-9}S m^2/J; KTG 210×10^{-9}S m^2/J; M 28×10^{-9}S m^2/J
The highest mobility of $4x10^{-5}m^2/(V\ s)$ is found for the *all-trans* conformation of the polysilane backbone [5]

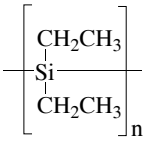
Optical Properties:

Optical Properties General: At least two different crystalline phases with λ_{max} of 350nm and 378nm have been observed; the solid state composition has been reported to vary with molecular weight and thermal history. Further heating into the mesophase leads to a uv absorption with λ_{max} of 318nm [3,5]
Transmission and Spectra: Uv [2,4,5,7], Raman [4], nmr [3,6,7], esr [6] and gc-ms [6] spectra reported.

Polymer Stability:

Thermal Stability General: Can be thermally cycled or solvent cast to form at least five nominally crystalline polymorphs. Referred to as type II*, I, II, III and QM (for quenched mesophase). Phases III and I appear to be monotropic while the type II structure is clearly enantiotropic. The QM form may be only representative of a kinetically limited structure and so has not been assigned. The QM phase can be warmed to sequentially give the type III > I > II structures [2,4]
Decomposition Details: The first is a broad endotherm centred near -22°C, and the second is an exotherm near -2°C. The first corresponds to the QM to III transition while the second is

suggestive of a cold crystallisation process in the transformation from the type III to I phase [2,4]



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared from dichlorodecylsilane by dehalogenation coupling with Na under standard conditions for Wurtz polysilane synthesis [2,3]
Applications:

Poly(diethylsilane) P-176

Synonyms: *Poly(diethylsilylene). Diethylsilane homopolymer, sru. PDES*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane), Poly(dipropylsilane), Poly[[bis(3-methylphenyl)silylene]methylene], Poly[[bis(4-methylphenyl)silylene]methylene], Poly(dihexylsilane)
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
125457-34-3

Molecular Formula: $(C_4H_{10}Si)n$
Fragments: $C_4H_{10}Si$
Morphology: The Si backbone conformation of the crystal is *all-trans*, and the sidechain conformation is mainly determined by intramolecular steric hindrance. A monoclinic unit cell with a=1.108nm, b=1.210nm, c=0.399nm and γ=84.8° [3,4,5]

Surface Properties & Solubility:

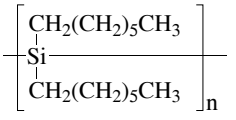
Surface and Interfacial Properties General: From contact angle measurements using water and methylene iodide, surface tensions for solid films of poly(silylene) polymers were obtained using the geometric-mean method; value depends strongly on nature of substituents [6]

Optical Properties:

Optical Properties General: Soft X-ray emission and absorption spectra in the Si L region of a number of substituted polysilanes, $(SiR_2)n$, were obtained using synchrotron radiation to study their electronic structures. Studied polysilanes were substituted with Me (R=CH_3), Et, Pr, Bu, n-pentyl and Ph groups. Although similar spectral features in both X-ray emission and absorption are observed among alkyl-substituted polysilanes, slight differences are distinguished between alkyl- and phenyl-substituted ones. These spectral features are qualitatively reproduced by summing calculated d-of-state spectra for Si-3s- and Si-3d-orbitals. Thus, spectral features are explained through the hybridisation of electronic orbitals in both backbone Si atoms and substituent C atoms [2]. The length of alkyl substituents has little effect on the electronic structure of the Si backbone [6]
Transmission and Spectra: nmr [3] and uv-vis [1,3] spectra reported.

Polymer Stability:

Decomposition Details: Photolysis proceeds via silylene extrusion competing with homolytic cleavage [8]



Applications/Commercial Products:

Processing & Manufacturing Routes: PDES on smooth quartz plates has been prepared by the friction deposition technique [1]. Alsosynth. by Wurtz-type reductive coupling of corresponding dichlorosilane [5]
Applications: Used in fabricated electroluminescent device [5]

CAS Reg. No.	Note
100044-91-5	homopolymer
100044-92-6	sru

Molecular Formula: $(C_{14}H_{30}Si)n$
Fragments: $C_{14}H_{30}Si$
Molecular Weight: 1.9×10^6 [6]
Morphology: Planar zigzag structure together with a small amount of a disordered component.
The *d*-spacing, 4.54Å, is characteristic of the packing of *trans*-planar alkyl side chains into a triclinic unit cell. It has a chain repeat distance of 13.8Å, corresponding to a 7/3 helical conformation.
Orthorhombic unit cell having dimensions a=14.7Å, b=27.4Å and c=4.0Å [1,2,3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.93 g/cm^3	[3]

Thermodynamic Properties General: The smaller enthalpy associated with the transition probably due to the conformation and packing [3]

Melting Temperature:

No.	Value	Note
1	38–39°C	[1]

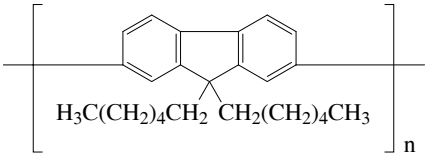
Transition Temperature:

No.	Value	Note	Type
1	142°C	at 3 Torr [6]	Bp

Surface Properties & Solubility:
Surface Tension:

No.	Value	Note
1	25–52.8 mN/m	dependent on the substituent groups [7]

Optical Properties:
Optical Properties General: Exhibits similar piezochromic behaviour to that found with PDBS and PDPS. At 42°C, the polymer undergoes a reversible structural transition, which has been observed by ir, Raman and X-ray diffraction [1,2,3]
Transmission and Spectra: Ir [1,2,3], Raman [1,3], uv [1,2,3,6,8] and nmr [3,6] spectra reported.



Polymer Stability:
Thermal Stability General: The long wavelength UV absorption of PDHepS rapidly disappears upon heating above 45°C and the original spectrum is restored. This thermal effect is reversible, as observed with PDHS [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: *n*-Heptyltrichlorosilane was rapidly added to *n*-heptylmagnesium bromide in Et_2O at 0°C, allowed to warm to room temperature and stirred for 12h. The solution was refluxed for another 2h, and after filtration, the solution was concentrated and distilled three times [6]
Applications: Electrophotographic photoreceptor [4]. Effective mid-uv resists [5]

Poly(9,9-dihexylfluorene) P-178

Synonyms: *Poly(9,9-dihexyl-9H-fluorene-2,7-diyl). PDHF. F6*
Material class: Thermoplastic
Polymer Type: polyfluorene

CAS Number:

CAS Reg. No.	Note
123863-98-9	Poly(9,9-dihexylfluorene)
133019-09-7	Poly(9,9-dihexyl-9*H*-fluorene-2,7-diyl)
201807-75-2	2,7-Dibromo-9,9-dihexyl-9*H*-fluorene homopolymer

Molecular Formula: $(C_{25}H_{32})_n$
Fragments: $C_{25}H_{32}$
General Information: Stable blue-light-emitting electroluminescent and photoluminescent polymer with liquid crystalline properties. Polymer is produced as yellow powder or flakes.
Morphology: Hexagonal unit cell with vectors $a_1=a_2=12.4$Å [1]. Liquid crystalline phase occurs above *ca.* 160°C [1,2].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	55–103°C	dependent on molecular weight [2,3,4]

Transition Temperature General: Transition to nematic phase at about 160–200°C. Liquid becomes isotropic from about 300°C [1,2].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$, toluene, CH_2Cl_2, THF, xylene, chlorobenzene [2,3,5]; insol. alcohols, Me_2CO, H_2O [6].

Mechanical Properties:
Elastic Modulus:

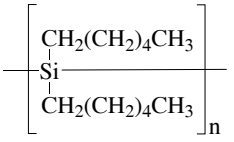
No.	Value	Note
1	16600–23200 MPa	thin film [7]

Hardness: 0.37 ± 0.07GPa (thin film) [7].

Electrical Properties:
Electrical Properties General: Several LED devices with PDHF as blue light-emitter have been reported, with light turn-on voltages up to 17V [8,9,10]. Very low conductivity for undoped polymer; conductivity of about 0.001S cm^{-1} for samples doped with tetrafluoroborate [6].

Optical Properties:
Optical Properties General: Blue-light photoluminescence occurs with λ_{max} in region of 410–420 nm and band gap of approx. 2.9eV [4,6]. High photoluminescent quantum efficiency of up to 90% in $CHCl_3$ solution [11]. Electroluminescence from LED devices with λ_{max} in region of 470–488nm [8,10].
Transmission and Spectra: pmr [3,4,9], cmr [3,4,9], ir [3,10,11], uv and photoluminescence [2,3,4,5,9,10,11,12,13], electroluminescence [8,9,10] and x-ray [1] spectral data have been reported.

Polymer Stability:
Polymer Stability General: Good stability in presence of oxygen, moisture and light [2]. The electrical and photoinduced degradation of films have been reported [12].
Thermal Stability General: Good thermal stability with 5% weight loss only above 400°C [5,9].



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by oxidation of 9,9-dihexylfluorene monomer with $FeCl_3$ [3], Ni(0)-catalysed polymerisation of 2,7-dibromo-9,9-dihexylfluorene [9,11,14], or by Suzuki coupling of the dibromo monomer with diboronate derivative to give higher molecular-weight polymers [4,10].

Applications: Main potential application is as a blue-light emitter for light-emitting diodes, also for thin film transistors, lasers and light-emitting electrochemical cells.

Poly(dihexylsilane) P-179

Synonyms: *Poly(dihexylsilylene). Dichlorodihexylsilane homopolymer. PDHS*
Monomers: Dichlorodihexylsilane
Material class: Thermoplastic
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
94904-85-5	poly(dihexylsilylene)
97036-67-4	dichlorodihexylsilane homopolymer

Molecular Formula: $(C_{12}H_{26}Si)n$
Fragments: $C_{12}H_{26}Si$
Additives: Dopants such as I_2 and $FeCl_3$ have been added to increase conductivity.
General Information: Thermochromic polymer exhibiting photoluminescence and electroluminescence. Prod. as white solid.
Morphology: At r.t. in polymer films an *all-trans* planar conformation of the backbone is predominant [1,2,3] with ordered sidechains and with orthorhombic unit cell, a = 13.76, b = 23.86, c = 3.99 Å [4]. Above *ca.* 42°C the planar conformation is completely converted to a columnar mesophase conformation with disordered sidechains [3,4]. The effect of pressure is to distort the *all-trans* conformation at lower temperatures [5]. In very thin films (thickness <2000Å) crystallisation is hindered and the backbone and sidechains become disordered [6,7].

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	-52.5°C	heat capacity data [9]
2	-33°C	hole transport data [10]

Transition Temperature General: The strong endothermic transition at 42°C corresponds to the change to a disordered conformation [1,3,8,9].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. THF, hexane [11], octane, toluene.

Mechanical Properties:

Mechanical Properties General: Polymer generally has low ductility with films breaking when under stress at the transition point (41°C) [12].
Elastic Modulus:

No.	Value	Note
1	126 MPa	[12]

Fracture Mechanical Properties: Fracture strain 2.7% [12].

Electrical Properties:

Electrical Properties General: Conductivity increased by dopants such as I_2 or $FeCl_3$ [13]. Hole transport occurs by chain hopping [10]. Electroluminescence observed only at low temperatures, with quantum yield decreasing to zero above 230K [14]. LED devices used with PDHS as emissive layer had a turn-on voltage of 26V [15]. Ionisation potential increases above transition temperature: 5.78eV (20°C), 5.94eV (50°C) [28].

Optical Properties:

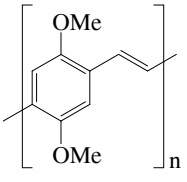
Optical Properties General: For polymer films at r.t. there is a strong UV absorption band with λ_{max} *ca.* 370nm and a weak band with λ_{max} *ca.* 316nm. On heating to 42°C the longer wavelength band disappears and the higher energy band increases in intensity [1,2,3,8,16]. When films are subjected to pressure, the longer wavelength band can be restored above 42°C and the shorter wavelength band decreases in intensity [1,5]. Oriented films exhibit a reduction in absorption anisotropy for polarised UV light on going from the planar to disordered conformations [17]. When the thickness of films is decreased the longer wavelength band decreases relative to the shorter wavelength band [6]. Polymer solutions at r.t. exhibit only the shorter wavelength band (*ca.* 316nm) [2], while on cooling there is a transition to a longer wavelength band (λ_{max} *ca.* 254 nm) [18,19]. A third band has been detected on heating solutions from low temperatures [20]. A photoluminescence band occurs in UV region with λ_{max} *ca.* 375nm for films; the quantum yield increases at lower temperatures [14,15].
Refractive Index:

No.	Value	Note
1	1.55–1.62	Increase in refractive index on going from planar to disordered state on heating [21]

Transmission and Spectra: Pmr [22,23], cmr [22,23], Si-29 nmr [25], ir [2,5,8,23,24], Raman [3,5], uv [2,3,8,14,16,17,20], photoluminescence [14,15,16,24], electroluminescence [14,15] and x-ray diffraction [1,4,26,27] data have been reported.

Polymer Stability:

Polymer Stability General: Photoscission of chains occurs on exposure to uv radiation.
Thermal Stability General: Decomposes (5% weight loss) at 288°C [9].
Chemical Stability: Undergoes slow chemical degradation by alkali metal cations and K metal in THF solution [29].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mainly by Wurtz dehalogenation coupling of dichlorodihexylsilane with Na in a solvent such as toluene, THF or octane [22,23]. The addition of a crown ether increases polymer yield [30,31]. Polymer also produced by electrolytic methods [32].
Applications: Potential applications as optical modulating component and in photoaligned films.

Poly(*p*-2,5-dimethoxyphenylene vinylene) P-180

Synonyms: *PDMV. MO-PPV. Poly(2,5-dimethoxy-1,4-phenylene-1,2-ethenediyl)*
Related Polymers: Poly(*p*-phenylene vinylene)
Monomers: 2,5-Dimethoxy-1,4-benzenedicarboxaldehyde
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)

CAS Number:

CAS Reg. No.	Note
25190-54-9	
144225-26-3	(*E*)-form

Molecular Formula: $(C_{10}H_{10}O_2)_n$
Fragments: $C_{10}H_{10}O_2$
Morphology: Bond lengths and angles of polymer repeat unit have been calculated [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	[6]

Electrical Properties:

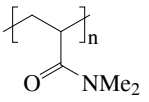
Electrical Properties General: Chemical doping increases conductivity [2,3,4,5]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.7–1.99	700–2500 nm [8]

Transmission and Spectra: C-13 nmr [9], H-1 nmr [10], ir [4,6,10,11], x-ray [13] and uv spectral data [12] have been reported



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by base or thermal elimination of dialkyl sulfonium salt [2,10,4,14]; Wittig reaction of 2,5-dimethoxyterephthaldehyde [7]; or dehydrochlorination of 2,5-dimethoxy-*p*-xylylene dichloride [7]
Applications: Of potential application as electroluminescent diodes

Poly(*N,N*-dimethylacrylamide) P-181

Synonyms: *Poly(N,N-dimethyl-2-propenamide). PDMA*
Related Polymers: Polyacrylamide, Poly(*N*-isopropylacrylamide)
Monomers: 2-Propenoic acid, dimethylamide
Polymer Type: polyamide
CAS Number:

CAS Reg. No.	Note
26793-34-0	
37165-17-6	isotactic
89616-11-5	syndiotactic

Molecular Formula: $(C_4H_9NO)_n$
Fragments: C_4H_9NO
Molecular Weight: MW 34000
Morphology: Amorph. at and below 19% isotactic content; partially crystalline at 23% isotactic content. Crystallinity increases with increasing isotacticity [22]
Miscellaneous: A review of props. and uses has been reported [14]

Volumetric & Calorimetric Properties:

Equation of State: Mark-Houwink parameters have been reported [17,26]
Melting Temperature:

No.	Value	Note
1	309°C	28% isotactic [22]
2	326°C	41% isotactic [22]

Glass-Transition Temperature:

No.	Value	Note
1	119°C	14% isotactic [22]
2	112°C	41% isotactic [22]
3	89°C	[23]
4	110°C	[23]
5	119°C	[25]

Transition Temperature General: Other values of T_g have been reported [11]. T_g decreases noticeably above an isotactic content of 39% [22]. T_m only observed in isotactic polymers at an isotactic content above 23% [22]

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(vinylidene fluoride), provided the wt. fraction of PVDF is less than 0.7 [1]; with poly(styrene-*co*-acrylonitrile), when the acrylonitrile content is 68% [2]; with poly(chloromethyl methacrylate), poly(2-chloroethyl methacrylate), poly(3-chloropropyl methacrylate), poly(2-bromoethyl methacrylate) and poly(2-iodoethyl methacrylate) [7]. Also miscible with poly(acrylonitrile-*co*-methyl acrylate) [20], poly(vinylphenol) [21,27] and poly(styrene-*co*-vinylphenol) [27]. Immiscible with polystyrene, poly(styrene-*co*-styrene-4-carboxylic acid) and poly(styrene-*co*-styrene-4-sulfonic acid) [27]
Solvents/Non-solvents: Sol. H_2O [24,26,28], MeOH, 2-methoxyethanol, 2-butanone, Et_2O, toluene, $CHCl_3$, dioxane [28]

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.5 dl g^{-1} (MeOH) [21], $[\eta]$ 1.33 dl g^{-1} (CH_2Cl_2, 14% isotactic), 1.91 dl g^{-1} (CH_2Cl_2, 41% isotactic) [22]. Shear viscosity shows a gradual decrease with time [24]
Water Content: An increase in tacticity results in reduced water uptake [22]. The rate of water vapour sorption decreases with increasing tacticity [22]

Mechanical Properties:

Mechanical Properties General: Modulus and yield stress of isotactic polymer are strongly dependent upon the degree of tacticity and crystallinity. For polymers of low tacticity, water absorption significantly affects mech. props. [22]

Optical Properties:

Transmission and Spectra: H-1 nmr [3,18], fluorescence [6] and C-13 nmr [9,13] spectral data have been reported

Polymer Stability:

Decomposition Details: Decomposition temp. 347° (min., 14% isotactic) [22], 338° (41% isotactic) [22]
Chemical Stability: Alkaline hydrol. at 100° is more complete for the isotactic form than for the atactic form (56% and 4% respectively) [15]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. of the block copolymer has been reported [4]. May be synth. by anionic polymerisation [12,22] in THF at -78° using lithium and caesium alkyl catalysts [5]. Synth. by electropolymerisation in aq. sulfuric acid [8]; by plasa polymerisation [10] and by radical polymerisation [16]. May also be synth. by "group-transfer" polymerisation using ketene silyl acetals as initiator and zinc halide catalyst [19]
Applications: Has applications in coatings and adhesives

Polydimethylbutadiene P-182

Synonyms: *Methyl rubber. Poly(2,3-dimethyl-1,3-butadiene)*
Monomers: 2,3-Dimethyl-1,3-butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
25034-65-5

General Information: *trans*-1,4-Polydimethylbutadiene. *cis*-1,4-Polydimethylbutadiene

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	253–259°C	*trans*-1,4; 2,3-dimethyl-1,3-butadiene [1]
2	189–192°C	*cis*-1,4 [1]
3	267–272°C	*trans*-1,4 highly stereoregular [1]

Polydimethyldiphenylsiloxane fluid P-183

Synonyms: *Polydiphenyldimethylsiloxane fluid*
Related Polymers: Polyphenylsiloxane fluid, PDMS fluid
Monomers: Dichlorodiphenylsilane, Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Fluids, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
156048-34-9

Molecular Formula: $[(C_{12}H_{10}OSi).(C_2H_6OSi)]_n$
Fragments: $C_{12}H_{10}OSi$ C_2H_6OSi
Identification: Silicone fluids containing phenyl groups have higher values of density than dimethylsiloxane

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.98 g/cm^3	low phenyl
2	d 1.05 g/cm^3	high phenyl [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0009 K^{-1}	low phenyl [6]	V
2	0.00055 K^{-1}	high phenyl	V

Thermal Conductivity:

No.	Value	Note
1	0.13–0.15 W/mK	0.00032–0.00036 cal (cm s °C)$^{-1}$, falls as phenyl substitution rises [12,13]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.4 kJ/kg.C	0.34 Btu lb^{-1}°F^{-1} [3]	p

Transition Temperature General: Low phenyl subsitution lowers pour point; high phenyl silicone raises pour point above that of dimethyl silicone [1,8]
Transition Temperature:

No.	Value	Note
1	-73°C	Pour point (-100°F, low phenyl) [3]
2	-40°C	Pour point (-40°F, high phenyl)

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16–18.4 J$^{1/2}$ cm$^{-3/2}$ (7.8–9 cal$^{1/2}$ cm$^{-3/2}$) [5,9]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, ethers, esters, ketones. Insol. alcohols, H_2O. (Low MW methyl phenyl silicones are sol. alcohols)
Surface and Interfacial Properties General: The high phenyl substituted form is a better lubricant than methyl silicone oils [17]
Wettability/Surface Energy and Interfacial Tension: γ_c 21 mJ m^{-2} (21 dyne cm^{-1}, low phenyl). γ_c 25 mJ m^{-2} (25 dyne cm^{-1}, high phenyl) [3,6]

Transport Properties:

Polymer Melts: Viscosity temp. coefficient 0.65–0.85 (rises with rise in phenyl subsitution) (see [poly phenyl siloxane fluid] [3,10,14,15]

Mechanical Properties:

Miscellaneous Moduli:

No.	Value	Note	Type
1	1650–2000 MPa	16700–20000 kg cm^{-2} [10,11]	Bulk modulus

Mechanical Properties Miscellaneous: Compressibility decreases with increasing phenyl substitution [10,11]

Electrical Properties:

Electrical Properties General: Has excellent insulating props. but these are inferior to those of dimethylsilicone fluids
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9–3	[4,16]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	[4]

Optical Properties:

Optical Properties General: Refractive index higher than that of dimethyl silicone [7]

Refractive Index:

No.	Value	Note
1	1.422	low phenyl [3]
2	1.498	high phenyl [3]

Transmission and Spectra: Transparent above 280 nm [5]

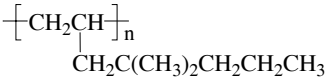
Polymer Stability:

Polymer Stability General: Usable over wide temp. range; good low temp. props.
Thermal Stability General: Usable between -75° and 225° in presence of air. In absence of air usable up to 300° (low phenyl for low temps. and high phenyl for high temps.) [3]
Upper Use Temperature:

No.	Value
1	250°C
2	225°C

Decomposition Details: Oxidised at temps. of over 250° [2]
Flammability: Fl. p. 230° (440°F) [3]
Environmental Stress: Stable to H_2O, air, oxygen and other materials. The high phenyl form is resistant to radiation [1]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. Very thin films liable to degradation [1,4,5]
Hydrolytic Stability: Stable to H_2O and aq. solns. Very thin films spread on H_2O; liable to hydrolytic degradation [1,4,5]
Biological Stability: Non-biodegradable [4,5]
Recyclability: Can be reused; no large scale recycling

Applications/Commercial Products:



Processing & Manufacturing Routes: For low viscosity fluids dimethyldichlorosilane and diphenyldichlorosilane are hydrolysed and the hydrolysate equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane to serve as chain terminator. For high viscosity fluids dimethyldiphenyl and dimethyl cyclic polysiloxanes are polymerised together under alkaline catalysis with traces of chain terminator at 150°
Applications: Used for low temp. damping for aerospace instruments and electronic equipment, heat transfer media and solder baths. Used as dielectric coolant and coupler and in greases for ball bearing lubrication. Other applications in chromatography columns

Trade name	Supplier
SF1150 series	General Electric Silicones

Poly(4,4-dimethyl-1-hexene) P-184

Synonyms: *Poly(1-(2,2-dimethylbutyl)-1,2-ethanediyl)*
Monomers: 4,4-Dimethyl-1-hexene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
35064-73-4

Molecular Formula: $(C_8H_{16})_n$
Fragments: C_8H_{16}
General Information: Hard, crystalline polymer [1]
Morphology: Three isomers are known [3]

Volumetric & Calorimetric Properties:

Melting Temperature:

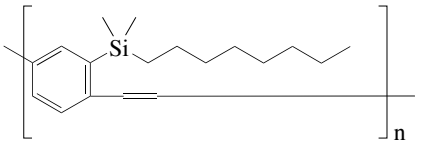
No.	Value	Note
1	>350°C	min. [1,2]

Transition Temperature:

No.	Value	Note	Type
1	314°C	[1]	Polymer melt

Transport Properties:

Polymer Solutions Dilute: η_{inh} 1.12 (decahydronaphthalene, 130°) [1,2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-$AlEt_3$ [1,3]. Catalysts may be prepared by treating $TiCl_4$ with a lithium aluminium tetraalkyl in an inert atmosphere and an inert organic solvent [2]

Poly[2-(dimethyloctylsilyl)-1,4-phenylene vinylene] P-186

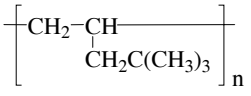
Synonyms: *Poly[[(dimethyloctylsilyl)-1,4-phenylene]-1,2-ethenediyl]. DMOS-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
189084-69-3	poly[[(dimethyloctylsilyl)-1,4-phenylene]-1,2-ethenediyl]
184687-87-4	

Molecular Formula: $(C_{18}H_{28}Si)_n$
Fragments: $C_{18}H_{28}Si$
General Information: Silyl-substituted green light emitting photoluminescent and electroluminescent polymer. Prod. as yellow solid.

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$, THF, toluene [1].

Electrical Properties:
Electrical Properties General: Polymer used in LED devices as green light emitter [1,2,3,4]. The high turn-on voltage of 15V can be reduced with the use of fluorinated derivatives [3] or copolymers with MEH-PPV [4].



Optical Properties:
Optical Properties General: Exhibits photoluminescence with high quantum efficiency in green region of spectrum (λ_{max} in region of 520-540nm). Band gap of polymer 2.34eV [3].
Transmission and Spectra: Uv and photoluminescence [1,3,4,5], electroluminescence [1,2,3,4] and ftir [1] spectral data have been reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Gilch method from 1,4-bis(halomethyl)-2-(dimethyloctylsilyl)benzene and *tert*-BuOK [1,6].
Applications: Can be used as emissive layer in light-emitting diodes as homopolymer or in form of copolymers.

Poly(2,6-dimethyl-1,4-phenylene oxide) P-188

Synonyms: *DMPPO. Modified PPO. PPO-M. PPE. Poly(2,6-dimethylphenol). Polyphenylene oxide. Polyphenylene ether. Poly(2,6-dimethyl-1,4-phenylene ether). Poly[oxy(2,6-dimethyl-1,4-phenylene)]*
Related Polymers: Poly(phenylene oxide)
Monomers: 2,6-Dimethylphenol
Material class: Thermoplastic
Polymer Type: polyphenylene oxide
CAS Number:

CAS Reg. No.	Note
25134-01-4	homopolymer
24938-67-8	

Molecular Formula: $(C_8H_8O)_n$
Fragments: C_8H_8O
Molecular Weight: MW 40000, M_n 18000
Additives: Blended with polystyrene to improve flow props. Blends are often referred to as PPO
General Information: The most important polyphenylene oxide polymer, this material is often confusingly called Polyphenylene oxide. An attractive, tough, stiff material with a wide temp. range of use with its principal applications as a blend. Linear crystalline polymer of good thermal stability but limited flow props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.21 g/cm^3	[4]
2	d^{23} 1.06 g/cm^3	[26]
3	d 0.958 g/cm^3	[26]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00053 K^{-1}	[3]	L
2	0.00021 K^{-1}	[3]	V
3	5.2×10^{-5} K^{-1}	ASTM D696 [26,27,29]	L
4	0.000209 K^{-1}	[9]	V

Equation of State: Einstein/Debye low temp. equation constants have been reported [13]. Hartmann-Haque equation of state constant values have been reported [14]
Latent Heat Crystallization: S 247 J K^{-1} mol^{-1} (210°), 295.1 J K^{-1} mol^{-1} (307°) [1]. ΔC_p 32.2 J K^{-1} mol^{-1} [1]. ΔC_p 28.8 J K^{-1} mol^{-1} (0.24 J g^{-1} K^{-1}) [3]. ΔH_f 1.97 kJ mol^{-1} (16.4 J g^{-1}) [8]. ΔH_f 5.0–5.9 kJ mol^{-1} [28]. ΔS_f 7.7–11.3 J K^{-1} mol^{-1} [10]. ΔH_c 4200 kJ mol^{-1} (35 kJ g^{-1}) [11]. ΔH_f 5.4 kJ mol^{-1} (1290 cal mol^{-1}) [12]. Other specific heat capacity values have been reported [29]
Thermal Conductivity:

No.	Value	Note
1	0.22 W/mK	ASTM C177 [29]

Specific Heat Capacity:

1	12140 MPa	23°, ASTM D1621-64 [4]
2	83 MPa	[26,27]

Impact Strength: Impact strength 15 kJ m^{-2} (150 kgf cm cm^{-2}, 100°, DIN 53453) [18]. Puncture impact 50 J (23°, ASTM D3763)
Hardness: Rockwell M78 (ASTM D785)
Friction Abrasion and Resistance: μ_{dyn} (polymer/self) 0.18-0.23. Abrasion resistance 17 mg (1000 cycles)$^{-1}$ (Taber CS-17 test)
Izod Notch:

No.	Value	Notch	Note
1	85.4 J/m	N	23°, ASTM D256 [4]
2	53 J/m	N	-40° [26,27]
3	91 J/m	Y	93°, ASTM D256 [26,27]
4	2000 J/m	N	min., ASTM D256 [26,27]

Charpy:

No.	Value	Notch	Note
1	4	Y	-20–100° [19]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor remain low and constant over broad ranges of temp., frequency and humidity [26,27]. Exhibits high volume resistivity and dielectric strength [24]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.58	60 Hz	23°, ASTM D150 [26,27]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	3.18 mm thick, ASTM D149 [26,27]

Arc Resistance:

No.	Value	Note
1	75s	ASTM D195 [26,27]

Complex Permittivity and Electroactive Polymers: μ 0.88 D [16]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00035	60 Hz	23° [26,27]
2	0.0009	1 MHz	23°, ASTM D150 [26,27]
3	0.01	1 Hz	approx., 100° [18]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.567	[16]

Transmission and Spectra: Mass spectral data have been reported [21]

Volume Properties/Surface Properties: Colour beige

Polymer Stability:

Polymer Stability General: Sensitive to photochemical and thermal oxidation
Thermal Stability General: Exhibits high heat deflection temp. [24]
Upper Use Temperature:

No.	Value	Note
1	105°C	[24]
2	80–105°C	

Decomposition Details: Thermal degradation occurs in two steps; a rapid exothermic process between 430° and 500° producing phenolic products, H_2O and a cross-linked residue followed by a slower, char-forming process above 500° [22]. Char yield 17% (800°, N_2), 17% (800°, air) [4]. Rapidly degrades above 250° in oxygen atmosphere. Decomposition temp. 450° (10° min^{-1}, N_2) [25]
Flammability: Limiting oxygen index 32% (ASTM D2863) [4]. Smoke evolution D_m 775.35 [4]
Environmental Stress: Shows low radiation resistivity [20]. Prone to environmental stress cracking. Prolonged outdoor exposure causes discoloration, crazing and loss of props. [24]
Chemical Stability: Resistant to strong acids and alkalis. Attacked by many organic solvents [24]
Biological Stability: Methyl groups in the aromatic ring hinder biodegradation [23]
Stability Miscellaneous: Toxicity T_i (time to incapacitation) 8.65 min. T_d (time to death) 19.96 min. [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by oxidative coupling with a homogeneous oxidation catalyst (e.g. oxygen, Cu(*I*) salt and pyridine catalyst in a chlorinated hydrocarbon solvent). Most often used as a blend with polystyrene and also nylons
Mould Shrinkage (%):

No.	Value	Note
1	0.005–0.007%	ASTM D955 [29]

Applications: Automotive industry, electronic appliances, office equipment, replacement for zinc die-castings, water distribution and environmental appliances. Mouldings have good dimensional stability. Blended with polystyrene to give Noryl resins, a major engineering thermoplastic. PPO/PA alloys (Vestoblend and Ultranyl) are also prod. commercially

Poly(2,6-dimethylphenylene oxide)/polystyrene blends P-189

Related Polymers: Poly(2,6-dimethylphenylene oxide), Polystyrene
Monomers: 2,6-Dimethylphenol, Styrene
Material class: Blends
Polymer Type: polyphenylene oxide, polystyrene
Molecular Formula: $[(C_8H_8O).(C_8H_8)]_n$
Fragments: C_8H_8O C_8H_8
Additives: Organic phosphates added to increase flame retardancy. Glass fillers must then be added to offset adverse electrical props.
General Information: Poly(2,6-dimethylphenylene oxide) and polystyrene are miscible in all proportions. Props. of the blends can be varied over a wide range by changing the ratio of components and the amount and type of additives [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.06 g/cm^3	[2]
2	d 1.21 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6×10^{-5} K^{-1}	unreinforced, ASTM D696 [2]	V
2	4×10^{-5} K^{-1}	20% glass reinforced, ASTM D696 [2]	V

Thermodynamic Properties General: High heat deflection temp. Low coefficient of thermal expansion [3]
Thermal Conductivity:

No.	Value	Note
1	0.22 W/mK	unreinforced, ASTM C177 [2]
2	0.24 W/mK	20% glass reinforced, ASTM C177 [2]

Deflection Temperature:

No.	Value	Note
1	130°C	1.8 MPa, unreinforced [2]
2	132°C	1.8 MPa, 20% glass reinforced [2]

Vicat Softening Point:

No.	Value	Note
1	148°C	unreinforced [2]
2	145°C	20% glass reinforced [2]

Transport Properties:

Water Content: Very low water absorption [2]
Water Absorption:

No.	Value	Note
1	0.07 %	24h, ASTM D570 [2]
2	0.14 %	equilib., ASTM D570 [2]

Mechanical Properties:

Mechanical Properties General: Relatively constant mech. props. over a wide temp. range (-40–105°) [2,3]

Tensile (Young's) Modulus:

No.	Value	Note
1	2500 MPa	unreinforced, ASTM D638 [2]
2	6500 MPa	20% glass reinforced, ASTM D638 [2]

Flexural Modulus:

No.	Value
1	2500 MPa

Tensile Strength Break:

No.	Value	Note	Elongation
1	90 MPa	20% glass reinforced, ASTM D638 [2]	3%
2	50 MPa	unreinforced, ASTM D638 [2]	50%

Flexural Strength Yield:

No.	Value	Note
1	98 MPa	unreinforced, ASTM D790 [2]

Impact Strength: High-impact strength which is retained at -40° [1,3]
Hardness: Rockwell R115 (ASTM D785) [2], L106 (20% glass reinforced, ASTM D785) [2]
Izod Notch:

No.	Value	Notch	Note
1	80 J/m	Y	20% glass reinforced, ASTM D256 [2]
2	200 J/m	Y	ASTM D256 [2]

Charpy:

No.	Value	Notch	Note
1	0.005	Y	unreinforced [2]

Electrical Properties:

Electrical Properties General: High volume resistivity and dielectric strength unaffected by changes in humidity [3]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.7	50 Hz	unreinforced, ASTM D150 [2]
2	2.9	50 Hz	glass reinforced, ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	22 $kV.mm^{-1}$	3.2 mm, unreinforced, ASTM D149
2	17 $kV.mm^{-1}$	3.2 mm, glass reinforced, ASTM D149 [2]

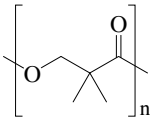
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0004	50 Hz	unreinforced, ASTM D150 [2]
2	8×10^{-5}	50 Hz	glass reinforced, ASTM D150 [2]

Polymer Stability:

Flammability: Variation of polymer components will produce different blends with different flame retardant props. Flame retardancy of blends is intermed. between high flame retardancy of PPE and high flammability of polystyrene. Limiting oxygen index 24% (ASTM D2863) [1]
Chemical Stability: Attacked by many organic solvents, particularly aromatic and chlorinated aliphatics [3]. Swollen by aliphatic compds.
Hydrolytic Stability: Highly resistant to hydrol. under acidic and basic conditions [2] and very stable to water

Applications/Commercial Products:



Processing & Manufacturing Routes: Can be extruded or injection moulded and fabricated by solvent, ultrasonic or heat melding [3]
Applications: Water distribution including plumbing fixtures, pumps and filters, electrical-electronic appliances; cable covers, junction boxes, motor housings, business machines, and automobiles. Instrument panels, electrical connectors and filler panels. Some grades suitable for use with foodstuffs

Poly(α,α-dimethyl-β-propiolactone) P-190

Synonyms: *Poly(pivalolactone). PVL. Poly(β-pivalolactone). Poly(3,3-dimethyl-2-oxetanone). Poly(oxycarbonyl(1,1-dimethylethylene)). Poly(oxy(2,2-dimethyl-1-oxo-1,3-propanediyl)). Poly(hydroxypivalic acid). Poly(2,2-dimethylhydracrylic acid). Poly(3-hydroxy-2,2-dimethylpropanoic acid)*
Monomers: 3-Hydroxy-2,2-dimethylpropanoic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.	Note
30622-81-2	Poly(3-hydroxy-2,2-dimethyl propanoic acid)
24969-13-9	Poly(3,3-dimethyl-2-oxetanone)

Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Morphology: Displays three crystalline polymorphs α, β and γ. Cryst. struct. has been reported [5,32,39]. Three polymorphic forms have been reported [4,17,26]. Morphological study has been reported [18]. α form monoclinic a 0.905, b 1.158, c 0.603, β 121.5°, helix 2_1 [6]; α form monoclinic a 0.902, b 1.164, c 0.602, β 121° 29", helix 2_1 [7]; β form c 0.476 [18]; γ form orthorhombic a 0.823, b 1.127, c 0.604, helix 2_1 [18]. γ form orthorhombic a 0.823, b 1.128, c 0.602, helix 2_1 [21]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.223 g/cm^3	cryst. [4]
2	d^{20} 1.097 g/cm^3	amorph. [4]
3	d^{25} 1.1 g/cm^3	amorph. [9]
4	d 1.19 g/cm^3	[35]
5	d^{25} 1.23 g/cm^3	cryst. [9]
6	d^{235} 0.94 g/cm^3	amorph. [9]
7	d 1.18 g/cm^3	[10]
8	d^{23} 1.185 g/cm^3	[15]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00065 K^{-1}	200-250° [9]	V

Thermodynamic Properties General: C_p values have been reported [25,38]
Latent Heat Crystallization: Heat of polymerisation -84.2 kJ mol^{-1} (-20.1 kcal mol^{-1}) [3]. ΔH°_f 14.86 kJ mol^{-1} (3.55 kcal mol^{-1}); $\Delta^\circ S_f$ 28.97 J mol^{-1} K^{-1} (6.92 cal mol^{-1}°C^{-1}) [9]; ΔH_f 118 Jg^{-1} [13]; ΔH_f 14.5 kJ mol^{-1} [15]; ΔH_f 120 Jg^{-1} [35]. Heat of polymerisation 77 kJ mol^{-1} [33]. Other enthalpy, entropy and Gibbs functions have been reported [38]
Melting Temperature:

No.	Value	Note
1	245°C	[4]
2	228°C	β-form [4]
3	240°C	[6,10,15,24,33]
4	235°C	508K, α-form [8]
5	242°C	[12]
6	234°C	[14]
7	230–240°C	α-form [18]
8	239°C	512K, β-form [8]
9	210–220°C	γ-form [18]

Glass-Transition Temperature:

No.	Value	Note
1	-10°C	[4,10]
2	96°C	369K [13]
3	100°C	373K [15,35]
4	6°C	[23]
5	137°C	410K [24,37]
6	-25°C	[25]
7	-3°C	270K [34]
8	67°C	340K [34]
9	-13°C	260K [38]

Deflection Temperature:

No.	Value	Note
1	180–200°C	264 lb f in^{-2} [4]

Vicat Softening Point:

No.	Value	Note
1	220°C	[4]

Transition Temperature:

No.	Value	Note	Type
1	238–240°C	[9]	T°_m
2	265–271°C	[16]	T°_m

3	269°C	[20]	T°_{m}
4	272°C	[22]	T°_{m}
5	240°C	513K [35]	T°_{m}
6	27°C	300K [13]	T_{γ}
7	2°C	275K [24,37]	T_{γ}

Surface Properties & Solubility:

Solubility Properties General: Immiscible with bisphenol A polycarbonate [12] and polyvinyl chloride [15]
Solvents/Non-solvents: Sol. CH_2Cl_2 [9], hot phenol, hot 2-chlorophenol, hot cresols, hot trichloroacetic acid [27]. Insol. common organic solvents [23]
Wettability/Surface Energy and Interfacial Tension: Interfacial surface free energy 6.1×10^{-6} J cm^{-2} (61 erg cm^{-2}, perpendicular) [20]; 4.3×10^{-6} J cm^{-2} (43 erg cm^{-2}, perpendicular) [16]; 2.9×10^{-6} J cm^{-2} (29 erg cm^{-2}, parallel) [20]; 1.3×10^{-6} J cm^{-2} (13 erg cm^{-2}, parallel) [16]

Transport Properties:

Polymer Solutions Dilute: η_{inh} 0.3 dl.g^{-1} (trifluoroacetic acid) [2]; η_{inh} 1.48 dl.g^{-1} (phenol/tetrachloroethane (60:40), 30°) [19]. Other viscosity values have been reported [23]
Polymer Melts: Melt viscosity has been reported [4]
Water Content: Other water absorption values have been reported [31]
Water Absorption:

No.	Value	Note
1	0.2 %	24h [4]
2	0.14–0.22 %	11 days [23]

Mechanical Properties:

Mechanical Properties General: Fibre-mechanical props. have been reported [10,33]. Tensile strength break values have been reported. [4,23,30] Yield stress and strain have been reported in graphical form [23]. Storage and loss moduli have been reported in graphical form [13,23]

Tensile (Young's) Modulus:

No.	Value	Note
1	1130 MPa	[35]

Elastic Modulus:

No.	Value	Note
1	6276 MPa	64000 kg cm^{-2} [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	38 MPa	4-6%	[4]

Impact Strength: Tensile impact strength 100 kJ m^{-2} [4]. Impact resistance has been reported [30]
Viscoelastic Behaviour: Creep resistance 0.8% length increase (10000h, 20°, 20.6 MPa stress) [4]. Stress-strain [8,23] and stress-relaxation curves have been reported [13]. Viscoelastic props. have been reported [13]
Hardness: Shore D85 [4]
Izod Area:

No.	Value	Notch	Note
1	4 kJ/m^2	Unnotched	[4]

Charpy:

No.	Value	Notch	Note
1	3.4	Y	[4]
2	4.6	N	[4]

Electrical Properties:

Electrical Properties General: Dielectric relaxation data has been reported. [37] Dissipation factor data have been reported in graphical form [13,14,23,24]

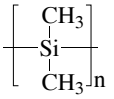
Optical Properties:

Optical Properties General: Optical props. have been reported [30]
Transmission and Spectra: Mass [2,11,19], H-1 nmr [14], C-13 nmr [17] and x-ray PES spectral data have been reported [36]

Polymer Stability:

Decomposition Details: Stable for 1000h at 200° (fibres) [33]. Thermal decomposition causes depolymerisation by unzipping [4]. Thermal degradation details have been reported [11,19]. Activation energy of thermal degradation 98.4 kJ mol^{-1} (23.5 kcal mol^{-1}, 400–600°) [28]. Temp. of max. decomposition rate 410° [19]
Environmental Stress: Fibres have high resistance to weathering [4] and uv light [3]
Chemical Stability: Resistant to aliphatic and aromatic hydrocarbons, alcohols, ketones, and AcOH [4]. Fibres are resistant to acids, alkalis and solvents [4,33]
Biological Stability: Biodegradation study has been reported [29]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by nucleophilic or electrophilic ring-opening polymerisation of 2,2-dimethyl-β-propiolactone. Also synth. by ring opening polymerisation of pivalolactone using a weakly basic substance such as a tertiary amine or a phosphine as a catalyst, e.g. triphenylphosphine at 75° [3,9,39]
Applications: Fibre used in modification of rubbers. Matrix for fibre composites

Poly(dimethylsilane) P-191

Synonyms: *Poly(dimethylsilylene). PDMS. PDMSi*
Related Polymers: Polycarbosilanes, Poly(silane)
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
28883-63-8

Molecular Formula: $(C_2H_6Si)n$
Fragments: C_2H_6Si
Molecular Weight: 2,175 [17]
Morphology: Off-white powder [7,10] with a Si-Si backbone chain conformation of *all-trans* configuration, similar to that found with analogues PDES and PDPrS. The room temperature d-spacing can be indexed by a monoclinic unit cell with dimensions a=0.745nm (12.2Å); b=0.724nm (8.0Å); c=0.389nm (3.88Å) and γ=90° [1,3,5,20]
Miscellaneous: Side-chain interactions are minimal, yet the Si backbone is exceptionally rigid.
Chain orientation is strongly affected by vacuum pressure and also by the substrate temperature during deposition. The substrate temperature also affects the orientation of the polymer. An ordered phase is observed at low temperature, followed by disordered and ordered phases with an increase in temperature. As temperature is further increased, a transformation to a more disordered phase (gauche-rich conformation) occurs slowly [2,3,5,7]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: T_{CM} 162°C; ΔH_{CM} 0.6kJ mol^{-1}; T_{ML} 226°C; ΔH_{ML} 0.2kJ/mol [7,13]
The kinetic parameters of thermal degradation were evaluated by different integral methods using TG data. The activation energy of decomposition (E) for the polymer is 122kJ mol^{-1}, and the corresponding value of order of reaction is 1 [16]

Surface Properties & Solubility:

Solubility Properties General: Insoluble in organic solvents at room temperature [3,12]

Mechanical Properties:

Mechanical Properties General: See [20]

Electrical Properties:

Electrical Properties General: Electrical conductivity along the c axis is expected to be greater than that perpendicular to the c axis [3]. It has been found that electrical conductivity increases with increasing irradiation time, and found from alternating current measurements that both the real and the imaginary parts of the complex dielectric constant increase with increasing irradiation time [8]

Optical Properties:

Optical Properties General: Heating the polymer to 160°C does not lead to any significant change of the UV spectrum, pointing to the absence of thermochromic effect, as found with other poly(dialkylsilyene)s. Only a slight shift of the band to 334nm and its broadening are observed, the picture being not reversible. However, ir spectra samples after heating in air to 200°C show the presence of SiOSi bonds due to the partial oxidation of the polymer [8,12,20]
Transmission and Spectra: Ir [7,8,9,12,21], Raman [12], uv-vis [3,8,9,10], nmr [2,7,20] and pes [11] spectra reported.

Polymer Stability:

Thermal Stability General: Thermal degradation has been investigated by pyrolysis-gas chromatography and thermogravimetry. Decomposition produces linear and cyclic oligomeric products [16]. The polymer was found to be much less stable than the styrene copolymer.
Decomposition Details: The DSC behavior of the polymer is complicated and shows a number of weak endotherms. Second and subsequent heating scans show only two well defined peaks at 162°C and 226°C [6,7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synthesised by the reaction of dimethyldichlorosilane with Na in toluene [12]. Due to its insolubility, thin films have been prepared by a new vacuum evaporation technique [3,4]. Epitaxial growth of evaporated films on poly(tetrafluoroethylene) layer [15]
Applications: Electro luminescent device [4]. Good ceramic material precursors for making meltable and soluble polycarbosilanes [6]. Preparation of polycarbosilane in the presence of zeolite as a catalyst [14]. Correction of pattern defects of colour filters for liquid crystal displays [18]. Rare earth magnets with surface protection layers [19]. Method of synthesising the polycarbosilane at normal pressure by adding several wt. % of polyborodiphenylsiloxane to PDMS [20]

Polydimethylsiloxane P-192

Synonyms: *PDMS. Dimethicone. Dimethylsilicone. Dimethyl polysiloxane. Polydimethylsilicone. Poly[oxy(dimethylsilylene)]. Methylsilicone*
Related Polymers: Polysiloxanes, PDMS Fluids, PDMS Gum, Dimethiconol
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.
9006-65-9
9016-00-6
63148-62-9

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	-123°C	[3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 $J^{1/2}$ $cm^{-3/2}$ (7.5–7.6 $cal^{1/2}$ $cm^{-3/2}$). δ_d 15.9; δ_p 0.0; δ_h 4.1 [1,5,6]
Solvents/Non-solvents: Sol. chlorinated hydrocarbons, aromatic hydrocarbons, aliphatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [1,4,5,6]

Electrical Properties:

Electrical Properties General: Has excellent insulating props.

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.404	[4]

Polymer Stability:

Polymer Stability General: Stable material usable over wide temp. range
Flammability: Low flammability [2,7]
Environmental Stress: Resistant to oxidative degradation, water, and corona discharge [7]
Chemical Stability: Chemically inert [4,7]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. [1,2,7]
Biological Stability: Non-biodegradable

Applications/Commercial Products:

Processing & Manufacturing Routes: Cyclic dimethylsiloxanes are polymerised at 150–200° with an alkaline catalyst. Small quantities of hexamethyldisiloxane are added to terminate the siloxane chains
Applications: Low MW PDMS is the basis of silicone fluids while high MW PDMS is the basis of PDMS gum which is cured to produce rubbers. Liq. prepolymer used in manufacture of optical channel waveguides

Transport Properties:

Polymer Melts: Kinematic viscosity 100000 St (approx.) [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.404	[1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Cyclic dimethylsiloxanes are polymerised at 150–200° with an alkaline catalyst. Small quantities of hexamethyldisiloxane are added to terminate the siloxane chains. To reduce mould shrinkage low MW siloxanes can be removed by solvent extraction or thermal treatment. In solvent extraction volatile siloxanes are removed by washing in MeOH. In thermal treatment the gum is steam or air stripped at 250°. These processes reduce the volatile fraction of the gum from around 10% by weight to less than 2%
Applications: Gum precursor for rubber manufacture. See methylsilicone rubber

Poly(dimethylsiloxanes) with liquid crystal sidechains P-193

Synonyms: *Side chain liquid crystalline polydimethylsiloxane copolymers*
Related Polymers: Poly(hydrogenmethyl siloxanes) with liquid crystal sidechains, Poly(methylhydrogensiloxane-*co*-dimethylsiloxane) fluid
Monomers: Dichlorodimethylsilane
Material class: Polymer liquid crystals, Copolymers
Polymer Type: dimethylsilicones
Molecular Formula: $[(C_2H_6OSi)(C_{24}H_{36}OSi)]_n$
Fragments: C_2H_6OSi $C_{24}H_{36}OSi$
Morphology: Shows liq. cryst. phase below isotropisation temp. [4]

Volumetric & Calorimetric Properties:

Volumetric Properties General: For copolymers with alkyl ester side chains the thickness of films falls by over 10% with rise in temp. above the liq. crystalline 'mesophonic' temp. range [3]
Melting Temperature:

No.	Value	Note
1	51°C	alkyl ether side chain [2]

Glass-Transition Temperature:

No.	Value	Note
1	-121°C	alkyl ether side chain [2]
2	15°C	alkyl ether side chain [2]

Transition Temperature:

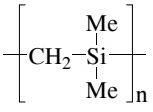
No.	Value	Note	Type
1	222°C	[2]	Isotropisation temp

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons. Insol. alcohols, H_2O [1]

Polymer Stability:

Thermal Stability General: Stable over wide temp. range, primarily above T_g
Chemical Stability: Stability depends on props. of the side chain
Hydrolytic Stability: Stable to H_2O, and aq. solns. Depolymerised by high pressure steam [5]
Recyclability: Not recyclable



Applications/Commercial Products:

Processing & Manufacturing Routes: Substituted alkene and polymethyldimethylsiloxane fluid are mixed together in dry toluene under nitrogen with platinum catalyst at 100° for about 48h. If there is a small excess of the substituted alkene this results in complete conversion of all SiH bonds [1,6]

Poly[(dimethylsilylene)methylene] P-194

Synonyms: *Poly(1,1,3,3-tetramethyl-1,3-disilacyclobutane), SRU. PDMSM*
Monomers: 1,1,3,3-Tetramethyl-1,3-disilacyclobutane
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.	Note
25722-25-2	
98261-12-2	α-Et, ω-Br
98241-69-1	α-Me, ω-Cl

Molecular Formula: $(C_3H_8Si)n$
Fragments: C_3H_8Si
Molecular Weight: MW 357,000–721,000 [11,12,13,14]; M_n 120,000 and 170,000 [5,6,7]
General Information: Has significant inorganic character. A candidate for analysis with regard to the problem of the effect of structure on the statistical properties of a chain molecule. Like PDMSO, it is an amorphous, non-glassy material at room temperature, has excellent thermal stability, and is soluble in a variety of solvents [3]. Also available end-capped α=Et, ω=Br or α=Me, ω=Cl [2].
Tacticity: Relatively small characteristic ratio [4]. The melt is much more strongly structured, and the individual chains have mean square dimensions 40% higher than the ones predicted by the RIS model for the single chain. Intermolecular packing interactions in the structured PDMSM melt are accompanied by expansion of individual chains [5]
Morphology: An amorphous, non-glassy material at room temperature. The packing of poly(di-*n*-alkylsilylenemethylene) (PDASM) chains has been studied using X-ray electron diffraction. The PDASM with the shorter substituent showed a lack of ability to interlock its side chains due to the short length of the alkyl groups. It has been found that the length of the alkyl side chains could change the packing arrangement from monoclinic to orthorhombic to hexagonal with only short-range order as the alkyl side chain length decreases at room temperature [1,15]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.906 g/cm^3	[12]

Thermodynamic Properties General: Enthalpy of sorption of *n*-alkanes has been calculated and shown to be in good agreement simulation with available experimental [15]
Glass-Transition Temperature:

No.	Value	Note
1	-95–-88°C	Low temperature is a direct result of the larger Si-C bond length compared to the C-C bond length [11,14,16]

Surface Properties & Solubility:

Solubility Properties General: Soluble in a variety of solvents [3,12,15,16]. Viscosity and osmotic pressure of dilute solutions have been measured [3]. High molar mass PDMSM is miscible only with PIB oligomers with MW=1500 g mol^{-1} [11].
Wettability/Surface Energy and Interfacial Tension: Cohesive energy density 32–34cal cm^{-1} at 373K. Surface energy 30–31erg cm^{-1} at 373K [5]

Transport Properties:

Transport Properties General: PDMSM has the highest gas permeability coefficient, but poor film-forming properties of this amorphous polymer complicate its application as a membrane material. PDMSTM, due to its crystallinity and higher glass-transition temperature, shows much lower permeability coefficients [12]
Polymer Melts: PDMSM melt densities in the temperature range 296–308K and 0.1MPa [15]
Permeability and Diffusion General: Experimental and simulated gas permeability of polysilylmethylenes has been reported [12,14]

Mechanical Properties:

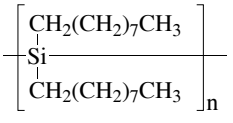
Mechanical Properties General: Elasticity and thermoelastic measurements have been recorded [3]. Poor mechanical characteristics, such as inability to form stable films, may be solved by direct controlled curing of the polymer (radiation induced or chemical, in particular, peroxide-induced curing), or by introduction into the polymer of a necessary amount of reactive functional groups (for example, unsaturated) by copolymerisation of the monomer with comonomers containing these groups. This would enable cross-linking following film formation. However, both these approaches have proven difficult to accomplish, because of the high chemical stability of the polymer, and the labour-consuming preparation of the soluble functionalised silylmethylene polymer [14]

Electrical Properties:

Electrical Properties General: Dielectric constants and refractive indices have been measured [3]

Optical Properties:

Transmission and Spectra: Ir [8,10,13], uv [13], nmr [7,13] and X-ray diffraction pattern has been studied [1,13].



Polymer Stability:
Thermal Stability General: Orders of thermal stability are as follows: In He, polydimethylsilylmethylene > polydimethylsiloxane > polyisobutylene; in air, polydimethylsiloxane > polyisobutylene [7]
Decomposition Details: A fractionally pptd. PDMSM had a weight loss of 5% at 266°C in air [11], and less than 5% at 585–600°C in He [7,11]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by the Grignard synthesis of the monomer, 1,1,3,3-tetramethyl-1,3-disilacyclobutane, followed by its ring-opening polymerisation using a suitable platinum catalyst [2,3,6,11]. Photocatalysed ring-opening polymerisation of 1,1,3,3-tetramethyl-1,3-disilacyclobutane [1,2,12]
Applications: PDMSM gums have been converted into a new type of rubber [6]. Polycarbosilanes have been of significant interest owing to their potential applications as silicon carbide ceramic precursors [12]. Most promising polymer for use as a material separating hydrocarbon gases [14]. Membrane material [15]. Secondary battery [17]

Poly(dinonylsilane) P-195

Synonyms: *Poly(dinonylsilylene). PDNS*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane)
Polymer Type: polysilanes
CAS Number:

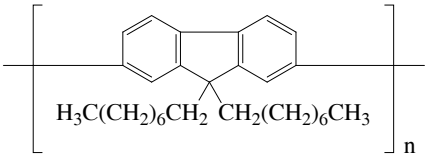
CAS Reg. No.
148160-57-0

Molecular Formula: $(C_{18}H_{38}Si)n$
Fragments: $C_{18}H_{38}Si$
Morphology: Si-Si backbone conformation *trans*-gauche-*trans*-gauche′ (TGTG′) has been observed.

The room temperature d-spacings can be indexed by an orthorhombic unit cell with dimensions a=20.5Å; b=25.1Å; c=7.8Å and γ=90° [1,2]

Electrical Properties:
Electrical Properties General: A value of 2.6×10^{-7}S m^2/J is found for phase KTG. Above the KTG to M transition at 23°C, a value of 2.3×10^{-8}S m^2/J in phase M is obtained close to the values obtained for the other polymers in phase M [2]

Optical Properties:
Optical Properties General: At high temperatures, a single absorption at 318nm is observed for phase M. On cooling, a small absorption centered at 375nm appeared at 9°C, while at -9°C a hypsochromic shift to 358nm is observed with a shoulder at 350nm. On heating, this transforms into a single absorption centered at 350nm characteristic for phase KTG. This change is related to the cold crystallisation. At 25°C, the normal thermochromism at the transition is observed, resulting in a λ_{max} of 318nm.
The crystallisation to the ktg phase is a slow process so that part of the polymer is immobilised below -15°C in a phase that is less crystalline but shows a somewhat larger λ_{max} of 358nm. At -5°C, the cold crystallisation completes the formation of the ktg phase. Further heating results in the normal ktg to M transition at 23°C



Optical Properties:
Transmission and Spectra: uv [2]

Polymer Stability:
Thermal Stability General: The DSC scan obtained for PDNS shows an exothermic cold crystallisation peak at -5°C with an enthalpy change of *ca.* 4kJ mol^{-1} on heating followed at 23°C by the endothermic peak with a ΔH of 12kJ mol^{-1} associated with the ktg to M transition. On cooling, a single exothermic crystallisation peak is observed at -9°C with a ΔH of 8kJ mol^{-1} [2]

Poly(9,9-dioctylfluorene) P-196

Synonyms: *Poly(9,9-dioctyl-9H-fluorene-2,7-diyl). PDOF. PFO. F8*
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.	Note
123864-00-6	Poly(9,9-dioctylfluorene)
195456-48-5	Poly(9,9-dioctyl-9*H*-fluorene-2,7-diyl)

Molecular Formula: $(C_{29}H_{40})_n$
Fragments: $C_{29}H_{40}$
General Information: Stable blue light-emitting electroluminescent and photoluminescent polymer with liquid crystalline properties. Polymer is produced as yellow powder or flakes.
Morphology: Morphology of crystal phases reported in detail [1,2,3]. Heat treatment of liquid crystalline polymer followed by quenching results in orientation as glassy monodomain on a suitable polymer layer for use in LED devices [4].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	47–80°C	dependent on molecular weight [1,5,6,7,8]

Transition Temperature General: Transition to nematic phase at about 160° [1]. Liquid becomes isotropic at about 270–280° [1,20].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$, toluene, CH_2Cl_2, THF [5,6].

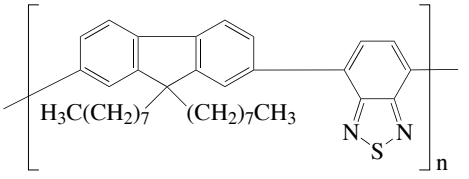
Electrical Properties:
Electrical Properties General: Several LED devices with PDOF as blue light-emitter have been reported, with light turn-on voltages of 4–7.5V [4,7,9,10]. Ionisation potential of PDOF film 5.6–5.8eV [11,12].

Optical Properties:
Optical Properties General: Blue-light photoluminescence occurs with λ_{max} in region of 410–420nm and band gap of 3.1–3.6eV [7,12]. Electroluminescence from LED devices with λ_{max} in region of 435–456nm [7,9,10], including polarised electroluminescence [4].
Refractive Index:

No.	Value	Note
1	1.614–1.781	min. at 900nm; max. at 450nm [13]

Transmission and Spectra: Pmr [14,15], cmr [14,15], Raman [16,17], uv and photoluminescence [3,5,7,8,9,16,18], electroluminescence [4,7,9,10,19] and x-ray [1,2,3] spectral data have been reported.

Polymer Stability:
Polymer Stability General: Good stability in presence of oxygen, moisture and light [5].
Thermal Stability General: Thermal degradation above 348°C [7,20].



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. originally by oxidation of 9,9-dioctylfluorene monomer with $FeCl_3$ [6], and later by Ni(0)-catalysed polymerisation of 2,7-dibromo-9,9-dioctylfluorene, or Suzuki coupling of the dibromo monomer with diboronate derivative to give higher molecular-weight polymers [14,15].
Applications: Main potential application is as a blue light-emitter for light-emitting diodes, also for thin film transistors, lasers and light-emitting electrochemical cells.

Poly(9,9-dioctylfluorene-*co*-2,1,3-benzothiadiazole) P-197

Synonyms: *Poly[2,1,3-benzothiadiazole-4,7-diyl(9,9-dioctyl-9H-fluorene-2,7-diyl)]. 9,9-Dioctylfluorene 2,1,3-benzothiadiazole copolymer. F8BT*
Related Polymers: Poly(9,9-dioctylfluorene)
Monomers: 2,1,3-Benzothiadiazole
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.	Note
210347-52-7	Poly[2,1,3-benzothiadiazole-4,7-diyl (9,9-dioctyl-9*H*-fluorene-2,7-diyl)]
316825-94-2	9,9-Dioctylfluorene-2,1,3-benzothiadiazole copolymer

Molecular Formula: $(C_{35}H_{42}N_2S)_n$
Fragments: $C_{35}H_{42}N_2S$
General Information: Stable green-yellow light-emitting photoluminescent and electroluminescent polymer with liquid crystalline properties and with good electron transport mobility. Polymer is prod. as yellow fibrous solid.
Morphology: Morphology of films is dependent on molecular weight and annealing temperature [1] as well as solvent used for casting [2].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	125–135°C	[3]

Transition Temperature General: Transition to liquid crystalline phase in the region of 220–280°C depending on molecular weight [3,16]. High molecular-weight samples still exhibited no transition to isotropic liquid above 300°C [3].

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameter 19.4–21.6 $(J\ cm^{-3})^{1/2}$ [20].
Solvents/Non-solvents: Tetrachloroethane, *p*-xylene, *o*-xylene, toluene, $CHCl_3$, isodurene [2].

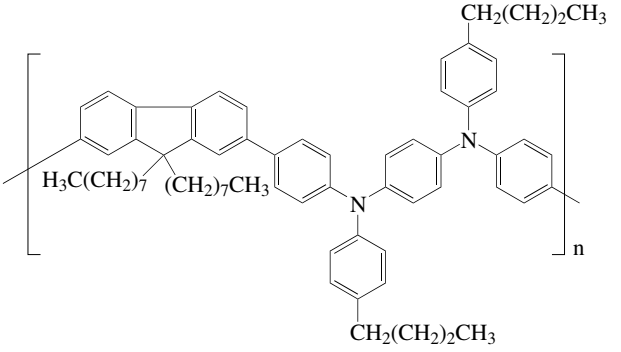
Electrical Properties:

Electrical Properties General: Electron mobility has been recorded; ionisation potential 5.9eV, estimated electron affinity 3.2eV [4]. Photocurrent in photovoltaic devices is greatly enhanced by blending with a hole-transporting fluorene copolymer [5,6,7,8]. LED devices with F8BT as green-yellow light emitter have been reported [9,10,11].

Optical Properties:

Optical Properties General: Green-yellow light photoluminescence and electroluminescence with λ_{max} in the region of 550nm reported, with dichroic ratios up to 9 from aligned films [11]. Refractive indices for aligned and unaligned films at different wavelengths have been reported [12,13].
Transmission and Spectra: Pmr [14], Raman [1,15], uv and photoluminescence [1,6,7,8,9,10,11,16], electroluminescence [9,10,11] and x-ray [1] spectral data have been reported.

Applications/Commercial Products:



Processing & Manufacturing Routes: Produced mainly by Suzuki coupling between 4,7-dibromo-2,1,3-benzothiadiazole and the diboronate derivative obtained from 2,7-dibromo-9,9-dioctylfluorene [14,17,18].
Applications: Main potential applications as polymer blend in photovoltaic devices, for light-emitting diodes and as gain medium for lasers.

Poly(9,9-dioctylfluorene-*co*-bis-*N*,*N*′-(4-butylphenyl)-*N*,*N*′-diphenyl-1,4-benzenediamine) P-198

Synonyms: *PFB*
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.
223569-28-6

Molecular Formula: $(C_{67}H_{78})_n$
Fragments: $C_{67}H_{78}$
General Information: Stable blue light-emitting photoluminescent and electroluminescent polymer with high hole-transporting mobility.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, xylene [1,2].

Electrical Properties:

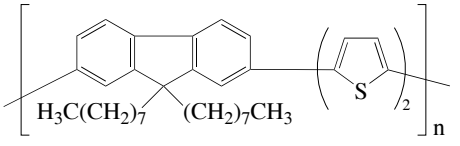
Electrical Properties General: Ionisation potential 5.09eV [3]. The hole mobility of PFB films has been studied [3,4]. In photovoltaic devices the photocurrent from PFB alone is much less than from blends with F8BT [5].

Optical Properties:

Optical Properties General: Blue-light photoluminescence and electroluminescence with λ_{max} values in the region of 450–460nm reported [1,6]. A graph of refractive indices *vs.* wavelength in films has been reported [7].
Transmission and Spectra: UV and photoluminescence [1,2,6], electroluminescence [6], and Raman [8] spectral data have been reported.

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mostly by Suzuki coupling of the diboronate derivative of 2,7-dibromo-9,9-dioctylfluorene with the dibromo derivative of the benzenediamine monomer [3,9].



Applications: Mostly used as a polymer blend with dioctylfluorene-benzothiadiazole copolymer for development of photovoltaic devices.

Poly(9,9-dioctylfluorene-*co*-2,2′-bithiophene) P-199

Synonyms: *Poly[[2,2′-bithiophene]-5,5′-diyl(9,9-dioctyl-9H-fluorene-2,7-diyl)]. 9,9-Dioctylfluorene-2,2′-bithiophene copolymer. F8T2. PBTF*
Related Polymers: Poly(9,9-dioctylfluorene), Poly(thiophene)
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.	Note
210347-56-1	Poly[[2,2′-bithiophene]-5,5′-diyl(9,9-dioctyl-9*H*-fluorene-2,7-diyl)]
289625-34-9	9,9-Dioctylfluorene-2,2′-bithiophene copolymer

Molecular Formula: $(C_{37}H_{44}S_2)n$
Fragments: $C_{37}H_{44}S_2$
General Information: Stable green light-emitting photoluminescent and electroluminescent polymer with liquid crystalline properties and with good hole mobility. Polymer is prod. as yellow fibrous solid.
Morphology: Morphology has been described, with nematic phase usually occurring above 265°C [1,2,3].

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	73–132°C	[3,4]

Transition Temperature General: Melting to nematic phase in the region of 200–265°C [1,3]. Recrystallisation occurs at 195°C on slow cooling [3].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. xylenes, THF, $CHCl_3$ [2,5]

Electrical Properties:

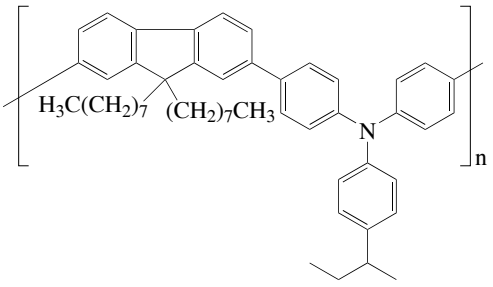
Electrical Properties General: Hole-transporting polymer with p-channel characteristics in thin-film transistors [2,3]. Aligned films show mobility anisotropies of current flow in transistor [6]. LED devices with F8T2 as green light emitter have been reported [4,7,8].

Optical Properties:

Optical Properties General: Green light photoluminescence and electroluminescence with λ_{max} in the region of 550–590nm; a red shift is observed on changing from $CHCl_3$ soln. to film [4,5,7,9].
Transmission and Spectra: Pmr [5,9,10], cmr [9,10], ir [10], uv and photoluminescence [1,2,4,5,6,7,9,10] and electroluminescence [4,7,8] spectral data have been reported.

Polymer Stability:

Decomposition Details: Decomposition temp. >400°C [2].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mainly by Suzuki coupling between 5,5′-dibromo-2,2′-bithiophene and the diboronate derivative obtained from 2,7-dibromo-9,9-dioctylfluorene [5,8,11]; also by Stille-type coupling with distannylated bithiophene derivative [9].
Applications: Potential applications in thin-film transistors, light-emitting diodes and photovoltaic devices.

Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.
220797-16-0

Molecular Formula: $(C_{51}H_{61}N)_n$
Fragments: $C_{51}H_{61}N$
General Information: Stable photoluminescent and electroluminescent polymer with good hole transporting properties. Polymer is prod. as pale yellow solid.

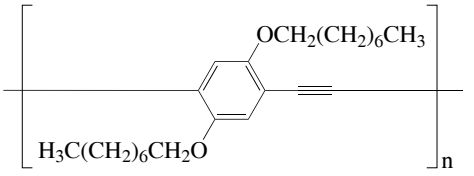
Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	148°C	reported for sample with M_n=56000 [1]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Solubility parameter 17.3–19.3 (J $cm^{-3})^{1/2}$ [1]
Solvents/Non-solvents: Sol. *p*-xylene [1], toluene [2]

Electrical Properties:
Electrical Properties General: Polymer has good hole transport mobility, with ionisation potential of 5.30eV and band gap of 3eV [1,3]. LED devices of TFB blended with F8BT with strong electroluminescence and light turn-on voltages as low as 2V have been reported [1,2,4,5,6,9].

Optical Properties:
Optical Properties General: Polymer exhibits blue-light photoluminescence with λ_{max} in the region of 440nm [7]; yellow-green light electroluminescence from LED devices with TFB:F8BT blends.
Transmission and Spectra: Pmr [2], Raman [1], uv and photoluminescence [7,8] and photoelectron [8] spectral data have been reported.



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Suzuki coupling between *N*,*N*-bis(4-bromophenyl)-4-(1-methylpropyl)aniline and the diboronate compd. derived from 2,7-dibromo-9,9-dioctylfluorene [2,3].
Applications: Used mainly as blend with F8BT for development of light-emitting diodes.

Supplier
H. W. Sands

Poly(2,5-dioctyloxy-1,4-phenylene ethynylene) P-201

Synonyms: *Poly[[2,5-bis(octyloxy)-1,4-phenylene]-1,2-ethynediyl]. O-OPPE*
Material class: Thermoplastic
Polymer Type: poly(arylene ethynylene)
CAS Number:

CAS Reg. No.	Note
153033-25-1	poly[[2,5-bis(octyloxy)-1,4-phenylene]-1,2-ethynediyl]
153033-33-1	

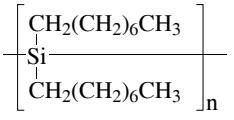
Molecular Formula: $(C_{24}H_{36}O_2)n$
Fragments: $C_{24}H_{36}O_2$
General Information: Photoluminescent and electroluminescent polymer with greater solubility than poly(1,4-phenylene ethynylene). Prod. as orange solid.
Morphology: The annealed polymer exhibits a layered structure with main chains coplanar and side chains extending obliquely from main chains and not interleaved with adjacent side chains [1].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$, toluene, CH_2Cl_2 [1]

Electrical Properties:
Electrical Properties General: Exhibits electroluminescence in LED devices in yellow-green region of spectrum with turn-on voltage of 11v [2].

Optical Properties:
Optical Properties General: Exhibits photoluminescence in green region of spectrum (λ_{max} 470–480 nm in $CHCl_3$) [1,3,4] with a considerable red shift on going from soln. to film (λ_{max} in region of 540–580 nm) [1,5]. Refractive indices and third-order nonlinear optical susceptibilities have been reported [6].
Refractive Index:

No.	Value	Note
1	1.78	(550nm, film) [1]



Transmission and Spectra: Pmr [3,4], cmr [4], ir [4], uv and photoluminescence [1,3,4,5], electroluminescence [2] and x-ray diffraction [1] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by catalytic coupling reaction between 1,4-dioctyloxy-2,5-diiodobenzene and 1,4-diethynyl-2,5-dioctyloxybenzene [1], or Pd-catalysed reaction of 1,4-dioctyloxy-2,5-diiodobenzene with tributylethynyltin [4,5].
Applications: Potential applications in chemical sensors [7] and for light-emitting diodes [2].

Poly(dioctylsilane) P-202

Synonyms: *Poly(dioctylsilylene). PDOctSi. PDOS. PDOctS*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane)
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
97036-68-5	PDOS homopolymer
98865-30-6	PDOS SRU

Molecular Formula: $(C_{16}H_{34}Si)n$
Fragments: $C_{16}H_{34}Si$
Molecular Weight: 32,000–10^6. The two samples were separated from a reaction product which had a bimodal molecular weight distribution. The higher molecular weight material adopts the *all-trans* conformation [2,5,6]
Tacticity: Exhibits the hexagonal, columnar mesophase both above and below its first-order transition temp. of -32°C. This type of behaviour is characteristic of poly(*n*-alkyl-*n*-alkylsilanes) with a side chain asymmetry of 2 or 3 C atoms.
Morphology: Soft white waxy solid.
3 types of Si-Si backbone conformations, i.e., helical, planar zigzag, and *trans*-gauche-*trans*-gauche′ (TGTG′), have been observed.
Unit cells parameters a=16.4Å; b=26.4Å; c=4.0Å and γ=90° [1,2,3,4,5,7,10,11]
PDOS has been found to yield at least three structures, and these are referred to as QM, ordered I, and II. All three appear to have qualitatively similar analogues in the literature. PDOS samples evidence two additional structures which are, from their X-ray spectra, reminiscent of the higher temperature thermotropic mesophase, type M, and so are designated M′ and M″. This M′ phase can best be distinguished by other characterisation methods. Isolating the claimed M″ was especially problematic because it is transient and only appeared as a minority phase in PDOS during the type I to II transition. Assuming solely a simple two-phase superposition of the type I and II phases does not fit the indicated M″ profile.
The type II structure is monotropic and appears only after warming from either the QM or type I phases above 10°C. In the latter instance, this process occurs extremely slowly. The PDOS type I phase itself forms only on cooling from the mesophase within a narrow temperature window spanning from 5 to 10°C. The precise conditions for formation of the M′ and M″ phases are not fully clarified. In this study the M′ phase was only observed on heating, but there is evidence that this phase may also form on cooling at sufficiently slow cooling rates.
Miscellaneous: Exhibits up to five distinct structural forms at temperatures below that of a 25°C transition to the thermotropic mesophase. Three of these are clearly ordered while the other two are mesophases with features suggestive of a less ordered state [5]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.91–1.01 g/cm^3	[5]

Thermodynamic Properties General: See [7,10]

Surface Properties & Solubility:
Solvents/Non-solvents: Quite hydrophobic and impervious to water, but soluble in toluene and other nonpolar organic solvents [1]

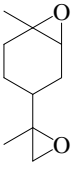
Electrical Properties:
Electrical Properties General: In the crystalline phase, the polymer displays a considerably higher conductivity than PDBS and PDHS in phase radiation-induced KHE. A similar value of 7x10^{-7}Sm^2/J has been observed [7]. Resistivity properties have been reported [13].

Optical Properties:
Optical Properties General: Exhibits a dramatic change in UV absorption above the phase-transition temperature. A shift of the 315nm absorption band to 370nm and a continuous blue shift of this band with pressure have been observed [4,10]

Optical Properties:
Transmission and Spectra: Ir [3,4]; Raman [3]; uv-vis [1,3,4,5,6,7,9,10,11]; nmr [9]; epr [12] spectra reported.

Polymer Stability:
Thermal Stability General: The type II and M′ structures both appear thermally stable up to 25°C. Thus, the reported 10°C crystal-HCM transition represents alternative structural pathways (on heating either QM to M′ or I to M″) [5,10]
Heating: *all-trans* phase to mesophase change at 11°C
Cooling: mesophase to *all-trans* phase change at -3°C [7]

Polymer Stability:
Decomposition Details: The DSC reveals a large cooling peak at 282K and two very small peaks at 252K and 316K. From this it has been observed that the polymer has a three-structure below 282K but a dimensional-ordered hcm with melted side chains and a disordered structure backbone above 316K. In addition, the small DSC peak at 316K should be attributed to the remaining *all-trans* component disappearance [10]



Applications/Commercial Products:
Processing & Manufacturing Routes: The dichlorodioctylsilane was polymerised by a Wurtz condensation reaction with Na in toluene at 110°C (36% yield) [1,5,10]
Applications: Used in electrically conductive polymer compositions [13,14]. Electrophotographic photoreceptor [15]. Effective mid-UV resists [16]

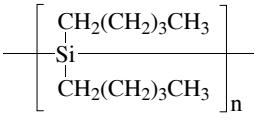
Poly(dipentene dioxide) P-203

Synonyms: *Poly[1-methyl-4-(2-methyloxiranyl)-7-oxabicyclo[4.1.0]heptane]. Poly(limonene dioxide)*
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.
29616-43-1

Molecular Formula: $(C_{10}H_{16}O_2)_n$



Applications/Commercial Products:

Processing & Manufacturing Routes: May be polymerised by photoinduction in the presence of an aryl substituted sulfonium salt [1]
Applications: Used in coatings. Uncured resin used as a reactive diluent in epoxy resin compositions

Poly(dipentylsilane) P-204

Synonyms: *Poly(dipentylsilylene). Dichlorodipentylsilane homopolymer. PDPS*
Material class: Thermoplastic
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
96228-24-9	poly(dipentylsilylene)
97036-66-3	dichlorodipentylsilane homopolymer

Molecular Formula: $(C_{10}H_{22}Si)n$
Fragments: $C_{10}H_{22}Si$
General Information: Thermochromic polymer exhibiting photoluminescence and electroluminescence in uv region. Prod. as white solid.
Morphology: Most stable conformation of backbone at r.t. is a 7/3 helical structure [1,2,3,4]. At low temperatures a *trans*-conformation is stable [2,5], which can also exist at r.t. [1]. On increasing the temperature to 35°C only the 7/3 helical conformation remains [1] and between 56 and 70°C there is a transition to a disordered columnar mesophase [1,2,6]. The *trans*-conformation can be formed at normal temperatures by application of high pressure [7].

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	-45.6°C	derived from heat capacity data [8]

Transition Temperature General: Endothermic transition at 35°C [1] and a weaker transition between 56 and 70°C [1,2,8], which is dependent on molecular weight of the sample [2]. These correspond to changes in conformation [1,2].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. toluene, $CHCl_3$, hexane, cyclohexane, THF; insol. alcohols [9].

Electrical Properties:

Electrical Properties General: Hole transport predominates by interchain hopping. There is little difference in hole transport for oriented and unoriented films [5]. LED devices using the polymer as an emissive layer have been produced, with electroluminescence in UV region (λ_{max} 355nm) [10]

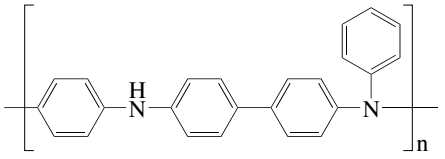
Optical Properties:

Optical Properties General: For polymer solutions the UV absorption spectrum exhibits a red shift with a reduction in temperature (λ_{max} 320nm at r.t. to 353nm at -36°C) [3]. Polymer films on heating exhibit a broadening of absorption with little change in position (λ_{max} *ca.* 315nm) [3,4]. An increase from normal to high pressure applied to polymer films results in a considerable red shift (λ_{max} 315 to 360nm), which is not completely reversible on reducing the pressure [11,12]. Photoluminescence peaks occur in UV region (λ_{max} 340, 370nm) [10]
Transmission and Spectra: Si-29 nmr [3,6,13], cmr [3], Raman [1,2,4,12], uv [1,3,4,11,12], electroluminescence [10] and x-ray diffraction data [1,3,4,7] have been reported

Polymer Stability:

Polymer Stability General: Photochemical degradation occurs on prolonged exposure to UV radiation by scission of σ-bonds
Decomposition Details: Decomposes (5% weight loss) at 272°C [8]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by Wurtz dehalogenation coupling of dichlorodipentylsilane with Na in toluene [9,13]

Poly(*N*,*N*′-diphenylbenzidine) P-205

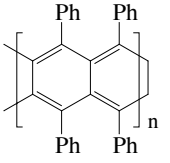
Synonyms: *Poly(DPBz). NNPheBz. Poly(DPB)*
Monomers: *N*,*N*′-Diphenylbenzidine
Polymer Type: polyaniline
CAS Number:

CAS Reg. No.
108443-85-2

Molecular Formula: $(C_{24}H_{18}N_2)_n$
Fragments: $C_{24}H_{18}N_2$
Molecular Weight: Initial GPC studies indicated sharp MW distributions for all polymers [3]
General Information: Can be reversibly doped [2]
Morphology: Green-dark brown [3]. *sec*-Amine hydrogen signatures observed in ir and nmr and accompanying strong five adjacent aromatic H signatures in the ir indicate alternating N- and *p*- linkages for the polymer [2,3]
Identification: C, 6; H, 4.6; N, 0.49 [3,5,6]

Surface Properties & Solubility:
Solubility Properties General: Can be recast from films from saturated solutions in a number of solvents, including $CHCl_3$ and DMF, of which the latter was found to be the most solubilising. Insoluble in H_2O [3]

Electrical Properties:
Electrical Properties General: $\sigma = 2x10^{-5}$ to 9.7×10^{-7} S cm^{-1} [2,3,6]



Optical Properties:
Optical Properties General: Forms a green to brown (dependent on doping state), environmentally stable, electroactive film, with electrochromic changes from a glass-clear transparency at extreme cathodic (reducing) potential to dark blue at large oxidative potential [3]
Transmission and Spectra: Ir [2,3,4,5,6], uv-vis [3,5], xps [2,5] and nmr [3] data reported

Polymer Stability:
Thermal Stability General: The thermogram of Poly(DPBz) indicates that the onset of the first major weight loss step occurs at about the same temperature as that of the monomer. The weight loss at this temperature constitutes approx. 20–40% of the initial weight, depending on the sample, and is attributed to the unreacted monomer and also possibly short-chain oligomers. The subsequent weight loss occurs either gradually or as a second weight loss step at approx. 500°C [5]
Biological Stability: Toxic [5]

Applications/Commercial Products:
Processing & Manufacturing Routes: Electrolytically polymerised in MeCN in the presence of $[Bu_4N]ClO_4$ and 2,6-lutidine [1,5]. The polymer has been synthesised from DPBz using ammonium persulfate as oxidising agent [5,6]
Applications: Corrosion protection of aluminium alloys by coating [7]. Organic electroluminescent devices [8]. Secondary batteries with improved cathodes [9]

2	260°C	[3]

Glass-Transition Temperature:

No.	Value	Note
1	204°C	[1]
2	213°C	[3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Flory-Huggins polymer-solvent interaction parameters have been reported: 0.56 (chloromethane, 250°) [1]; 0.28 ($CHCl_3$, 250°) [1]; 1.25 (decane, 250°) [1]; -0.36 (cyclohexanol, 250°) [1]

Optical Properties:

Refractive Index:

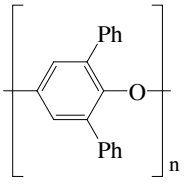
No.	Value	Note
1	1.6539	[2]

Transmission and Spectra: Ir spectral data have been reported [3]

Polymer Stability:

Thermal Stability General: Stable under N_2 atmosphere up to 400° [1]

Decomposition Details: Polymer decomposition temp. 423° [3]. Max. rate of weight loss occurs at 450° [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [4]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. chloromethane). Catalysts (quaternary ammonium salts) are used to achieve high MWs [2,3,4]. In transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2 with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [2,4]

Poly[(diphenylsilylene)(methylene)] P-210

Synonyms: *Poly(diphenylcarbosilane). Poly(diphenylsilylmethylene). 1,1,3,3-Tetraphenyl-1,3-disilacyclobutane homopolymer, sru. PDPhSM*
Related Polymers: Polycarbosilanes
Monomers: 1,1,3,3-Tetraphenyl-1,3-disilacyclobutane
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
86490-33-7

Molecular Formula: $(C_{13}H_{12}Si)n$
Fragments: $C_{13}H_{12}Si$
Molecular Weight: 90,000–2,640,000 solvent dependent [3,5]
General Information: PDPhSM is of particular interest because of its high thermal stability (>670K), high rigidity, low toughness and long material lifetime visible light emission induced by irradiation with an ultraviolet laser light [1,2,6]
The thermostability of PDArSMs with tolyl groups was found to be comparable to that of PDPhSM when carried out in nitrogen, whereas the polymers were highly thermally unstable in air compared with PDPhSM [6,7,10,14]
Morphology: Yellow crystalline solid [14]. The surface morphology and crystallinity of the films were greatly affected by the metal species used. The surface roughness of the films ranged from 2 to 400nm, depending on the metal, but could be adjusted within the range by use of a combination of several metals. The films were transparent and smooth, like glass, with Pt or Pt/Pd, but opaque and very rough with Cu and Au [2,9]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: See [14]
Melting Temperature:

No.	Value	Note
1	350–352°C	[5,10,14]. Thin films are difficult to synthesise due to high melting point [1]

Glass-Transition Temperature:

No.	Value	Note
1	130°C	[3]
2	140–141°C	[5,10,14]

Surface Properties & Solubility:

Solubility Properties General: In addition to its high melting point, lack of solubility in most organic solvents means thin films are difficult to synthesise [1,5,14]. Slightly soluble in hot diphenyl ether and appreciable solubility in hot diphenyl sulfone [14]. Solubility has been improved appreciably by incorporation of an MP unit into the polymer backbone (PMPSM) [3]

Transport Properties:

Transport Properties General: The melt viscosity of PDPhSM was found to be higher than that of PMPSM at 360°C. The melt viscosities of the polymer blends consisting of PDPhSM and PMPSM decreased with increasing PMPSM content. [4,14]
Melt Flow Index:

No.	Value	Note
1	30–77 g/10 min	[14]

Mechanical Properties:

Mechanical Properties General: Polymerisation induces mechanical stress at the substrate-film interface, probably caused by change of the film thickness during the polymerisation. These mechanical stresses could lead to the cracking of coatings; the higher the thickness change, the easier the cracking. This cracking was not observed in films made with Pt or Pt/Pd. However, it appeared a little in films made with Cu and more extensively when Au was used to activate the polymerisation [2]. To improve its mechanical properties, binary polymer blends consisting of PDPSM as a hard component and an amorphous PSM as a soft component have been studied [4]
Tensile Strength Break:

No.	Value	Note	Elongation
1	6 MPa	[4,6]	500% at break [4]

Hardness: PDPhSM has a high hardness [4]

Optical Properties:

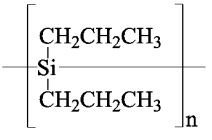
Optical Properties General: The polymer films have been shown to exhibit the same long lifetime visible light emission upon UV laser irradiation as those reported for chemically synthesised polymers [2].
When PDPhSM films were irradiated with an excimer laser (KrF, 248nm), light emission, whose spectra were broad ranging from 300–500nm and exhibiting a large peak at 340nm, was observed. Blue-green light emission was observed for several seconds after the laser light was turned off. Furthermore, the emission spectra were found to change with a number of laser shots irradiated. The emission peak at 340nm decreased rapidly, while the emission in the range from 400–600nm increased gradually as the sample was repeatedly irradiated with the laser [7]

Optical Properties:

Transmission and Spectra: Ir [1,9,14]; uv [1,9]; nmr [1,3,5,9,12,14]; xps [1]; ms [6,9].

Polymer Stability:

Polymer Stability General: Thickness of PDPhSM thin films was found to be dependent upon the nature of sputtered metal [1]
Thermal Stability General: The thermogravimetric behaviour of PDPhSM films fabricated at 550K for 10min. in air and initially subjected to 4min. of different metal sputtering in air, together with that of chemically synthesised PDPhSM has been studied. The temperature at which the weight loss reached 5% (Td5) was



considered to be one criterion of the thermal stability. The Td5 was 610K for Pt/Pd, 650K for Cu, 735K for Au and 695K for chemically synthesised PDPhSM. These films exhibited a thermal stability similar to that of chemically synthesised film, depending on the kind of metal, and they exhibited different crystallinities. The film prepared with Pt/Pd appeared to be the most amorphous, while those with Cu, Au, and chemically synthesised PDPhSM were more crystalline. Logically, the thermal stability tended to increase with the crystallinity of PDPhSM [1,2,3]. Thermostability of PDArSMs with tolyl groups were comparable to that of PDPhSM when the measurement was conducted under nitrogen, whereas the polymers having tolyl substituents were highly thermally unstable in air compared with PDPhSM [6,7,10,14]
Decomposition Details: Started to decompose at around 400°C and is complete at about 600°C under nitrogen. Exhibits a two-step weight loss in the temperature range *ca*. 400 to 700°C in air. The first decomposition step is assignable to elimination of phenyl groups, while the second one is presumably due to oxidative decomposition, which is evident from a large exothermic peak in the DTA trace [6,7,10]

Applications/Commercial Products:
Processing & Manufacturing Routes: New and unique method for fabricating PDPhSM thin films, consisting of four-step process: monomer deposition; preparation of polymerisation catalysts; thermal polymerisation activated by adding metal nanosized particles, and removal of unreacted monomer [1,2,9]. Also by Cu-catalysed polymerisation of 1,1,3,3-tetraphenyl-1,3-disilacyclobutane (TPDC) [3]
Applications: Polymer-based optical devices [1]. Porous insulation films for semiconductor devices [11]. A SiC/SiC composite [13]

Poly(dipropylsilane) P-211

Synonyms: *Poly(dipropylsilylene). PDPrS*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane), Poly(dihexylsilane)
Polymer Type: polysilanes

CAS Number:

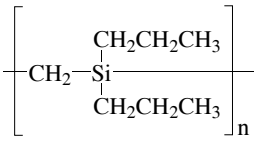
CAS Reg. No.
96228-25-0

Molecular Formula: $(C_6H_{14}Si)n$
Fragments: $C_6H_{14}Si$
Tacticity: Propyl groups exist in a single conformation [7]
Morphology: The conformation of the Si backbone is *all-trans*. The two propyl groups stretch asymmetrically due to the intramolecular steric hindrance of the second CH_2 group in the side chains bonded to the same Si atom. A tetragonal unit cell with a = b = 0.980nm; c = 0.399nm [3,5,7]

Surface Properties & Solubility:
Solubility Properties General: Insoluble [7].
Surface Tension:

No.	Value	Note
1	28.6 mN/m	Due almost entirely to depression forces. Obtained using geometric-mean method [3,10]

Optical Properties:
Optical Properties General: The polymer displays reversible thermochromic behaviour in solution with a bathochromic shift of 16–25nm occuring from 92 to -67°C. The temperature dependence of the UV absorption maxima is thought to be due to conformational changes occurring along the polymer backbone [3].
Transmission and Spectra: Ir and Raman [1,7], uv-vis [2,5,7,10] and nmr [5,7,10] spectra reported



Polymer Stability:
Thermal Stability General: Two clear transitions, a weak one at -17.0°C (onset at -29°C) with ΔH=0.66kJ/mol and a sharp intense peak at 235°C (onset at 222°C), which corresponds to a first order transition with ΔH=7.3 kJ/mol (0.064kJ/g, 15.2cal/g) [7]. When the sample was cooled to -40°C, no significant changes were observed, which shows that no drastic structural changes are involved below the weak phase transition at -29°C
Decomposition Details: First order DSC transition near 222°C. At 250°C, weight loss was 3% and decomposition ensued rapidly above 338°C [7]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by Wurtz-type reductive coupling of corresponding dichlorosilane [3,5]
Applications: Composing and placing security markings on items which need protection against forgery or counterfeiting [1]. In fabrication of electroluminescent devices [4]. Uv absorbers for cosmetics [9]

Poly[(dipropylsilylene)methylene] P-212

Synonyms: *Poly(di-n-propylsilylenemethylene). PDPrSM. PDPSM*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane)
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
163934-33-6

Molecular Formula: $(C_7H_{16}Si)_n$
Fragments: $C_7H_{16}Si$
Molecular Weight: 166,500–181,000 [3,4]
Tacticity: The fibre repeat, 4.86Å, indicates an all-gauche conformation in the main chain, giving a 41 helical structure. *Ab initio* and semi-empirical energy calculations show that with attachment of *n*-alkyl side chains an all-gauche conformation for the main chain gives the lowest energy. This is in contrast to the unsubstituted polymer, poly(silaethylene), which has a minimum energy for the *all-trans* conformation. The all-gauche conformation of the main chain of PDPrSM relieves the steric hindrance between side chains found in the *all-trans* conformation [1,2,3,4]
Morphology: Amorphous [3]. The alkyl side chains are interlocked with each other like cross-shaped gears in the two-dimensional monoclinic *ab* projections in the unit cell [1]. Unit cell parameters a = 10:52Å; b = 8:66Å; c = 4:86Å; α = 78:4°; β = 100:0° and γ = 98:2° [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.995 g/cm^3	[1]

Melting Temperature:

No.	Value	Note
1	-77.6°C	[3]

Glass-Transition Temperature:

No.	Value	Note
1	-41.2°C	Does not show any first-order transitions [5]

Transition Temperature General: Exhibits lower backbone flexibility than that observed for the analogous poly(dipropylsiloxane) [4]

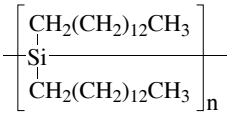
Optical Properties:

Transmission and Spectra: Nmr spectrum was consistent with α (anti-Markovnikov) addition of the olefins, with no sign of a β (Markovnikov) addition product in either the pmr or cmr spectra [3,4]

Polymer Stability:

Thermal Stability General: Part-transformed into a mobile state below isotropisation, which may possibly be classified as a conformationally disordered mesophase.
Decomposition Details: 5% decomposition temp=349°C; 10% decomposition temp = 380°C [3,5].
Chemical Stability: Oxidative stability [3,5]

Applications/Commercial Products:



Processing & Manufacturing Routes: Obt. by hydrosilylation of poly[hydridomethylsilylene(methylene)]; an excess of olefin was added followed by Karstedt's catalyst in xylene to yield PDPrSM [3]
Reaction of trichloro(chloromethyl)silane with respective Grignard reagent and subsequent cyclisation, 1,1,3,3-tetrapropyldisilacyclobutane, followed by catalytic polymerisation with H_2PtCl_6 gave PDPrSM, with strictly alternating SiR_2/CH_2 backbone structure [4]

Applications/Commercial Products:

Poly(ditetradecylsilane) P-213

Synonyms: *Poly(ditetradecylsilylene). PDTS. PTDSi. PdnTDS*
Related Polymers: Polycarbosilanes
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
117652-56-9	homopolymer
107999-70-2	sru

Molecular Formula: $(C_{28}H_{58}Si)_n$
Fragments: $C_{28}H_{58}Si$
Molecular Weight: 3.071×10^6 [7]
Morphology: White, semi-crystalline solid. Adopts a TGTG′ backbone conformation and orthorhombic unit cell, with dimensions a=21.5Å, b=29.5Å, c=7.9Å and γ=90°. Probably assumes a columnar hexagonal packing mode (HPM) with disordered backbone conformation[1,2,3]
Identification: Exhibits a continuous blue shift of the uv absorption band at 345nm. Does not show a red shift of the uv band with pressure, implying that pressure cannot induce a transition to the planar zigzag conformation.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.925	calc. 1.01 [1]

Thermodynamic Properties General: An endotherm leads to a value of ΔS_d 119J/(K mol) and accounts for about half of the maximum possible conformations participating in disordering [4]
Transition Temperature General: No glass-transition was observed, but has been estimated at -23°C from heat capacity data [4,8].

Optical Properties:

Optical Properties General: Thermochromic transition at 54°C. At room temperature, the polymer absorbs at 350nm, a value intermediate to those observed for PDHS (370nm) and PDPS

(313nm). Above its transition it exhibits a blue shift; PDTS absorbs at 313nm, as do the other poly(di-*n*-alkylsilanes) above their respective transition temperatures [1,2]
Transmission and Spectra: Ir [1,2], Raman [2], uv-vis [1,2,6], epr [5] and nmr [5,6,8] spectra reported.

Polymer Stability:
Thermal Stability General: The backbone becomes disordered above the transition temperature. Undergoes an order-disorder transition at 55°C [1]
Observation under a polarising microscope shows the edge of birefringent objects become isotropic and start flowing at 210°C. Beyond this temperature a complete transition to the isotropic state is observed.

Polymer Stability:
Decomposition Details: A broad endotherm appears as a broad doublet with some shoulders in the first run, changes in the subsequent scans, leaving a single peak with a broad onset. The peak temperature from an average of three measurements is at 55.9°C with a heat of transition of 39.2 ± 0.35kJ mol^{-1} for all samples, irrespective of the different thermal histories of the samples. No further transition was observed when the samples were heated to just below the decomposition temperature [8]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared from dichlorotetrasilane by dehalogenation coupling with Na under standard conditions for Wurtz polysilane synthesis (60% yield) [7].
Applications: Fabry Perot miniature resonator optical switch [10]

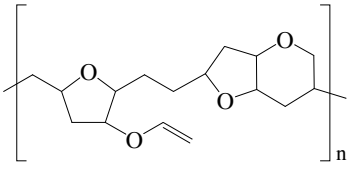
Poly(divinyl-1,4-butanediyl ether-*co*-maleic anhydride) P-214

Related Polymers: General information
Monomers: Divinyl-1,4-butanediyl ether, Maleic anhydride
Material class: Thermoplastic
CAS Number:

CAS Reg. No.
33520-84-2



Molecular Formula: $[(C_8H_{14}O_2).(C_4H_2O_3)]_n$
Fragments: $C_8H_{14}O_2$ $C_4H_2O_3$

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free-radical initiated copolymerisation
Applications: Enzyme carrier, fibrinolytic active polymers to prevent blood coagulation [1,2]

Poly(divinyl ether) P-215

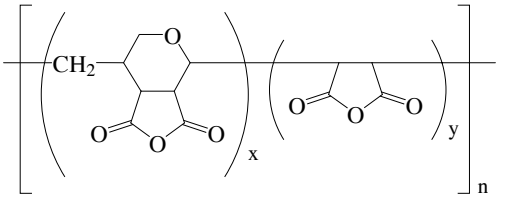
Related Polymers: Poly(vinyl ethers)
Monomers: Divinyl ether
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
9003-19-4

Molecular Formula: $(C_{16}H_{23}O_4)_n$
Fragments: $C_{16}H_{23}O_4$

Volumetric & Calorimetric Properties:
Latent Heat Crystallization: Thermodynamic props. have been reported [1]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: δ_{small} 33.48 $J^{1/2}$ $cm^{-3/2}$ (7.99 $cal^{1/2}$ $cm^{-3/2}$) [2]. Other solubility parameters have been reported [2]



Optical Properties:
Transmission and Spectra: C-13 nmr spectral data have been reported [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: Free-radical initiated polymerisation with stereoselective cyclisation
Applications: Applications include use in hair conditioners, electric conductive films, microcapsules, photosensitive films, adhesives and coatings

Poly(divinyl ether-maleic anhydride) P-216

Synonyms: *DIVEMA. Pyran polymer. Poly[2,5-furandione-co-1,1′-oxybisethene]*
Related Polymers: Poly(vinyl ethers)
Monomers: Divinyl ether, Maleic anhydride
Material class: Synthetic Elastomers
CAS Number:

CAS Reg. No.
27100-68-1

Molecular Formula: $(C_{12}H_{10}O_7)_n$
Fragments: $C_{12}H_{10}O_7$
General Information: An alternating copolymer

Volumetric & Calorimetric Properties:
Latent Heat Crystallization: ΔE_{act} 112.7 kJ mol^{-1} (26.9 kcal mol^{-1}, $CHCl_3$); 111.9 kJ mol^{-1} (26.7 kcal mol^{-1}, DMF) [2]

Optical Properties:
Transmission and Spectra: H-1 nmr, C-13 nmr and uv spectral data have been reported [3,4]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical initiated copolymerisation of divinyl ether and maleic anhydride with stereoselective cyclisation
Applications: Modulates a variety of biological responses related to bacteria, fungi and viruses. A neoplasm inhibitor, antitumour and antiviral agent

Poly(1-docosene) P-217

Synonyms: *Poly(1-eicosylethylene). Poly(1-eicosyl-1,2-ethanediyl)*
Monomers: 1-Docosene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
31441-79-9	atactic
59284-12-7	isotactic

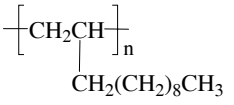
Molecular Formula: $(C_{22}H_{44})_n$
Fragments: $C_{22}H_{44}$
Morphology: Three polymorphic forms: form I orthorhombic, a 0.75, b 8.8, c 0.67, helix 4_1 [4]; form II monoclinic, a 0.53, b 10.8, c 0.77, β 94°, helix 4_1 [4]

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: ΔH_f 145 J g^{-1} (form I); 120 J g^{-1} (form II); 40 J g^{-1} (form III) [3]
Melting Temperature:

No.	Value	Note
1	91°C	364K [1]
2	92°C	365K [2]
3	90°C	363K, form I [3]
4	83°C	356K, form II [3]
5	75°C	348K, form III [3]
6	90°C	363K [4]

Transition Temperature:

No.	Value	Note	Type
1	69°C	342K	T_1
2	72°C	345K [2]	T_2



Optical Properties:
Transmission and Spectra: Ir and Raman [1,3] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3$-$AlEt_2Cl$ at room temp. [1]

5	46°C	319K, Form I
6	32°C	305K, Form II
7	-25°C	248K, Form III [7]

Glass-Transition Temperature:

No.	Value	Note
1	-25°C	[2]
2	-6°C	[4]
3	-36°C	[21]

Transition Temperature:

No.	Value	Note	Type
1	45–50°C	[3]	Softening point
2	-45°C		α
3	-165°C	[5]	β
4	-145°C	520 Hz [4]	β

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Energy of cohesion has been reported [8]
Wettability/Surface Energy and Interfacial Tension: Critical surface tension has been reported [8]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	50 g/10 min	approx., ASTM D1238-15T η_{inh} 1 dl g^{-1} (tetrahydronaphthalene, 100° or 145°) [11]

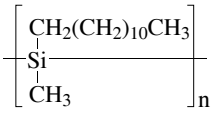
Polymer Solutions Dilute: [η] 0.96–1.45 dl g^{-1} (25°, $CHCl_3$) [1]. η_{inh} 2.43–2.98 (25°, C_6H_6) [3]. [η] 2.4 dl g^{-1} (25°, toluene) [16]. Theta temp. and dilute soln. props. have been reported [10]
Polymer Solutions Concentrated : Conc. soln. props. have been reported [15, 20]
Polymer Melts: Melt flow activation energy 29.3 kJ mol^{-1} (7 kcal mol^{-1}) [11]

Mechanical Properties:

Mechanical Properties General: Dynamic tensile storage and loss moduli in relation to struct. have been reported [19]
Viscoelastic Behaviour: Viscoelastic props. have been reported [6]

Optical Properties:

Transmission and Spectra: Ir, Raman [9,12,13,14] and H-1 nmr [18] spectral data have been reported
Total Internal Reflection: Stress optical coefficient -4900–-5070 [16]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_3$-$AlEt_2Cl$

Poly(*n*-dodecylmethylsilane) P-219

Synonyms: *Poly(dodecylmethylsilylene). (DodecMeSi)n. ME12*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
88018-84-2

Molecular Formula: $(C_{13}H_{28}Si)n$
Fragments: $C_{13}H_{28}Si$
Molecular Weight: 0.87×10^5–10^6 [2,3,4,6].
Morphology: Forms an ordered structure on cooling [5]

Volumetric & Calorimetric Properties:

Transition Temperature General: Melts without decomposition [11].

Surface Properties & Solubility:

Solubility Properties General: Readily soluble in common organic solvents [11].

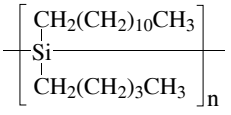
Optical Properties:

Optical Properties General: Displays an abrupt thermochromic transition (302nm to 328nm, after red shift is complete), with an onset temperature of 26°C [2,6].
Cooled through the transition temperature, it adopts a more extended conformation with a greater number of *all-trans* segments along the polymer chain. Support for this interpretation is provided by the variable-temperature Si-29 CP MAS NMR spectra. As the polymer goes through the thermochromic transition, a new downfield resonance appears and grows in intensity [2].
The photoefficiency for both scissioning and cross-linking has been studied, which is reported only to fragment upon irradiation [9,10].

Optical Properties:

Transmission and Spectra: Ir [6], uv-vis [2,3,5,6], pes [3] and nmr [4,6,7] spectra reported.

Applications/Commercial Products:



Processing & Manufacturing Routes: Synthesised from dichloromethyl-*n*-dodecylsilane by dehalogenative coupling reaction with Na under standard conditions for polysilane synthesis by Wurtz coupling [1,2,3,4,11].
Polymerisation of dodecylmethyldichlorosilane was carried out by the Kipping method with melted Na metal in toluene under vigorous stirring [6].

Applications/Commercial Products:
Applications: Small light source for optical recording disks [8].

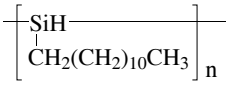
Poly(dodecylpentylsilane) P-220

Synonyms: *Poly(dodecylpentylsilylene). C12-C5*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
171673-35-1



Molecular Formula: $(C_{17}H_{36}Si)_n$
Fragments: $C_{17}H_{36}Si$
General Information: Films are the weakest in the series of poly(*n*-alkylpentylsilylenes) [1].
Morphology: The X-ray diffraction pattern indicates little order, probably a manifestation of a partial alignment of the molecules as in a nematic phase, but the degree of order is significantly diminished with respect to the hexagonal, columnar liquid crystalline structure seen in so many poly(*n*-alkyl-*n*-alkylsilylene)s at high temperatures. It is thought that two or more different conformations are present at low temperatures [1].
Miscellaneous: The X-ray diffraction pattern changes on cooling to around -20°C, corresponding to the higher-temperature peak seen in the DSC cooling scan. The onset of this DSC transition is at -19°C with the peak at -23°C.
Below -25°C, very little change is seen in the pattern, as evidenced by the similarity diffraction of the patterns at -25 and -50°C. At -50°C, the broad, sharp-tipped peak observed is split into two reflection peaks. There also may be one or more weaker peaks present between these maxima, as there is some structure to this region. This corroborates what is suggested by the low-temperature uv spectra that there must be several backbone conformations present in C5-C12 at low temperatures. The presence of a shoulder on the high-angle side of the amorphous halo may indicate multiple preferred conformations of the alkyl side chains as well, because the d-spacing of the amorphous halo for alkyl polysilanes is approximately that of the interchain distance commonly seen for alkyl chains [1].

Optical Properties:
Optical Properties General: The variable temperature UV spectra of a film upon slow cooling shows one broad transition. At 25°C a relatively broad peak is seen with a maximum at 320nm, which is characteristic of a helical backbone conformation. Upon cooling, a shoulder on the 320nm absorption band develops between -25 and -40°C. Below -40°C it is apparent that there are at least two overlapping bands. It is thought that two or more different conformations are present at low temperatures [1].
Transmission and Spectra: Uv [1] spectra reported.

Polymer Stability:
Thermal Stability General: Single equilibrium phase transition observed via DSC. Possible multiple phases or conformations at low temperature [1]

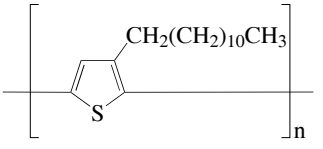
Poly(dodecylsilane) P-221

Synonyms: *Poly(dodecylsilylene). PD12S*
Related Polymers: Polycarbosilanes, Poly(methyl phenyl silylene methylene), Dichloropoly(methylphenylsilane), Poly(methylphenylsilane)
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
187536-66-9

Molecular Formula: $(C_{12}H_{26}Si)_n$
Fragments: $C_{12}H_{26}Si$
Molecular Weight: 1.4×10^6 [4]
Morphology: White oil [2], with a Si-Si backbone chain conformation of TGTG′. The room temperature d-spacing can be indexed by an orthorhombic unit cell with dimensions a=21.6Å; b=25.0Å; c=7.8Å and γ=90° [1]



Optical Properties:
Transmission and Spectra: Uv [4]; nmr [2,4] spectra reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared from dichlorododecylsilane by dehalogenation coupling with Na under standard conditions for Wurtz polysilane synthesis[2,3,4]
Applications: Process stabiliser for an organic material (e.g. polypropylene fibres) against degradation induced by light, heat or oxidation [2,3]

Poly(3-dodecylthiophene) P-222

Synonyms: *Poly(3-dodecyl-2,5-thiophenediyl). P3DT. P3DDT*
Monomers: 3-Dodecylthiophene
Material class: Thermoplastic
Polymer Type: polythiophene

CAS Number:

CAS Reg. No.	Note
104934-53-4	
137191-59-4	poly(3-dodecyl-2,5-thiophenediyl)

Molecular Formula: $(C_{16}H_{26}S)n$
Fragments: $C_{16}H_{26}S$
Additives: Dopants such as I_2 [1], hexafluorophosphate [2], $FeCl_3$ [3] and perchlorate are added to increase conductivity.
General Information: Conductive thermochromic polymer [4] which exhibits electroluminescence [5] and has greater solubility and processability than polythiophene.
Morphology: Orthorhombic unit cell, a=34.75Å, b=7.52Å, c=7.77Å [6]. Polymorphic with two crystal phases [7].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.07 g/cm^3	fibre [4]

Melting Temperature:

No.	Value	Note
1	81–156°C	[3,7,8]

Glass-Transition Temperature:

No.	Value	Note
1	-20–5.6°C	Glass-transition temperature increases with addition of $FeCl_3$ dopant [3,8]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, C_6H_6, tetrahydronaphthalene [9], THF [10]

Mechanical Properties:

Mechanical Properties General: Mechanical properties have been reported [11]. Strength and stiffness of drawn polymer are much lower than for polythiophene.

Electrical Properties:

Electrical Properties General: Conductivity depends on polymer structure, nature and concentration of dopant, and temperature, with maximum values of about 1000 S cm^{-1} reported for I_2-doped samples [1].

Optical Properties:

Transmission and Spectra: Pmr [2,10,12], cmr [2], ir [4,9,10], uv [10,12,13] and x-ray [4,6,14] spectra have been reported.
Volume Properties/Surface Properties: Thermochromic polymer changes from red colour at 30°C to yellow at 80°C [4].

Polymer Stability:

Decomposition Details: Samples that are undoped and doped with I_2 decompose at about 350°C [15]. Dedoping occurs on heating.

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by chemical or electrochemical oxidative polymerisation of monomer with different catalysts [2,4,9,12,16] to produce mostly regiorandom (head-to-head/head-to-tail) polymers, or by catalytic polymerisation of 2-bromo-5-(bromomagnesio)-3-dodecylthiophene [1,13] or 2-bromo-5-(bromozincio)-3-dodecylthiophene [10] to produce regioregular (head-to-tail) polymers.
Applications: Potential applications in photovoltaic devices, light-emitting diodes, rechargeable batteries, field-effect transistors and chemical and optical sensors [5].

Trade name	Details	Supplier
Rieke	regioregular and regiorandom polymers	Rieke Metals

Poly(1-eicosene) P-223

Synonyms: *Poly(1-octadecylethylene). Poly(1-octadecyl-1,2-ethanediyl)*
Monomers: 1-Eicosene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
27323-11-1	atactic
72108-27-1	isotactic

Molecular Formula: $(C_{20}H_{40})_n$
Fragments: $C_{20}H_{40}$
Morphology: Three polymorphic forms [2]: form II orthorhombic [1]; isotactic orthorhombic [7]; atactic hexagonal (room temp.) and orthorhombic (low temp.)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.912 g/cm^3	[5]

Thermodynamic Properties General: ΔH_f 27.46 kJ mol^{-1}, ΔS_f 82.96 J mol$_{-1}$ K^{-1} [2]
Melting Temperature:

No.	Value	Note
1	58°C	[1,2]
2	54°C	327 K, actactic
3	80°C	353 K, isotactic [3]
4	81.8°C	[5]

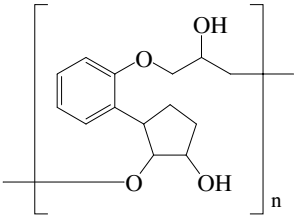
Transition Temperature General: Behaviour of T_m of the isotactic form has been reported [4]

Transition Temperature:

No.	Value	Note	Type
1	40.5°C	[5]	First T_m

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$ [3]

Transport Properties:
Polymer Solutions Dilute: [η] 1.73 dl g^{-1} (25°, toluene) [1]; [η] 0.56 dl g^{-1} (25°, $CHCl_3$) [2]



Optical Properties:
Transmission and Spectra: C-13 nmr [3] and ir [6,7] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3$-$AlEt_3$ at 40° in heptane [1,5]

Poly(1,2-epoxy-3-phenoxypropane) P-226

Synonyms: *Poly[(phenoxymethyl)oxirane]. Poly(phenyl glycidyl ether)*
Monomers: (Phenoxymethyl)oxirane
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.
25265-27-4

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	203°C	isotactic [6]

Glass-Transition Temperature:

No.	Value	Note
1	18°C	approx., isotactic [4]

Surface Properties & Solubility:
Solvents/Non-solvents: Isotactic insol. most solvents [4], Me_2CO [5], Et_2O, C_6H_6 [6]

Transport Properties:
Polymer Solutions Dilute: $[\eta]_{inh}$ 1.61 dl g^{-1} (tetrachloroethane, 30°, isotactic) [4], 2.2 dl g^{-1} (chloronaphthalene, 135°, isotactic) [6]

Applications/Commercial Products:
Processing & Manufacturing Routes: Anionic polymerisation initiated by sodium caprolactam yields oligo(hydroxy ethers) of various structures depending on concentration of the initiator and reaction temp. [1] Phenyl glycidyl ether can be cationically polymerised to yield cyclic dimers when catalysed by 'onium' salts [2]; or thermally polymerised using (4-octyloxyphenyl)iodonium hexafluorophosphate. [3] Isotactic polymer can be synth. using aluminium isopropoxide in combination with a zinc salt [4] or diethylzinc [5] as initiator. Isotactic polymer in 64% yield can be obtained with the aluminium isopropoxide-diethyl zinc system. [5] Crystalline isotactic polymer may be synth. using an $AlEt_3$-H_2O catalyst [6]
Applications: Uncured resin used as a reactive diluent in epoxy resin compositions

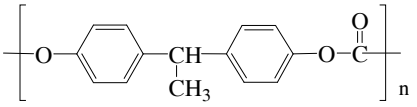
Polyester carbonates P-227

Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Bisphenol A-terephthalic acid polyester carbonate, Bisphenol A-isophthalic acid polyester carbonate, Bisphenol A-terephthalic acid-isophthalic acid polyester carbonate
Material class: Thermoplastic
Molecular Formula: $[(C_{16}H_{14}O_3).(C_{23}H_{18}O_4)]_n$
Fragments: $C_{16}H_{14}O_3$ $C_{23}H_{18}O_4$
General Information: Glass fibre reinforced versions are available



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by interfacial polymerisation at low temps. (0–30°) of the sodium salt of Bisphenol A (aq. phase) with aromatic acid chlorides and phosgene in an organic phase. The catalysts are tertiary amines, quaternary ammonium or phosphonium salts. Phenols, phenylchlorocarbonates and aromatic carbonyl halides are used as chain terminators. The polyester carbonates are isol. from the organic phase
Mould Shrinkage (%):

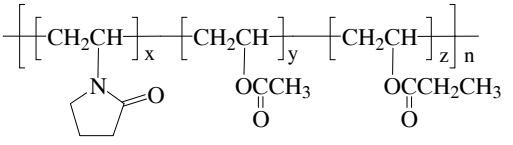
Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5937	25° [3]
2	1.594	calc. [1]



Transmission and Spectra: Ir spectral data have been reported [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by two routes; phosgenation or ester interchange. Phosgenation is accomplished by interfacial polycondensation (most widely used) involving base-catalysed reaction of phosgene with an aromatic dihydroxy compound in CH_2Cl_2, with a catalyst to give high MW products [2,3], or by soln. polymerisation in pyridine [2] Ester exchange involves melt (150–300°) polymerisation of the aromatic dihydroxy compound with excess diphenyl carbonate in the absence of air. Reaction rate may be increased by use of alkaline catalysts or a medium-high vacuum in the final stages [2,3]

Polyetheretherketone P-231

Synonyms: *PEEK. Polyaryletheretherketone. Poly(oxy-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,4-phenylene)*
Related Polymers: Polyetherketone, Polyetherketoneketone, Polyetherketoneetherketoneketone, Polyetheretherketone 30% Glass fibre filled, Polyetheretherketone 30% Carbon fibre filled, Polyetheretherketoneketone
Monomers: 4,4′-Difluorobenzophenone, Hydroquinone
Material class: Thermoplastic
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.
31694-16-3

Molecular Formula: $(C_{19}H_{12}O_3)_n$
Fragments: $C_{19}H_{12}O_3$
Additives: Glass fibre, carbon fibre, PTFE, graphite
Miscellaneous: Commercial material is approx. 35% crystalline

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by polycondensation under anhydrous conditions of an aromatic diol and an aromatic dihalide in which the halogen atoms are activated by carbonyl groups. Processed by injection moulding, extrusion, compression and transfer moulding
Mould Shrinkage (%):

No.	Value
1	1%

Applications: Pipelines, pump and valve parts, cable insulation, composites, film, circuit boards, switchgear, bearings and sensor coatings. Generally used for applications in 'aggressive environments'

Polyetheretherketone, 30% Carbon fibre filled P-232

Synonyms: *Polyaryletheretherketone, 30% Carbon fibre filled. PEEK, 30% Carbon fibre filled*
Related Polymers: Polyetheretherketone, Polyetheretherketone, 30% Glass fibre filled
Monomers: 4,4′-Difluorobenzophenone
Material class: Thermoplastic, Composites
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.
31694-16-3

Molecular Formula: $(C_{19}H_{12}O_3)_n$
Fragments: $C_{19}H_{12}O_3$
Additives: Carbon fibre
General Information: Both standard and "easy-flow" grades are available in a black granular form
Morphology: Commercial products are typically 35% crystalline [1]
Miscellaneous: Addition of carbon fibre improves tensile strength and heat distortion temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.44 g/cm^3	cryst., ISO R1183 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.5×10^{-5} K^{-1}	$T < T_g$, ASTM D696 [1]	L

Thermal Conductivity:

No.	Value	Note
1	0.92 W/mK	ASTM C177 [1]

Melting Temperature:

No.	Value	Note
1	340–343°C	[1]
2	326–330°C	short fibre reinforced [25]

Glass-Transition Temperature:

No.	Value	Note
1	143°C	[1]

Transition Temperature General: The presence of short fibres has a comparatively small effect on T_m [25]
Deflection Temperature:

No.	Value	Note
1	300–315°C	1.82 MPa, ISO R75 [1]

Heat Distortion Temperature:

No.	Value	Note
1	300–315 °C	1.82 MPa, ISO R 74 [1]

Transport Properties:

Permeability and Diffusion General: Diffusion coefficient [H_2] 3.93×10^9 cm^2 s^{-1} (60°, 75% relative humidity), 5.91×10^9 cm^2 s^{-1} (70°, 75% relative humidity), 8.43×10^9 cm^2 s^{-1} (80°, 75% relative humidity) [24]
Water Absorption:

No.	Value	Note
1	0.12 %	24h, 23°, ASTM D570 [10]
2	0.3 %	saturation, air, 23° [8]
3	0.14 %	50% relative humidity, saturation, 23° [8]
4	0.06 %	24h, 23°, ISO R62A [1]

Mechanical Properties:

Mechanical Properties General: The effect on processing parameters on the ultimate flexural strength, flexural modulus and tensile strength have been reported. The use of higher forming temps., 400–440°, gives an improvement in mechanical props. [7,21]. Shows good mechanical props. at elevated temps. and high humidity, e.g. 95% retention of flexural strength and 70% retention of tensile strength after 1400h at 80° and 75% relative humidity [24]

Tensile (Young's) Modulus:

No.	Value	Note
1	24100 MPa	3500 kpsi, ASTM D638 [10]
2	12400 MPa	short fibre [25]

Flexural Modulus:

No.	Value	Note
1	19200–20200 MPa	23°, ISO R178 [1]
2	18600 MPa	120°, ISO R178 [1]
3	5100 MPa	250°, ISO R178 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	228 MPa	33 kpsi, ASTM D638	1.3%
2	215.8 MPa	short fibre [25]	2.5%

Flexural Strength at Break:

No.	Value	Note
1	355 MPa	23°, ISO R178 [1]
2	260 MPa	120°, ISO R178 [1]
3	105 MPa	250°, ISO R178 [1]

Compressive Strength:

No.	Value	Note
1	240 MPa	23°, with flow, ASTM D695 [1]
2	153 MPa	23°, across flow, ASTM D695 [1]

Viscoelastic Behaviour: Elastic costants over the range 20–200° have been reported [5]
Hardness: Rockwell R124 (ASTM D785) [1], M107 (ASTM D785) [1]
Failure Properties General: The energy absorption capability of tubes has been investigated; tubes with fibres orientated at 15° to the tube axis give the highest value 225 kJ kg^{-1}. Crush zone morphology has been reported [18]. The testing of compressive strength of unidirectional and cross-ply laminates has been reported. Failure in unidirectional laminates occurs through in-plane fibre buckling. In the cross ply laminate out-of-plane fibre buckling is the mode of failure and the failure of longitudinal plies occurs at higher compressional stress than in the unidirectional case [16]. The effect of varying the forming temp. on mode I and mode II delamination resistance has been reported [21]. The application of heat (330–380°) at a pressure of 1.4 MPa allows recovery of mode I delamination resistance to varying degrees [23]
Fracture Mechanical Properties: Ultimate shear strength 97 MPa (23°, ASTM D3846) [1]. The effects of MW, volume fraction of fibre and strength of fibre/matix bond on fracture behaviour have been investigated. Crack stability and temp. variation have been reported [3,4]. Shows excellent fracture toughness at temps. up to 100° above which creep causes a decrease in toughness. Two types of crack propagation have been described in high temp. fatigue: time dependent and cycle dependent
Friction Abrasion and Resistance: Wear behaviour as a function of counterface (steel) roughness and temp. has been reported [2]. Coefficient of friction 0.16 (20°, 160 kg load), (200°, 13 kg load) [1]. Wear rate 88 μm h^{-1} (20°, 160 kg load), 200 μm h^{-1} (200°, 120 kg load), 225 μm h^{-} (20°, 22 kg load) [1]
Izod Notch:

No.	Value	Notch	Note
1	9.1 J/m	Y	23°, 0.25 mm notch, ISO R180/1A [1]
2	42.1 J/m	N	23°, ISO R180/1A [1]

Electrical Properties:
Electrical Properties General: Volume resistivity 140000 Ω cm (IEC 93) [1]

Optical Properties:
Optical Properties General: Specific optical density, D_s 5 (3.2 mm thick, flaming mode, BS6401/ASTM E662), 2 (3.2 mm thick, non-flaming mode, BS6401/ASTM E662) [1]. Specific optical density is zero after 1.5 min. [1]. Time to 90% D_s 19 min. (3.2 mm thick, flaming mode, BS6401/ASTM E662) [1]

Polymer Stability:
Upper Use Temperature:

No.	Value	Note
1	240–260°C	UL 746B [1]

Decomposition Details: Products of decomposition include CO and CO_2 [1]
Flammability: Flammability rating V0 (1.45 mm thick, UL94) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Processed by conventional injection moulding and extrusion techniques. Injection moulding conditions are generally the same as those used for the non-filled grade although temps. are approx. 20° lower for the latter. Machining conditions such as turning, milling and drilling generally require lower speeds than the unreinforced grade [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.3%	across flow [1]
2	0.03%	with flow [1]

Polyetheretherketone, 30% Glass fibre filled P-233
Synonyms: *Polyaryletheretherketone, 30% Glass fibre filled. PEEK, 30% Glass fibre filled*
Related Polymers: Polyetheretherketone, Polyetheretherketone, 30% Carbon fibre filled
Monomers: 4,4′-Difluorobenzophenone, Hydroquinone
Material class: Thermoplastic, Composites
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.
31694-16-3

Molecular Formula: $(C_{19}H_{12}O_3)_n$
Fragments: $C_{19}H_{12}O_3$
Additives: Glass fibre
General Information: Both standard and "easy-flow" grades are available in a brown granular form
Morphology: Commercial products are typically 35% crystalline [1]
Miscellaneous: Addition of glass fibre improves tensile strength and heat distortion temperature

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.49 g/cm^3	cryst., ISO R1183 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.2×10^{-5}–2.5×10^{-5} K^{-1}	T < T_g, ASTM D696 [1,2]	L

Thermal Conductivity:

No.	Value	Note
1	0.43 W/mK	ASTM C177 [1]
2	0.43 W/mK	2.98 Btu in (h ft^2°F)$^{-1}$, ASTM D696 [2]

Melting Temperature:

No.	Value	Note
1	340–343°C	[1,2]
2	329.5°C	short fibre reinforced

Glass-Transition Temperature:

No.	Value	Note
1	142–143°C	[1,2]

Transition Temperature General: The incorporation of short glass fibres has only a comparatively small effect on T_m [4]
Deflection Temperature:

No.	Value	Note
1	300–315°C	1.82 MPa, ISO R75 [1]

Heat Distortion Temperature:

No.	Value	Note
1	300–315 °C	1.82 Mpa, ISO R75 [1]

Transport Properties:
Water Absorption:

No.	Value	Note
1	0.11 %	24h, 23°, ISO R62A [1]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	17900 MPa	2600 kpsi, ASTM D638 [5]
2	7400 MPa	short fibre [4]

Flexural Modulus:

No.	Value	Note
1	9700–10000 MPa	23°, ISO R178 [1]
2	7600 MPa	1100 kpsi, 23°, ASTM D790 [2]
3	9200 MPa	120°, ISO R178 [1]
4	3000 MPa	250°, ISO R178 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	196.5 MPa	28500 psi, ASTM D638	2–3%
2	128.7 MPa	short fibre [4]	2.4%

Flexural Strength at Break:

No.	Value	Note
1	233 MPa	23°, ISO R178 [1]
2	186 MPa	27 kpsi, 23°, ASTM D790 [2]
3	175 MPa	120°, ISO R178 [1]
4	70 MPa	250°, ISO R178 [1]

Poisson's Ratio:

No.	Value	Note
1	0.45	23°, across flow, ASTM D638 [1]

Compressive Strength:

No.	Value	Note
1	215 MPa	23°, with flow, ASTM D695 [1,2]
2	149 MPa	23°, across flow, ASTM D695 [1,2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2400 MPa	23° [1]	shear modulus

Hardness: Rockwell R124 (ASTM D785) [1,2], M103 (ASTM D785) [1]
Fracture Mechanical Properties: Ultimate shear strength 97 Mpa (23°, ASTM D3846 [1], 100 Mpa 14065 psi, 23°, ASTM D3846 [2]
Friction Abrasion and Resistance: Wear behaviour as function of counterface (steel) roughness and temp. has been reported [3]
Izod Notch:

No.	Value	Notch	Note
1	102 J/m	Y	23°, 0.25 mm notch, ISO R180/1A [1]
2	96 J/m	Y	23°, 0.25 mm notch, ASTM D256 [2]
3	409 J/m	N	23°, ISO R180/1A [1]
4	726 J/m	N	23°, ASTM D256 [2]

Electrical Properties:
Surface/Volume Resistance:

No.	Value	Note	Type
1	10×10^{15} Ω.cm	ASTM D257 [2]	V

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.7	50–100 Hz	1–150°, ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	17.5 $kV.mm^{-1}$	50µm film, ASTM D149 [2]

Strong Field Phenomena General: Comparative tracking index 175 V (23°, IEC112) [1]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004	1 MHz	23°, ASTM D150 [2]

Polymer Stability:
Upper Use Temperature:

No.	Value	Note
1	240–260°C	UL 746B [1]

Flammability: Flammability rating V0 (1.45 mm thick, UL94) [1]
Hydrolytic Stability: Exposure to water at 200° and under pressure of 14 bar causes loss of tensile and flexural strength and flexural modulus. Elongation to weak and falling weight impact strength are affected [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Processed by conventional injection moulding and extrusion techniques. Injection moulding conditions are generally the same as those used for the non-filled grade although temps. are approx. 20° lower for the latter. Machining conditions such as turning, milling and drilling generally require lower speeds than the reinforced grade [1]

Mould Shrinkage (%):

No.	Value	Note
1	1.1%	across flow [1]
2	0.2%	with flow [1]

Polyetherketone P-235

Synonyms: *PEK. mPEK. Poly(oxy-1,3-phenylenecarbonyl-1,4-phenylene). Poly(oxy-1,4-phenylenecarbonyl-1,4-phenylene)*
Related Polymers: Polyetheretherketone, Polyetherketoneketone, Polyetherketoneetherketoneketone, Polyetheretherketoneketone
Monomers: 4,4′-Dihydroxybenzophenone
Material class: Thermoplastic
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.	Note
27380-27-4	1,4-isomer
110418-45-6	1,3-isomer
127288-82-8	
54991-68-3	
104381-45-5	

Molecular Formula: $(C_{13}H_8O_2)_n$
Fragments: $C_{13}H_8O_2$
Additives: Glass fibre, carbon fibre, PTFE
General Information: Is a semi-crystalline engineering polymer with very good thermal and chemical stability. The normal polymer has *para*-substitution throughout (the 1,4-isomer) but a form with *meta*-substituted units (the 1,3-isomer) is known (mPEK). PEK/mPEK copolymers have been synth. [10]
Morphology: Can be crystallised over a wide temp. range or quenched to an amorph. glass. Two crystalline polymorphs have been reported [5]. Orthorhombic a 0.776, b 0.600, c 1.001; volume 466.0Å^3; density 1.398 g cm^{-3} [1]; a 0.762, b 0.587, c 1.003 [12]. Crystallinity 31%; crystallite size a 6.9, b 5.0, c 7.7 [12]. mPEK is amorph. when isolated but is capable of solvent-induced crystallisation to give a mixture of polymorphs. PEK/mPEK copolymers can be thermally crystallised [10]. Differences in the morphology of polymeric and oligomeric PEK are attributable to chain folding in the polymeric form [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.317 g/cm^3	[12]
2	d 1.43 g/cm^3	cryst. [12]
3	d 1.272 g/cm^3	amorph. [12]
4	d 1.29–1.32 g/cm^3	mPEK, amorph. [16]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.2×10^{-5} K^{-1}	21–149°, ASTM D696 [18]	L
2	3.8×10^{-5} K^{-1}	149–199°, ASTM D696 [18]	L
3	4.4×10^{-5} K^{-1}	199–249°, ASTM D696 [18]	L

Thermal Conductivity:

No.	Value	Note
1	0.245 W/mK	1.7 Btu in h^{-1} ft^{-2}°F^{-1}), ASTM D695 [18]

Melting Temperature:

No.	Value	Note

2	365–373°C	[7]
3	373°C	[18]
4	375°C	[12]
5	180°C	mPEK [10]
6	264–307°C	PEK/mPEK copolymer, varying composition [10]

Glass-Transition Temperature:

No.	Value	Note
1	153°C	[4]
2	162°C	[18]
3	131–132°C	mPEK [10,16]
4	142–150°C	PEK/mPEK copolymer, varying composition [10]

Vicat Softening Point:

No.	Value	Note
1	340°C	[2]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 5.1 dl g^{-1} (conc. H_2SO_4, MW 11500), 11.2 dl g^{-1} (conc. H_2SO_4, MW 34900), 15.2 dl g^{-1} (conc. H_2SO_4, MW 49600) [17]

Mechanical Properties:

Mechanical Properties General: Tensile stress at 200° increases with increasing crystallisation temp., particularly when T_c is significantly higher than T_g. The total crystallinity of the polymers, however, is essentially the same despite the increasing crystallisation temp. The variation of tensile stress is not observed when measurements are carried out at room temp. [14]. The elastic moduli in the crystalline regions, both parallel and perpendicular to the chain axis have been reported [12]

Tensile (Young's) Modulus:

No.	Value	Note
1	1800 MPa	[2]
2	4500 MPa	650 kpsi, ASTM D638 [18]
3	5400 MPa	[12]
4	57000 MPa	parallel to chain axis [12]
5	5400–5700 MPa	perpendicular to chain axis [12]
6	4100–4200 MPa	mPEK [16]

Flexural Modulus:

No.	Value	Note
1	4900 MPa	500 kg mm^{-2} [7]
2	4500 MPa	650 kpsi, ASTM D790 [18]

Tensile Strength Break:

No.	Value	Note	Elongation
1	96.5 MPa	14 kpsi, ASTM D638 [18]	14%
2	128 MPa	13 kg mm^{-2} [7]	
3	323 MPa	[12]	30.2%
4	56–77 MPa	mPEK [16]	1–2%

Flexural Strength at Break:

No.	Value	Note
1	196 MPa	28500 psi, ASTM D790 [18]
2	206 MPa	21 kg mm^{-2} [7]

Tensile Strength Yield:

No.	Value	Note
1	117 MPa	17 kpsi, ASTM D638 [18]

Compressive Strength:

No.	Value	Note
1	75 MPa	[2]

Viscoelastic Behaviour: Stress at constant strain rate decreases with increasing temp. At room temp. stress at yield increases with increasing strain rate [15]
Hardness: Rockwell R126 (ASTM D785) [18]
Failure Properties General: Bending strength 59 MPa [2]
Fracture Mechanical Properties: Crack velocities during catastrophic failure have been measured at approx. 200 m s^{-1}. The possible decomposition of polymer in the crack zone of a running crack has been reported [11]
Izod Notch:

No.	Value	Notch	Note
1	69.4 J/m	N	23°, 1.3 ft Ib in^{-1}, ASTM D256 [18]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.4–3.5	50–100 kHz	0–150°, ASTM D150 [18]

Dielectric Strength:

No.	Value	Note
1	19 kV.mm^{-1}	50µm film, ASTM D149 [18]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	1 MHz	23°, ASTM D150 [18]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	260°C	continuous, ASTM D695 [18]

Decomposition Details: 5% Weight loss in N_2 occurs at 520° [7]. Onset of degradation 420° (mPEK) [16]. The main decomposition products at 500° are CO, CO_2 and low MW hydrocarbons [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by condensation reaction between dihalides and diphenoxides or self condensation of acid chlorides with Lewis acid catalysts. Processed using conventional injection moulding and extrusion equipment. High MW PEK reacts with 4,4′-difluorobenzophenone in the presence of potassium carbonate to give low MW PEK. The reaction via oligomerisation of the monomer and trans-etherification between oligomers and PEK have been reported [9]. High MW PEK can be synth. by nucleophilic polycondensation of 4,4′-dihydroxybenzophenone or the dihalo analogue in the presence of sodium carbonate and a silicon/copper catalyst. Can also be made by electrophilic polycondensation of 4-phenoxybenzoyl chloride in the presence of a Friedel-Crafts catalyst [6,7]. Synth. via a ketimine route has been reported [8]. The preparation of mPEK and PEK/mPEK copolymers has been reported [10,16]

Polyetherketoneetherketoneketone P-236

Synonyms: *Poly(oxy-1,4-phenylenecarbonyl-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,4-phenylenecarbonyl-1,4-phenylene). Poly(-oxy-1,4-phenylenecarbonyl-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,3-phenylenecarbonyl-1,4-phenylene). PEKEKK*
Related Polymers: Polyetheretherketone, Polyetherketone, Polyetherketoneketone, Polyetheretherketoneketone
Material class: Thermoplastic
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.
132210-87-8
88030-82-4
60015-05-6
104381-49-9

Molecular Formula: $(C_{26}H_{16}O_4)_n$
Fragments: $C_{26}H_{16}O_4$
Additives: Is a semi-crystalline polymer with good thermal stability
Morphology: Two crystalline polymorphs exist, the relative proportions of which depend on the mode of crystallisation. As prepared the polymer is mainly in one crystalline form but after annealing the second form predominates. Reprecipitation alters the crystalline form [3,5,6,7]. Orthorhombic a 0.774 b 0.604, 1.005; cubic volume 469.9 Å [1]. The crystallisation in miscible and immiscible blends does not affect the unit cell dimensions [4]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.403 g/cm^3	[1]

Melting Temperature:

No.	Value	Note
1	370°C	[1]
2	388°C	approx. [4]
3	342–386°C	varying MW and cryst. structrure [5,7]
4	392°C	[6]

Glass-Transition Temperature:

No.	Value	Note
1	158°C	[2]
2	172.5°C	[4]
3	162–172°C	varying MW [5]

Transition Temperature General: T_g and T_m vary with MW and also with the crystalline form of the polymer. Shows double melting behaviour when crystallised above T_g. The presence of isomeric defect struct. can also modify transition temps. [5,6,7]
Transition Temperature:

No.	Value	Note	Type
1	344°C	approx. [4]	cryst. temp.
2	199–212°C	[5]	cryst. temp.

Surface Properties & Solubility:

Surface and Interfacial Properties General: The effect of time and cooling rate on bonding with titanium has been reported [9]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 9.6 dl g^{-1} (conc. H_2SO_4, MW 23600), 11.6 dl g^{-1} (conc. H_2SO_4, MW 33700) [11]

Mechanical Properties:

Mechanical Properties General: Mechanical props. are dependent on morphology and therefore can vary with the processing conditions

Tensile (Young's) Modulus:

No.	Value	Note
1	4000 MPa	[9]

Tensile Strength Break:

No.	Value	Note
1	118 MPa	[9]

Flexural Strength at Break:

No.	Value	Note
1	130 MPa	[9]

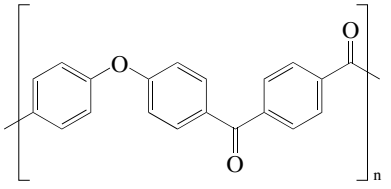
Optical Properties:

Transmission and Spectra: C-13 nmr spectral data have been reported

Polymer Stability:

Decomposition Details: Undergoes a trans-etherification reaction when heated at 340° in the presence of potassium carbonate. The resulting polymer contains etherketone and etherketoneketone units in addition to the original etherketoneetherketoneketone units [8]

Applications/Commercial Products:



Processing & Manufacturing Routes: Can be synth. by nucleophilic polycondensation in the presence of sodium carbonate or potassium carbonate or by electrophilic polycondensation in the presence of a Friedel-Crafts catalyst. If the nucleophilic polycondensation reaction is carried out at higher temps. in the presence of a larger amount of potassium carbonate then transetherification can occur [8,10]

Polyetherketoneketone P-237

Synonyms: *Polyaryletherketoneketone. PEKK. Poly(oxy-1,4-phenylenecarbonyl-1,4-phenylenecarbonyl-1,4-phenylene)*
Related Polymers: Polyetheretherketone, Polyetherketone, Polyetherketoneetherketoneketone, Polyetheretherketoneketone, Polyetherketoneketone, glass-filled, Polyetherketoneketone, carbon-filled
Material class: Thermoplastic
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.
54991-67-2

Molecular Formula: $(C_{18}H_{12}O_3)_n$
Fragments: $C_{18}H_{12}O_3$
Additives: Carbon- and glass-filled products available
General Information: Available in amorphous and crystalline grades
Morphology: Two cryst. struct. have been reported; 2 chain orthorhombic unit cell a 0.786, b 0.575, c 1.016; 1 chain (metrically) orthorhombic unit cell a 0.786, b 0.575, c 1.016 [1]. An orthorhombic struct. with different dimensions has been reported; a 0.417, b 1.134, c 1.008 cubic volume 476.4 Å; density 1.395 g cm^{-3} [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

Polyethersulfone P-240

Synonyms: *PES. Poly(oxy-1,4-phenylenesulfonyl-1,4-phenylene)*
Related Polymers: Polyethersulfone, 20% Glass fibre reinforced, Polyethersulfone, 30% Glass fibre reinforced, Polyethersulfone, 30% Carbon fibre reinforced
Monomers: 4,4′-Dichlorodiphenyl sulfone, 4,4′-Dihydroxydiphenyl sulfone, Bis(4-chlorosulfonylphenyl) ether, Diphenyl ester
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25667-42-9	Victrex, Ultrason E

Molecular Formula: $[(C_{24}H_{16}O_6S_2).(C_{12}H_8O_3S)]_n$
Fragments: $C_{24}H_{16}O_6S_2$ $C_{12}H_8O_3S$
Additives: Fillers include carbon fibre and glass
General Information: Polyethersulfone is an amorph., engineering thermoplastic which at room temp. is tough, strong and rigid. It is distinguished by excellent high temp. performance, impressive creep resistance, hydrolytic stability, low flammability, and smoke emission. Long-term thermal stability is excellent. A lifetime of 50000h can be expected at 190°. Props. show little change up to 200°. Dimensional stability is also excellent up to this temp. A rapid fall in props. occurs beyond 200° with very little strength or rigidity being maintained over 230°. Compared with other plastics PES provides a greater margin of performance in such areas as toughness. Unreinforced polyethersulfone is available in transparent and opaque forms in both injection moulding and extrusion grades. Light amber colour [6]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.37 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.5×10^{-5} K^{-1}	ASTM D696 [2]	L

Volumetric Properties General: Has higher coefficient of linear thermal expansion compared to reinforced grades
Thermal Conductivity:

No.	Value	Note
1	0.18 W/mK	ASTM C177 [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.12 kJ/kg.C	23° [6]	P

Melting Temperature:

No.	Value	Note
1	345–390°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	220°C	[6]

Transition Temperature General: Tg of PES is 35° higher than that of PSU
Deflection Temperature:

No.	Value	Note
1	204°C	1.8 MPa, ASTM D648 [1]
2	208°C	0.45 MPa, ISO/IEC 75 [5]

Vicat Softening Point:

No.	Value	Note
1	220°C	ISO/IEC 306, VST/A/50 [5]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	approx. [6]	Second order (β)

Surface Properties & Solubility:

Solubility Properties General: Undergoes stress-cracking or dissolves in polar compds. such as ketones and some halogenated hydrocarbons [6]
Cohesive Energy Density Solubility Parameters: δ 22 $J^{1/2}$ $cm^{-3/2}$ (min.) [4]
Solvents/Non-solvents: Sol. polar solvents, DMF, *N*-methylpyrrolidinone. Sol. CH_2Cl_2 (may crystallise when dissolved, resulting in an unstable soln.) [4]

Transport Properties:

Transport Properties General: PES has higher water absorption than PSU [2]
Melt Flow Index:

No.	Value	Note
1	30 g/10 min	0.3 MPa, 400°, ASTM D1238 [1]

Water Absorption:

No.	Value	Note
1	0.61 %	24h [6]
2	2.1 %	equilib., ASTM D570 [6]

Mechanical Properties:

Mechanical Properties General: Tough and rigid thermoplastic. Provides a greater margin of performance in such areas as toughness in comparison with other plastics. Creep resistance at room temp. is particularly impressive, after 10 years under a constant tensile stress of 7250 psi, samples have shown only 3% strain. Impact behaviour is similar to that of nylon, both being tough materials but notch-sensitive. Mech. props. show low sensitivity to temp. changes [1,3,7]

Tensile (Young's) Modulus:

No.	Value	Note
1	2660 MPa	ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	2900 MPa	ASTM D790 [1]

Tensile Strength Break:

1	ASTM D638 [6]	40%

Compressive Modulus:

No.	Value	Note
1	2680 MPa	ASTM D695 [6]

Poisson's Ratio:

No.	Value	Note
1	0.4	0.5% strain [4]

Tensile Strength Yield:

No.	Value	Note
1	83 MPa	ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	111 MPa	ASTM D790 [6]

Compressive Strength:

No.	Value	Note
1	100 MPa	ASTM D695 [6]

Complex Moduli: Tensile creep modulus 2700 MPa (1000h, 23°, Dehnung $\leq$0.5%, ISO/IEC 899) [5]
Impact Strength: Tensile impact strength 337 kJ m^{-2} (ASTM D1822) [4]
Hardness: Rockwell M88 (ASTM D785) [4]
Failure Properties General: Shear strength (yield) 50 MPa (ASTM D732) [6]

Friction Abrasion and Resistance: Abrasion resistance 19 mg (1000 cycles) $^{-1}$ (ASTM D1040, Taber CS-17 test) [6]
Izod Notch:

No.	Value	Notch	Break	Note
1	83 J/m	Y		3.1 mm, ASTM D256 [4]
2		N	Y	[4]

Electrical Properties:

Electrical Properties General: PES offers excellent insulating and other electrical props. It has low dielectric constants and dissipation factors even in the GHz (microwave) frequency range. This performance is retained over a wide temp. range
Surface/Volume Resistance:

No.	Value	Note	Type
2	$>0.1 \times 10^{15}$ Ω.cm	min. ISO/IEC 93 [5]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.65	60 Hz	ASTM D150 [6]
2	3.65	1 kHz	ASTM D150 [6]
3	3.52	1 MHz	ASTM D150 [6]

Dielectric Strength:

No.	Value	Note
1	15.5 kV.mm^{-1}	3.2 mm, ASTM D149 [6]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0019	60 Hz	ASTM D150 [6]
2	0.0023	1 kHz	ASTM D150 [6]
3	0.0048	1 MHz	ASTM D150 [6]

Optical Properties:

Optical Properties General: Exhibits optical transparency
Refractive Index:

No.	Value	Note
1	1.65	ASTM D1505 [6]

Transmission and Spectra: Light transmittance 70% [6]
Volume Properties/Surface Properties: Haze <7% (3.1 mm thick, ASTM D1004) [6]

Polymer Stability:

Polymer Stability General: Long-term performance at high temps. in severe service environments. Withstands exposure to elevated temp. in air and water for prolonged periods [1]
Thermal Stability General: Excellent thermal stability and resistance to thermal oxidation
Upper Use Temperature:

No.	Value	Note
1	180°C	UL 746 [1]
2	180°C	UL 746B [1]

Flammability: Flammability rating V0 (0.8 mm thick, UL 94) [6]. Limiting oxygen index 38% (ASTM D286) [6]. Exhibits excellent resistance to burning. Has outstanding flame retardancy and very low smoke release characteristics [6]. Smoke density 35 (6.2 mm, ASTM E662) [6]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light. Absorbance in the uv region causes discoloration and loss of mechanical props. due to polymer degradation. For outdoor application protective lacquers or grades of the material containing carbon black are recommended [6]. Has good resistance to microwave, visible and infrared radiation as well as α, β and γ radiation [6,9]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resistant to aliphatic hydrocarbons and most alcohols. Is crazed, swollen or dissolved by chlorinated hydrocarbons, esters and ketones [6]
Hydrolytic Stability: Superb resistance to hydrolysis by hot water and steam [6]
Stability Miscellaneous: Good dimensional stability [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Commercial synth. of polyethersulfone is obtained mainly via the nucleophilic substitution polycondensation route. This synth. is based on reaction of essentially equimolar quantities of 4,4′-dichlorodiphenylsulfone with Bisphenol S in dipolar aprotic solvent in the presence of an alkali base. Diphenyl sulfone, sulfolane and *N*-methyl-2-pyrrolidinone are examples of suitable solvents. Potassium carbonate is used as base. Polyethersulfone can be synthesised by the electrophilic Friedel-Crafts reaction of bis(4-chlorosulfonylphenyl) ether with diphenyl ether. The same reaction can be carried out using 4-chlorosulfonyldiphenyl ether as the single source monomer. Polyethersulfone can be compression moulded, injection moulded and extruded using conventional equipment. Processing times are comparable with those of conventional engineering thermoplastics. Prior to processing it requires drying for 3.5h at 150°. The recommended mould temp. is 140–165° and melt temp. 345–390°. The resin can be extruded into film, sheet and profiles and it can be thermoformed. Mould shrinkage is low and it therefore is suitable for applications requiring close tolerances and little dimensional change over a wide temp. range. PES can be plated by an electrodeless nickel or copper process [1,7,9,10,11]
Mould Shrinkage (%):

No.	Value	Note
1	0.6%	ASTM D955 [1]

Applications: Mixtures of polyethersulfone with continuous carbon or other high performance fibres provide high strength, high temp. composites which can be shaped by thermoforming. A range of grades is available to meet special requirements. Easy flow unreinforced and glass reinforced grades are available for difficult mouldings. Typical applications are lighting fixtures, electrical/electronic, medical devices, chemical process equipment and automotive applications. Electrical applications include high temp. electrical multipin connectors, coil bobbins, integrated circuit sockets, edge and round multipin connectors, terminal blocks, printed circuit boards and DIP switches. The material mechanical strength accounts for its use in radomes, pump housings, bearing cages, and power saw manifolds. Small appliance manufacturers use PES for hair dryer outlets, hot combs, and projector lamp grilles. Transparency has led to its use in indicator lights and sight glasses. Exceptional fire-safety characteristics make it suitable for use in commercial aircraft interiors. Due to its amorph. character it can be dissolved and spray coated into metals. It meets U.S. Food and Drugs Administration (FDA) requirements for direct food contact

Polyethersulfone, 30% Carbon fibre reinforced P-241

Synonyms: *PES, 30% Carbon fibre reinforced*
Related Polymers: Polyethersulfone
Monomers: 4,4′-Dichlorodiphenylsulfone, 4,4′-Dihydroxydiphenyl sulfone, Bis(4-chlorosulfonylphenyl)ether, Diphenyl ether
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25667-42-9	Victrex, Ultrason E

Molecular Formula: $[(C_{24}H_{16}O_6S_2).(C_{12}H_8O_3S)]_n$
Fragments: $C_{24}H_{16}O_6S_2$ $C_{12}H_8O_3S$
Additives: Carbon fibre
General Information: Extremely strong and rigid thermoplastic which offers a weight saving over metals. Of interest to the aerospace industry and in general transportation. Due to the incorporation of carbon fibre it is conductive and offers full resistance to uv but at high expense

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.48 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.9×10^{-5} K^{-1}	[1]	L

Volumetric Properties General: Has lower coefficient of linear thermal expansion compared to unreinforced PES
Thermal Conductivity:

No.	Value	Note
1	0.45 W/mK	ASTM C177 [1]

Melting Temperature:

No.	Value	Note
1	360–380°C	[3]

Glass-Transition Temperature:

No.	Value	Note
1	225°C	[2]

Deflection Temperature:

No.	Value	Note
1	220°C	1.8 MPa, ASTM D648 [1]
2	220°C	0.45 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	[4]	Second order (β)

Surface Properties & Solubility:

Solubility Properties General: Undergoes stress-cracking, or dissolves, in polar compounds such as ketones and some halogenated hydrocarbons [4]
Solvents/Non-solvents: Sol. polar solvents, DMF, *N*-methylpyrrolidinone. Sol. CH_2Cl_2, may crystallise when dissolved, resulting in an unstable soln. [5]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.5 %	24h, ASTM D570 [1]
2	1.6 %	saturation, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Compared with unreinforced PES it has superior tensile and flexural props., but reduced notched Izod impact strength and lower elongation at break

Tensile (Young's) Modulus:

No.	Value	Note
1	14615–19993 MPa	2120–2900 kpsi, ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	17000 MPa	ASTM D790 [1]

Tensile Strength Break:

No.	Note	Elongation
1	ASTM D638 [1]	1–2%

Tensile Strength Yield:

No.	Value	Note
1	180 MPa	ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	255 MPa	ASTM D790 [1]

Compressive Strength:

No.	Value	Note
1	150 MPa	ASTM D695 [1]

Hardness: Rockwell M99 (ASTM D785) [1]
Failure Properties General: Shear strength 90 MPa (ASTM D732) [1]
Friction Abrasion and Resistance: Coefficient of friction (static) 0.15. Coefficient of friction (dynamic) 0.18 (LNP SOP) [1]
Izod Notch:

No.	Value	Notch	Note
1	90 J/m	Y	ASTM D256 [1]
2	300 J/m	N	ASTM D256 [1]

Electrical Properties:

Electrical Properties General: Due to the incorporation of carbon fibre this material is conductive. Volume and surface resistivities have been reported, 10–100 Ω cm [1]

Polymer Stability:

Polymer Stability General: Stable in the long-term at high temps. in severe service environments
Thermal Stability General: Excellent thermal stability and resistance to thermal oxidation
Upper Use Temperature:

No.	Value	Note
1	180°C	UL 746B [1]

Flammability: Flammability rating V0 (3.2 mm, UL 94) [1]. Limiting oxygen index 42% [3]. Has outstanding flame retardancy and very low smoke release characteristics [4]
Environmental Stress: High degree of oxidative stability. Resistant to uv light [4]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resists aliphatic hydrocarbons and most alcohols. Is crazed, swollen, or dissolved by chlorinated hydrocarbons, esters and ketones [4]
Hydrolytic Stability: Superb resistance to hydrol. by hot water and steam [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Mould temp. of 90–160° and melt temp. of 360–380° are recommended for injection moulding. Prior to melt processing the resin is dried for 3h at 150° to prevent bubbling, surface streaks, and splash marks in moulded parts. Injection moulded components can have anisotropic props. [3]

Mould Shrinkage (%):

No.	Value	Note
1	0.2%	ASTM D955 [3]

Applications: Used for electrical and electronic components and in aerospace applications (nose cones and air ducting)

2	0.0018	1 kHz	ASTM D150 [1]
3	0.0081	1 MHz	ASTM D150 [1]

Optical Properties:

Volume Properties/Surface Properties: Opaque. Amber coloured [8]

Polymer Stability:

Polymer Stability General: Long-term performance at high temps. in severe service environments. Withstands exposure at elevated temps. in air and water for prolonged periods [1]
Thermal Stability General: Excellent thermal stability and resistance to thermal oxidation
Upper Use Temperature:

No.	Value	Note
1	190°C	UL 746B [1]

Flammability: Flammability rating V0 (0.8 mm thick, UL 94) [1]. Limiting oxygen index 41% [7]. Has outstanding flame retardancy and very low smoke release characteristics [4]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light. Resistant to α, β and γ radiation [8]. Stress cracking resistance is substantially enhanced compared with unreinforced PES [4]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resists aliphatic hydrocarbons and most alcohols. Is crazed, swollen or dissolved by chlorinated hydrocarbons, esters and ketones [4]
Hydrolytic Stability: Superb resistance to hydrol. by hot water and steam [4]
Stability Miscellaneous: Good dimensional stability [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Moulded in modern injection-moulding equipment. Mould temp. of 140–165° and melt temp. of 345–390° are recommended. Prior to melt processing the resin is dried for 3.5 h at 150° to prevent bubbling, surface streaks, and splash marks in moulded parts [1]. Incorporation of glass fibre can cause anisotropy in moulded parts [7]
Mould Shrinkage (%):

No.	Value	Note
1	0.4%	ASTM D955 [1]

Applications: Applications in the automotive industry, under the bonnet or in the gear box area, (carburettor parts, bearing cages). Aerospace applications and electrical components such as printed circuit boards and connectors

Poly(ethyl acrylate) P-244

Synonyms: *PEA. Poly(ethyl 2-propenoate). Poly[1-(ethoxycarbonyl)ethylene]*
Monomers: Ethyl acrylate
Material class: Natural elastomers
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
9003-32-1

Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Molecular Weight: The MW ranges from 10000–5000000
Additives: Soap-urea, activated thiol, soap-sulfur, diamines, lead thiourea, carbon black, trithiocyanuric acid and Agerite stalites
General Information: Poly(ethyl acrylate) is a considerably soft, rubbery and slightly tacky low polymer with low T_g. It is resistant to swelling in nonpolar oils and liqs. and has good thermal stability. There is no significant change in T_g with changes in tacticity. It forms the basis of acrylate rubber. Copolymers with a variety of monomers (e.g. polyolefins, vinyl acetate, vinyl chloride) give a wide range of products. Cross-linking elevates and extends the rubbery plateau with little effect on T_g until extensive cross-linking has been introduced. Cross-linking decreases thermoplasticity and solubility and increases resilience.

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.12 g/cm^3

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00028 K^{-1}	glass	V
2	0.00061 K^{-1}	liq.	V

Volumetric Properties General: Van der Waals volume 56.11 cm^3 mol^{-1}. Molar volume 86.6 cm^3 mol^{-1}
Specific Heat Capacity:

No.	Value	Note	Type
1	145 kJ/kg.C	145 J mol^{-1} K^{-1}, 25°, solid	P
2	182 kJ/kg.C	182 J mol^{-1}, K^{-1}, 25°, liq.	P

Glass-Transition Temperature:

No.	Value	Note
1	-24°C	conventional
2	-24°C	syndiotactic
3	-25°C	isotactic

Brittleness Temperature:

No.	Value
1	-24°C

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18.8 J$^{1/2}$ cm$^{-3/2}$. Molar cohesive energy 30.6–31.9 kJ mol^{-1}. CED 353.34 J cm^{-3}
Plasticisers: Thiokol TP-759, Plastolein 9720, Admex 760
Solvents/Non-solvents: Sol. THF, DMF, Me_2CO, butanone, EtOAc, $CHCl_3$, toluene, C_6H_6. Insol. H_2O, EtOH, cyclohexanol, Et_2O, aliphatic hydrocarbons. Generally sol. in polar solvents, insol. in non polar solvents. No phase separation or precipitation occurs on solvent evaporation
Surface Tension:

No.	Value
1	35–42 mN/m

Mechanical Properties:
Tensile Strength Break:

No.	Value	Elongation
1	0.2 MPa	1800%

Optical Properties:
Optical Properties General: Specific refractive index increment 0.109 (Me_2CO, 4360°); 0.106 (Me_2CO, 5460°)
Refractive Index:

No.	Value	Note
1	1.464	25°

Polymer Stability:
Polymer Stability General: Retains original props. under normal use conditions
Thermal Stability General: Decomposes slowly unless subjected to extreme heat
Decomposition Details: When heated to 300–500° decomposes to ethylene, EtOH and CO_2
Flammability: Burns readily in air and oxygen
Environmental Stress: Unaffected by normal degradation; primary uv absorption occurs below the solar spectrum of 290 nm. Uv absorbers improve stability
Chemical Stability: When heated in presence of free radical initiators, undergoes cross-linking and some degradation. Resistant to oxygen
Hydrolytic Stability: Reasonably stable to both acid and alkaline hydrol.

Applications/Commercial Products:
Processing & Manufacturing Routes: Commercial poly(ethyl acrylate) is usually prepared by free radical soln. and emulsion polymerisation. It is processed by injection moulding, blow moulding, extrusion and thermoforming
Applications: Acrylics are widely used in paints, coatings and lacquers, in paper industry, as radiation curable systems, as adhesives and sealing compds., in gaskets for automotive industry and in textile and leather industries

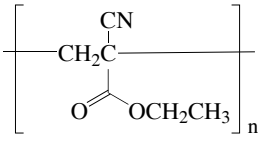
Polyethylbutadiene P-245



Synonyms: *Poly(2-ethyl-1,3-butadiene)*
Monomers: 2-Ethyl-1,3-butadiene
Material class: Synthetic Elastomers
Polymer Type: polydienes

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerisation in an emulsion system has been reported [3]
Applications: Potential application as protective coating on optical products

Poly(ethyl cyanoacrylate) P-246

Synonyms: *Poly(ethyl 2-cyano-2-propenoate). PECA. PEtCA. Ethyl cyanoacrylate polymer*
Related Polymers: Poly(alkyl 2-cyanoacrylates), Poly(methyl 2-cyanoacrylate), Poly(isobutyl 2-cyanoacrylate), Poly(allyl 2-cyanoacrylate)
Monomers: Ethyl 2-cyanoacrylate
Material class: Gums and resins
Polymer Type: acrylic, acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
66547-34-0
25067-30-5

Molecular Formula: $(C_5H_7NO_2)_n$
Molecular Weight: 108000
Additives: Additives may increase mech. props
General Information: Most widely used commercial cyanoacrylate polymer. Is a clear, hard resin with good adhesive props. though brittle with low peel and impact strength
Morphology: Amorph.

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.2 g/cm^3	[10]
2	d 1.248 g/cm^3	20° [2]

Thermodynamic Properties General: Thermodynamic props. have been reported [19]. Heat capacity increases with increasing temp.

Specific Heat Capacity:

No.	Value	Note	Type
1	1.044 kJ/kg.C	0.118 kJ mol^{-1}, -73° [19]	P
2	1.37 kJ/kg.C	0.155 kJ mol^{-1}, 25° [19]	P
3	1.65 kJ/kg.C	0.186 kJ mol^{-1}, 127° [19]	P

Glass-Transition Temperature:

No.	Value	Note
1	116°C	dynamic mechanical analysis [1]
2	140°C	differential scanning calorimetry [2]
3	115°C	dilatometry [3]
4	133°C	differential scanning calorimetry [18]

Vicat Softening Point:

No.	Value	Note
1	126°C	[4]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 11.2–11.4 $J^{1/2}$ $cm^{-3/2}$ (calc.) [8,10]
Solvents/Non-solvents: Sol. THF, CH_2Cl_2, Me_2CO, acetonitrile, DMF, nitromethane, *N*-methylpyrrolidone, nitrobenzene . Insol. EtOAc, MeOH, toluene, hexane, Et_2O, C_6H_6, $CHCl_3$, H_2O [5]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink parameters have been reported [5]. η 0.51 (30°, THF) [9]; 0.58 (30°, 28 d, THF) [9]; η 0.32 dl g^{-1} (20°, 1% in nitromethane) [19]. Commercial materials available in low, medium and high viscosity
Water Content: 0.7%

Mechanical Properties:

Mechanical Properties General: Increasing polymer viscosity increases adhesive bond strength, which is also increased by additives. Storage modulus decreases with increasing temp.; breaking strength decreases on heating [8] or on exposure to moisture [9]

Tensile (Young's) Modulus:

No.	Value	Note
1	2200 MPa	bulk polymer [1]

Flexural Modulus:

No.	Value	Note
1	2068 MPa	300 kpsi, ASTM D790

Tensile Strength Break:

No.	Value	Note	Elongation
1	28 MPa	steel-steel, ASTM D638 [4]	2%
2	46 MPa	Bulk polymer [10]	4.3%
3	35 MPa	cold rolled steel	
4	5.7 MPa	bone	

Miscellaneous Moduli:

No.	Value	Note	Type
1	8800 MPa	25°[1]	storage modulus

Impact Strength: Shear impact strength 267–533 J m^{-1} (5–10 ft Ib in^{-1}, ASTM D950) [4] 4.8 kJ m^{-2} (23°, 24h) [18], 2.2 kJ m^{-2} (100°, 24h) [18]; 1.2 kJ m^{-2} (150°, 5h) [18]
Mechanical Properties Miscellaneous: Tensile shear strength 14 MPa (cold rolled steel); 17.2 MPa (2500 psi, steel) [4]; 13.7 MPa (2000 psi, Al) [4]. Overlap shear strength 14.5 MPa (low viscosity, cold rolled steel); 1.8 MPa (high viscosity, cold rolled steel); 10 MPa (low viscosity, brass); 13 MPa (high viscosity, brass) [10>; >22.8 MPa (cold rolled steel, added trihydroxy benzoic acid). T peel strength 0.09 kg cm^{-1}, 0.11 kg cm^{-1} [16], 2.5 kg cm^{-1} [17] (cold rolled steel). Lap shear break strength 17 MPa. Mechanical failure of bonded polymers usually occurs before bond failure. Dynamic mechanical props. and loss factor values have been reported [1,10]
Hardness: Rockwell M58
Izod Notch:

No.	Value	Notch	Note
1	40 J/m	N	cold rolled steel

Izod Area:

No.	Value	Notch	Note
1	0.3 kJ/m^2	Notched	3 kg cm cm^{-2} [14]
2	0.65 kJ/m^2	Notched	6.5 kg cm cm^{-2} [15]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.98	1 MHz	[4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.45	20° [4,10]

Polymer Stability:

Thermal Stability General: Loss of bond strength occurs above 90 °
Upper Use Temperature:

No.	Value	Note
1	80°C	approx.

Decomposition Details: Depolymerisation begins as low as 90° by chain fragmentation without MW loss [8]. Decomposition onset 168° (N_2), 153° (air) [8]. Depolymerisation is virtually complete above 260°
Environmental Stress: Has poor resistance to moisture [9] when adhered to metals. Unsuitable for use in situations of high heat, high impact, moisture or outdoor conditions
Chemical Stability: is stable to motor oils and alcohols
Hydrolytic Stability: Degraded rapidly by alkali soln., releasing formaldehyde [9,12]

Applications/Commercial Products:

Processing & Manufacturing Routes: Spontaneous polymerisation of ethyl cyanoacrylate catalysed by base see poly(alkyl cyanoacrylates)
Applications: Used for binding small parts in many industries where an instant bond is required

Polyethylene P-247

Synonyms: *Polyethene. Polythene. PE*
Related Polymers: High-density polyethylene, Low-density polyethylene, Linear low-density polyethylene, Ultra high MW polyethylene, Medium-density polyethylene, Ultra (or very) low-density polyethylene, Polyethylene films, Polyethylene fibres, Polyethylene blends
Monomers: Ethylene, Butene, Hexene, Octene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.
9002-88-4

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4

Molecular Weight: M_n 20000–40000 (typical commercial value). MW 300–600 (for waxes). M_n 3000000 (min., ultra high MW)
Additives: Antioxidants. Carbon black for electroconductive composites
General Information: Polyethylene is the generic name for a large family of olefin homopolymers and copolymers. The method of production, co-monomer and consequent MW, degree of polymerisation, crystallinity and density give rise to a broad range of props. divided into groups related to density. High-density polyethylene (HDPE), density 0.941 g cm^{-3}; ultra high MW polyethylene (UHMWPE), density 0.93; medium-density polyethylene (MDPE), density 0.93–0.94; linear low-density polyethylene (LLDPE), density 0.915–0.925; low-density polyethylene (LDPE), density 0.91–0.94; very low-density polyethylene (VLDPE, ULDPE), density 0.88–0.91. This classification is based on 2 parameters readily measured in 1950's. It cannot easily describe important distinctions between struct. and props. of resin brands [2]
Morphology: The smallest crystalline units are planar lamellae comprised of chains perpendicular to the plane, folding back and forth. A few chains interconnecting adjacent lamellae through an amorph. region lead to the formation of the larger spherulites. The high nucleation rate gives rise to small spherulites - which are always present even after rapid quenching. The spherulite size may greatly affect props. [3]
Identification: Cl, S, P absent; N may be present in antioxidant. No simple chemical tests for identification. Low density, lack of chemical reactivity, limited solubility are indicative [4]. May be distinguished from polypropylene by sinking in isophorone, polypropylene floats
Miscellaneous: The repeating unit $(CH_2CH_2)_n$ is strictly polymethylene $(CH_2)_m$. Originally prepd. by the polymerisation of diazomethane, it predated PE to which it is nominally identical but much more linear. It is now basically only of historical interest [1]. Ethylene polymers in practice can contain short and long-chain branched sections [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1 g/cm^3	25° cryst. phase,
2	d 0.852–0.862 g/cm^3	25° amorph. phase, [1,2,3]

Melting Temperature:

No.	Value	Note
1	135°C	crystallinity 70–90%, density 0.96–0.97
2	105–115°C	crystallinity 40–50%, density 0.910–0.915 [3]
3	142.6°C	theoretical 100% crystallinity [4]

Transition Temperature General: Controversy whether β-transition temp. or γ-transition temp. is T_g [1]. Transition temps. are dependent on crystallinity
Transition Temperature:

No.	Value	Note	Type
1	50°C	approx., cryst. phase motion	α transition temp.
2	-20°C	approx., branch point motion	β transition temp.
3	-120°C	approx., CH_2 gp motion	γ transition temp.

Surface Properties & Solubility:

Plasticisers: Plasticisers are little used since flexibility can be adjusted by polymerisation conditions and blending, without deterioration of phys. props. They include vinyl plasticisers (at *ca.* 0–2 wt.%), hydrocarbons (up to *ca.* 20 wt.%), rubbers and chlorinated paraffins in conjunction with antimony oxide for flame retardance [4, 5]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, aromatic hydrocarbons, halogenated hydrocarbons, elevated temp. above

50° for low density types. Solubility decreases with increasing density and crystallinity. Temps. up to 170° may be required for highly crystalline PE. Insol. all liquids at room temp., polar liquids at elevated temp. [4, 6]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.1–17 g/10 min	load 2.16 kg, 190° [20]

Polymer Melts: Viscosity is very dependent on shear rate [20]
Permeability of Gases: [N_2] 12.25–131.3 0.14–1.5 × 10^{-13} cm^3 (cm s Pa)$^{-1}$.11.82–131.3 (0.18–2 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 25°); 113.8–595.3 1.3–6.8 × 10^{-13} cm^3 (cm s Pa)$^{-1}$. (1.75–9.1 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 50°); [O_2] 0.53–4.2 × 10^{-13} cm^3 (cm s Pa)$^{-1}$. (0.7–5.6 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 25°); 1.6–5.3 × 10^{-13} cm^3 (cm s Pa)$^{-1}$. (2.1–7.1 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 50°); [CO_2] 2.3–26.3 × 10^{-13} cm^3 (cm s Pa)$^{-1}$. (3–35 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 25°); 8.9–53 × 10^{-13} (cm s Pa)$^{-1}$ (11.8–71 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 50°). Transmission decreases with increasing crystallinity [4]
Water Absorption:

No.	Value	Note
1	0.2 %	1 year, 20° [4]

Mechanical Properties:

Mechanical Properties General: It is difficult to correlate stress-strain props. of polyethylenes with density, crystallinity and melt flow index since test conditions and specimen preparation are significant. In general, props. involving small deformation depend on crystallinity and density while those involving large deformations depend on MW and chain branching. Typically LDPE is soft and flexible while HDPE is harder and stiffer [1,4]

Electrical Properties:

Electrical Properties General: Being completely non-polar, polyethylenes have very high electrical resistivity and exceptionally low loss, making them ideal for high frequency insulation. Occluded air or voids, oxidation and mech. stress are deleterious [1,4]
Surface/Volume Resistance:

No.	Value	Note	Type
2	$>0.1 \times 10^{15}$ Ω.cm	min.	S

Dielectric Strength:

No.	Value	Note
1	20–160 kV.mm^{-1}	greater for thin films, increases with density and MW, but more affected by thickness and temp. [4]

Dissipation Power Factor: tan δ <0.0002 (but increased by process residues, modification, etc.) [4]
Dissipation (Power) Factor:

No.	Value	Note
1	<0.0002	Max. but increased by process residues, modification, etc. [4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.51–1.52	increases with density
2	1.49	amorph.
3	1.52	cryst. α, β
4	1.582	cryst. γ [4]

Total Internal Reflection: Birefringence 0.001–0.004 (varies irregularly with stress in the specimen) [4]
Volume Properties/Surface Properties: Opaque, translucent in thin film (due to light scattering by spherulites)

Polymer Stability:

Thermal Stability General: Stable in absence of air to 280–300°. Melts and becomes transparent on pyrolysis. Does not melt if cross-linked
Decomposition Details: Above 300° decomposes to yield low MW hydrocarbons
Flammability: Burns with a yellow tipped blue flame with little smoke; continues to burn and may drip when removed from flame. On extinguishing smells similar to hot paraffin wax
Environmental Stress: Susceptible to environmental stress cracking, especially if subject to strain and exposure to polar liquids or vapours [1,4]
Chemical Stability: Highly inert to swelling by all solvents. Resistant to polar solvents, vegetable oils, H_2O, alkalis, most conc. acids (inc. HF) at room temp. Decomposed by strong oxidising agents e.g. fuming HNO_3, H_2SO_4. Slowly attacked by halogens and chlorinating agents [1,4]

Applications/Commercial Products:

Processing & Manufacturing Routes: There are 4 types of reaction system operated under 3 synthesis technologies for the polymerisation of ethylene of commercial importance; reaction systems are 1. High pressure (60–360 MPa) free radical process using oxygen, peroxide or other oxidiser as initiator at a temp. up to 350° to produce LDPE by a liquid phase reaction; (a recent variant, uses low pressure (0.7–2.1 MPa) and low temp. (<100°) but requires ultra high purity ethylene to produce LDPE by a gas phase reaction); 2. Low pressure (0.1–20 MPa) using a heterogeneous catalyst (supported molybdenum or chromium oxides) at a temp. of 50–300° to produce HDPE (Philipps Process); 3. A low pressure process using ionic catalysts (titanium halides and aluminium alkyls - Ziegler catalysts) and 4. Low pressure process using Ziegler catalysts supported on inorganic carriers. Synthesis technologies are supercritical ethylene at a temp. above the melting temp. of the PE being produced and high pressure, the mixture of supercritical ethylene and molten PE serves as the polymerisation medium. As well as reaction systems 1, 3, 4 above, metallocene (Kaminsky) catalysts are accomodated; B. Solution or Slurry - A variety of catalysts may be used with a hydrocarbon solvent at 120–150°. This versatile method was the first to use Philipps and Ziegler catalysts. Solvent strip stage required; C. Gas Phase - Many catalysts can be adapted to use in a mechanically stirred, or fluidised, bed of PE particles in a gas phase reactor. Absence of solvent recirculation gives an economical process [2, 7]. In the early 1930's, Perrin at ICI discovered the high pressure reaction system [8]. Standard Oil Co. developed a process using molybdenum oxide supported on alumina as a catalyst in the early 1950's [9]. This process is not now commercially used. Also in the early 1950's, Ziegler discovered the titanium halide + alkyl aluminium compound catalyst [10, 11, 12] and the potential of chromium oxide supported on silica (Philipps catalyst) was discovered [13, 14]. A DuPont process in the mid 1950's gave linear PE but using a pressure of 707 MPa was not commercially viable [15]. More recent developments are the metallocene (Kaminsky) catalysts [16, 17] and the Union Carbide, Unipol process [18], which both allow a high degree of product control
Applications: Due to its great versatility, PE is the largest quantity manufactured polymer in the world (*ca.* 4.5 × 10^7 tonnes total in 1994). PE is primarily used for commodity plastics but also for some speciality polymers. Applications include various types of films; coatings for paper, metal, wire and glass; containers for both household and industrial use; toys; pipe and tubing; and fibres

Trade name	Details	Supplier
A-C	Also includes	Allied Signal Corporation

Poly(ethylene-*co*-acrylic acid) P-248

Synonyms: *EAA copolymer*
Related Polymers: Poly(acrylic acid), Poly(ethylene)
Monomers: Ethylene, Acrylic acid
Material class: Copolymers
Polymer Type: polyethylene, acrylic
CAS Number:

CAS Reg. No.	Note
9003-06-9	
25750-82-7	sodium salt
27515-34-0	potassium salt

Molecular Formula: $[(C_2H_4).(C_4H_4O_2)]_n$
Fragments: C_2H_4 $C_4H_4O_2$
Molecular Weight: The MW can range from 1000–100000
Additives: Carbon black, flame retardants, and titanium dioxide
General Information: Can be amorph. or partially crystalline. It is one phase material if amorph. and two phase if crystalline. It has excellent adhesion to most metallic and non-metallic substrates and good toughness, tear strength and stiffness. The hydrogen bonds between neighbouring carboxylic acid groups induce a cross-linking effect resulting in good toughness. Usually prod. as a neutralised dispersion with alkali and metal ions which forms a clear glassy material

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.96 g/cm^3	20% acrylic acid

Volumetric Properties General: Density of the polymer is dependent on the content of acrylic acid and it reaches a maximum at 20% of acrylic acid content
Glass-Transition Temperature:

No.	Value
1	0°C

Vicat Softening Point:

No.	Value	Note
1	50°C	XO [3]
2	86°C	EAA [2]

3	85°C	[2]
4	82°C	[2]

Brittleness Temperature:

No.	Value	Note
1	-20°C	XO [3]
2	-73°C	EAA [2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. H_2O. Swollen by organic solvents at elevated temps. Ionic bonding decreases solubility in organic solvents

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	300 g/10 min	XO grades [3]
2	11 g/10 min	EAA 435 [2]
3	5.5 g/10 min	EAA 449 [2]
4	9 g/10 min	EAA 459 [2]
5	67 g/10 min	14% acrylic acid
6	12.2 g/10 min	88% Na salt
7	0.3 g/10 min	33% Na salt

Polymer Melts: Melt viscosity increases with acid content and also increases with neutralisation. Can be controlled by adjusting copolymer MW. Melt strength and elasticity values are similar to those of polyethylene

Permeability and Diffusion General: Permeability of liquids and gases is high for low crystallinity polymer and low for maximum crystallinity. Low permeability of natural oils

Water Content: 1% (approx.)

Water Absorption:

No.	Value
1	1 %

Mechanical Properties:

Mechanical Properties General: Tensile strength decreases with increasing acid unit content, to a minimum at 12–15%, then increases. Fracture strength exhibits a max. at same acid content. Increasing neutralisation increases tensile strength, reducing elongation at break

Tensile Strength Break:

No.	Value	Note	Elongation
1	11 MPa	XO grades [3]	300%
2	14.1–19 MPa	EAA grades [2]	650%
3	14.8 MPa	14% acrylic acid	470%
4	21.7 MPa	88% Na salt	420%
5	33 MPa	33% Na salt	280%

Tensile Strength Yield:

No.	Value	Note
1	6.2 MPa	XO grades [3]
2	9.3–9.7 MPa	EAA grades [2]

Hardness: Shore D54 (XO grades) [3], Shore D47-D49 (EAA grades) [2]

Friction Abrasion and Resistance: Has good abrasion resistance

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency
1	2.4–2.5	60 Hz

Dielectric Strength:

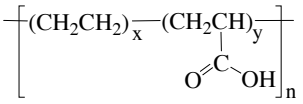
No.	Value	Note
1	39.37 $kV.mm^{-1}$	1 $kV\ mil^{-1}$, $\frac{1}{8}$ in thick

Dissipation (Power) Factor:

No.	Value	Frequency
1	0.006–0.008	60 Hz

Applications/Commercial Products:

Processing & Manufacturing Routes: Ethylene can be polymerised with acrylic acid under high pressure using free radical initiators to produce a highly branched polymer. Copolymer can be processed like LDPE. The carboxylic acid groups present in the copolymer cause corrosion. When the acid content is up to 8% and melt temp. less than 177° temper-hardened steel is good enough but at higher acid contents nickel or chrome plated surfaces are required.



Applications: Coatings, laminates and bonding with paper, metal foils, nylon, polyethylene and polyester. Processing aid in sheet extrusion and injection moulding. It is also recommended as a flush vehicle

Poly(ethylene-*co*-acrylic acid) P-249

copolymer with acrylic acid

copolymer with methacrylic acid

Polymer Stability:

Thermal Stability General: Props. maintained at very low temps. [1]
Environmental Stress: Environmental stress crack resistance increases with increasing carboxyl content [1]
Chemical Stability: Polymers tend to be corrosive due to presence of acid groups [1]
Stability Miscellaneous: FDA approved grades available

Poly(ethylene adipate) P-250

Synonyms: *Poly(oxyethyleneoxyadipoyl). PEA. Poly(ethylene glycol adipate). Adipic acid-ethylene glycol copolymer. Poly[oxy-1,2-ethanediyloxy(1,6-dioxo-1,6-hexanediyl)]*
Monomers: 1,2-Ethanediol, Hexanedioic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.	Note
24938-37-2	Poly(ethylene adipate)
24937-05-1	

Molecular Formula: $(C_8H_{12}O_4)_n$
Fragments: $C_8H_{12}O_4$
Morphology: Monoclinic a 0.547, b 0.723, c 1.172, β 113.5° [12]; (c 1.191) [3], monoclinic a 0.547, b 0.724, c 1.155, β 113.5° [13]; monoclinic a 0.540, b 0.726, c 1.085, β 113.3° [14]; monoclinic a 0.50, b 0.74, c 1.171 [15]; monoclinic a 2.57, b 3.07, c 1.171, β 103.8° [2]. Morphology has been studied [11,47]. There are two crystalline modifications [27,50,55,56]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.25 g/cm^3	[2,5]
2	d 1.221 g/cm^3	[17]
3	d 1.263 g/cm^3	[25]
4	d 1.21 g/cm^3	[35]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00065 K^{-1}	amorph. [17]	v
2	0.00064 K^{-1}	crystalline [17]	v
3	0.00071 K^{-1}	[19]	v
4	0.00051 K^{-1}	[24]	v

Volumetric Properties General: Compressibility 0.00065 cm^3 g^{-1} atm^{-1} [17], -5.3 × 10^{-5} cm^3 g^{-1} bar^{-1} [24]
Equation of State: Equation of state information has been reported [19]
Thermodynamic Properties General: ΔH_f 15.91 kJ mol^{-1} (3800 cal mol^{-1}), S_f 50 J mol^{-1} (12 cal mol^{-1}) [8]; ΔH_m 12.1 kJ mol^{-1} (70.4 J g^{-1}), ΔS_m 6.7 J mol^{-1} K^{-1} [24]; ΔH_f 10.73 kJ mol^{-1} (62.4 J g^{-1}) (14.9 cal g^{-1}) [17]; $\Delta H_{cryst.}$ 147 J cm^{-3} (35 cal cm^{-3}) [18]. Other ΔH values have been reported [50]. C_p values have been reported [52]. ΔH_f 2.1 kJ mol^{-1} [66]; ΔS_f 7.8 J mol^{-1} K^{-1} [66]
Thermal Conductivity:

No.	Value	Note
1	0.169 W/mK	Coefficient of thermal conductivity [58]

Melting Temperature:

No.	Value	Note
1	50°C	[1,8]
2	52–54°C	[2,19,34]
3	47°C	[9,18]
4	65°C	[17]
5	53°C	[24]
6	49.7°C	[35]
7	47–52°C	[38]
8	53–55°C	[65]

Glass-Transition Temperature:

No.	Value	Note
1	-70°C	203K [8]
2	-68°C	[10]
3	-50°C	223K [18]
4	-26°C	110 Hz [23]
5	-30°C	[25]
6	-46°C	[34]
7	-47°C	[35]
8	-60°C	β-form [56]

Transition Temperature General: Other transition temps. have been reported [30,44]
Transition Temperature:

No.	Value	Note	Type
1	55°C	328K [18]	$T°_m$
2	-95°C	110 Hz [23]	T_γ
3	70°C	343K [51]	$T°_m$

Surface Properties & Solubility:

Solubility Properties General: Phase diagrams with organic solvents have been reported [22]
Cohesive Energy Density Solubility Parameters: δ_o 19.8 J$^{1/2}$ cm$^{-3/2}$; δ_d16.3 J$^{1/2}$ cm$^{-3/2}$; δ_p 6.1 J$^{1/2}$ cm$^{-3/2}$; δ_h 9.4 J$^{1/2}$ cm$^{-3/2}$ [33]. Energy of cohesion has been reported [48]. Molar cohesive energy 54.18 kJ mol^{-1} (12.94 kcal mol^{-1}) [63]. Cohesive energy density 5.19 kJ mol^{-1} [66]
Internal Pressure Heat Solution and Miscellaneous: Polymer - solvent interaction parameters for C_6H_6, $CHCl_3$ and THF have been reported [32, 64]
Solvents/Non-solvents: Sol. C_6H_6, Me_2CO, EtOAc, AcOH [1], DMSO [28], $CHCl_3$ [4,31], trichloroethene [4], 1,1,2,2-tetrachloroethane [4], trifluoroacetic acid [21]. Slightly sol. CCl_4,

tetrachloroethene [4]. Insol. H_2O [1], EtOH [1], petrol [1], Et_2O [1,31]

Surface and Interfacial Properties General: Interfacial free energy 0.89 mJ cm^{-2} (8.9 erg cm^{-2}, parallel) [18]. Interfacial free energy 2.27 mJ cm^{-2} (22.7 erg cm^{-2}, perpendicular) [18]

Transport Properties:

Polymer Solutions Dilute: [η] 0.15 dl g^{-1} (25°, C_6H_6) [19]; η_{inh} 0.16 dl g^{-1} (30°, $CHCl_3$) [29]. Other viscosity values have been reported [37]. Theta temp. 114.5° (cyclohexanol) [62]

Polymer Melts: Melt viscosity has been reported [39]

Water Content: Water absorption has been reported [43]

Mechanical Properties:

Complex Moduli: Real and imaginary parts of complex shear modulus have been reported [25]

Electrical Properties:

Electrical Properties General: Other dielectric constants and loss factors have been reported in graphical form [23]. Volume resistivity has been reported [59]. Dissipation factor has been reported [31,57,59]

Dielectric Permittivity (Constant):

No.	Value	Note
1	5.16	[5]

Static Electrification: Effective dipole moment μ_e 0.8 [23]. Electrical conductivity has been reported [57]

Optical Properties:

Transmission and Spectra: Ir [6,27,41,50,53,54], H-1 nmr [45,61], mass [20,29,60], Raman [54], C-13 nmr [21,28,61], esr [26,46], XPES [36] and uv [40] spectral data have been reported

Polymer Stability:

Decomposition Details: Thermooxidative decomposition occurs without formation of hydroperoxides. [16] Max. decomposition occurs at 380° [29]. Energy of activation for decomposition 177.5–188 kJ mol^{-1} (42.4–45 kcal mol^{-1}) [42]. Decomposition has been studied by mass spectroscopy [20]. Activation energy of oxidation 80–92 kJ mol^{-1} (19–22 kcal mol^{-1}) [16]

Biological Stability: Biodegradability has been reported [49]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synthesised by condensation polymerisation of ethylene glycol and adipic acid at 200–250° [1,7,19,21]

Applications: Used as plasticiser for PVC. Used in polyurethane industry for manufacturing of pre-polymers, thermoplastic elastomers, coatings and adhesives, dispersing agents, and cast elastomers

Poly(ethylene azelate) P-251

Synonyms: *Poly(oxyethyleneoxyazelaoyl). Poly[oxy-1,2-ethanediyloxy(1,9-dioxo-1,9-nonanediyl)]. PE7. Poly(1,2-ethanediol-cononanedioic acid)*
Monomers: 1,2-Ethanediol, Nonanedioic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.
26760-99-6
26762-07-2

Molecular Formula: $(C_{11}H_{18}O_4)_n$
Fragments: $C_{11}H_{18}O_4$
Morphology: Cryst. struct. has been studied [3]. Orthorhombic, a 0.745, b 0.497, c 3.12 [17]; monoclinic, a 2.57, b 3.07, c 3.12, β 103.8° [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.172 g/cm^3	[13]
2	d 1.163 g/cm^3	[15]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00062 K^{-1}	[15]	V

Volumetric Properties General: Compressibility 6.8×10^{-5} cm^3 g^{-1} bar^{-1} [15]
Latent Heat Crystallization: ΔH_m 83.6 J g^{-1}, ΔS_m 10.5 J mol^{-1} K^{-1} [15]
Melting Temperature:

No.	Value	Note
1	44–47°C	[1,13,18]
2	34–36°C	[7]
3	47°C	[15]
4	37°C	[16]

Glass-Transition Temperature:

No.	Value	Note
1	-54°C	[16]

Transition Temperature:

No.	Value	Note	Type
1	45°C	[2]	Softening temp.
2	47°C	[2]	Thread formation temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density 309 J cm^{-3} (74 cal cm^{-3}) [6]
Solvents/Non-solvents: Sol. C_6H_6, boiling EtOAc, boiling cyclohexanone [1,2]. Slightly sol. EtOH [1]. Insol. EtOAc, cyclohexanone [1]

Transport Properties:

Polymer Solutions Dilute: [η] values have been reported. Viscosity 0.28 [2]

Electrical Properties:

Electrical Properties General: Dielectric constant and loss factor have been reported [14]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.96	[14]

Optical Properties:

Optical Properties General: Refractive index has been reported [14]
Transmission and Spectra: Esr [8], ir and Raman [9] spectral data have been reported

Polymer Stability:

Biological Stability: Microbial degradation [10] and biodegradation [11] have been reported

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by condensation polymerisation of ethylene glycol and azelaic acid at 250° under vacuum [1,5,6,7,12,15]

Polyethylene blends P-252

Synonyms: *Polyethylene alloys. Blended polyethylenes*
Related Polymers: PE blends with styremics, Linear low density (low pressure process) PE, Medium-density PE, Ultrahigh molecular weight PE, High-density (low pressure process) PE, General information on polyethylenes, Low-density (highpressure process) PE, PE blends with rubbers, Very low or ultralow density PE
Material class: Blends, Thermoplastic
Polymer Type: polyethylene, polyolefins
General Information: Due to the wide variation in props. between polyethylene classes and within each class there is enormous scope for further modification of props. by blending; classes within a single class (e.g. low MW HDPE with high MW HDPE); class to class (e.g. LDPE with LLDPE); and with other polymers/ elastomers e.g. with polyamides and rubbers. Immiscibility is common and compatibilisation and strength improvement may be achieved by using copolymers, grafted polymers, functionalised polyethylene, rubbers, CaO (coated/uncoated) and glass fibres. Common PE/PE blends include use of low MW HDPE waxes to improve melt flow characteristics, hardness, abrasion resistance, grease resistance of other PE grades; LLDPE blended with LDPE to give LDPE processability with LLDPE dart impact strength, puncture strength and tear strength; addition of mLLDPE to commodity LLDPE to improve sealability; addition of mLLDPE to various PE grades to improve oxygen barrier properties, toughness, clarity [1]. Rapidly growing important area [2,3,4,5,6,7,9]. With proper resin selection it is possible to pick and choose the desired specific physical props. of the contributing resin selection in order to achieve a finished (film) with very unique end use props. [9]
Morphology: Viscosity ratio, processing conditions and compatibiliser level affect size and number of EVOH layers in LDPE/ EVOH blend [10]. Partial co-crystallisation can occur between branched and linear PE [11]. Morphology of LDPE or LLDPE blended with gelatinised starch plasticised with glycerol is controlled by the starch content [12]. Moulding and storage conditions affect the morphology of starch blended with maleated HDPE, maleated LLDPE, or maleated EVA [14]. Phase morphology in HDPE/PP/PS and HDPE/PS/PMMA blends can be predicted and manipulated [13]. Morphology and its effect on props. of octene based LLDPE blended with ethylene-propylene-butylene terpolymer is given [15]. Phase structures in binary blends of any two of HDPE, LDPE, LLDPE are discussed as a basis for understanding of more complex variations [16]
Miscellaneous: TEM can detect phase separation at just below 1 mol% co-monomer (butene or octene) and DSC can detect phase separation at approx. 1.3 mol% (butene) or 1.5 mol% (octene) in linear blends with lightly branched copolymer PE [17]. Small angle neutron scattering has been used to investigate liquid/liquid phase separation in linear PE/branched PE blends [18]. In LLDPE blended with a given weight of LDPE, FTIR to identify the α-olefin followed by DSC to quantify the amount of α-olefin form a rapid anal. method [3]. Blends of EVA with LDPE or LLDPE and blends of Dow Affinity PE with LDPE or LLDPE are compared [6]. In blends of butene LLDPE or octene LLDPE with linear PE's, for lightly branched copolymers melt phase separation is more affected by the number of branches than their length [19]. The effect of long-chain branching in EPM in blends including EPM/PP/HDPE has been reported [20]

Volumetric & Calorimetric Properties:

Equation of State: An equation of state model based on generalised Flory theory is given which accounts for effects of MW and degree of branching on miscibility in polyolefin blends (including PE/PP, HDPE/LLDPE, HDPE/iPP) [4]
Thermodynamic Properties General: Thermal and other props. of HDPE blended with homogenous branched PE have been reported [21] also of octene based LLDPE with ethylene-propylene-butylene terpolymer [15] and UHMWPE with low MW short chain branched PE [22]

Surface Properties & Solubility:

Surface and Interfacial Properties General: Interfacial adhesion in PE/SBH blends is improved by adding the product from extended reactive blending of functionalised PE (containing free carboxylic groups) with SBH [23]. The contact angle between LLDPE blended with LLDPE-graft- maleic anhydride and water or DMF decreases with increasing grafting [7]

Transport Properties:

Polymer Melts: Effects of blending 2 miscible metallocene catalysed HDPE'S of very different MW on dynamic viscoelasticity, steady state viscosity and dimensional stability are reported [24]. Rheological props. of octene based LLDPE blended with ethylene-propylene-butylene terpolymer are given [15]. The blend components are immiscible but processability is improved if there is less than 20 wt% terpolymer. Flow of flame retardant HDPE is improved by blending with mLLDPE [25]. Viscosity of UHMWPE/low MW short chain branched PE is given [22]. Rheological props. of HDPE virgin/recycled blends are examined [26]
Permeability and Diffusion General: Permeability, esp. of oxygen, can be reduced by large amounts (740 × for 6 phr compatibiliser) by increasing the size and number of EVOH layers in LDPE/ EVOH blends [10]

Mechanical Properties:

Mechanical Properties General: Mechanical and other props. of HDPE/homogenous branched PE blends are described. [21] Blends of LDPE or LLDPE with gelatinised starch plasticised with glycerol have high elongation at high starch loading even without an interfacial modifier [12]. Blending an octene based LLDPE with less than 20 wt% of an ethylene-propylene-butylene terpolymer shows improved mechanical props. [15]. 70/30 LDPE/ m(LLD)PE gives better film props. (for heavy duty packaging) than 70/30 LDPE/LLDPE- even when downgauged [27]. mPE's use as a performance enhancing blend component with other polyolefins is also discussed elsewhere [9,28]. Orientation of UHMWPE in blends with low MW (short chain branched) PE increases tensile strength and modulus [2]. The effect of multiple extrusion cycles on blends of virgin HDPE with recycled HDPE has been analysed [26]
Mechanical Properties Miscellaneous: In maleated PE (HDPE or LLDPE) blends with starch, tensile props. increase during the first 5 weeks of storage (at 50° or -10°), tensile strength increasing more at the higher storage temp., but flexural strength remains constant [14]
Failure Properties General: Slow crack growth resistance in a blend of pipe grade branched (0.6 mol% butyl branches) PE with a linear PE was worse than for the pure branched PE despite partial co-crystallisation [11]
Fracture Mechanical Properties: The presence and distribution of the chain molecules is important in determining the fracture behaviour of binary low MW linear PE/high MW linear or branched PE [29]

Optical Properties:

Transmission and Spectra: FTIR has been used in the identification of α-olefin in LLDPE blends [3]

Polymer Stability:

Polymer Stability General: Blending of a starch grafted methyl-vinyl ketone into PE gives a photobiodegradable polymer [8]yet LDPE/corn starch blends appear less biodegradable than LDPE (under thermoxidative conditions- not uv irradiation) [31]
Thermal Stability General: LLDPE blended with mLLDPE increases heat resistance (relative to mLLDPE) [5]
Recyclability: Blending of recycled/virgin material of the same classification is often a primary method of recycling PE's [26,30]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by extrusion mixing, solid state shear extrusion pulverisation [30]. Processing

props. may be blend dependent [12,21,26]. Processing additives may be used e.g. fluoropolymers [2]
Applications: As for 'parent class' of PE but with higher specfication, e.g. film with heat resistance comparable to LLDPE and sealability comparable to mLLDPE [5]. Reduction of defects e.g. shark skin, slipstick [24]. But note that on occasion, a 'new class' may outperform or replace existing common blend [32]

Trade name	Details	Supplier
Hiplen		HIP Petrochemija DP
Kompact	PU/PE	Ubbink Nederland BV
Microthene	various PE	Quantum Chemical
Pemuplasten	also other polyolefins	Plastenterprises Pemú Ltd.
Pionier	PE/paraffin oil compounds	Hansen and Rosenthal
Thermocomp	filled and blends	LNP Engineering
Vestowax	PE compounds and other products	Astor Wax

Polyethylene blends with polystyrenes P-253

Synonyms: *PE/PS blends. Polyethylene blends with styrenics*
Related Polymers: Low-density polyethylene, Polystyrene, HDPE
Material class: Blends
Polymer Type: polyethylene, polystyrene
Additives: Compatibilisers (especially ethylene-styrene block copolymers and interpolymers)
Morphology: Phase struct. and miscibility depend greatly on the mixing equipment [2] and method of mixing [4]; the compatibiliser and its nature [1,3,5,6]

Transport Properties:

Polymer Melts: Relative viscosity of low-density polyethylene/ polystyrene blends shows marked negative deviation from unity [5]

Mechanical Properties:

Mechanical Properties General: Tensile props. depend strongly on matrix orientation and dispersed phase morphology and orientation. [4] Tensile modulus shows a negative deviation from additivity rule which is greatest if SEBS compatibiliser is present [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1000–4000 MPa	approx., 100% polystyrene [4]

Flexural Modulus:

No.	Value	Note
1	250 MPa	approx., 50–100% LDPE [5]
2	1800 MPa	approx., 100% polystyrene [5]

Tensile Strength Break:

No.	Value	Note
1	20 MPa	approx., 100% HDPE-50% HDPE/ 50% polystyrene [4]
2	30–45 MPa	100% polystyrene [4]

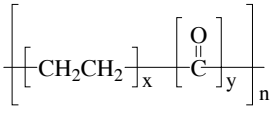
Polyethylene blends with rubbers P-254

Related Polymers: Polyethylene blends
Material class: Blends, Synthetic Elastomers

Transport Properties:

Polymer Melts: Melt viscosity increases with rubber content [1,2]. At rubber concentrations of 10% and 30% blends are compatible. The type of rubber and the blend ratio may affect props. [1]. For HDPE blended with recycled tyre rubber, viscosity decreases with increasing shear rate and increases with rubber content [2]



Mechanical Properties:

Mechanical Properties General: Mechanical props are improved if the rubber is partially cross-linked [1]. For recycled tyre rubber, tensile and tear strengths are higher if the components are co-pulverised than if the powdered components are mixed [3]. In a tri-blend of LDPE/LLDPE/EPDM a double yield phenomenon is observed [4]

Poly(ethylene-*co*-carbon monoxide) P-255

Synonyms: *ECO. Ethylene copolymer with carbon monoxide*
Monomers: Ethylene, Carbon monoxide
Material class: Copolymers
Polymer Type: polyethylene, polyolefinspolyketones
CAS Number:

CAS Reg. No.	Note
25052-62-4	
111190-67-1	alternating

Molecular Formula: $[(C_2H_4)_x(CO)_y]_n$
General Information: While moderately extensive work has been done [1] on ECO particularly because of its biodegradability there are, as yet, few major applications. [2] Polymers containing low levels of CO have props. similar to those of LDPE, but are highly sensitive to photodegradation. 1:1 Copolymers have higher melting points and improved mech. props.
Morphology: Good uniformity is obtained in autoclave reactors. At approx. 50 mol. % CO, the composition is repeating C_2H_4CO units leading to a crystal lattice and high melting point, higher than that of polyethylene. Crystal repeat unit 0.25 nm until ethylene:carbon monoxide ratio reaches approx. 1.1:1 when repeat unit changes to approx. 0.75 nm corresponding to 2 CH_2CH_2CO units in a linear zigzag form [1]

Volumetric & Calorimetric Properties:

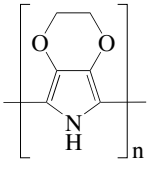
Latent Heat Crystallization: ΔH_{fusion} 2.5 kJ mol^{-1}; ΔS_{fusion} 4.8 J mol^{-1} K^{-1}. Values are lower than corresponding values for polyethylene
Melting Temperature:

No.	Value	Note
1	125°C	approx., 38–40% CO
2	242°C	49.8% CO [1]
3	111°C	27.5% CO
4	122°C	35.1% CO
5	126°C	38.7% CO
6	147°C	40.6% CO
7	181°C	43.9% CO
8	203°C	46.3% CO
9	235°C	49.0% CO [4]

Transition Temperature General: T_m rises linearly with CO content

Polymer Stability:

Polymer Stability General: ECO polymers are photodegradable because light absorption by ketone groups causes chain scission [1]
Decomposition Details: Decomposes via chain scission to yield alkene and ketone fragments [4]
Biological Stability: Is biodegradable



Applications/Commercial Products:

Processing & Manufacturing Routes: Single stage autoclave can be used to give polymer with up to approx. 20 mol. % CO with good uniformity. Max. temp. is lower than for a tubular reactor and degradation is minimised. Polymers with up to 12 mol. % CO have been produced in tubular reactors. Terpolymers with vinyl acetate or alkyl acrylates have been produced
Applications: Used for photodegradable requirements e.g. drink can carriers. Terpolymers used for foam, and as PVC plasticisers

Poly(3,4-ethylenedioxypyrrole) P-256

Synonyms: *2,3-Dihydro-6H-1,4-dioxino[2,3-c]pyrrole homopolymer. PEDOP. PEDP*
Monomers: 3,4-Ethylenedioxypyrrole
Material class: Thermoplastic
Polymer Type: polypyrrole
CAS Number:

CAS Reg. No.
259737-85-4

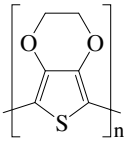
Molecular Formula: $(C_6H_5NO_2)n$
Fragments: $C_6H_5NO_2$
Additives: Various dopants such as sulfonate, phosphate, perchlorate or iodine can be added or incorporated at the polymerisation stage.
General Information: Stable conductive polymer with electrochromic properties.

Electrical Properties:

Electrical Properties General: Polymer has a very low half-wave potential for oxidation (p-doping) and band gap of *ca.* 2 eV [1].

Typical conductivity values in oxidised form of 40 S cm^{-1} (CF_3SO_3 dopant) [2] and 15.5 S cm^{-1} (perchlorate dopant) [3] have been reported.

Optical Properties:
Optical Properties General: In neutral state polymer is red in colour and changes in oxidised state to transmissive blue/grey colour [1,5]. UV absorption with λ_{max} in the region of 505nm recorded [3], while in oxidised form absorption is at longer wavelength. Electrochromic effects have been recorded at different voltages [1].



Polymer Stability:
Polymer Stability General: Polymer in oxidised form generally has high stability and is not susceptible to biological reducing agents such as glutathione and Cleland's reagent [4].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. from the monomer by electrochemical oxidation in a suitable solvent such as acetonitrile or propylene carbonate [1,3,5], or by chemical polymerisation with oxidising agents such as Fe^{3+}, Cu^{2+} or even air [6].
Applications: Polymer can be used for printer toners [7] or in electrochromic devices [8]. In a blend with poly(styrene sulfonate) it can be used as an electrically conducting antistatic layer for photographic films [9].

Poly(3,4-ethylenedioxythiophene) P-257

Synonyms: *PEDOT. PEDT*
Monomers: 3,4-Ethylenedioxythiophene
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
163359-60-2

Molecular Formula: $(C_6H_4O_2S)_n$
Fragments: $C_6H_4O_2S$
General Information: A low band gap polymer which is black or dark blue when neutral but light blue, almost transparent, after doping [1,3]
Morphology: Electrochemically produced films are smooth and homogeneous [6].The doped polymer is amorph. [1]. Doping is accompanied by a rapid contraction followed by a gradual expansion. This is attributed to structural changes associated with the doping process [6]

Electrical Properties:
Electrical Properties General: Possesses exceptionally high electrical stability. Can be *n*-doped resulting in conductivity 200 S cm^{-1}. Surface resistance is not affected by atmospheric humidity [9]. Conductivity of the polymer varies with the oxidising agent used in its preparation: conductivity 5–10 S cm^{-1} ($FeCl_3$, 20°, MeCN), 31 S cm^{-1} ($FeCl_3$, 180°, benzonitrile), 200 S cm^{-1} (anodic oxidation, MeCN) , 40 S cm^{-1} (anodic oxidation, H_2O) [10]. Surface resistivity 200–1000000 Ω [9]. Volume resistivity 0.005–0.2 (conductivity value) [10]
Magnetic Properties: Doped polymers exhibit Curie-like susceptibility below -198° and Pauli-like susceptibility above this temp. [4]

Optical Properties:
Optical Properties General: Low band gap; exhibits significant electrochromic props. Optical density 0.01 (max.) [9]. Optical band gap 16 eV (approx., 760–780 nm). Onset of optical absorption approx. 1.5 eV, maximum optical absorption 2.2 eV [7]
Transmission and Spectra: XANES and XPS spectral data [3] have been reported. Has a strong absorption in the visible region but after doping is quite transparent in the uv/visible region and shows strong absorption in near infrared range [1,6]

Polymer Stability:
Polymer Stability General: Superior thermal stability compared to other alkylthiophene polymers
Thermal Stability General: Has good thermal stability [6]; the resistance varies little on standing at 110° or for short periods (less than 10 min.) at 200°. After 70 min. the resistance starts to increase. Doped polymer is stable up to 150° [1,4]
Decomposition Details: Thermal degradation leads to loss of the thiophene struct. within the chain; conversion into sulfates takes place (accompanied by pairing with a suitable counter-ion) [3]. Onset of degradation of the doped polymer at approx. 150°. Major decomposition occurs between 390° and 450° [4]
Chemical Stability: Has good chemical stability [6]
Hydrolytic Stability: Is more resistant than polypyrrole to hydrol. [6,9]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by electro or $FeCl_3$-catalysed polymerisation of the monomer [1], which may be obtained indirectly from diethyl oxalate [2]. The blue form is prepared as a tetrachloroferrate which stabilises the cationic nature of the chain [3]. Films containing doping agents are prepared by anodic oxidation [4]. Electropolymerisation in aq. media using anionic surfactants to increase monomer solubility has been reported [5]. Doping is a three stage process [8]. Processable colloidal solns. can be produced by the chemical polymerisation of 3,4-ethylenedioxythiophene in aq. solns. of polystyrenesulfonic acids [9,10]
Applications: Has been mainly used as light-emitting diodes to date. Also has various potential uses in optical and electrooptical devices. Used in antistatic transparent films, and in electroplating for metallisation of insulators. Other uses as electrodes in solid electrolyte capacitors and in electrochromic devices

Poly(3,4-ethylenedioxythiophene)/poly(4-styrenesulfonate) blend P-258

Synonyms: *Ethenylbenzenesulfonic acid homopolymer compound with 2,3-dihydrothieno[3,4-b]-1,4-dioxin homopolymer. PEDOT-PSS. PEDOT:PSS. PEDOT/PSS. PEDT-PSS*
Monomers: 2,3-dihydrothieno[3,4-*b*]-1,4-dioxin
Material class: Thermoplastic
Polymer Type: polythiophene, polystyrene
CAS Number:

CAS Reg. No.
155090-83-8

Molecular Formula: $(C_6H_4O_2S)n.(C_8H_8O_3S)n$
Fragments: $C_6H_4O_2S$ $C_8H_8O_3S$
General Information: A polymer blend of poly(3,4-ethylenedioxythiophene) (PEDOT) and polystyrenesulfonic acid (PSS), which can be regarded as a doped form of positively charged PEDOT with PSS as the counterion (usually in excess). The polymer has good hole conducting properties, with PEDOT acting as the charge carrier. Commercially produced as aqueous colloidal dispersions that can be cast into films. The aqueous dispersions are dark blue in colour, while the films are transparent or very pale blue.
Morphology: In general, the morphology has a considerable effect on conductivity and is also influenced by addition of solvent to the dispersions. The films cast from colloidal dispersions consist of grains of conjugated polymer random coils, PEDOT chains being attached ionically to PSS chains with some neutral species such as PSSH between the grains [1]. PSS predominates on the surface [2]. There is an interaction between the chains on addition to the dispersions of a solvent such as sorbitol [3] or glycerol [4] leading to a rearrangement of the polymer chains and enhanced clustering into PEDOT domains. Addition of ethylene glycol may change the polymer chains from a random coil conformation to a linear or expanded coil structure with PEDOT changing from a benzenoid to quinoid structure [5]. Another possible result from the addition of DMSO is a screening effect and reduction of coulombic attraction between PSS counterion and PEDOT charge carrier [6]. With an increase in content of PSS in the blend, the more water is taken up and the films become more hygroscopic [7].

Surface Properties & Solubility:

Solubility Properties General: Polymer blend is in the form of colloidal dispersions in water; the films can be redispersed in water at 100°C [5]. Insoluble in common organic solvents [8]. The addition of ethylene glycol to dispersions makes the films insoluble in water [5]

Electrical Properties:

Electrical Properties General: Films cast from Baytron P dispersions have conductivities in the region of 0.05–10 S cm^{-1}, with minimum surface resistivity of 300Ω/square and PEDOT work function of about 5.2 eV [9]. An increased proportion of PEDOT in the blend results in greater conductivity [1,15]. The effect on conductivity of the addition of solvents to the dispersions has been widely reported. Addition of ethylene glycol increased conductivity in films from 0.4 to 160–200 S cm^{-1} [5,10], while with DMSO conductivity increased from 0.8 to 80 S cm^{-1} [6]. Glycerol [4] and sorbitol [1,3] also increased conductivity. A water rinse of films removes surface PSS and increases conductivity by 50% [11]. Addition of NaOH or CsOH to the dispersions reduced the work function of PEDOT from about 5.1 to 4 eV [12]. The effect of heat [7] and hydrochloric acid [13] on conductivity and sheet resistance of films has been reported.
Magnetic Properties: Magnetic susceptibility dependence on temperature has been studied [6].

Optical Properties:

Optical Properties General: The films have good transparency with no significant absorption up to 900nm. Electrochromic behaviour from electrochemical doping is observed with an absorption maximum (dark blue colour) at about 600nm [14].
Transmission and Spectra: XPS spectroscopy has been widely used to study morphology [1,2,6,13,15,16]. Raman [5,10,13,17], ftir [4,13,17], esr [5] and uv/visible [5,14] spectral data also reported.

Polymer Stability:

Thermal Stability General: The films are generally stable on heating in air up to 1000h with no change in conductivity [7]. No significant changes in composition and conductivity were observed on heating to 250°C [13].
Chemical Stability: Treatment of films with hydrochloric acid followed by heating leads to loss of polystyrenesulfonic acid [13]. Any PSS present as Na salt is acidified to PSSH with subsequent loss of free acid [2,16].
Hydrolytic Stability: The films are redispersed by hot water at 100°C [5]. Water treatment reduces the surface content of PSS [11].
Stability Miscellaneous: UV light induces photooxidation of PEDT with a loss of conductivity [15]. The stability of polymer films deposited on indium-tin oxide (ITO) anodes has also been studied, with indium ions detected in the polymer structure [13,15,21].

Applications/Commercial Products:

Processing & Manufacturing Routes: Baytron P dispersions are produced by oxidation of ethylenedioxythiophene monomer in aqueous polystyrenesulfonic acid using $Na_2S_2O_8$ as oxidising agent [8,9,18]. Powders have been produced by Fe(*III*) oxidation of monomer and PSS in $MeCN/H_2O$ mixtures [19]. Electrochemical oxidation of monomer and PSS has also been reported [20]
Applications: Of increasing importance is use of the polymer blend in light-emitting diodes as a hole-injection layer in the form of a thin film between the anode, usually indium-tin oxide (ITO), and an emissive polymer [15,17,21,22]. Other applications include antistatic layers for photographic films [8], photovoltaic devices [4,23], electrochromic windows [14], capacitors and high-power lithium batteries [15].

Poly(ethylene-*co*-ethyl acrylate) P-259

Related Polymers: Polyethylene, Poly(ethyl acrylate)
Monomers: Ethylene, Ethyl acrylate
Material class: Natural elastomers, Copolymers
Polymer Type: polyethylene, acrylic
CAS Number:

CAS Reg. No.
9010-86-0

Molecular Formula: $[(C_2H_4).(C_5H_8O_2)]_n$
Fragments: C_2H_4 $C_5H_8O_2$
Molecular Weight: The MW can range from 1000–200000
Additives: Diphenylguanidine, methylenedianiline and N774
General Information: Rubbery, tough and flexible. The polymers are low melting resins, suitable for hot melt adhesives to polyethylene-like products. Ethyl acrylate is about 15% to 30% of the copolymer composition and it contributes flexibility and polarity to the polymer. The hot melt adhesives have a unique combination of props., including high shear fail temps., toughness at low temps. and excellent adhesion to non-polar substrates. When compounded with other polymers it helps to improve the low temp. toughness and stress cracking props. When compounded with carbon black it is used for microchip packaging and a variety of hospital uses where static electricity presents a potential hazard. This polymer with 8% ethyl acrylate is approved by the FDA for food contact applications

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.93 g/cm^3	18% ethyl acrylate

Melting Temperature:

No.	Value
1	152°C

Vicat Softening Point:

No.	Value
1	116°C

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	6 g/10 min	18% ethyl acrylate

Polymer Solutions Dilute: η_{inh} 0.81 (18% ethyl acrylate)

Applications/Commercial Products:

Processing & Manufacturing Routes: Resins are produced by free radical polymerisation in specially modified high pressure polyethylene reactors. With the increase in ethyl acrylate content the copolymer becomes more flexible, tougher and more resilient. It is usually sold as an unmodified pelletised resin, but it can also be the base resin for specially highly filled compds., such as flame retardant compds. and semiconductive materials for wire coating. The copolymers can be processed on standard extrusion, blow moulding or injection moulding equipment used for LDPE of similar melt index. Typical extrusion melt temp. is 178° (320°F). The range of injection moulding temp. varies between 155° (280°F) and 222° (400°F) depending on melt index and the ethyl acrylate content. These copolymers usually do not require the use of additives for processing, whether it is extrusion, injection moulding or blow moulding
Applications: Used as a polymer modifier, in hot-melt adhesives and sealants, flexible hose and tubing, laminate sheets, multilayer films, injection moulded and extruded parts and wire and cable applications. It is compatible with almost all other olefin polymers. It is compounded with polyolefins, polyamides and polyesters to produce specifically required high modulus polymers while retaining much of its original props.

Polyethylene fibres P-260

Synonyms: *PE fibres*
Related Polymers: Polyethylene, LDPE, HDPE, Polypropylene fibre, UHMWPE
Monomers: Ethylene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4

Molecular Weight: MW 20000–1000000; M_w/M_n 2–15
Additives: Hindered amine light stabilisers; substituted hindered phenol thermal stabilisers
General Information: Although fibres can be formed from several polyolefins, polyethylene fibres are very much of secondary importance to polypropylene fibres, and no others are of practical importance. Early fibres of LDPE, lacked dimensional stability, abrasion resistance, resilience, light stability. Improvements were obtained when MDPE, became available. Current interest centres on performance fibres mainly of UHMPE, [4,5,7] and blends. [8] Structure contains fewer short chain branches
Morphology: Drawing increases orientation. In the case of gel spun UHMWPE, fibre, this can be virtually complete. [4] Linear density is also reduced during drawing. High temp. annealing of spun fibre under tension gives a hard elastic fibre of strength comparable to drawn fibre but with substantially increased elastic recovery. The hard elastic fibres are thought to deform through opening of the stacked lamellae structure producing voids. [1] In high modulus UHMWPE fibre, longitudinal tension enhances orthorhombic to pseudohexagonal transformation while axial tension inhibits or prevents the transformation. [4,5]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Density values have been reported .[6] Thermal expansion coefficient is higher in *a* direction than *b* direction for ultra high modulus UHMWPE fibres, enhancing transformation from orthorhombic to psuedohexagonal struct. [4]

Mechanical Properties:

Mechanical Properties General: Props tend to be far inferior to theoretical values. Super drawing, high pressure extrusion, spinning of liquid crystalline polymers, gel spinning and hot drawing have been used to obtain improvement in mech. props. [1]
Tensile Strength Break:

No.	Value	Note	Elongation
1	76 MPa	commercial fibre	
2	2600 MPa	high strength commercial fibre, diameter 0.038 mm [1,2]	3.5%

Elastic Modulus:

No.	Value	Note
1	117000 MPa	high strength commercial fibre, diameter 0.038 mm [1,2]

Mechanical Properties Miscellaneous: Resilience 70% (min., 40°); 90% (approx., -40°, 120°) [1,3]

Polymer Stability:

Polymer Stability General: Stability is generally as for the type of polyethylene used in the fibre
Flammability: May be reduced by application of a fabric finish.

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed by melt spinning, melt blowing, spun bonding, spurting, [1] gel spinning [4,9,10,11,12,13,14,15,16,17]
Applications: Applications include high strength, low weight packaging (spunbond PE fibre), high modulus fibre (UHMWPE), bicomponent fibres (eg with PP, for melt bonding), meltblown fabrics, felted fabric and paper making (spurted fibre). All olefin fibres are of most use where low moisture absorption (hence good stain resistance and almost equal wet/dry props) and/or low density outweigh the relatively poor oxidation stability and light stability.

Polyethylene, High density P-261

Synonyms: *High-density polyethylene. PE-HD. Low pressure polyethylene. HDPE*
Related Polymers: Polyethylene, HDPE film, HDPE blends, LLDPE
Monomers: Ethylene, 1-Butene, 1-Hexene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
Molecular Weight: M_n 10000–1000000 (typical commercial values; waxes may be lower and high/ultra high MW polymers higher)
Additives: Stabilisers, uv stabilisers, flame retardants, antistatic additives (especially carbon black)
General Information: The most molecularly regular polyethylene grade. Approximates to structural unit with five Me groups per 1000 carbon atoms. Metallocene catalysts are used to improve chain regularity. Virtually no branches or a small number of branches introduced by copolymerisation with another α-olefin. The number (or degree) of branches varies from 0.5–10 branches per 1000 carbon atoms. One chain end is a Me group and the other is either a Me or a vinyl group. The degree of branching, MW and the MW distribution influence most physical and mechanical props. [2,3]
Morphology: Is semicryst. with crystallinity between 40 and 80%. Principal cryst. form orthorhombic, a 0.740, b 0.493, c 0.2534 nm. The pseudo monoclinic form is also known, which is stable at temps. below 50°; annealing at 80–100° restores the orthorhombic form (monoclinic, a 0.405, b 0.485, c 0.254 nm, $\alpha = \beta = 90°$, γ 105°). Chains have a flat zigzag configuration folded every 5–15 nm. These form planar lamellae, the plane of which they are perpendicular to. Interlamellar tie molecules give mech. strength and rigidity, forming the lamellae into fibrils. Fibrils spread outwards from central points to form spherulites of 1–10 μm diameter. Amorph. regions between lamellae give flexibility and high-impact strength [2,3]. Most HDPE articles exhibit a degree of molecular and crystalline orientation [30]. In uniaxial orientation the c-axis alignment with the stretch direction can approach 100%. In the second orientation mode the a-axis aligns to the film

machine direction [31]. Effect of processing variables and MW distribution on extruded tubular HDPE film morphology has been reported [52,53]. Deformation of spherulites has been reported [43,57]
Miscellaneous: Due to the customisable nature of polyethylenes, and differences between manufacturing processes, data given here are overall ranges. Specific manufacturer's grades normally have closer tolerances; with certain processes, they may even be available outside the ranges quoted [4]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.94–0.97 g/cm^3	
2	d 0.94–0.96 g/cm^3	Ziegler-Natta process
3	d 0.96–0.97 g/cm^3	Philipps process [1,2,3,5]
4	d 0.964 g/cm^3	[8]
5	d 1 g/cm^3	orthorhombic
6	d 0.965 g/cm^3	monoclinic

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.9×10^{-5}–0.00011 K^{-1}	homo and copolymers, ASTM D696,	L
2	4.8×10^{-5} K^{-1}	30% glass fibre reinforced, ASTM D696 [5]	L
3	0.00012–0.00018 K^{-1}	23–80°, DIN 53752 [14]	L

Equation of State: Mark-Houwink equation parameters have been reported [3,38,39,41,42,43,44,45,46,47,48,49,50]
Thermodynamic Properties General: Other thermodynamic props. have been reported [11,35,36,37]. Variation of thermal expansion coefficient with temp. has been reported [11]
Latent Heat Crystallization: $\Delta H^{\circ}_{fusion}$ 280–300 J g^{-1} (100% crystalline) [2]
Thermal Conductivity:

No.	Value	Note
1	0.46–0.5 W/mK	0.00155 cal (cm s °C)$^{-1}$, homopolymer
2	0.42 W/mK	0.001 cal (cm s °C)$^{-1}$
3	0.36–0.46 W/mK	0.0008–0.0011 cal (cm s °C)$^{-1}$, 30% glass fibre reinforced, ASTM C177 [5]
4	0.35–0.43 W/mK	DIN 52612 [14]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.7–1.9 kJ/kg.C	ISO 1006 [14]	P

Melting Temperature:

No.	Value	Note
1	130–137°C	homopolymer [5]
2	122–127°C	rubber modified [5]
3	125–135°C	copolymers
4	120–140°C	glass fibre reinforced [5]
5	135°C	crystallinity 70–90%, unbranched PE [5]
6	146–147°C	extrapolated equilibrium melting point for orthorhombic HDPE [2,26]

Glass-Transition Temperature:

No.	Value	Note
1	-140–-100°C	[2,27,28,29]

Transition Temperature General: T_g not clearly defined due to high crystallinity; usually associated with γ transition. Brittleness temp. is related. T_m for commercial resins decreases linearly with branching; 1° per branch per 1000 carbon atoms [2]
Deflection Temperature:

No.	Value	Note
1	79–91°C	175–196°F, 0.455 MPa (66 psi), homopolymer [5]
2	65–80°C	149–176°F, 0.455 MPa (66 psi), copolymers [5]
3	127–129°C	260–265°F, 0.455 MPa (66 psi) [5]
4	121°C	250°F, 1.84 MPa (264 psi), 30% glass fibre reinforced [5]
5	121–127°C	250–260°F, 0.455 MPa (66 psi) [5]
6	115–121°C	240–250°F, 1.84 MPa (264 psi), 20–30% glass fibre reinforced, ASTM D648 [5]
7	41–49°C	1.8 MPa, ISO 75 [14]

Vicat Softening Point:

No.	Value	Note
1	124–133°C	VST/A/50
2	72–80°C	VST/B/50, DIN/ISO 306 [14]

Brittleness Temperature:

No.	Value	Note
1	-140–-100°C	[2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. (above 80°) aromatic hydrocarbons, aliphatic hydrocarbons, halogenated hydrocarbons, xylenes, tetralin, decalin, 1,2,4-trimethylbenzene, *o*-dichlorobenzene, 1,2,4-trichlorobenzene [2]; binary systems comprising carbon disulfide with xylene, cyclohexane, C_6H_6, toluene, CCl_4, THF or $CHCl_3$ [56]. Insol. all known single solvents at room temp.

Transport Properties:

Transport Properties General: Difficulties and apparent contradictions arise because of MW and molecular struct. effects. [9,10]. Means of overcoming these effects have been reported [59]
Melt Flow Index:

No.	Value	Note
1	0.1–1.8 g/10 min	ISO 1133–1991, 2.16 kg, medium MW, blow moulding and extrusion grades [14]
2	1.4–26 g/10 min	ISO 1133–1991, 2.16 kg, injection and rotational moulding grades [14]
3	2–10 g/10 min	ISO 1133–1991, 21.6 kg (condition 7), high MW blow moulding grades [14]
4	0.001–500 g/10 min	overall range, melt flow ratio 25–150 [2]

Polymer Solutions Dilute: Viscosity number 135–540 ml g^{-1} (0.001 g ml^{-1} decalin, ISO 1628) [14]

Polymer Melts: Rheological props. of conventional and metallocene catalysed HDPE have been compared [9,10]. New melt flow information showing a sharp minimum in flow resistance with a narrow temp. window has been reported [56]. The die orifice, die and barrel cleanliness, temp. and sample mass are the more crucial parameters affecting melt index variability. [60] Wall slip effects have been studied using sliding plate rheometer and capillary rheometer [61], or rectangular conduit [62]. A superfluid-like stick-slip transition occurs above a critical stress at temps. of 180–260°. The amount of slip is a material property which decreases with decreasing MW [63]. Viscosity before transition and the stick-slip transition are MW dependent [63]. If MW exceeds 1000000 a flow curve discontinuity occurs at 148–152°. Flow is a maximum, surface roughness and periodic bulk distortions are absent but melt fracture is always present [55,58,64,65,66]. Elsewhere between T_m and 160° (normal lower limit temp. for processing) flow induced crystallisation to a highly oriented solid occurs [55,67]. The nature of chain branching strongly affects melt strength and flow props. [9,10,68,69]. Effect of viscous heating in capillary rheometry [70] and of non-linear flow on melt mixing [71] has been reported. Low MW mHDPE acts as a processing aid for higher MW mHDPE, the G′G″ correlation corresp. to complete miscibility. Dynamic viscoelasticity and steady state viscosity are also reported for this blend [72]. Effects of fillers on rheology are reported for cross-linked HDPE granules [73] and pulverised recycled tyre rubber [74]

Permeability of Gases: Permeabilities of a range of gases have been reported [8,12]

Water Absorption:

No.	Value	Note
1	0.01 %	max., 24h, 1/8 in thick, homopolymer and copolymers
2	0.02–0.06 %	24h, 1/8 in thick, glass fibre reinforced, ASTM D570 [5]
3	0.01 %	max., saturation, 23°, DIN 53495/1L [14]

Gas Permeability:

No.	Gas	Value	Note
1	He	75.3 cm^3 mm/(m^2 day atm)	8.6×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
2	O_2	26.3 cm^3 mm/(m^2 day atm)	3×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
3	Ar	113.8 cm^3 mm/(m^2 day atm)	1.3×10^{-13} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
4	CO_2	23.6 cm^3 mm/(m^2 day atm)	2.7×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
5	CO	13.13 cm^3 mm/(m^2 day atm)	1.5×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
6	N_2	9.63 cm^3 mm/(m^2 day atm)	1.1×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
7	CH_4	25.4 cm^3 mm/(m^2 day atm)	2.9×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]
8	NH_3	700 cm^3 mm/(m^2 day atm)	8×10^{-13} cm^2 $(s\ Pa)^{-1}$, 20° [8,13]
9	H_2O	788 cm^3 mm/(m^2 day atm)	9×10^{-13} cm^2 $(s\ Pa)^{-1}$, 25° [8,32]
10	propane	76.2 cm^3 mm/(m^2 day atm)	8.7×10^{-14} cm^2 $(s\ Pa)^{-1}$, 25° [8,12]

Mechanical Properties:

Mechanical Properties General: Mech. props. (e.g. bending modulus) [25] are affected by the thermal history of the sample and its corresponding morphology. Mech. props. are improved by biaxial orientation [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1070–1090 MPa	155–158 kpsi, homopolymer, ASTM D638 [5]
2	620–895 MPa	90–130 kpsi, low-medium MW copolymers, ASTM D638 [5]
3	940 MPa	136 kpsi, high MW copolymers, ASTM D638 [5]
4	4825–6205 MPa	700–900 kpsi, 30% glass fibre reinforced, ASTM D638 [5]

Flexural Modulus:

No.	Value	Note
1	1000–1550 MPa	145–225 kpsi, 23°, homopolymer, ASTM D790 [5]
2	830–1240 MPa	120–180 kpsi, 23°, copolymer, ASTM D790 [5]
3	4830–5515 MPa	700–800 kpsi, 23°, 30% glass fibre reinforced, ASTM D790 [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	22–31 MPa	3200–4500 psi, homopolymer [5]	10–1200%
2	16–20 MPa	2300–2900 psi, rubber modified [5]	600–700%
3	21–45 MPa	3000–6500 psi, low-medium MW copolymer [5]	10–1300%
4	17–30 MPa	2500–4300 psi, high MW copolymer [5]	170–800%
5	52–62 MPa	7500–9000 psi, 30% glass fibre reinforced [5]	1.5–2.5%
6	48–59 MPa	7000–8500 psi, 20–30% long glass fibre reinforced, ASTM D638 [5]	2.0–2.5%

Flexural Strength at Break:

No.	Value	Note
1	76–83 MPa	11000–12000 psi, 30% glass fibre reinforced [5]
2	55–65 MPa	8000–9500 psi, 20–30% long glass fibre reinforced, ASTM D790 [5]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	26–33 MPa		3800–4800 psi, homopolymer [5]
2	10–18 MPa		1400–2600 psi, rubber modified [5]
3	18–29 MPa		2600–4200 psi, low-medium MW copolymer [5]
4	19–27 MPa	8–15% elongation	2800–3900 psi, high MW copolymer, ASTM D638 [5]

Compressive Strength:

No.	Value	Note
1	19–25 MPa	2700–3600 psi, homopolymer, low-medium MW copolymer [5]
2	41–48 MPa	6000–7000 psi, 30% glass fibre reinforced [5]
3	34–41 MPa	5000–6000 psi, 20–30% long glass fibre reinforced, ASTM D695 [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	250–400 MPa	1000h, elongation $\leq$0.5%, 23°, ISO 899 [14]	Tensile Creep modulus
2	550–1000 MPa	ISO 6721-2 [14]	Shear modulus

Impact Strength: Tensile impact resistance 30–700 kJ m^{-2} (23°, ASTM D1822, ISO 8256/1B). Charpy impact values over a range of temps. and annealing conditions have been reported [6]
Hardness: Shore D66-D73 (homopolymer); D55–D60 (rubber modified) ; D58-D70 (low-medium MW copolymers); D63-D65 (high MW copolymers, ASTM D2240) [5]. Ball indentation hardness H 132/30 35–65 MPa (DIN/ISO 2039-1) [14]
Failure Properties General: Bottle test-time to failure 10–4000h (300 ml/22 g test bottle, internal pressure 2 bar, 5% aq. Lutensol FSA 10 soln., 50°) [14]
Fracture Mechanical Properties: Non-linear-elastic thermal decohesion model for impact fracture correlates well with notched Charpy specimens [15,21]
Izod Notch:

No.	Value	Notch	Note
1	21–210 J/m	Y	0.4–4 ft lb in^{-1}, $\frac{1}{8}$ in, homopolymer [5]
2	19–320 J/m	Y	0.35–6 ft lb in^{-1}, $\frac{1}{8}$ in, copolymers [8]
3	170–240 J/m	Y	3.2–4.5 ft lb in^{-1}, $\frac{1}{8}$ in, high MW copolymers [5]

Electrical Properties:

Electrical Properties General: Data given for electrically unmodified polymers. Up to 50% aluminium powder [22] or 40% carbon black [23] are added for antistatic/conductivity props. Changes in mech. props. also occur. Value of dissipation factor depends on temp. and struct. [11]
Surface/Volume Resistance:

No.	Value	Note	Type
2	$>0.1\times10^{15}$ Ω.cm	min., ISO 93, DIN 0303-30 [5,14]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.3–2.6	100 Hz–1 GHz	ASTM D150, ISO 250, DIN 0303-4 [5,14]

Dielectric Strength:

No.	Value	Note
1	118 kV.mm^{-1}	3000 V mil^{-1}, 5 mil thick [5]
2	$>$100 kV.mm^{-1}	min., 3800 V mil^{-1}, ISO 243/1 [14]
3	17.71–19.68 kV.mm^{-1}	450–500 V mil^{-1}, $\frac{1}{8}$ in, short time, ASTM D149 [5]
4	1968 kV.mm^{-1}	5000 V mil^{-1}, 1 mil thick [5]

Complex Permittivity and Electroactive Polymers: Comparative Tracking Index CTI 600 (test soln. A); CTI 600M (test soln. B) (ISO 112/A, DIN 0303-1) [14]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0005	1 kHz–1 GHz	ASTM D150 [5]
2	$<$0.0002	100 Hz–1 MHz	max., ISO 250, DIN 0303-4 [14]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.53–1.54	25°, decreases with increasing branching [3]

Transmission and Spectra: Films are opaque if thick, translucent if thin [2,3]. Uv transmission limit approx. 230 nm
Total Internal Reflection: Specific birefringence 0.059 (crystalline phase); 0.28 (amorph. phase) [3]

Polymer Stability:

Polymer Stability General: Is non-polar, and largely chemically and environmentally inert. Unless used in multi-material products, HDPE is readily recyclable or useable as a fuel [16]
Thermal Stability General: (-0.7)–(-3.0)% change in linear dimensions at 100° for 30 min. [5]
Upper Use Temperature:

No.	Value	Note
1	90°C	50% loss of tensile strength after 20000h, ISO 216-1 [14]

Decomposition Details: At 225° small quantities of fumes evolved. Decomposition and oxidative pyrolysis occur at 300°. Heat of reaction may cause rapid temp. rise and accelerate decomposition. CO, H_2O, CO_2, aldehydes and hydrocarbons are evolved [2,14]. In inert atmosphere, pyrolysis yields waxes and hydrocarbons above 500° [2]
Flammability: Above 300° decomposition products may ignite. Burning may be accompanied by the release of flaming molten droplets. Flammability rating HB (0.4 mm, 1–6 mm thick, ISO UL94) [14]
Environmental Stress: Light of wavelength $<$400 nm initiates photooxidative degradation. Initial products accelerate the process. Final products are similar to those of thermal oxidation. Environmental stress cracking resistance has been reported [14]
Chemical Stability: May be swollen by non-polar reagents.; is less susceptible than lower density types. Can be nitrated at room temp. or decomposed by nitric acid/sulfuric acid mixtures at temps of 100–150° [2]
Hydrolytic Stability: Has good resistance to acids and alkalis [14,17,18]. Reacts only slowly with sulfuric acid at elevated temp.
Recyclability: Readily recyclable [20] either by itself or in blends with other polyethylenes. Some applications (*e.g.* bottle crates) employ closed loop recycling [16]. Some PE tradenames refer exclusively to recycled material. Oil-containing vessels may be recycled [19]

Applications/Commercial Products:

Processing & Manufacturing Routes: An immense variety of catalysts can be used for low pressure PE production but only the following are of current commercial interest. Philips catalyst, based on Cr^{VI} compounds supported on silica or similar. Temp. 85–110°. activity approx. 300–1000 kg HDPE per g Cr. MW and

MW distribution are controlled by temp. and catalyst composition/preparation. M_w/M_n approx. 6–12, MFR 90–120. Organochromium catalyst activity 800–1000 kg HDPE per g Cr Ziegler catalysts - Ti or V compound with organoaluminium cocatalyst, may be supported or not. Temp. 70–110°, 0.1–2 MPa, using inert liq. (e.g hexane, isobutane) or gas phase. MW typically high. Hydrogen used as chain transfer agent to reduce MW; metallocene catalysts [33] most recent commercial catalyst based on complex of Zr, Ti or Hf (usually containing 2 cyclopentadienyl rings) plus an organoaluminium or perfluorinated boron aromatic cocatalyst. MW of polymer very sensitive to hydrogen. Polymer is very regular; bimodal catalysts (combinations of catalyst) may be used to obtain broad MW distribution. Slurry processing is the oldest method and gives full range of HDPEs from low to ultra-high MW; approx. 60% world production is from the slurry process. Uses loop, continuous stirred or liq. pool reactors. Temp. 70–110°, 3–4.5 MPa, 0.5–1.5h, conversion rate up to 98%; Gas phase process (Unipol) can accommodate a wide variety of solid and supported catalysts using a fluidised bed of dry PE particles. Temp. 70–80°, 2 MPa; Solution process, in heavy solvent or molten PE (PE sol. saturated hydrocarbons (C_6-C_9) above 120°). Used mostly for LMWPE as soln. viscosity increases rapidly with MW of PE. Temp. 150–200°, 5–10 MPa, 5–10 min. (solvent) or 170–350°, 30–200 MPa, $\leq$1 min. [34] (molten PE). The solution process was the first to use metallocene catalysts. Bimodal processes using series reactors may be used for broad MW distribution. Typical processing temp. range 150–250° at which most HDPE behaviour non-Newtonian; effective viscosity is reduced by increasing melt flow speed. Most conventional techniques may be used. Injection moulding (temp. 200–260°, 70–140 MPa, typical cycle time 10–30s) [53]; Blow moulding is largest volume technique for HDPE; uses high MW, high melt viscosity resins; Rotational moulding uses a speed of rotation 10–40 rpm [51]; extrusion (temp. approx. 150°, 40–50 MPa) [58]. Blown film: continuous film 0.007–0.125 mm thick prod. by extrusion through a circular die (diameter 40–100 cm, gap approx. 1 mm) usually on 'high stalk' film lines. Blow-up ratios up to 4:1 used. Post consumer HDPE may be reprocessed by the same methods. Can be electron beam cross-linked [24]

Mould Shrinkage (%):

No.	Value	Note
1	1.6–2.3%	longitudinal
2	1.2–2.4%	transverse, free
3	1.3–1.4%	transverse, restricted [14]
4	1.5–4%	0.015–0.04 in in^{-1}, homopolymers
5	1.2–4%	0.012–0.04 in in^{-1}, copolymers, ASTM D955 [5]
6	1.2–1.3%	longitudinal

Applications: Main applications are in hollow articles (blown bottles, containers) and in film and pipe (growth rate for these three approx. 2.5–4% per annum). Also used in injection moulding (growth rate approx. 1% per annum)

Trade name	Details	Supplier
Alathon	homo and copolymers also includes EVA, EPR	OxyChem
Alathon		Alathon
Alathon		Transmare BV
Alcudia	also used for other densities	Repsol Quimica
Alcudia		Petroplas
Atochem		Paklink Ltd.
Cabelec	modified/carbon black filled	Cabot Plastics Ltd.
Conductomer HDC-22H	22% carbon black-conductive	Synthetic Rubber Technologies
Ecothene		Quantum Chemical
Electrafil PE	carbon black filled - conductive	Akzo
Eltex	also PP and ethene-propene copolymers	Solvay
Empee	also LDPE, flame retardant	Monmouth Plastics
Eraclene		Enichem
Eraclene		Ashland
Eucalene	also LDPE	Van Raaijen Kunststoffen
Finathene	also LDPE	Fina Chemicals (Division of Petrofina SA)
Fortiflex	includes HMW HDPE	Solvay
HDPE ***	copolymer, includes HMW HDPE and glass filled	Dow
HDPEX	auto cross-linkable	Borealis Compounds AB
HiD	homo and copolymer	Chevron Chemical Co.
Hilex		Royalite Plastics Ltd.
Hiplex		HIP Petrochemija DP
Hobolene		Riddle and Hobbs Ltd.
Hostalen	name covers HD, MD, HMW, UHMW, as well as PP and EVA copolymers	Hoechst (UK) Ltd
Hostalen		Tinto Plastics
Lacqtene	also includes LDPE, LLDPE	Elf Atochem (UK) Ltd.
Lacqtene		Ashland
Lupolen	includes most types of PE as well as several other polymers	BASF
Lupolen		Northern Industrial Plastics Ltd.
Luwax	includes homo and copolymer, also LDPE and oxidised PE	BASF
Marlex	includes LDPE, MDPE and copolymers	Philips Petroleum International
Mirathen		Anilac NV/SA
Mitsubishi	includes other types and other products	Mitsubishi Chemical
Novapol	includes LLDPE, LDPE, linear MDPE and copolymers	Novacor
Octowax	wax emulsion	Tiarco
Okulen		Christian Berner Oy
PEX-C	electron beam cross-linked	Mercury Plastics, Ohio
Pemuplasten		Plastenterprises Pemú Ltd.

Petrothene	covers most grades of PE homo and copolymers as well as EVA, PP, EPR	Quantum Chemical
Plastin	film	4P Folie Forchheim GmbH.
Polybleu	drinking water grade	Meridionale des Plastiques SA
Polybond	also includes various copolymers	Uniroyal
Polycere		BP Chemicals
RTP	10% glass filled, also used for other products	RTP Company
Repsol	also LDPE and PP	Commercial Quimica Insular SA
Rigidex	also MDPE and various ethylene copolymers	BP Chemicals
Rigidex		Hellyar Plastics Ltd.
Sabic	also LDPE	NV Chemach SA
Scolefin		Poole and Davidson Plastics
Scolefin		Anilac NV/SA
Stamylan	also LDPE, LLDPE, UHMWPE copolymers and PP	DSM
Stamylan		Macrodan A/S
Stamylan		Ashland
Stat-Kon	electrically conducting composite, also other products	LNP Engineering
Stat-Kon	electrically conducting composite, also other products	ICI Chemicals and Polymers Ltd.
Statoil	includes LDPE, PP copolymers and other products	Northern Industrial Plastics Ltd.
Sumiplene	also LDPE	Sumica SA
Suntec	also LDPE and EVA	Asahi Chem. Co Ltd
Super Naltene	PE sheet and rolls	Martyn Industrials
Tecnodure	also includes PP and blends, PC and blends, PS, ABS	Campos 1925 SA
Tipelin	also hexene-ethene copolymer, iPP	Tiszai Vegyi Kombinát
Tipplen	also PP and ethene-propene copolymers	Tiszai Vegyi Kombinát
Tipplen	also PP and ethene-propene copolymers	Alfordshire Ltd.
Valeron	film	Vauleer Packaging Systems
Vestolen	narrow MW distribution, specials also includes PB, PP, EPR	Hüls AG
Zemid		DuPont

Poly(ethylene isophthalate) P-262

Synonyms: *Poly(oxyethyleneoxyisophthaloyl). Poly(oxy-1,2-ethanediyloxycarbonyl-1,3-phenylenecarbonyl)*
Monomers: Isophthalic acid, Ethylene glycol
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
26948-62-9	repeating unit
26810-06-0	from isophthalic acid
68103-50-4	from dimethyl isophthalate

Molecular Formula: $(C_{10}H_8O_4)_n$
Fragments: $C_{10}H_8O_4$
Morphology: Two polymorphic forms known [3,21] α-form c 1,48, β-form c 2.1 [3]. Struct. studies have been reported [18]. α-form triclinic a 0.520, b 0.708, c 1.48, α 109°, β 136°, γ 96° [21]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.346 g/cm^3	amorph. [2,11]
2	d^{25} 1.358 g/cm^3	cryst. [2]
3	d^{0} 1.3596 g/cm^3	[22]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00013 K^{-1}	T < 51° [22]	V
2	0.000524 K^{-1}	T > 51° [22]	V

Latent Heat Crystallization: ΔH_β 54 kJ mol^{-1} (13 kcal mol^{-1}) [4]. E_{act} (T_g) 283 kJ mol^{-1} (70 kcal mol^{-1}) [10]
Melting Temperature:

No.	Value	Note
1	240°C	[2]
2	143°C	[3]
3	102–108°C	[15]

Glass-Transition Temperature:

No.	Value	Note
1	61°C	334K [10]
2	68°C	[11]
3	51°C	[22]

Transition Temperature General: Other transition temps. have been reported [19]
Transition Temperature:

No.	Value	Note	Type
1	110°C	[2]	Softening point
2	-50°C	[11]	β-transition temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. tetrachloroethane [3], 5% trichloroacetic acid [5], CH_2Cl_2 [7], DMF, DMSO, 1-methyl-2-pyrrolidinone, *m*-cresol [12,15], H_2SO_4 [15]. Insol. Me_2CO, 2-butanone, C_6H_6, toluene, THF, chlorobenzene, nitrobenzene, 1,4-dioxane, cyclohexanone [12], *n*-heptane [3], MeOH [7], H_2O [8], CH_2Cl_2 [12], $CHCl_3$ [12], *n*-hexane [12]

Transport Properties:

Polymer Solutions Dilute: [η] 0.33 dl g^{-1} (phenol/tetrachloroethane (60:40)) [2]; $[\eta]_{inh}$ 0.07 dl g^{-1} (1-methyl-2-pyrrolidinone, 30°) [8]; $[\eta]_{inh}$ 0.09 dl g^{-1} (1-methyl-2-pyrrolidinone, 30°) [12]; [η] 0.75 dl g^{-1} (phenol/tetrachloroethane, (60:40), 25°) [22]. Other η values have been reported [3]
Permeability of Gases: Diffusion coefficient [O_2] 2.7 × 10^{-7} mm^2 s^{-1} (1.2 mm film) [11]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.98 cm^3 mm/(m^2 day atm)	2.5 cm^3 mil 100 in^{-2} day atm^{-1} [11]
2	CO_2	2.52 cm^3 mm/(m^2 day atm)	0.0384 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 1.2 mm film [11]

Mechanical Properties:

Complex Moduli: Complex dynamic modulus from -170–200° has been reported [23]

Electrical Properties:

Electrical Properties General: Volume resistivity [20] and electrical conductivity [16] values have been reported. Other dissipation power values have been reported. [1,11,20] Dielectric constant (82–94°) has been reported [4]
Dissipation (Power) Factor:

No.	Value	Note
1	0.03	-30° [1]

Optical Properties:

Transmission and Spectra: Ir [3,12], fluorescence [9], H-1 nmr [5,12,13], C-13 nmr [7,14] and mass spectral [8] data have been reported

Polymer Stability:

Decomposition Details: Thermal degradation produces cyclic oligomers [8]. Polymer decomposition temp. 445° [8]
Biological Stability: Biodegradation studies have been reported [17]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification of dimethyl isophthalate with ethylene glycol at 240° followed by condensation polymerisation at 240° under vacuum [2,3,6,7,8]

Poly(ethylene-*co*-methyl acrylate) P-263

Synonyms: *Ethylene-acrylic elastomer. Poly(ethylene-co-methyl 2-propenoate)*
Related Polymers: Polyethylene, Poly(methyl acrylate)
Monomers: Methyl acrylate, Ethylene
Material class: Natural elastomers, Copolymers
Polymer Type: polyethylene, acrylic
Molecular Formula: $[(C_2H_4).(C_4H_6O_2)]_n$
Fragments: C_2H_4 $C_4H_6O_2$
Molecular Weight: The MW can range from 1000–100000
Additives: Octadecylamine, diphenylamine, hexamethylenediamine carbamate, diphenylguanidine, stearic acid, organophosphate (Gafac RC210), pentaerythritoltetrastearate, alumina, FEF carbon black (N-550), and SRF carbon black (N-774)
General Information: One of the most thermally stable of all the α-olefin copolymers. It is compatible with all the polyolefin resins and can be filled to more than 50% without loss of its elastomeric props. Four different base polymers are commercially available Vamac G, Vamac LS, Vamac D and Vamac DLS. Vamac G polymer is a terpolymer of 55% methyl acrylate, ethylene and a cure site monomer. Vamac LS is a higher methyl acrylate content terpolymer the composition of which was chosen to increase the oil resistance while minimising loss in low temp. flexibility. Vamac D and Vamac DLS are peroxide cure copolymers. The removal of carboxylic acid cure site in these polymers has improved the stability towards amine based additives. Its vulcanisates remain flexible at low temp. and possess high resistance to degradation, unique vibration damping props., and resistance to compression set and flex fatigue

Volumetric & Calorimetric Properties:

Brittleness Temperature:

No.	Value
1	-39°C

Surface Properties & Solubility:

Plasticisers: Santicizer 409 (polyester plasticiser), dioctyl sebacate
Solvents/Non-solvents: Sol. aromatic hydrocarbons, polar solvents. Insol. aliphatic hydrocarbons, H_2O

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	11.6 MPa		460%
2	11.6 MPa	oven-aged, 7 d, 177°	300%
3	11.8 MPa	oven-aged, 3 d, 200°	250%

Miscellaneous Moduli:

No.	Value	Note	Type
1	3.2 MPa		100% Modulus
2	5.6 MPa	oven-aged, 3 d, 200°	100% Modulus
3	6.8 MPa		200% Modulus
4	5 MPa	oven-aged, 7 d, 177°	100% Modulus

Hardness: Durometer A85 (oven-aged, 3 d, 200°). Durometer A82 (oven-aged, 7 d, 177°). Durometer A71

Polymer Stability:

Thermal Stability General: Excellent thermal stability. At elevated temps., ageing occurs by an oxidative cross-linking process which causes brittleness
Upper Use Temperature:

No.	Value
1	121°C
2	200°C

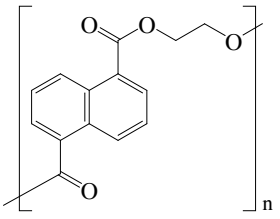
Decomposition Details: Heat resistance profile shows that useful life exceeds 24 months at 121° but falls to 7 d at 200°
Flammability: Flammable. Rate of burning may be retarded by compounding
Environmental Stress: More resistant than polyethylene
Chemical Stability: Good stability but attacked by conc. sulfuric acid, aromatic hydrocarbons and polar solvents
Hydrolytic Stability: Stable to dilute acids and bases. Immersion in boiling H_2O for 70h causes only 5% change in volume

Applications/Commercial Products:

Processing & Manufacturing Routes: It is produced in a conventional high pressure reactor where methyl acrylate monomer is injected with the ethylene gas resulting in a random copolymer. Commercial polymers contain 18% to 24% by weight of methyl acrylate
Mould Shrinkage (%):

No.	Value	Note
1	2%	unplasticised
2	4.5%	compounded

Applications: In the automotive industry (static and dynamic seals), cable and wire jacketing, pipe seals, hydraulic system seals, dampers for machinery and high speed printers. Also used as peroxide cure copolymers



Trade name	Details	Supplier
Acrythene	EM 802-009	Quantum Chemical
Bynel	various grades	DuPont
EMAC	SP range	Chevron Chemical
Nucrel	various grades	DuPont
Optema	TC range; XS-12.04	Exxon Chemical

2	CO_2	2.43 cm^3 mm/(m^2 day atm)	0.037 × 10^{-10} cm^2 $(s\ cmHg)^{-1}$ [11]

Mechanical Properties:

Mechanical Properties General: Variation of Young's Modulus and tensile strength with temp. has been reported in graphical form [10]. Tensile modulus and tensile strength break and yield have been reported [9]

Tensile (Young's) Modulus:

No.	Value	Note
1	5540–6256 MPa	56500–63800 kg cm^{-2} [12]
2	6080 MPa	620 kg mm^{-2} [11]

Tensile Strength Break:

No.	Value	Note	Elongation
1	588 MPa	60 kg mm^{-2} [7]	
2	274 MPa	[11]	90%
3	138–142 MPa	[12]	28–33%

Elastic Modulus:

No.	Value	Note
1	145000 MPa	[6,10]
2	17651 MPa	1800 kg mm^{-2} [7]

Viscoelastic Behaviour: Stress-strain curves [6,9], necking behaviour [9] and creep behaviour [9] have been reported.

Electrical Properties:

Electrical Properties General: Variation of dielectric constant and dielectric loss with temp. of both wet and dry samples has been reported in graphical form [3]. Other values of dissipation factor have been reported [10,13]. Other values of dielectric strength have been reported [13]

Surface/Volume Resistance:

No.	Value	Note	Type
1	200×10^{15} Ω.cm	25° [11]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.9	1 kHz	[11]

Dielectric Strength:

No.	Value	Note
1	287 $kV.mm^{-1}$	[12]

Static Electrification: Dependence of electrical conductivity on temp. has been reported in graphical form [5]. Breakdown voltage 400 V μm^{-1} [7]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	1 kHz	[11]

Optical Properties:

Optical Properties General: Refractive index has been reported [9]

Transmission and Spectra: Fluorescence [1], esr [8], Raman [14], XPS [8], C-13 nmr [15] and ir [16] spectral data have been reported. Film blocks light below 380 nm [11]

Polymer Stability:

Thermal Stability General: Heat resistance has been reported [13]

Upper Use Temperature:

No.	Value	Note
1	180°C	Electrical UL 746B E52857 (m) [11]
2	160°C	Mechanical UL 746B E52857 (m) [11]

Environmental Stress: Degrades photochemically with scission of the naphthyl-carbon bond [2]

Chemical Stability: Stable towards most chemicals except conc. sulfuric acid, conc. nitric acid and conc. hydrochloric acid [11]

Hydrolytic Stability: Stable to immersion in water for 200h (maintains 60% elongation under water at 130°) [7]

Stability Miscellaneous: Radiation resistance 11 MGY (to reduce elongation by 50%) [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by the transesterification of dimethyl naphthalate with ethylene glycol at 185° followed by polycondensation at 285° under vacuum using a titanium catalyst [7,17]

Applications: Used for audio and videotape. Has electronics applications

Poly(ethylene-2,6-naphthalate) general purpose P-266

Synonyms: *Poly(ethylene-2,6-naphthalenedicarboxylate). PEN. Poly(oxyethyleneoxycarbonyl-2,6-naphthalenecarbonyl). PEN-2,6. Poly(oxy-1,2-ethanediyloxycarbonyl-2,6-naphthalenediylcarbonyl)*
Related Polymers: Poly(ethylene-2,6-naphthalate) films
Monomers: 1,2-Ethanediol, 2,6-Naphthalenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
24968-11-4	repeating unit
25230-87-9	from dicarboxylic acid
25853-85-4	from 2,6-dimethyl naphthalate

Molecular Formula: $(C_{14}H_{10}O_4)_n$
Fragments: $C_{14}H_{10}O_4$
Morphology: Two crystalline forms are known. α-Form triclinic a 0.651, b 0.575, c 1.32, α 81.33°, β 144°, γ 100° [7], β-form triclinic a 0.926, b 1.559, c 1.273, α 121.6°, β 95.57°, γ 122.52° [9]

Surface Properties & Solubility:

Solubility Properties General: Miscibility with poly(ethylene terephthalate) [12] and poly(tetramethylene terephthalate) [22] has been reported
Wettability/Surface Energy and Interfacial Tension: Surface free energy 0.06 J m^{-2} (calc.) [9]

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.8 dl g^{-1} (phenol/*p*-chlorophenol/tetrachloroethane (25:40:35), 25°) [5]; [η] 0.593 dl g^{-1} (phenol/*o*-dichlorobenzene, 25°) [8]; [η] 0.480–0.565 dl g^{-1} (hexafluoroisopropanol, 30°) [9]; [η] 0.57 dl g^{-1} (phenol/tetrachloroethane, (60:40), 25°) [25]
Polymer Melts: Melt viscosity [16] and rheological props [16] have been reported

Mechanical Properties:

Mechanical Properties General: Fibre-mechanical props have been reported [24]. Storage moduli and loss modulus relationships with temp. have been reported [16,23]. Shear storage and loss moduli (-140–270°) have been reported [10]
Flexural Modulus:

No.	Value	Note
1	2550 MPa	370 kpsi, ASTM D790 [5]

Poly(ethylene oxide) P-267

Synonyms: *Polyoxydin. PEG. Poly(ethylene glycol). Polyoxyethylene glycol. Poly(α-hydroxy-ω-hydroxy oxy-1,2-ethanediyl). PEO*
Related Polymers: Poly(propylene oxide*co*-ethylene oxide)
Monomers: Ethylene oxide
Polymer Type: polyalkylene ether, polyethylene oxide
CAS Number:

CAS Reg. No.
25322-68-3

Molecular Formula: $(C_2H_4O)_n$
Fragments: C_2H_4O
Molecular Weight: MW 200–600 (clear, colourless, viscous liqs.), 600–3000 (low melting, waxy solids), 800 (approx., partly crystalline), 100000–1000000 (highly crystalline, thermoplastic solids)
Additives: Metal salts for polyelectrolytes, 2,6-Di-*tert*-butyl-4-methylphenol, substituted phenols, cresols, quinones, mixtures of

aliphatic amines and dihydric phenols, carbamates and other compounds as stabilisers
General Information: Available in a wide range of MWs up to several million. Can be linear or branched, amorph., or crystalline.
Morphology: Spherulitic; monoclinic; a 0.796 nm, b 1.311 nm, c 1.939 nm; β 124.8°; 4 molecular chains per unit cell [1]. Crystal morphology varies with the crystallisation process and crystallisation temp. T_c. Crystal thickness increases as T_c increases. Can crystallise with integral-folded (IFC) or non-integral folded chains (NIFC) depending on the conditions during crystallisation. Raman longitudinal acoustic mode studies on the isothermal crystallisation of PEO (MW 3000) have shown that the initial lamellae are made up of non-integer-fold chains but integer-fold chains eventually develop in a solid-state conversion. SAXS studies have also been reported on NIFC and IFC formation in PEO complexes with some disubstituted aromatic compounds [8,36,37]. Crystallisation and melting have been studied and the lamellar growth rate measured in real time by a combination of optical and atomic force microscopy [34]
Miscellaneous: Viscometry evidence suggests that PEO prepared using calcium or zinc catalysts retains metal atoms in the polymer in a bonded form. Consequently the polymer carries a positive charge and will behave as a polyelectrolyte [31,37]. Can form association complexes with various electron acceptors e.g. poly(methacrylic acid), phenolic compounds, urea, polyacrylic acid. Complexes with electrolytes, particularly lithium salts, are of special interest for their potential uses, e.g. in batteries and electrochromic sensors/displays. The synth. and struct. of PEO-based polyelectrolytes has been widely reported. [2,46,47,57]. The name PEG generally refers to polymer of lower MW. The uses of PEO have been reviewed [2]

Glass-Transition Temperature:

No.	Value	Note
1	-52°C	high MW, partly crystalline [1]
2	-17°C	MW 6000; 95% crystalline [1]
3	-95–-15°C	varying MW [2]

Transition Temperature General: T_m varies with MW and crystallinity/crystallisation temp. [3,10,28]. Increasing the draw ratio increases the melting temp. of PEO filaments (MW 300000–4000000) from approx. 65° to approx. 72° at draw ratio 30 [14]. The glass-transition temp. varies with increasing MW, rising from -95° at an approximate MW of 100 to between -15° and -20° at MW values around 10000. After this point it falls, levelling off at approx. 60° when MW is approx. 1000000. This variation has been attributed to the effect of changing crystallinity. Quenched polymers tend to exhibit T_gs rising in a monotonic manner with increasing MW [2]

Surface Properties & Solubility:

Solubility Properties General: Shows inverse solubility in water, becoming less sol. as the temp. rises. When a certain temp. (the cloud point), is reached the polymer precipitates and remains insol. if the temp. rises further. The cloud point depends on concentration and MW, falling as concentration increases. The presence of salts usually brings about a decrease in the cloud point; the magnitude of the change depends on the concentration, valence and size of the ionic species present. Phase separation of aq. solns. of PEO as a result of spinodal degradation is caused by increasing pressure. The effect is independent of concentration but varies with MW [52]. At concentrations of $<1\%$ aq. solns. of high MW PEO become stringy. At concentrations of approx. 20% the solns. are gel-like and above this they resemble hard, water plasticised polymers [1,2]. PEO was believed to aggregate in water and other solvents. However, more recent work has shown that evidence of aggregation is not found providing that the solvent is adequately purified. Anomalous results can occur with solvent which is not pretreated, leading to erroneous conclusions. [15,32]. The swelling behaviour of a PEO hydrogel in a wide variety of solvents has been reported. Water and formamide show anomalous swelling/temp. relationships. [40,42,45]
Cohesive Energy Density Solubility Parameters: Solubility parameters 10.3 $J^{1/2}$ cm$^{-3/2}$ (70°, MW 10700), 6.3 $J^{1/2}$ cm$^{-3/2}$ (100°, MW 10700), 6.07 $J^{1/2}$ cm$^{-3/2}$ (120°, MW 10700), 5.9 $J^{1/2}$ cm$^{-3/2}$ (150°, MW 10700) [30]
Solvents/Non-solvents: Sol. H_2O, chlorinated hydrocarbons, 2-butanone, 2-ethoxyethyl acetate, butyl acetate, cyclohexanone, esters, DMF, C_6H_6 (elevated temp.), toluene (elevated temp.) [1]. Insol. ethers, aliphatic hydrocarbons [1]
Surface and Interfacial Properties General: The surface activity of PEO in water increases with MW up to a value of approx. 10000 above which the interfacial absorption characteristics remain essentially constant. An anomalous additional reduction in surface tension is observed in aq. PEO solns. at high polymer concentrations. The phenomenon is attributed to the formation of dense layers of PEO. Although the reduction in surface tension at low concentrations is independent of MW, the additional surface tension reduction is strongly MW dependent [3,51,53,55]. Surface free energy of low MW PEO decreases with increasing MW [10]

Surface Tension:

No.	Value	Note
1	33.8 mN/m	[23]

Transport Properties:

Transport Properties General: The solubility of many alkali metal salts in PEO soln. decreases as the temp. increases. With one exception ($NaNO_3$), it is found that salts which form no complex with PEO display this negative temp. dependence in their solubility [49]. At low concentrations of aq. PEO the solubilities of gases are little different to those in pure water, but at polymer concentrations greater than approx. 70% they increase appreciably. Solubilities in neat polymer are higher for PEO of greater MW [54]. Melt flow index has been reported [2]
Polymer Solutions Dilute: At approx. 50% PEO (actual value MW dependent) a PEO/water system behaves as a binary eutectic mixture [35]. The effects of temp., pressure and the presence of salts on the rheological props. of aq. PEO soln. have been studied. Aq. solns. of high MW PEO exhibit shear thinning behaviour. Increasing temp. and the addition of salts cause a decrease in shear thinning and in the apparent viscosity. However, an increase is observed on the addition of EtOH, a poor solvent for PEO [8]. The viscosity of aq. PEO solns. increases with concentration, and MW but decreases with increasing temp. and shear rate [2]. Under normal conditions higher MW PEO exhibits LCST behaviour in aq. soln. With increasing pressure the LCST falls and the polymer eventually exhibits UCST beaviour [21]. Studies on PEO in aq. THF have shown that as temp. falls to near the LCST the polymer contracts, the inherent viscosity decreasing to approx. 33% of its previously virtually constant value [33]. A detailed study of local dynamics in toluene soln. has been reported [20,24,25]. Intrinsic viscosity [16,18] 3.7 dl g^{-1} (MeOH, 25°, MW 40000), 26.5 dl g^{-1} (MeOH, 25°, MW 1200000), 0.221 dl g^{-1} (H_2O, 25°, MW 62), 10.2 dl g^{-1} (H_2O, 25°, MW 86000), 257 dl g^{-1} (H_2O, 25°, MW 11000000), 0.28 dl g^{-1} (C_6H_6, 25°, MW 400), 22.6 dl g^{-1} (C_6H_6, 25°, MW 348000), 158 dl g^{-1} (C_6H_6, 25°, MW 5200000), 0.24 dl g^{-1} (aq. 0.45*M* K_2SO_4, 34.5°, MW 106), 1.19 dl g^{-1} (aq. 0.45*M* K_2SO_4, 34.5°, MW 5190). Huggins constants [24] and Mark-Houwink constants [1,16, 19, 24, 25, 26] have been reported. Theta temp. 17° (approx., MeOH), 35° (aq. 0.45*M* K_2SO_4), 45° (aq. 0.45*M* K_2SO_4) [16]. Second virial coefficients have been reported [9,15,16]. Flory-Huggins interaction parameter has been reported [9,19]
Polymer Melts: Melt behaviour is pseudoplastic, melt viscosity decreases significantly with an increase in shear rate. The effect is more pronounced for higher MW polymers
Permeability of Gases: [O_2] 85.8 µmol (m s GPa)$^{-1}$ (film) [2]
Water Content: PEG hydrogels form various hydrates depending on the MW. Lower MWs form a tetrahydrate and higher ones a trihydrate possibly with a hexahydrate. The transition point for tetrahydrate to trihydrate lies between M_n 429 and 949 [6]
Gas Permeability:

No.	Gas	Note
1	[O_2]	85.8 µmol (m s GPa)$^{-1}$ (film) [2]

Mechanical Properties:

Mechanical Properties General: The effects of draw ratio on the tensile strength and modulus of PEO filaments, prepared by solid-state extrusion, have been reported. Both strength and modulus increase with the draw ratio, the former levelling off to a constant value. The increase in tensile strength is more pronounced for higher MW polymer [14]

Tensile (Young's) Modulus:

No.	Value	Note
1	5000–9000 MPa	approx., MW 300000–4000000 [14]

Tensile Strength Break:

No.	Value	Note	Elongation
1	16 MPa	film, machine direction [2]	550%
2	13 MPa	film, transverse direction [2]	650%
3	10 MPa	approx., filament MW 300000–4000000 [14]	
4	82.7 MPa	12000 lb in^{-2} [3]	700%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	11.7 MPa	10%	1700 lb in^{-2} [3]

Miscellaneous Moduli:

No.	Value	Note	Type
1	290 MPa	film, machine direction [2]	Secant modulus
2	480 MPa	film, transverse direction [2]	Secant modulus

Viscoelastic Behaviour: The viscoelastic parameters of PEO in compression creep have been reported and the effects of temp. and pressure investigated. PEO chains exhibit volume deformation increasing with rising temp. [50]. The ultrasonic velocity and absorption depend on MW and concentration [56]
Failure Properties General: Tear strength 100 kN m^{-1}(film, machine direction), 240 kN m^{-1}(film, transverse direction) [2]
Fracture Mechanical Properties: Is resistant to cold crack at -46 [2]
Friction Abrasion and Resistance: PEO is effective as a friction reducer in aq. solns. at high dilution [3]

Electrical Properties:

Electrical Properties General: Has a much higher conductivity than expected, particularly so in the liq. state. Conductivity increases as the temp. rises to 65–70° and then tends to level off. At temps. below T_m conductivity rises with increasing frequency. At higher temps. the conductivity is virtually the same for frequencies of 1 kHz and above [3,57]. The dielectric constant and loss are strongly dependent on temp., pressure and frequency [39]
Complex Permittivity and Electroactive Polymers: Polymer electrolytes based on PEO have been studied extensively. Complexes with alkali, alkaline earth and transition metal salts are possible all with a variety of counter ions. The relationship between struct. and conductivity has been investigated as has the variation of conductivity with temp. and composition. In the case of PEO-$LiBF_4$ based electrolytes the relationship between Li salt concentration and morphological changes in the polymers complex. The highest conductivity is obtained for PEO:$LiBF_4$ ration of 8:1.Permittivity data on PEO-LiBF4 mixtures agrees with the findings on conductivity [46,47,57]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.46	PEG, MW approx. 200 [3]
2	1.463	PEG, MW approx. 300 [3]
3	1.467	PEG, MW approx. 400 [3]
4	1.469	PEG, MW approx. 600 [3]

Transmission and Spectra: Ir, Raman and nmr spectral data have been reported [3,11,12].
Total Internal Reflection: Increasing the draw ratio increases the birefringence of PEO filaments [14]

Polymer Stability:

Polymer Stability General: PEO is susceptible to oxidation. It can degrade by autodegradation via the formation and cleavage of intrachain hydroperoxide bonds. Uv light or the presence of heavy metal ions or strong acids can promote hydroperoxide formation. Degradation is also caused by mechanical means such as high shear [2]. The stability of aq. solns. can be improved by the addition of isopropanol, EtOH, ethylene glycol, propylene glycol or manganese ion. [1,2]

Thermal Stability General: After 100h at 80° in air a free-flowing powder form of the polymer (MW 6000) is transformed into a waxy, lower melting point material. Thermal treatment *in vacuo* at 80° for 1000h, however, has little effect on either form or melting point. The addition of an antioxidant such as 2,2′-methylenebis(4-methyl-6-*tert*-butylphenol) stabilises the polymer against thermo-oxidative degradation [17]. In an inert atmosphere the presence of salts reduces the thermal stability of PEO but in air the polymer is stabilised against thermooxidation [11]

Decomposition Details: Pyrolysis studies on PEO (MW 900000) show that degradation, by C-O and C-C bond scission, occurs in the range 235–255°. The products include CO_2, formaldehyde, CH_3CHO and $(CH_3CH_2)_2O$. The thermal and thermooxidative degradation of the homopolymer, with or without added salts, has been reported [5,11]

Flammability: Fl. p. 171–182° (MW 200, Cleveland open cup), 254–265° (MW 1000, Cleveland open cup), 271° (MW 4000, Cleveland open cup), 148° (min., MW 1000, Cleveland closed cup), 177° (min., MW 200, Cleveland closed cup), 177° (min., MW 4000, Cleveland open cup)[1]

Chemical Stability: Is hygroscopic. Its aq. solns. are corrosive to carbon steel but not to stainless steel. For prolonged storage, especially in hot environments, PEO should be stored under an inert atmosphere such as nitrogen to avoid degradation [1]

Biological Stability: Is biodegradable

Stability Miscellaneous: Exposure to ionising radiation can lead to either cross-linking or degradation. In the presence of oxygen, exposure results in degradation. In an inert atmosphere, however, cross-linking occurs, producing polymer networks which exhibit hydrogel props. Uv-induced cross-linking of PEO in the presence of a variety of initiators, and the gel fraction and swelling behaviour of the resultant products have been reported. Network density can be controlled by varying the irradiation temp. [2,3,4,41]. Ultrasonic irradiation (500 kHz) of an aq. soln. of PEO causes a gradual decrease in the MW from (narrow range) to 1000–10000 range centred approx. 1500) over a two hour period [48]

Applications/Commercial Products:

Processing & Manufacturing Routes: Ethylene oxide can be polymerised by three methods [1]; acid or cationic initiation using Bronsted or Lewis acids; base or anionic initiation using metal alkoxides; ionic coordinate initiation usually using alkaline earth or transition metal complexes. Star-shaped PEO of various types (three-arm, multi-arm and comb-shaped) has been prepared by the anionic polymerisation of oxirane using a plurifunctional organometallic initiator [43]. The efficient separation of linear and star polmers by supercritical fluids and the fractional precipitation of star molecules have been reported. [22,44]. Can be cross-linked to form gels by reaction with isocyanates [40,42];γ-irradiation of degassed aq. PEO soln. [41]; electron beam irradiation in aq. soln. [45]. High MW PEO can be moulded, extruded and calendered. Sheets and films are heat-sealable [2]

Applications: Low MW PEO (MW 800) is used as an intermediate in chemical manufacture, e.g. of surfactants and thickeners. Slightly higher MW (1000–2000) polymers are used in pharmaceutical applications (e.g. ointments, suppositories) and in cosmetics (creams and lotions). Medium MW polymers are used as adhesives, binders, plasticisers, lubricants, moulding compounds and preservatives for items e.g. archaeological findings which have been subjected to long submersion under water. High MW PEO is used as textile sizes, hydrodynamic friction reducing agents, as a water sol. coating for seeds and also in cosmetics and toiletries, packaging, adhesives, chromatography and dentistry. Association complexes of PEO are used in medical applications (controlled release formulations, microencapsulation and artificial kidneys). Complexes with electrolytes, particularly lithium salts, are of special interest for their potential uses in batteries and electrochromic sensors/displays.

Poly(ethylene oxybenzoate) P-268

Synonyms: *PEB. PEOB. Poly(ethylene benzoate). Poly(ethylene-p-hydroxybenzoate). Poly(4-(2-hydroxyethoxy)benzoic acid). Poly(oxyethyleneoxy-1,4-phenylenecarbonyl). Poly(p-(ethyleneoxy)benzoate). Poly(oxy-1,2-ethanediyloxy-1,4-phenylenecarbonyl). Poly(methyl 4-(2-hydroxyethoxy)benzoate)*
Monomers: Methyl 4-(2-hydroxyethoxy)benzoate
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
25248-22-0	repeating unit
25302-46-9	Poly(ethylene-*p*-hydroxy benzoate)
25585-19-7	Poly(4-(2-hydroxyethoxy)benzoic acid
25232-94-4	Poly(methyl 4-(2-hydroxyethoxy)benzoate

Molecular Formula: $(C_9H_8O_3)_n$
Fragments: $C_9H_8O_3$
Morphology: α form - orthorhombic a 1.046, b 0.476, c 1.560, helix 2_1 [2]; α form - orthorhombic a 1.049, b 0.475, c 1.560, helix 2_1 [6]; α form - orthorhombic a 1.052, b 0.475, c 1.565, helix 2_1 [17]; β form - monoclinic a 0.819, b 1.107, c 1.905, β 114.8°, helix 2_1 [8]. Other forms have been reported [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3 g/cm^3	amorph. [1]
2	d 1.39 g/cm^3	cryst. [1]
3	d 1.34 g/cm^3	fibre [5]
4	d 1.312 g/cm^3	amorph. [5]
5	d^{25} 1.34 g/cm^3	α-form [8]
6	d^{25} 1.31 g/cm^3	β-form [8]
7	d^{30} 1.337 g/cm^3	[9]

Volumetric Properties General: Bulk compressibility 13.8×10^{-6} atm^{-1} [9]. Linear thermal expansion coefficient has been reported [16]

Latent Heat Crystallization: Enthalpy and entropy values have been reported [18]
Melting Temperature:

No.	Value	Note
1	223°C	[5]
2	225°C	[7]
3	205°C	478 K [11]
4	229°C	[17]
5	208°C	[19]
6	220°C	[20]

Glass-Transition Temperature:

No.	Value	Note
1	65°C	amorph. [5]
2	84°C	cryst. [5,7]
3	71°C	344K [11]
4	80°C	[17]

Transition Temperature General: Other T_g values have been reported [18,19]
Transition Temperature:

No.	Value	Note	Type
1	197–201°C	fibre [5]	Softening point
2	182–185°C	fibre [13]	Softening point

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. 2-chlorophenol [5], 4-chlorophenol [11], phenol/tetrachloroethane (50:50) [20]. Insol. most organic solvents [5]

Transport Properties:

Polymer Solutions Dilute: [η] 0.62 dl g^{-1} (2-chlorophenol, film, 25°) [5]; $[\eta]_{inh}$ 0.53 dl g^{-1} (4-chlorophenol, 50°) [11]; [η] 0.61 dl g^{-1} [19]; [η] 0.72 dl g^{-1} (tetrachloroethane/phenol (50:50), 25°) [20]
Permeability of Gases: Gas permeability (25 μm film) [N_2] 0.1 ml m^{-2} h^{-1} atm^{-1}; [O_2] 3.49 ml m^{-2} h^{-1} atm^{-1}; [CO_2] 7.43 ml m^{-2} h^{-1} atm^{-1} [5]
Water Absorption:

No.	Value	Note
1	0.4–0.5 %	20°, 65% relative humidity, fibre [5]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	4707 MPa	480 kg mm^{-2}, fibre [12]
2	4903–5884 MPa	500–600 kg mm^{-2}, fibre

Tensile Strength Break:

No.	Value	Note	Elongation
1	4–5.3 MPa	fibre [5]	15–30%
2	5.3 MPa	fibre [7]	25%
3	176 MPa	18 kg mm^{-2}, 25 μm film, 200 mm min^{-1}	127%

Elastic Modulus:

No.	Value	Note
1	6000 MPa	α-form, crystallite [2,16]
2	8900 MPa	macroscopic [7]
3	5900 MPa	crystallite [7]
4	2000 MPa	α-form, crystallite, 175° [16]

Poisson's Ratio:

No.	Value	Note
1	0.49	[9]

Impact Strength: Missile impact strength 31 kg cm (25 μm film) [5]
Viscoelastic Behaviour: Stress-strain curves for fibre have been reported [1,5,9,16]

Electrical Properties:

Electrical Properties General: Dielectric constant has been reported [10,15]

Optical Properties:

Transmission and Spectra: Esr [1,4], and ir [14,20] spectral data have been reported. Transmittance 92% (25 μm film, 560 μm) [5]
Total Internal Reflection: Birefringence 0.12 [12]

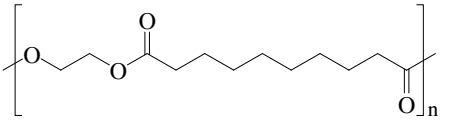
Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	150°C	fibre [5]

Environmental Stress: The fibre has good weathering and uv resistance [5]
Chemical Stability: The fibre has good resistance to sulfuric acid, nitric acid, hydrochloric acid, formic acid, AcOH, sodium hydroxide and phenol [5]
Hydrolytic Stability: The fibre has good resistance to hydrol. [5]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by treating 4-hydroxybenzoic acid with ethylene oxide to form 4-(2-hydroxyethoxy) benzoic acid, which is then treated with MeOH to form methyl 4-(2-hydroxyethoxy) benzoate. This monomer then undergoes condensation polymerisation at 250–260° under vacuum [5,11]
Applications: Used as a filament yarn in the silk clothing industry

Trade name	Supplier
A-Tell	Unitika Ltd.

Poly(ethylene sebacate) P-269

Synonyms: *Poly(oxyethyleneoxysebacoyl). PES. Poly[oxy-1,2-ethanediyloxy(1,10-dioxo-1,10-decanediyl)]. Poly(ethylene sebacinate). Poly(1,2-ethanediol-co-decanedioic acid)*
Monomers: 1,2-Ethanediol, Decanedioic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.
25037-32-5
25034-96-2

Molecular Formula: $(C_{12}H_{20}O_4)_n$
Fragments: $C_{12}H_{20}O_4$
Morphology: Two polymorphic forms [20,36] have been studied [7,24,30], form I, monoclinic, a 0.552, b 0.730, c 1.665, β 115.0° [21]; monoclinic, a 0.552, b 0.740, c 1.690, β 65° [22]; monoclinic, a 0.55, b 1.50, c 1.69, β 65° [23]; monoclinic, a 0.558, b 0.731, c 1.676, β 115.5° [24]; form II, triclinic, a 0.539, b 0.760, c 1.676, α 104.8°, β 111.7°, γ 72.4° [36]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.167 g/cm^3	[17]
2	d^{25} 1.113 g/cm^3	amorph. [17]
3	d 1.211 g/cm^3	crystalline [17]
4	d^{25} 1.148 g/cm^3	[18,19]
5	d 1.244 g/cm^3	crystalline [21]
6	d 1.083 g/cm^3	amorph. [26]
7	d 1.173 g/cm^3	[24]
8	d 1.101 g/cm^3	amorph. [33]
9	d 1.156 g/cm^3	[35]
10	d 1.136 g/cm^3	[35]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00075 K^{-1}	amorph. [26]	V
2	0.00053 K^{-1}	crystalline [26]	V
3	0.00074 K^{-1}	25° [32]	V
4	0.000196 K^{-1}	T <Tg [37]	V
5	0.000358 K^{-1}	T >Tg [37]	V

Volumetric Properties General: Compressibility 0.0001 cm^3 g^{-1} atm^{-1} [26]
Equation of State: Equation of state information has been reported [31]
Latent Heat Crystallization: ΔH_f 80.8 kJ mol^{-1} (19.3 kcal mol^{-1}, film), 88 kJ mol^{-1} (21 kcal mol^{-1}, block) [9]; ΔH_f 13.8 kJ mol^{-1} (3300 cal mol^{-1}), S_f 40.2 J mol^{-1} K^{-1} (9.6 cal mol^{-1} $°C^{-1}$) [14]; ΔH_f 29.1 kJ mol^{-1} (30.5 cal g^{-1}), S_f 55.3 J mol^{-1} K^{-1} (13.2 cal mol^{-1} $°C^{-1}$, 277°) [16]; S_f 83.7 J mol^{-1} K^{-1} (20 cal mol^{-1} $°C^{-1}$) [17]; ΔH 35.12 kJ mol^{-1} (36.8 cal g^{-1}) [35]. Other ΔH values have been reported [4,26,34]
Specific Heat Capacity:

No.	Value	Note	Type
1	0.12 kJ/kg.C	6.78 cal mol^{-1} K^{-1}, 0° [13]	P

Melting Temperature:

No.	Value	Note
1	72°C	[15]
2	76°C	[16,29]
3	69°C	[17]
4	68–74°C	[18]
5	69.5°C	[20]
6	80–83.8°C	[25]
7	83°C	[26,38]
8	81°C	[24]
9	77°C	[31]
10	72.6°C	[35]
11	74–75°C	[37]

Glass-Transition Temperature:

No.	Value	Note
1	<-80°C	max. [14]
2	-53°C	220K [29]
3	-44°C	[35]
4	-30°C	[37]

Transition Temperature:

No.	Value	Note	Type
1	88°C	361K [29]	$T°_m$
2	-23°C	[33]	T_β
3	-70°C	[34]	T_β
4	-130°C	[34]	T_γ

Surface Properties & Solubility:

Solubility Properties General: Miscibility with polyepichlorohydrin has been reported [35]
Cohesive Energy Density Solubility Parameters: Cohesion energy 52.3 kJ mol^{-1} (12.5 kcal mol^{-1}) [41]
Internal Pressure Heat Solution and Miscellaneous: Absorption of EtOAc has been reported [8]. Toluene phase diagram has been reported [20]
Solvents/Non-solvents: Sol. warm isoamyl acetate, warm hexanol [24], 2-butanone [36]. Insol. MeOH [36]. Calculated solvent interaction parameters predict sol. C_6H_6, $CHCl_3$, THF [39]
Surface and Interfacial Properties General: Interfacial free energy 0.89 mJ cm^{-2} (8.9 erg cm^{-2}, parallel) [29]. Interfacial free energy 2.24 mJ cm^{-2} (22.4 erg cm^{-2}, perpendicular) [29]

Transport Properties:

Polymer Solutions Dilute: Soln. props. in DMF and cyclohexane have been reported [6]. [η] 0.15 $dl.g^{-1}$ (C_6H_6, 25°) [31]. [η] 0.55 $dl.g^{-1}$ (*m*-cresol, 30°) [37]. Other viscosity values have been reported [6]
Permeability and Diffusion General: Diffusion coefficient of water has been reported [5]
Water Content: Water sorption has been reported [5]

Mechanical Properties:

Complex Moduli: Real and imaginary complex shear moduli have been reported [34]
Viscoelastic Behaviour: Viscoelastic props. have been reported [42]

Electrical Properties:

Electrical Properties General: Volume resistivity has been reported [10]. Dielectric constant and loss factor have been reported. [19,33] Dissipation factor value has been reported [10]
Magnetic Properties: Diamagnetic susceptibility has been reported [41]

Optical Properties:

Transmission and Spectra: Esr [1], ir [2,3], Raman [2], H-1 nmr [27] and C-13 nmr [32] spectral data have been reported

Polymer Stability:

Decomposition Details: Thermal [11] and oxidative thermal degradation have been reported [11,28]. Activation energy for oxidation 80–84 kJ mol^{-1} (19–20 kcal mol^{-1}) [28]
Biological Stability: Biodegradation studies have been reported [12,40]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification of dimethyl sebacate with ethylene glycol under vacuum at 170–225° [18,31]

Poly(ethylene succinate) P-270

Synonyms: *Polyethylene glycol succinate. Poly(oxyethyleneoxysuccinoyl). Poly(oxyethyleneoxysuccinyl). Ethylene glycol succinate polyester. Poly[oxy-1,2-ethanediyloxy(1,4-dioxo-1,4-butanediyl)]*
Monomers: 1,2-Ethanediol, Succinic acid
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.	Note
25667-11-2	repeating unit
25569-53-3	Poly(ethylene succinate)

Molecular Formula: $(C_6H_8O_4)_n$
Fragments: $C_6H_8O_4$
General Information: Hard, brittle and white [30]
Morphology: Structural [45] and morphological [27,53,54] studies have been made and two polymorphic forms are known [40,58]. Orthorhombic, a 0.760, b 1.075, c 0.833 [11]; monoclinic, a 0.905, b 1.109, c 0.832, β 102.8° [32]. Other cryst. measurements have been reported (c 0.83, 0.842, 0.832 [33,36,58])

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.358 g/cm^3	[32,34]
2	d 1.32 g/cm^3	[48]

Latent Heat Crystallization: Activation energy of polymerisation 54–59 kJ mol^{-1} (13–14 kcal mol^{-1}) [10]. Other ΔH_f values have been reported [7]. ΔH_f 13.8 kJ mol^{-1} (22.9 cal g^{-1}) [38]. Activation energy of melting 47.1 kJ mol^{-1} (11.25 kcal mol^{-1}) [38]. Conformational energy of fusion 335 J mol^{-1} (80 cal mol^{-1}) [39]. Conformational entropy of fusion 1.62 J K^{-1} mol^{-1} [39]
Melting Temperature:

No.	Value	Note
1	102–103°C	[1,2]
2	104°C	[5]
3	105–107°C	[8]
4	102°C	[29,31]
5	104–106°C	[32]
6	98–99°C	[35]
7	112°C	[39]
8	95–96°C	[56]
9	108°C	[42]
10	101°C	[47]
11	98°C	[48]
12	91°C	[49]

Glass-Transition Temperature:

No.	Value	Note
1	-12°C	[47]
2	-15°C	[48]
3	-1°C	272K [50]
4	-14°C	[40]
5	-23°C	[57]

Transition Temperature General: Other T_g, T_m°, T_m values have been reported [7,29]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot EtOAc, AcOH, Ac_2O, Me_2CO, ethyl succinate [30], $CHCl_3$ [42,46], *o*-chlorophenol [42], DMSO [46], 2,2,2-trifluoroethanol [46], $CHCl_3$/trifluoroacetic acid (50:50) [46]. Slightly sol. C_6H_6 [2]. Insol. petrol [8,30], MeOH [9,42], H_2O, Et_2O, EtOH [2,30]
Wettability/Surface Energy and Interfacial Tension: Surface free energy 2×10^{-5} J mm^{-2} (2 erg cm^{-2}) [38]. Other surface free energy values have been reported [16]

Transport Properties:

Polymer Solutions Dilute: Soln. props. have been reported [18]. [η] 0.367 dl g^{-1} ($CHCl_3$, 25°) [42], η_{inh} 0.12 dl g^{-1} $CHCl_3$, 30°) [43]
Polymer Melts: Melt viscosity values have been reported [3,28,38]

Mechanical Properties:

Mechanical Properties General: Tensile strength of rods has been reported [54]

Electrical Properties:

Electrical Properties General: Volume resistivity and dissipation factor have been reported [19]

Dielectric Permittivity (Constant):

No.	Value	Note
1	5.6	[34]

Optical Properties:

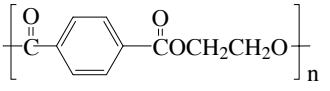
Refractive Index:

No.	Value	Note
1	1.4744	25° [52]

Transmission and Spectra: Ir [4,13,37,55], esr [9,50], Raman [13,55], mass [20,23,25,41,43,51] and C-13 [21,42,46,47] nmr spectral data have been reported

Polymer Stability:

Thermal Stability General: Thermal stability studies have been reported [14,20,22,23,25,41,43]. Decomposition temp. 350° [30]. Temp. of max. decomposition rate 410° [43]
Chemical Stability: Depolymerisation occurs in $CHCl_3$ and increases with increasing temp. [44]
Biological Stability: Biodegradability studies have been reported [12,15]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by condensation polymerisation of ethylene glycol and succinic acid at 200–250° under vacuum [8,9,25,26,30,31]

Poly(ethylene terephthalate) P-271

Synonyms: *PET. Poly(oxy-1,2-ethanediyloxycarbonyl-1,4-phenylenecarbonyl). Poly(oxyethylene oxyterephthaloyl)*
Monomers: Dimethyl terephthalate, 1,2-Ethanediol
Material class: Thermoplastic
Polymer Type: polyester
CAS Number:

CAS Reg. No.
25038-59-9

Molecular Formula: $(C_{10}H_8O_4)_n$
Fragments: $C_{10}H_8O_4$
Additives: Antioxidants (Irganox B-215 and 1098); compatibilisers (polypropylene-*graft*-maleic anhydride, polypropylene-*graft*-acrylic acid)

Morphology: May be crystallised from the glassy state at 120° and 200°. Struct. is not a simple biphasic system and may be mesomorphic [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.2 g/cm^3	melt, 300° [4]
2	d 1.333 g/cm^3	amorph. [4]
3	d 1.365 g/cm^3	biaxially oriented [4]
4	d 1.515 g/cm^3	cryst., calc. [6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00016 K^{-1}	30–60° [4]	L
2	0.00037 K^{-1}	90–190° [4]	L
3	0.00065 K^{-1}	melt [5]	L

Latent Heat Crystallization: ΔH_{fusion} 37.7–67 J g^{-1} (9–16 cal g^{-1})

Thermal Conductivity:

No.	Value	Note
1	0.147 W/mK	33°, film [12]
2	0.14 W/mK	0.000336 cal (cm s K)$^{-1}$, ASTM C177 [4]

Thermal Diffusivity: 0.000929 cm^2 s^{-1} (33°, film) [12]

Melting Temperature:

No.	Value	Note
1	245–258°C	[4]
2	280°C	[6]

Glass-Transition Temperature:

No.	Value	Note
1	73°C	[4]
2	67°C	amorph. [8]
3	81°C	cryst. [8]
4	125°C	cryst., oriented [9]

Deflection Temperature:

No.	Value	Note
1	65°C	150°F [4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. phenol, chlorophenol, chlorobenzene, dichloroethane. Insol. hexane, C_6H_6, EtOH, cyclohexane

Surface Tension:

No.	Value	Note
1	39.5 mN/m	25°, solid/liq. [10]
2	27 mN/m	290°, melt [10]

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.72–0.8 dl g^{-1} [4]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	7.87 cm^3 mm/(m^2 day atm)	20 cm^3 mil (100 in^2 day atm)$^{-1}$, 25°, unoriented [4]
2	CO_2	4.72 cm^3 mm/(m^2 day atm)	12 cm^3 mil (100 in^2 day atm)$^{-1}$, 25°, oriented [4]
3	O_2	3.94 cm^3 mm/(m^2 day atm)	10 cm^3 mil (100 in^2 day atm)$^{-1}$, 25°, unoriented [4]
4	O_2	1.96 cm^3 mm/(m^2 day atm)	5 cm^3 mil (100 in^2 day atm)$^{-1}$, 25°, oriented [4]
5	N_2	0.18 cm^3 mm/(m^2 day atm)	0.46 g mil (100 in^2 day atm)$^{-1}$, film, oriented
6	N_2	0.28–0.39 cm^3 mm/(m^2 day atm)	25°, oriented film

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2757 MPa	400 kpsi, ASTM D638, amorph. [4]
2	4136 MPa	600 kpsi, ASTM D638, oriented film [4]
3	14100 MPa	oriented film
4	63 MPa	oriented film, transverse [11]

Tensile Strength Break:

No.	Value	Note	Elongation
1	48 MPa	7000 psi, amorph. ASTM D638 [4]	250–500%
2	248 MPa	36 kpsi, longitudinal [4]	60%
3	69 MPa	10 kpsi, transverse [4]	150%
4	172 MPa	25 kpsi, biaxially oriented, ASTM D638 [4]	100%
5	172 MPa	film [7]	

Poisson's Ratio:

No.	Value	Note
1	0.44	extension [11]
2	0.37	transverse [11]

Impact Strength: Impact strength 240 J m^{-1} (film) [7]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	2×10^{15} Ω.cm	23°, 30% relative humidity [7]	S
2	0.0002×10^{15} Ω.cm	23°, 80% relative humidity [7]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.3	60 Hz	23° [7]
2	3.25	1 kHz	23° [7]
3	3	1 MHz	23° [4]
4	3.7	60 Hz	150° [7]

Dielectric Strength:

No.	Value	Note
1	295 kV.mm^{-1}	60 Hz, 23° [7]
2	275 kV.mm^{-1}	60 Hz, 150° [7]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0025	60 Hz	23° [7]
2	0.005	1 kHz	23° [7]
3	0.0016	1 MHz	23° [7]
4	0.0004	60 Hz	150° [7]

Polymer Stability:

Upper Use Temperature:

No.	Value
1	150°C

Flammability: Is completely combustible, leaving little residue. Burns more cleanly than coal and other fossil fuels
Chemical Stability: Good resistance to oils and fats, organic alcohols and hydrocarbons. Poor resistance to phenols, ketones, esters and chlorinated organic solvents
Hydrolytic Stability: Good resistance to dilute acids and alkalis, poor resistance to conc. bases
Recyclability: Can be recycled through depolymerisation

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by two routes; reaction of dimethyl terephthalate with 1,4-ethanediol with catalyst (usually acetate salts of zinc, calcium, manganese, magnesium and cobalt) at 150–210°. MeOH and excess diol removed via condenser. The intermediate is then polymerised at 270–280° at 0.5–1 mmHg with an antimony (III) oxide catalyst. Stabilisers or colour improvers, e.g. triaryl phosphites or phosphates, are added to prevent precipitation of insol. terephthalate salts. Higher MW products can be obtained by a solid-state post-polymerisation process or by chain extension reactions. Also prepd. by reaction of terephthalic acid and aq. ethylene glycol at 250° and 276 kPa for 3h. It is then further treated at 245° and atmospheric pressure for 2h. Common processing techniques used include injection moulding, extrusion and thermoforming. Polymer must be thoroughly dried otherwise loss of MW and deterioration of phys. props. occurs
Mould Shrinkage (%):

No.	Value	Note
1	0.003–0.005%	3 mm thickness, in direction of flow
2	0.003–0.005%	perpendicular to direction of flow

Applications: Clothing, films, bottles, food containers and engineering plastics for precision-moulded parts. A wide range of applications is possible because of the excellent balance of props. PET possesses and because the degree of crystallinity and the level of orientation in the finished part can be controlled. Can be made into articles with excellent clarity, and outstanding dimensional stability can be achieved. For packaging PET combines optimum processing, mech. and barrier props. Barrier props. are adequate for retention of carbon dioxide for packaging carbonated beverages and good oxygen barrier props. allow for its use in many types of food containers. However, barrier props. not sufficient for beer and foods that are highly sensitive to oxygen. Glass reinforced PET used for electrical connectors, auto body parts. Copolymer used for clear mouldings, e.g. medical devices, toys, cosmetic jars

Poly(ethylene-*co*-vinylacetate) P-272

Polymer Stability:

Environmental Stress: Stress crack resistance is significantly greater than for LDPE. Cross-linking gives further improvement [1]

Poly(ethylene-*co*-vinyl alcohol) P-273

Synonyms: *EVOH. ETVA. EVAL. EVA. Hydrolysed ethylene-vinyl alcohol copolymer. Poly(ethenol-co-ethene)*
Related Polymers: Poly(vinyl alcohol), Poly(ethylene), Ethylene-vinyl acetate copolymer, Ethylene-vinyl alcohol copolymer films
Monomers: Ethylene, Vinyl acetate
Material class: Gums and resins, Copolymers
Polymer Type: polyethylene, polyvinyl alcohol
CAS Number:

CAS Reg. No.
25067-34-9

Molecular Formula: $[(C_2H_4)_x(C_2H_4O)_y]_n$
Fragments: C_2H_4 C_2H_4O
General Information: Degree of hydrolysis is usually greater than 98%. Ethylene-vinyl alcohol copolymer can be prod. in any ratio. Polymer composition affects physical props. and applications. When ethylene content is 82–90 mol% it is used as an adhesive not as a barrier polymer; when vinyl alcohol content is 60–75 mol% it is used as barrier polymer and for processing into films [2]. The copolymer is random and amphoteric consisting of hydrophobic and hydrophilic segments
Morphology: EVOH copolymers are co-crystallisable over the entire range of copolymer compositions and can form isomorphic crysts.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.14–1.19 g/cm^3	ASTM D792 [1,4,7,36]
2	d 1.162 g/cm^3	62 mol % vinyl alcohol [3]
3	d 1.2 g/cm^3	73 mol % vinyl alcohol [3]
4	d 1.14 g/cm^3	44 mol % ethylene [6,7]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0006264 K^{-1}	melt. 59 mol % ethylene, degree of polymerisation 680 [9]	L

Volumetric Properties General: Density increases with increasing vinyl alcohol content [3,5]. The increase in density with increasing vinyl alcohol content may be related to the sample crystallinity [5]. Density may also depend on the melt index and hence MW [5]
Equation of State: Equation of state information has been reported [8]
Latent Heat Crystallization: The enthalpy of melting is affected by sample processing and increases with increasing vinyl alcohol content. ΔH_m 74–86 J g^{-1} (56 mol % vinyl alcohol), 89–101 J g^{-1} (68 mol % vinyl alcohol) [10]. Heat of combustion 27.3–40.8 kJ g^{-1} [17,18]. Heat of fusion depends on the vinyl alcohol content of the polymer. At low vinyl alcohol content, the heat of fusion decreases with increasing vinyl alcohol content, reaching a min. value of 2.35 J g^{-1} (9.84 cal g^{-1}) at 40 mol % vinyl alcohol. The heat of fusion then increases with vinyl alcohol content attaining a max. value of 4.73 J g^{-1} (19.8 cal g^{-1}) at 82 mol % vinyl alcohol [3].
Thermal Conductivity:

No.	Value	Note
1	0.2 W/mK	[8]

Specific Heat Capacity:

No.	Value	Type
1	1.9 kJ/kg.C	P

Melting Temperature:

No.	Value	Note
1	183°C	ethylene copolymer ratio 0.32, DSC method [4]
2	158°C	ethylene copolymer ratio 0.44, DSC method [4]
3	191°C	ethylene copolymer ratio 0.27, DSC method [4]
4	159°C	59 mol % ethylene [9]

6	107–205°C	13.8–82 mol % vinyl alcohol [3]
7	165°C	44 mol % ethylene [6]
8	142–181°C	[36]

Glass-Transition Temperature:

No.	Value	Note
1	52°C	29% ethylene, DSC method [11]
2	65°C	29% ethylene, DMA method [11]
3	31°C	59 mol % ethylene, DSC method [9]
4	58°C	dynamic mechanical analysis [12]
5	68°C	dry, ethylene copolymer ratio 0.32, DMA method [4]
6	69°C	[1]
7	55–69°C	[36]

Transition Temperature General: T_g is reduced by H_2O absorption [12,13] and by the sorption of alcohols [3,11], with MeOH and EtOH giving the lowest T_g values due to interactions with the polymer [11]. The effect on T_g of MeOH absorption is similar to that observed for poly(vinyl alcohol) [4]. A variation of approx. 15° was noted for the T_g of different EVOH samples [4]. T_m increases with increasing vinyl alcohol content and decreases with increasing ethylene content. [3,10] T_m is similar to that of LDPE samples at low concentrations of vinyl alcohol ($\leq$ 20 mol %) [5].

The Vicat softening point is higher than that of the corresponding ethylene-vinyl acetate copolymer and depends slightly on the vinyl alcohol content [5]. Samples with high melt index have a lower softening point [5]. T_m is lowest at 13.8 mol % vinyl alcohol [3]. T_m is affected by a sample's thermal history, with the effect more pronounced at higher vinyl alcohol content [10]. Brittleness temp. may be lower for samples with a high melt index [5]

Vicat Softening Point:

No.	Value	Note
1	90–110°C	≤ 20 mol% vinyl alcohol, ASTM D1525-76 [5]

Brittleness Temperature:

No.	Value	Note
1	-76°C	≤ 20 mol % vinyl alcohol [5]

Transition Temperature:

No.	Value	Note
1	-75–2°C	low temp. relaxation
2	124°C	high temp. relaxation [12]

Surface Properties & Solubility:

Solubility Properties General: EVOH (56 mol% vinyl alcohol) is compatible with poly(4-vinylpyridine) when the poly(4-vinylpyridine) content is less than 60% (w/w) [16]. Blends of EVOH (59 mol% ethylene) and nylon 6–12 (60 mol% nylon) are miscible in the molten state in the overall blend composition range at 150° [9]. The Flory interaction parameter for this blend is -0.58 [9]

Cohesive Energy Density Solubility Parameters: Cohesive energy density 41.8 J cm^{-3} (175 cal ml^{-1}) [11]

Plasticisers: Water [13], MeOH [4,11,14], EtOH [11], glycerol, glycerine [6]

Solvents/Non-solvents: Sol. DMSO. Insol. C_6H_6, Me_2CO, MeOH, EtOH [15]

Transport Properties:

Transport Properties General: Melt flow index varies widely and depends on the MW and MW distribution [5]

Melt Flow Index:

No.	Value	Note
1	1.3 g/10 min	32 mol % ethylene [7]
2	5.5 g/10 min	44 mol % ethylene [7]
3	12 g/10 min	210°, 44 mol % ethylene [6]
4	1.9–22 g/10 min	ASTM D1238-73 [5]

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.89 dl g^{-1} (30°, DMSO) [15]

Polymer Melts: The temp. dependence of the melt rheology has been reported [7]

Permeability and Diffusion General: Permeability increases with ethylene fraction (but moisture sensitivity decreases). 60–75 mol.% ethylene copolymer is a compromise chosen to allow good barrier properties with acceptably low moisture sensitivity

Water Content: Equilib. H_2O content at 23° after 7 d 0.5% (10% relative humidity); 0.8% (20% relative humidity); 1.7% (50% relative humidity); 3.5% (80% relative humidity); 4.4% (90% relative humidity). Equilib. H_2O content increases dramatically upon plasticisation with 15% glycerol [6]. WVTR 0.35 nmol m^{-1} s^{-1} (44 mol% ethylene); 0.95 nmol m^{-1} s^{-1} (32 mol% ethylene) [37]

Water Absorption:

No.	Value	Note
1	6.7–8.6 %	24h $\frac{1}{8}$ inch thick specimen, ASTM D570 [36]

Mechanical Properties:

Mechanical Properties General: Mechanical props. are affected by H_2O absorption, the presence of plasticisers [6], the thermal history, preparation conditions [5,10,35] and the copolymer composition [3,5]. The temp. dependence of elasticity and tensile modulus is found to be consistent with a stepwise increase in the molecular mobility [26]. The change in yield strain with annealing depends on the vinyl alcohol content. The yield stress and the Young's modulus of all samples increases with annealing below T_g [35]. Tensile strength at break and yield, and the elastic modulus of compression-moulded samples increase with increasing vinyl alcohol content. Tensile strength at yield is at a max. when vinyl alcohol content is 15 mol %. Elongation at break decreases with increasing vinyl alcohol content [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	345 MPa	50 kpsi, approx., injection moulding, moisture content 6.5% [6]
2	2000–2700 MPa	300–385 kpsi, ASTM D638 [36]

Tensile Strength Break:

No.	Value	Note	Elongation
1	22.8 MPa	3.3 kpsi, injection moulding, moisture content 6.5%	330%
2	10–15 MPa	compression moulding [5]	150–300%
3	59–80 MPa	8520–11600 psi, ASTM D638 [36]	180–280%
4	43 MPa	film, 44 mol% ethylene	4%
5	66.2 MPa	film, 32 mol% ethylene [38]	5%

Flexural Strength at Break:

No.	Value	Note
1	1.2–2 MPa	230–285 psi, ASTM D790 [36]

Tensile Strength Yield:

No.	Value	Note
1	10–20 MPa	compression moulding [5]
2	51–71 MPa	7385–10365 psi, ASTM D638 [36]

Impact Strength: Izod 53–62 J m^{-1} (1–1.7 ft lb/in, $\frac{1}{8}$ inch thick, ASTM D256A [36]

Viscoelastic Behaviour: Horizontal shift activation energy 3.69 kJ mol^{-1} (15.45 kcal mol^{-1}) (32 mol% ethylene), 3.29 kJ mol^{-1} (13.78 kcal mol^{-1}) (44 mol% ethylene) [7]. The vertical shift activation energy is zero [7]. Data on viscoelastic behaviour have been reported [22]

Mechanical Properties Miscellaneous: The torsional stiffness of EVOH polymers is higher than that of LDPE and ethylene-vinyl acetate [5]. Torsional stiffness decreases with increasing temp. and the same temp. effect is observed for increasing vinyl alcohol concentration [5]

Hardness: Shore A and D values have been measured under standard conditions (ASTM D2240-75). [5] Hardness increases as the vinyl alcohol content is increased [5]. Microhardness increases with vinyl alcohol content but is also affected by the samples' thermal history [10]. Quenched samples have a lower value of microhardness than slow cooled samples [10]. Microhardness increases with increasing annealing temp. for quenched samples with the opposite effect for slow cooled samples [10]. Microhardness is in the range 125–200 MPa depending on the sample [10]

Failure Properties General: Stress-strain curves show that EVOH is a soft, tough material [6]

Electrical Properties:

Electrical Properties General: Dielectric props. are affected by moisture absorption [12,13] and temp. [12,13,26]

Optical Properties:

Transmission and Spectra: Ir [27], Raman [28], C-13 nmr [29,30,31,32,33] and H-1 nmr spectral data [30,34] have been reported

Volume Properties/Surface Properties: Haze 2.3% (film, 44 mol% ethylene); 1.8% (film, 32mol% ethylene) [38]

Polymer Stability:

Thermal Stability General: Weight loss is very low (approx. 2%) at 300° for a sample containing 32 mol % ethylene [15]. Thermal stability depends on the copolymer composition and is related to the thermal stabilities of poly(ethylene) and poly(vinyl alcohol). The processing conditions affect the decomposition and MW degradation. Degradation by melt shearing can occur [24]

Flammability: Limiting oxygen index 18.0–19.6 (12–74 mol % vinyl alcohol) and increases as the vinyl alcohol content increases [18]

Environmental Stress: Environmental stress cracking (ASTM D1693-70) by aq. detergent and pure detergent is reduced by increasing the melt index and the detergent concentration [5]. Samples with the lowest vinyl alcohol content have the lowest resistance to environmental stress cracking in dil. detergent [5]

Chemical Stability: The vinyl alcohol groups in EVOH copolymer can react with formaldehyde to prod. formals [19,20,21] and with acetaldehyde [22] to form acetals. EVOH copolymers undergo a base-catalysed Michael-type addition reaction with vinyl sulfoxides [15]. Reaction with phosphoric acid in suspension or aq. soln. forms phosphorylated copolymers [17,18]. Swollen by H_2O and alcohols [4,6,11,14]

Hydrolytic Stability: EVOH samples prepared from ethylene-vinyl acetate copolymer may undergo further hydrol. with the addition of strong acid or base in a manner analogous to that of poly (vinyl alcohol), which increases the number of vinyl alcohol groups

Applications/Commercial Products:

Processing & Manufacturing Routes: EVOH coploymers are prepared by hydrolysis of the corresponding ethylene-vinyl acetate copolymer. Methanolic KOH in C_6H_6 has been used. Injection or extrusion moulding 185–250° [36]. Manufactured by hydrolysis of poly(ethylene-*co*-vinyl acetate)

Applications: The main use of EVOH copolymers is in the formation of film and sheeting material. High ethylene content copolymers may be used as adhesives (ethylene content 82–90 mol%) and as coating materials for treatment of poly(vinyl alcohol) fibres. The copolymer may be used as an additive for rubber materials. Barrier applications (typically as inner layer of laminate to protect from moisture- 25–45 mol% ethylene); adhesive (10–12 mol% ethylene [38]

Poly(ethylene-*co*-vinyl alcohol), Films P-274

Synonyms: *EVOH films. EVAL films. Hydrolysed ethylene-vinyl acetate films*

Related Polymers: Poly(vinyl alcohol) films, Poly(ethylene) films, Ehtylene-vinyl alcohol copolymers, general information

Monomers: Ethylene, Vinyl acetate
Material class: Copolymers, Fibres and Films
Polymer Type: polyethylene, polyvinyl alcohol
CAS Number:

CAS Reg. No.
25067-34-9

Molecular Formula: $[(C_2H_4).(C_2H_4O)]_n$
Fragments: C_2H_4 C_2H_4O
General Information: The vinyl alcohol content of the copolymer used to form films is 60–75 mol%
Miscellaneous: Multilayer sheets and films consist of base film, adhesive, EVOH, adhesive, heat sealant. The following commercial coextruded films are prod.: Nylon 6/EVOH/adhesive/Nylon 6 and poly(propylene)/adhesive/EVOH/adhesive/poly(propylene). Polyethylene and ethylene-propylene copolymer layers may also be used. Soarnol is an ACBCA film where A, ethylene-propylene copolymer; B, EVOH and C, blend of ethylene-propylene copolymer and maleated ethylene-propylene copolymer. Polyethylene-nylon blends may also be used

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.19 g/cm^3	commercial film, ethylene content 32 mol %, ASTM D638 [3,9,10]
2	d 1.14 g/cm^3	commercial film, ethylene content 44 mol %, ASTM D638 [3,9,10]
3	d 1.15 g/cm^3	commercial film [11]

Volumetric Properties General: Density increases with increasing vinyl alcohol content [12] and may be affected by water absorption [13,14]
Thermodynamic Properties General: Thermal conductivity has been measured by ir [15]
Transition Temperature General: T_g is significantly increased by γ-irradiation. T_m is only slightly affected [32,33]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot H_2O [6]. Swollen by H_2O, with swelling increasing with increasing vinyl alcohol content [21]
Wettability/Surface Energy and Interfacial Tension: Contact angle 53–61° (H_2O, 25°) [16], 60–68° (H_2O, 20°). The contact angle measurements in H_2O are affected by immersion in H_2O and differences between the advancing and receding contact angles are observed [20]. Contact angle 55–59° (glycerol, 20°), 48–52° (formamide, 20°), 34–37° (methylene iodide, 20°), 31–33° (ethylene glycol, 20°), 50.2–84.9° (hexane/ethylene glycol) [18], 54.2–93.6° (cyclohexane/ethylene glycol) [18]. Contact angle decreases with increasing vinyl alcohol content [17,21]. Contact angle 62.4–92.6° (heptane/ethylene glycol) [18], 53.6–86.8° (octane/ethylene glycol) [18], 49.4–83.8° (isooctane/ethylene glycol) [18]. Contact angles are affected by the copolymer composition and the degree of polymerisation [18]. γ_d 35.9–36.0, γ_p 9.5–13.9, γ_c 38.0–39 [17], γ_d 27.5–30.3, γ_p 12.0–15.5 [17]; γ_d 35.9–36.7; γ_p 9.7–11.2 [17]. γ_d increases slightly with increasing vinyl alcohol content whereas γ_p increases dramatically [17]. γ_d 28–30; γ_p 2.7–9.1 [18]. The dispersive component of the surface free energy is virtually independent of the ethylene content [18]. The other components increase with increasing ethylene content but are also affected by the degree of polymerisation [18]. The effect of surface roughness on the surface free energy has been reported [19]. Adhesion props. (hot tack strength) have been measured. Higher hot tack strength is obtained for films with lower ethylene content [22]

Transport Properties:

Permeability of Gases: Oxygen permeability [38,39,41,43] is affected by humidity [40,42,44] and temp. [42] Oxygen transmission decreases slightly as the relative humidity increases from 0–50% and increases significantly above 50% relative humidity [44]. The diffusion rates of O_2 and N_2 through EVOH films are lower than those of polyethylene owing to the presence of hydrogen bonds [45]. The permeability of N_2 and CO_2 is sensitive to moisture [40]. The permeation of EtOAc vapour has been reported [46]
Permeability of Liquids: The diffusion of MeOH [9] and MeOH/toluene mixtures [47] has been reported. The diffusion of alcohols is decreased by high humidity whereas diffusion of aldehydes is increased [48]. The absorption of aq. sodium chloride has been reported [14]
Water Content: Water absorption of EVOH films (vinyl alcohol content 70 mol %) at 25° has been reported in a graphical form [14]. Equilib. moisture content after 7d at 23° at levels of relative humidity shown in brackets: 0.5% (10%), 0.8% (20%), 1.7% (50%), 3.5% (80%), 4.4% (90%) [13]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.089 cm^3 mm/(m^2 day atm)	0.46×10^{-18} mol (m s Pa)$^{-1}$, 44 mol % ethylene, dry [3]
2	O_2	0.01 cm^3 mm/(m^2 day atm)	0.052×10^{-18} mol (m s Pa)$^{-1}$, 32 mol % ethylene, dry [3]
3	O_2	0.008 cm^3 mm/(m^2 day atm)	0.04 n mol (m s GPa)$^{-1}$, dry [1]
4	N_2	0.066 cm^3 mm/(m^2 day atm)	0.001×10^{-10} cm^3 cm (cm^2 s cmHg)$^{-1}$, max. [38,39]
5	SO_2	6.5 cm^3 mm/(m^2 day atm)	0.1×10^{-10} cm^3 cm (cm^2 s cmHg)$^{-1}$, max. [38]

Mechanical Properties:

Mechanical Properties General: Mechanical props. depend on the copolymer composition [3,12]. Tensile modulus depends on the vinyl alcohol content and has a minimum value at 40 mol % vinyl alcohol [12]. Young's modulus and yield stress increase with the degree of microhardness [35]. Tensile strength also varies with composition with a min. value for vinyl alcohol content of 40 mol % and a max. value at vinyl alcohol content of 62 mol % [12]. Elongation at break varies widely with vinyl alcohol content with no obvious trend in the data

Tensile (Young's) Modulus:

No.	Value	Note
1	1300–8000 MPa	25°, depending on copolymer composition [12]
2	2300 MPa	25°, 45% ethylene content [33]
3	2820 MPa	25°, 25% ethylene content [33]

Tensile Strength Break:

No.	Value	Note	Elongation
1	43 MPa	44 mol % ethylene, ASTM D638 [3]	4%
2	66.2 MPa	32 mol % ethylene, ASTM D638 [3]	5%
3	58–483 MPa	25°, depending on vinyl alcohol content [12]	6.96–24.1%
4	57.5 MPa	25°, 45% ethylene [33]	41.5%
5	78.5 MPa	25°, 25% ethylene [33]	21%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	71.5 MPa	7%	25°, 45% ethylene [33]
2	98.5 MPa	8.5%	25°, 25% ethylene [33]

Viscoelastic Behaviour: Variation of complex modulus and loss factor with temp. has been reported [33]
Mechanical Properties Miscellaneous: Tear strength 120 kg cm^{-1} (machine direction, 50 μm thick), 180 kg cm^{-1} (transverse direction, 50 μm thick) [36]. Heat sealing strength 3.5 kg mm^{-1} [36]. Heat sealing strength increases at lower initiation temps. for films with higher ethylene content [22]
Hardness: Microhardness increases with increasing vinyl alcohol content and with the degree of crystallinity [35].
Failure Properties General: Stress-strain curves have been reported [12,33]. Uniaxial orientation is unsuccessful due to splitting and cracking of films upon drawing [37]

Electrical Properties:

Static Electrification: EVOH film is free of static [3]

Optical Properties:

Transmission and Spectra: Raman [23] and ir [25] spectral data have been reported. Uv permeability (λ 200–400 μm) 75% (33 mol % vinyl alcohol units, film thickness 50 μm) [24]. Ir permeability rate (wave number 600–1700 cm^{-1}) 0% (33 mol % vinyl alcohol units, film thickness 50 μm) [24]
Volume Properties/Surface Properties: Haze 1.8% (32 mol % ethylene), 2.3% (44 mol % ethylene) [3]. Transparency excellent [3,5,26]

Polymer Stability:

Environmental Stress: Has good weatherability [3]. Undergoes oxidation on exposure to ozone with formation of peroxides [27]. Oxidative degradation has been studied and the oxidation products identified [28]. Hydroperoxide and carbonyl species are prod. and extensive preferential attack at the hydroxyl sites gives backbone ketone groups in films with less than 20% w/w vinyl alcohol [27]
Chemical Stability: Has high resistance to solvents and oils [3,26]. Resistance to olive oil at 70° is excellent [11]
Biological Stability: Some commercial films are biodegradable and show a weight reduction of 68.9% after a two week incubation with bacteria [6]. The biocompatibility of EVOH and other polymer films has been reported [16]
Recyclability: May be recycled [30]
Stability Miscellaneous: γ-Irradiation causes both degradation (chain scission) and cross-linking, [32,33] with subsequent reduction of tensile modulus, strength and elongation and elastic modulus. Brittleness is increased and degree of crystallinity reduced [33]

Applications/Commercial Products:

Processing & Manufacturing Routes: Multilayer films are prepared commercially by coextrusion in a one-step solvent-free process. Blow or cast coextrusion methods can be used. Films and sheeting with five or more layers can be prod. by coextrusion. Coextruded bottles may also be manufactured using blow-moulding technology. Processing of multilayer sheets, tubes and bottles is the same as for films
Applications: Films containing EVOH may be used in food packaging, e,.g. for cheese. The barrier props. of EVOH have led to its use in multilayer and laminated packaging products. It may be used as an inner lining for canisters and tanks used to transport chemicals and agrochemicals. In the building industry it is used as an additive for sound insulation materials and as a protective surface for building materials. EVOH has been used for medical applications e.g. membrane for blood purification by dialysis. Laminated bottles containing an EVOH layer are recyclable and have been used for food packaging

Density:

No.	Value	Note
1	d^{20} 1.12 g/cm^3	amorph. [1]
2	d^{25} 1.119 g/cm^3	amorph. [2]
3	d^{25} 1.19 g/cm^3	cryst. [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00054 K^{-1}	Uv polymerisation, >T_g [3]	V
2	0.000275 K^{-1}	Uv polymerisation, >T_g [3]	V

Volumetric Properties General: Molar volumes: Van der Waal's, V_w 66.3 cm^3 mol^{-1} (amorph. polymer; 25°)^{254}, glassy polymer, V_g 102 cm^3 mol^{-1} (amorph. polymer; 25°)^{254}, cryst. polymer, V_c 96 cm^3 mol^{-1} (cryst. polymer; 25°)^{254}
Equation of State: Mark-Houwink constants have been reported [22]

Thermodynamic Properties General: Molar heat capacity at constant pressure 166 J mol^{-1} K^{-1} solid, 25° [2]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.45 kJ/kg.C	J kg^{-1} K^{-1} solid; 25° [2]	P
2	1.67 kJ/kg.C	J kg K 27° [4]	P

Melting Temperature:

No.	Value	Note
1	47°C	refractometric method [7]

Glass-Transition Temperature:

No.	Value	Note
1	65°C	Uv polymerisation, dilatometric method [3]
2	63–65°C	atactic [8,9]
3	66°C	free-radical polymerisation at 44–60°, dilatometric method [10]
4	120°C	syndiotactic [9]
5	86°C	77% syndiotactic, 2% isotactic, 21% atactic [11]
6	8°C	isotactic [9]
7	8–12°C	anionic polymerisation/non-polar solvent, dilatometric method [10]

Transition Temperature General: In some composites (nylon fibre) T_g decreases as the fibre content increases. [5] T_g can be lowered by sorption of CO_2 [6]
Vicat Softening Point:

No.	Value	Note
1	81°C	[1]

Brittleness Temperature:

No.	Value	Note
1	50°C	refractometric method [7]

Transition Temperature:

No.	Value	Note	Type
1	37°C	[12]	β-transition temp.
2	-223°C	[12]	δ-transition temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density 351 J cm^{-3} (35°, 83.7 cal cc^{-1}) -1 [2], 32500 J mol^{-1} [9]. 17.4–22.7 J$^{1/2}$ cm$^{3/2}$ (poor H-bonding solvents) [14], 16.0–27.2 J$^{1/2}$ cm$^{3/2}$ (moderate H-bonding solvents) [14], 19.4–23.3 J$^{1/2}$ cm$^{3/2}$ (strong H-bonding solvents) [14], 18.3 J$^{1/2}$ cm$^{-3/2}$ [2], 18.2–18.7 J$^{1/2}$cm$^{-3/2}$ [2], 22.1 J$^{1/2}$ cm$^{-3/2}$ [2], 37.6 J$^{1/2}$ cm$^{-3/2}$ (8.99 cal$^{1/2}$ cm$^{-3/2}$) [16]. 37.8–38.3 J$^{1/2}$ cm$^{-3/2}$ (8.95–9.15 cal$^{1/2}$ cm$^{-3/2}$); [15]γ_d 18.8 γ_p 10.8, γ_hh 43 [2]
Plasticisers: Argon and CO_2 plasticise PEMA (at temps. above T_g) [17]
Solvents/Non-solvents: Sol. tetralin, turpentine (hot), CCl_4, EtOH (hot), isopropanol (>37°), Et_2O, formic acid. Insol. linseed oil, isopropyl ether [18]
Surface and Interfacial Properties General: 60° (air) [20], 81° (Me_2CO) [20], 82° (dodecane) [20]. 33 mN m^{-1} [2], 35.9 mN m^{-1}

(γ_d 26.9 mN m^{-1}, g_p 9 mN m^{-1}) [2], 49.2–52.2 mN m^{-1} (g_d 29.9–31.2 mN m^{-1} 19.3–21 mN m^{-1}) [20]
Wettability/Surface Energy and Interfacial Tension: Contact angle 62° (advancing, H_2O) [19]. Interfacial tension 13.9–15.2 mN m^{-1} (solid/H_2O) [20]

Transport Properties:

Polymer Solutions Dilute: Molar volumes 66.3 cm^3 mol^{-1} (van der Waal's, 25°, amorph.) [2], 102 cm^3 mol^{-1} (glassy, amorph. 25°) [2], 96 cm^3 mol^{-1} (cryst., 25°) [2]. Intrinisic viscosity [21] 1.45 dl g^{-1} (35°, C_6H_6), 4.7 dl g^{-1} (45°, *n*-butanol), 1.33 dl g^{m1} (35°, EtOAc), 0.88 dl g^{-1} (36.9°, isopropanol), 1.57 dl g^{-1} (23°, 2-butanone), 1.31 dl g^{-1} (47°, *m*-xylene). Theta temps. 44° (*n*-butanol, VM method), 23° (butanone), 0° (*n*-butyl bromide, VM method) -13° (*n*-butyl chloride, VM method), -1°
(methyl propyl ketone, VM method), 36.9° (isopropanol, MW 220000–130000), -3° (*m*-xylene, VM method) [21]. Polymer-liq. interaction parameters [23], 1.75 (hexane), 0.6 (-2-butanone), 0.98 (acetonitrile), -0.25 ($CHCl_3$), 0.98 (*n*-propanol), 0.72 (Me_2CO) 0.61 (EtOAc), 62.8 (isopropanol)
Permeability of Gases: [He] 0.34 × 10^{-4}, [Ne] 0.323 × 10^{-4}, [O_2] 2.8 × 10^{-4}, [Ar] 2.7 × 10^{-4}, [N_2] 2.9 × 10^{-4}, [CO_2] 0.58 × 10^{-4}, [Kr] 13.7 × 10^{-4}, [H_2S] 30.38 × 10^{-4}, [SF_6] 0.000118 × 10^{-4}, [H_2O] 0.0074 × 10^{-4} (below T_g), [H_2O] 2.1 × 10^{-4} cm^2 (s cmHg)$^{-1}$ (above T_g) [24]
Permeability of Liquids: Diffusion coefficients [Me_2CO] 17.4–0.85 cm^2 s^{-1} (20°, MW 34100-9350000), 20–0.95 × 10^{-7} cm^2 s^{-1} (20°, MW 24600-7440000); [25,26] [H_2O] 1.39 × 10^{-7} cm^2 s^{-1} (37°) [19]
Water Content: 0.35–0.5% (max.) [8]
Water Absorption:

No.	Value	Note
1	1 %	[19]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	34 MPa	[27,28]	7%
2	7–37 MPa	23° [8]	0.6–25%

Viscoelastic Behaviour: Williams-Landel-Ferry constants for temp. superposition and Vogel parameters have been reported [30]. Longitudinal sound speed 2700 m s^{-1} (room temp. 1 MHz) [31], 2400 m s^{-1} [33]. Longitudinal sound absorption 3.9 dB cm^{-1} (room temp. 2 MHz) [31]
Hardness: Knoop number 11 (Tukon) [28]. Vickers 11 (5 kg load) [29]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.7–3.4	[2]

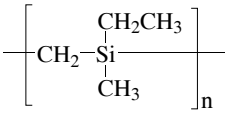
Optical Properties:

Refractive Index:

No.	Value	Note
1	1.485	20° [2,32]

Polymer Stability:

Polymer Stability General: Large doses of ionising radiation can cause brittleness, strength loss and general loss of desirable props. Irradiation causes main chain fracture; deterioration of props. is due to lowering of MW
Decomposition Details: Decomposes to monomer at 250° [29]



Applications/Commercial Products:

Trade name	Details	Supplier
Elvacite	2042, 2043	ICI, UK
Standard Samples	MW 200000–500000	Aldrich
Standard Samples		Polysciences Inc

Poly[(ethylmethylsilane)(methylene)] P-276

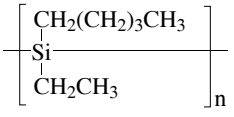
Synonyms: *Poly[(ethylmethylsilylene)(methylene)]*
Related Polymers: Polycarbosilanes
Polymer Type: polysilanes

CAS Number:

CAS Reg. No.
124479-34-1

Molecular Formula: $(C_4H_{10}Si)n$
Fragments: $C_4H_{10}Si$
Molecular Weight: 91,600 [1]
Identification: Found: C, 56.89%; H, 12.53%; Calculated: C, 60.61%; H, 12.12%

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:



No.	Value	Note
1	-78.2°C	[1]

Optical Properties:
Transmission and Spectra: Nmr [1] spectra reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by ring-opening polymerisation of 1,3-diethyl-1,3-dimethyl-1,3-disilacyclobutane [1].
Applications: Polydialkylsilalkylene polymers are useful in enhanced oil recovery using carbon dioxide flooding [2].

Bibliographic References

Poly(ethylpentylsilane) P-277

Synonyms: *Poly(ethylpentylsilylene). PEPS. C2-C5*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
132230-59-2

Molecular Formula: $(C_7H_{16}Si)n$
Fragments: $C_7H_{16}Si$
General Information: Soft, rubbery texture. Weakest in the poly(*n*-alkylpentylsilylene) series; films tear most easily [1,2].
Morphology: The diffraction pattern of the polymer at 25°C shows only a strong refection at 1.09nm. Probably a hexagonal, columnar liquid crystal [2,4]. Poorly ordered with a second order phase transition at -35°C [2].
Miscellaneous: Thin films cast from toluene are sticky, with properties similar to typical pressure sensitive adhesives. Because of the large asymmetry between the two sidechains and the small size of the ethyl group, this polymer is poorly ordered. Thus, no order-disorder transition is seen [1].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	-35–-33°C	[1]

Mechanical Properties:
Mechanical Properties General: The polymer film is less cohesive and tends to retract rather than retain its elongation when the tension on it is removed [2].
The modulus drops four orders of magnitude at -35°C so the polymer is quite soft at ambient conditions [1].

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	77.1 MPa	at 23°C [1]
2	0.7 MPa	at 100°C [1]

Optical Properties:
Optical Properties General: Variable-temperature uv spectrum at ambient conditions shows a somewhat broad absorption maximum is centred at 306nm. A shoulder at 330nm becomes perceptible upon cooling to -16°C ,which grows as the temperature is lowered, reaching an isosbestic point at -42°C. At -50°C, the 330nm band is just a little more intense than the original absorption peak (which has shifted slightly to 310nm). The ratio of these two peak intensities is unchanged upon further cooling to -80°C. Evidently, the backbone conformations are frozen due to lack of mobility at temperatures below -60°C. The behaviour described above is fully reversible. Upon heating, the isosbestic point changed only 1°C and the second band disappeared at -16°C [2].
Transmission and Spectra: Uv-vis [2,4] spectra reported.

Polymer Stability:
Thermal Stability General: A second-order transition at -35°C is observed in the DSC [2,4].
The tan gamma shows two peaks and suggests that another transition may be present *ca.* 10°C [2].

Applications/Commercial Products:
Processing & Manufacturing Routes: The monomer is prepared by Grignard reaction between *n*-pentylmagnesium bromide and ethyltrichlorosilanes in THF under Ar. After isolation by two fractional distillations, the resulting dichlorosilane was polymerised by the usual Wurtz condensation reaction with Na in toluene at 110°C [1].
Applications: Electrophotographic photoreceptor; binder resin for a single photosensitive layer in which a charge-generating and a charge-transporting substance are mixed [3].

Poly(ethyl vinyl ether-*co*-maleic anhydride) P-278

Synonyms: *Poly(ethoxyethene-**co**-2,5-furandione). Poly(2,5-furandione-co-ethoxyethane)*
Related Polymers: Poly(vinyl ethers)
Monomers: Ethyl vinyl ether, Maleic anhydride
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
26711-22-8	
62601-51-8	ethyl ester
36350-24-0	sodium salt
106209-34-1	alternating

Molecular Formula: $[(C_4H_8O).(C_4H_2O_3)]_n$
Fragments: C_4H_8O $C_4H_2O_3$

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

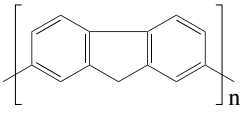
No.	Value	Note
1	68–69°C	[1]
2	146°C	[2]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. Me_2CO, 2-butanone, THF, acetophenone, EtOAc, MeOH, EtOH. Insol. decane, octane, *iso*-octane, hexane, cyclohexane, C_6H_6, dioxane, $CHCl_3$ [3]

Transport Properties:
Polymer Solutions Dilute: [η] 0.392 dl g^{-1} (THF, 30°), 0.215 dl g^{-1} (Me_2CO, 30°) [3]. η_{inh} 1.92 dl g^{-1} (0.5% in DMF, 30°) [2]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.406	25° [3]



Transmission and Spectra: H-1 and C-13 nmr spectral data have been reported [2,4]
Total Internal Reflection: dη/dC 0.0883 ml g^{-1} (THF, 25°) [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical initiated copolymerisation with AIBN
Applications: Stabilised pretreating liquid for metallic surfaces, conversions coatings on metals, surface soiling inhibitor with surfactant, resin drug carrier, denture fixative composition [5,6,7,8]

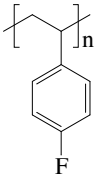
Poly(fluorene) P-279

Synonyms: *Poly(9H-fluorene-2,7-diyl). Poly(9H-fluorene)*
Monomers: Fluorene
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.	Note
95270-88-5	
99627-56-2	Poly(9*H*-fluorene-2,7-diyl)

Molecular Formula: $(C_{13}H_8)n$
Fragments: $C_{13}H_8$
General Information: Parent polymer structure of a group of conductive and electroluminescent polymers usually substituted at the 9-position.

Electrical Properties:
Electrical Properties General: Films are conductive in electrochemically oxidised or doped state and nonconductive in neutral state [1]. Conductivity of film doped with tetrafluoroborate 0.0001 S cm^{-1} [2].



Optical Properties:
Transmission and Spectra: Spectral data for ir [3], uv [4,5] and epr [6] have been reported.
Volume Properties/Surface Properties: Films are green in neutral state and red in oxidised state [1].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by electrochemical anodic oxidation of monomer in a suitable solvent such as acetonitrile [1,3,4,5,6].
Applications:

Poly(2-furanmethanol) P-281

Synonyms: *Furan resins. Poly(furfuryl alcohol-co-formaldehyde). Poly(furfuryl alcohol)*
Related Polymers: Furan Resins, Foundry Applications
Monomers: Furfuryl alcohol, Formaldehyde, Phenol, Melamine, Urea
Material class: Thermosetting resin
Polymer Type: furan

CAS Number:

CAS Reg. No.	Note
25989-02-0	copolymer with formaldehyde
25212-86-6	2-furan-methanol homopolymer

Molecular Formula: $(C_5H_4O)_n$
Fragments: C_5H_4O
Additives: The curing agent is typically *p*-sulfamic acid. Glass fibre. Hexabromo-2-butene and 2,3-dibromopropanol as flame retardants for the furfuryl alcohol-formaldehyde copolymer. Asbestos to improve corrosion resistance (furfuryl alcohol-formaldehyde copolymer). Phenol and urea as modifiers (furfuryl alcohol-formaldehyde copolymer)
General Information: Furfuryl alcohol undergoes self condensation reactions to produce a linear polymeric struct. with furfuryl rings linked by methylene groups. Condensation reactions with formaldehyde, phenol, melamine and urea produce a range of useful products derived at least partly from renewable raw materials. Furan resins, or furan polymers as they are also known, is a general term for polymers of derivatives of furan. The two most important of these are poly(furfuryl alcohol) and its copolymer with formaldehyde. Unless otherwise indicated, all data refers to poly(furfuryl alcohol)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.75 g/cm^3	asbestos filled
2	d 1.4–1.6 g/cm^3	glass filled laminate
3	d 1.48 g/cm^3	31% glass fibre filled [5]
4	d 1.21 g/cm^3	formaldehyde copolymer, oxalic acid catalysed [7]
5	d 1.25 g/cm^3	formaldehyde copolymer, sulfuric acid catalysed [7]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.1×10^{-5}–3.2×10^{-5} K^{-1}	carbon filled [2]	L
2	6.1×10^{-5} K^{-1}	Alkor [4]	L
3	2.4×10^{-5} K^{-1}	31% glass filled [5]	L

Volumetric Properties General: Density of furfuryl alcohol-formaldehyde copolymer is dependent upon the nature of the acid catalyst used in its synth.; higher values are obtained with inorganic acids. Density also dependent to a lesser degree on mole ratio of the comonomers [7]
Thermal Conductivity:

No.	Value	Note
1	0.12 W/mK	0.203 Btu ft^{-2} h^{-1} ft, asbestos filled [2]

Surface Properties & Solubility:

Solvents/Non-solvents: Low MW resin sol. Me_2CO, alcohols, esters, aromatic hydrocarbons [3]

Transport Properties:

Polymer Solutions Dilute: Viscosity 139 mPa s (formaldehyde copolymer, uncured, oxalic acid catalysed), 1264 mPa s (formaldehyde copolymer, uncured, sulfuric acid catalysed) [7]. Use of inorganic acids as catalysts in the synth. of formaldehyde copolymer gives a large increase in the viscosity of the uncured resin [7]

Water Absorption:

No.	Value	Note
1	0.01–0.2 %	
2	0.5 %	max., carbon filled [2]
3	0.2 %	Alkor, ASTM C143 [4]
4	2.5 %	31% glass fibre filled [5]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	10000–12000 MPa	asbestos filled
2	5500 MPa	32% glass-filled
3	10892 MPa	1580 kpsi, 21°, asbestos filled [2]
4	7159 MPa	73000 kg cm^{-2}, 31% glass fibre filled [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	20–32 MPa	asbestos filled	
2	82 MPa	32% glass-filled laminate	
3	10.3 MPa	1500 psi, carbon filled [2]	
4	27 MPa	4000 psi, 21°, asbestos filled [2]	
5	80.9 MPa	825 kg cm^{-2}, 31% glass fibre filled [5]	2.25%

Flexural Strength at Break:

No.	Value	Note
1	4–65 MPa	asbestos filled
2	138 MPa	32% glass filled
3	10.3 MPa	1500 psi, carbon filled [2]
4	51.7 MPa	7500 psi, 21°, asbestos filled [2]
5	6.9 MPa	1000 psi, Alkor, 7 days, 24°, ASTM C306 [4]
6	145 MPa	1475 kg cm^{-2}, 31% glass fibre filled [5]

Compressive Strength:

No.	Value	Note
1	70–100 MPa	asbestos filled
2	80 MPa	32% glass filled
3	82.7 MPa	12 kpsi, carbon filled [2]
4	79.3 MPa	11.5 kpsi, 21°, asbestos filled [2]
5	62.7 MPa	9100 psi, Alkor, 7 days, 24°, ASTM C306 [4]
6	102.5 MPa	1045 kg cm^{-2}, 31% glass fibre filled [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	26.2 MPa	3800 psi, Alkor, 24° [4]	Rupture modulus
2	6914 MPa	70500 kg cm^{-2}, 31% glass fibre filled [5]	Bending modulus

Impact Strength: Impact strength 12.8 J m^{-1} (135 kg cm cm^{-2}, 31% glass fibre filled) [5]
Hardness: Rockwell R110 (asbestos filled), Rockwell R106 (24°, asbestos filled) [2], R99 (66°, asbestos filled) [2], R78 (107°, asbestos filled) [2]. Ball indentation hardness (900 kg cm^{-2}, (31% glass fibre filled) [5]
Failure Properties General: Shear strength 24 MPa (3500 psi, 21°, asbestos filled) [2]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	4.7 kV.mm^{-1}	31% glass fibre filled [5]

Dissipation Power Factor: 0.61 (31% glass fibre filled) [5]
Dissipation (Power) Factor:

No.	Value	Note
1	0.61	31% glass fibre filled [5]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [12]

Polymer Stability:

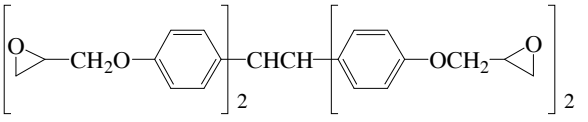
Upper Use Temperature:

No.	Value	Note
1	125–165°C	asbestos filled
2	148°C	glass-filled laminate
3	149–193°C	carbon filled [2]
4	193°C	Alkor [4]
5	149°C	filled furfuryl alcohol-formaldehyde copolymer [8]

Decomposition Details: Furfuryl alcohol resin (cured with alcoholic $ZnCl_2$ soln.) decomposes in Ar atmosphere at 340–540° with CO_2 and CO as the main products. Activation energy of decomposition 92.9 kJ mol^{-1} (22.2 kcal mol^{-1}); char yield 60% (800°) [1]. Char yield 31% (31% glass fibre filled) [5]. Filled furfuryl alcohol-formaldehyde copolymer is completely decomposed after 0.5h at 538° [8]
Flammability: Has good flame resistance and low smoke emission [5]. Flame spread 11.8 (formaldehyde copolymer, 11.6 phr hexabromo-2-butene, Monsanto Two-Foot tunnel) [6], 12 (formaldehyde copolymer, 15 phr 2,3-dibromopropanol, Monsanto Two-Foot tunnel) [6]. Max. smoke density 24 (formaldehyde copolymer, 11.6 phr hexabromo-2-butene, NBS chamber) [6], 22 (formaldehyde copolymer, 15 phr 2,3-dibromopropanol, NBS chamber) [6]
Chemical Stability: Asbestos-filled resin attacked by conc. nitric acid, conc. sulfuric acid, conc. chromic acid, sodium hypochlorite, bromine, iodine, aniline, pyridine and fluorine compounds [2]. Fully cured resin resistant to strong acids and organic solvents, but attacked by strong oxidising agents [3]. Filled furfuryl alcohol-formaldehyde copolymer has excellent resistance to sulfuric acid, sodium hydroxide, C_6H_6, CCl_4, sodium chloride, and MeOH; good resistance to hydrochloric acid; fair resistance to Me_2CO but poor resistance to nitric acid and wet chlorine gas [8]. Glass filled resins resistant to weak acids and bases, aliphatic hydrocarbons and aromatic hydrocarbons, esters, alcohols, ketones and chlorinated hydrocarbons; mod. resistant to strong acid and bases; attacked by halogens and oxidising agents [5]
Hydrolytic Stability: Glass filled resins stable to H_2O and salt solns. [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. [2,9,11] by polymerisation of furfuryl alcohol under acid catalysis (PH 3–5) at 80–



100° with the reaction rate moderated by external cooling. If a liq. resin is desired [10], the mixture is neutralised. Otherwise, the resin is cured *in situ* using acids such as *p*-toluenesulfonic acid to give dark solids. Processed by transfer and compression press moulding; extrusion is possible but is not reasonable for many requirements [8]. Furfuryl alcohol-formaldehyde copolymer may be synth. by reaction of 1 mole furfuryl alcohol with 0.5–0.75 mole aq. formaldehyde in the presence of oxalic acid catalyst. Alternatively, paraformaldehyde may be employed and an organic medium used [7]. Latent cure agents used for heat cure, sulfonic acids used for cure at lower temp. A furan resin two-component system can be mixed with a range of fillers to produce chemically-resistant compositions. Furan resins with latent heat curing catalyst are used as chemically-resistant coatings for chemical process equipment. A Furan resin two-component system can be used for refractory mixes by a cold-mixing process. In the foundry, for the hot box process, quartz sand is batch mixed with urea-modified furan resin (1.4–2%) and latent curing agent e.g. ammonium nitrate (0.3–0.5%). The mix is shaped and precured at 200–260° for up to 2 min in core boxes. Use of modified furan resins (0.9–1.2%) with curing agents (0.2–0.4%, usually sulfonic acids) enables a warm-box process for binding sand at 140–200°. Furan resins with special curing agents may be employed in a vacuum warm box process where the corebox is heated at 70–100°. For a no-bake process, sand and phenolic resole or furan resin (0.7–1.3%) and an acidic curing agent (0.2–0.6%) are cured at ambient temps. for 20 mins to several hours. Binding of foundry sand is also done using furan resins (0.8–2%) with peroxide hardeners (0.3–0.9%) in the Hardox process.
Applications: Chemically-resistant putties using furan resins have exceptional solvent and alkali resistance. They are used as bonding and grouting materials for industrial floors and walls. Industrail concrete and screed-topped floors are protected by laminated coatings e.g. furan resin and fibrous filler. Chemical processing equipment may be coated with filled furan resin systems to enhance chemical resistance. Shaped refractory products can be made using furan resins by a cold-mixing technique. Furan resins (homopolymers of 2-furanmethanol) may be carbonised to produce glassy carbon parts; active carbon materials e.g. molecular sieve, catalysts; and graphitised films. Furfuryl alcohol resins used mainly in the foundry industry as sand binders for casting moulds and cores. Applications due to good corrosion resistance in mortar, cement, waste disposal systems and sewers. As rapid repair materials in oilfield applications; in adhesives and binders in wood technology. Also used to make impregnating solns. to improve the imperviousness of materials. Glass-reinforced grades used in piping. Furfuryl alcohol-formaldehyde copolymer used in adhesives and as a binder

Polyglycidyl ether of Tetraphenolethane P-282

Synonyms: *1,1,2,2-Tetrakis[4-(2,3-epoxypropoxy)phenyl]ethane. 2,2′,2″,2‴-[1,2-Ethanediylidenetetrakis(phenyleneoxymethylene)]tetrakisoxirane. Tetrakis (4-glycidyloxyphenyl)ethane*
Related Polymers: Epoxy resins
Monomers: Epichlorohydrin, Phenol, Glyoxal
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.	Note
27043-37-4	
53228-95-8	homopolymer

Molecular Formula: $C_{38}H_{38}O_8$
Fragments: $C_{38}H_{38}O_8$
Additives: Glass fibre
Miscellaneous: All props. are dependent upon type of curing agent and/or the method of cure used

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	80°C	approx. [2]
2	96°C	Epon 1031 [9]

Transition Temperature General: Vicat softening temp. is higher for resin cured with maleic anhydride than for resin cured with a BF_3/ethylamine complex. Vicat temp. increases with increased time of ageing at 230°

Transport Properties:

Polymer Solutions Dilute: Viscosity 39 P (137°, Epon 1031) [9]
Polymer Melts: Melt viscosity 15 P (150°, Epon 1031) [9]

Mechanical Properties:

Flexural Modulus:

No.	Value	Note
1	20682 MPa	3000 kpsi, 23°, reinforced grade, nadic methyl anhydride and benzyldimethylamine cured [5]
2	13099 MPa	1900 kpsi 260°, reinforced grade, nadic methyl anhydride and benzyldimethylamine cured [5]

3	19993 MPa	2900 kpsi, 23°, reinforced grade, diaminophenylsulfone/BF_3. ethylamine cured [5]
4	16546 MPa	2400 kpsi, 260°, reinforced grade, diaminophenylsulfone/BF_3 . ethylamine cured [5]

Flexural Strength at Break:

No.	Value	Note
1	489 MPa	71 kpsi, 23°, reinforced grade, nadic methyl anhydride and benzyldimethylamine cured [5]
2	86 MPa	12.5 kpsi, 260°, reinforced grade, nadic methyl anhydride and benzyldimethylamine cured [5]
3	420 MPa	61 kpsi, 23°, reinforced grade, diaminophenylsulfone/BF_3.ethylamine cured [5]
4	172 MPa	25 kpsi, 260°, reinforced grade, diaminophenylsulfone/BF_3.ethylamine cured [5]

Optical Properties:

Transmission and Spectra: Ir [3] spectral data have been reported
Volume Properties/Surface Properties: Colour tan; Gardner 18 (min., 80% soln. in 2-butanone, Epon 1031) [9]

Polymer Stability:

Thermal Stability General: Weight loss of resin aged at 230° is greater for that cured with BF_3/ethylamine complex than that cured with maleic anhydride [7]. Resin cured with either maleic auhydride or *m*-phenylenediamine shows two exothermic peaks when subjected to differential thermal anal. under N_2, with these peaks occurring at 100–150° and 300–400°. The latter peaks may be due to isomerisation of the epoxy groups to carbonyl groups [8]
Decomposition Details: Activation energy of thermal degradation 21.4 kJmol^{-1} (5.1 kcal mol^{-1}) (cured with BF_3.ethylamine complex) [4]. Up to 500° the major pyrolysis product is CO_2; above this temp. the major product is CO [4]. Resin cured with 2-nitroresorcinol is stable to 300 ° when heated *in vacuo*, with 50% weight loss occurring at approx. 500° [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by the reaction of a tetraphenol-substituted ethane with epichlorohydrin in aq. 2-propanol under basic conditions [1] or the acid-catalysed reaction of glyoxal with phenol followed by treatment with epichlorohydrin [2]. Curing with pyromellitic dianhydride results in premature gelation [7]
Applications: As an additive to moulding compounds; in adhesives; in electrical laminates; in high performance composites for the aerospace industry. Not recommended for food contact use according to FDA regulations

2	-18°C	255K, 1 kHz [34]	T_β

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy 5.86 kJ mol^{-1} [35]. CED has been reported [61]
Solvents/Non-solvents: Sol. hot DMF, hot DMSO [2], hot phenol/trichlorophenol (60:40) [5], hot glycolide [9], hot nitromethane, hot nitrobenzene, hot 1-chloro-1-nitropropane, 10% sodium hydroxide soln., hexafluoroacetone sesquihydrate [30], 1,1,1,3,3,3-hexafluoro-2-propanol [36]. Slightly sol. $CHCl_3$/trifluoroacetic acid mixture [63]. Insol. common organic solvents [2,8]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	<2 g/10 min	max., 230° [50]
2	2.2 g/10 min	[78]

Polymer Solutions Dilute: [η] 0.4 dl g^{-1} (DMSO, 90°) [2]; η_{inh} 0.35 dl g^{-1} (trichlorophenol/phenol (60:40), 30°) [5]; η_{inh} 0.51 dl g^{-1} (phenol/tetrachloroethane (60:40), 30°) [15]; η_{inh} 1.42 dl g^{-1} (hexafluoroacetone sesquihydrate, 30°) [49]; [η] 1.14 dl g^{-1} (phenol/trichlorophenol (10:7)) [55]
Polymer Melts: Melt viscosity 500 Pa s (5000 poise, 245°) [48]
Permeability of Liquids: Water diffusion coefficient 5×10^{-9} cm^2 s^{-1} (37°). Other water diffusion coefficients have been reported [7,75]

Mechanical Properties:

Mechanical Properties General: Dynamic loss [2], storage [2], flexural and Young's moduli [64] have been reported. Tensile strength break has been reported [6,16]. Stiffness 1.84 MPa (fibre-Dexon 3-0) [20]. Elastic stiffness 41.9 kg (fibre-Dexon 2-0) [21]. Tensile strength at break 4.9 gpd (35% elongation, fibre- Dexon 2.0) [23], 9 gpd (20% elongation, fibre) [49], 10 gpd (fibre) [55], 6.5 gpd (fibre) [78]

Tensile (Young's) Modulus:

No.	Value	Note
1	6500 MPa	[80]

Flexural Modulus:

No.	Value	Note
1	10000–15000 MPa	rods [65]

Tensile Strength Break:

No.	Value	Note	Elongation
1	647 MPa	66 kg mm^{-2}, fibre-Dexon 2 [21]	33.1%
2	338–440 MPa	34.5–44.7 kg mm^{-2}, fibre-Dexon Plus [22]	
3	57 MPa	17.5×10^{-8} kg mm^{-2}, fibre-Dexon O [29,80]	34%
4	375 MPa	38.24 kg mm^{-2}, Dexon fibre [46]	20%
5	304 MPa	31 kg mm^{-2}, fibre [60]	

Flexural Strength at Break:

No.	Value	Note
1	355–395 MPa	rods [65]

Elastic Modulus:

No.	Value	Note
1	6760 MPa	690 kg mm^{-2}, fibre-Dexon 2-0 [21]

Miscellaneous Moduli:

No.	Value	Note	Type
1	6800 MPa	[2]	Modulus of glassy state

Viscoelastic Behaviour: Viscoelastic props. for Dexon fibre [58] and stress relaxation studies have been reported [67,81]
Failure Properties General: Break load 3873 N (fibre-Dexon 3-0) [20]. Shear strength 240 MPa (rods) [65]
Fracture Mechanical Properties: Toughness per unit length 0.806 kg cm cm^{-1} [21]
Friction Abrasion and Resistance: Coefficient of friction 0.191 (fibre-Dexon 3-0) [20]

Electrical Properties:

Electrical Properties General: Variation of tan δ with temp. has been reported in graphical form [34]
Dissipation Power Factor: Dielectric loss factor has been reported [2]

Optical Properties:

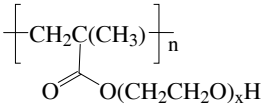
Transmission and Spectra: Ir [1,2,3,13,30,83], uv [1], Raman [27], XPES [33,39,62], SIMS [62], H-1 nmr [30,38,63], C-13 nmr [63,83] and mass [15,25] spectral data have been reported

Polymer Stability:

Decomposition Details: $T_{dec.}$ 240° (approx.) [10]; $T_{dec.}$ 254° [82] 50% weight loss at 346° [10,32]. Eact. 136.5 kJ mol^{-1} (32.6 kcal mol^{-1}, degradation, N_2) [14]. Eact. 154.1 kJ mol^{-1} (36.8 kcal mol^{-1}, degradation, O_2) [14]. Max. decomposition occurs at 340° [15], 390° (approx.) [83]. Thermal degradation curves have been reported [8,71]. Details of thermal degradation [14] and other decomposition temp. values [64] have been reported
Biological Stability: Fibre-biodegradability studies have been reported [6,7,16,17,29,51,52,53,57,67]
Stability Miscellaneous: γ-Radiation degradation studies have been reported [5,8,16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by esterification of glycolic acid. Synth. by cationic ring opening polymerisation of the cyclic diester glycolide, e.g.: using stannous octoate as the catalyst and lauryl alcohol as the chain control agent at 220° [6,8,9,30,36,40,41,42,43,54,55,59,60,66,68,69,70,78,83]
Applications: Used in surgical sutures, dentistry, orthopaedics, and drug delivery systems. Dexon is patented



Trade name	Supplier
Dexon	American Cyanamid Company
Dexon Plus	Davis and Beck

Poly(glycol methacrylates) P-284

where x = 1 (ethyleneglycol methacrylate)
x = 2 (diethyleneglycol methacrylate)

where x = 1 (ethyleneglycol dimethacrylate)
x = 2 (diethyleneglycol dimethacrylate)

Synonyms: *Poly(ethylene oxide) polymethacrylate. Poly(1,2-ethanediylbis(oxy-2,1-ethanediyl) methacrylate). Poly(ethylene glycol methacrylate). Poly(ethylene glycol dimethacrylate). Poly(ethylene glycol trimethacrylate). Poly(triethylene glycol methacrylate). Poly(tetraethylene glycol methacrylate). Poly(triethylene glycol dimethacrylate). Poly(tetraethylene glycol dimethacrylate)*
Related Polymers: Polymethacrylates, General
Monomers: Glycol dimethacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25101-31-9	triethylene glycol dimethacrylate
25721-76-0	ethylene glycol methacrylate

Molecular Formula: $(C_{10}H_{14}O_4)_n$
Fragments: $C_{10}H_{14}O_4$
General Information: The physical appearance of the polymers depends on the length of the glycol chain and the degree of polymerisation. For example the poly(ethylene oxide) polymethacrylates vary from crystalline solids (long chain) to viscous liqs. (short chain). As the MW increases the polymer tends towards greater solid character. Highly cross-linked polymers of poly(mono, di, tri and tetraethylene glycol methacrylates) can be prod. with 2–3 repeat units between cross-links [1]
Identification: Contains only C, H and O

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.229 g/cm^3	ethylene glycol methacrylate [1]
2	d 1.26 g/cm^3	ethylene glycol dimethacrylate [2]
3	d 1.221 g/cm^3	diethylene glycol methacrylate [1]
4	d 1.211 g/cm^3	triethylene glycol methacrylate [1]
5	d 1.175 g/cm^3	tetraethylene glycol methacrylate [1]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.0919–0.2047 kJ/kg.C	tetraethylene glycol methacrylate, MW 20000–23400 [3]	P

Melting Temperature:

No.	Value	Note
1	261–313.8°C	8–23 ethylene oxide units in chain, various MW [3]

Glass-Transition Temperature:

No.	Value	Note
1	204.6–240.3°C	4–23 ethylene oxide units in chain, various MW [3]
2	90°C	ethylene glycol methacrylate [4]
3	105°C	ethylene glycol methacrylate, preheated to 220° [4]
4	125°C	ethylene glycol, twice preheated to 220° [4]
5	271°C	ethylene glycol dimethacrylate [1]
6	250°C	diethylene glycol dimethacrylate [1]
7	135–248°C	triethylene glycol dimethacrylate [1,5]
8	27°C	tetraethylene glycol methacrylate [5]
9	115–279°C	tetraethylene glycol dimethacrylate [1,5]
10	-5°C	ethylene glycol 400 dimethacrylate [5]
11	-35°C	ethylene glycol 600 dimethacrylate [5]
12	-53°C	ethylene glycol 1000 dimethacrylate [5]

Vicat Softening Point:

No.	Value	Note
1	200°C	glycol dimethacrylate [2]

Surface Properties & Solubility:

Solubility Properties General: The swelling characteristics of ethylene, diethylene, triethylene and tetraethylene glycol methacrylates in xylene, MeOH, 2-butanone and isobutanol have been reported [1]
Cohesive Energy Density Solubility Parameters: δ 72.4 J$^{1/2}$ cm$^{-3/2}$ (17.3 cal$^{1/2}$ cm$^{-3/2}$) (diethylene glycol methacrylate), 74.1 J$^{1/2}$ cm$^{-3/2}$ (17.7 cal$^{1/2}$ cm$^{-3/2}$) (triethylene glycol methacrylate), 71.6 J$^{1/2}$ cm$^{-3/2}$ (17.1 cal$^{1/2}$ cm$^{-3/2}$) (ethylene glycol 600 methacrylate) [6]
Wettability/Surface Energy and Interfacial Tension: The contact angle of poly(methoxypolyethylene glycol methacrylates) decreases as the number of ethylene glycol units (n) increases. Contact angle 70° (approx., n = 1), 10° (max., n = 3). Contact angle remains essentially constant with further increase in n [7]

Surface Tension:

No.	Value	Note
1	33 mN/m	33 dyne cm^{-1}, glycol dimethacrylate [8]

Transport Properties:

Water Content: The water content of poly(methoxypolyethylene glycol methacrylates) increases rapidly as the number of ethylene glycol units (n) increases reaching a value of 90% (approx., n = 3) with a moderate rate of increase to a value of approx. 120% (n = 9) [7]

Water Absorption:

No.	Value	Note
1	450 %	approx., methoxypolyethylene glycol methacrylate, 3 ethylene glycol units [7]
2	600 %	approx., methoxypolyethylene glycol methacrylate, 9 ethylene glycol units [7]

Mechanical Properties:

Mechanical Properties General: The tensile strength of poly(-methoxypolyethylene glycol methacrylates) decreases as the number of ethylene glycol units (n) increases. Swelling the polymer in H_2O reduces the tensile strength slightly; the effect is more pronounced at lower values of n. Elongation at break 50% (approx., n = 1 and n = 9)-300% (min., n = 2), 110% (approx., n = 4) [7]

Tensile Strength Break:

No.	Value	Note
1	9.8 MPa	100 kg cm^{-2}, min., methoxypolyethylene glycol methacrylate, 1-ethylene glycol unit [7]
2	0.98 MPa	10 kg cm^{-2}, max., methoxypolyethylene glycol methacrylate, 3 ethylene glycol units [7]
3	0.098 MPa	1 kg cm^{-2}, max., methoxypolyethylene glycol methacrylate, 4 ethylene glycol units [7]

Poisson's Ratio:

No.	Value	Note
1	0.2	triethylene glycol dimethacrylate
2	0.25	tetraethylene glycol dimethacrylate
3	0.5	tetraethylene glycol methacrylate
4	0.41	ethylene glycol 400 dimethacrylate
5	0.3	ethylene glycol 600 dimethacrylate [5]

Electrical Properties:

Electrical Properties General: Solid polymer electrolyte complexes can be formed between certain salts and poly(methacrylates) with pendant ethylene oxide chains. The crystalline complex so formed results in a polymer with conducting props.

Optical Properties:

Total Internal Reflection: Intrinsic segmental anisotropy of ethylene glycol methacrylate [4] 1×10^{-25} cm^3 (DMF), -6×10^{-25} cm^3 (EtOH), -6×10^{-25} cm^3 (H_2O)

Polymer Stability:

Thermal Stability General: On heating pendant glycol groups can undergo a disproportionation reaction causing cross-linking of the chains [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by free-radical polymerisation, using 2,2-dimethoxy-2-phenylacetophenone as a photoinitiator, in air or under N_2 at 22–27° [1]

Applications: Mono, di, tri and tetraethylene glycol methacrylates are used in laser video discs. Ethylene glycol 1000 methacrylates are used in solid state battery electrolytes. Methoxypolyethylene glycol methacrylates have biomedical applications

Vicat Softening Point:

No.	Value	Note
1	118°C	1-chloroethyl [3]
2	81°C	1,1,1-trifluoroisopropyl [3]

Surface Properties & Solubility:

Solvents/Non-solvents: 2,2,2-Trichloroethyl: sol. $CHCl_3$, acetonitrile, THF [6]. 2,2,2-Trifluoroethyl: sol. Me_2CO, acetonitrile, $CHCl_3$, THF [6]

Surface and Interfacial Properties General: Critical surface tension: 14.8–15.4 mN m^{-1} (20°, 1*H*-hexafluoroisopropyl) [10], 15 mN m^{-1} (20°, heptafluoroisopropyl) [10], 19.1 mN m^{-1} (chlorohexafluoroisopropyl) [10], 14.7 mN m^{-1} (20°, *tert*-nonafluorobutyl) [8], 10.6 mN m^{-1} (20°, 1*H*,1*H*-pentadecafluorooctyl [10,11,13], 10.6 mN m^{-1} (heptadecafluorooctyl) [10]

Surface Tension:

No.	Value	Note
1	19 mN/m	tetrafluoropropyl, 20° [9]
2	15 mN/m	tetrafluoroisopropyl, 20° [10]
3	10.5 mN/m	pentadecafluorooctyl, γ_d 10.0, γ_s 0.5 [11]
4	15.3 mN/m	heptadecafluorooctyl, 20° [12]

Optical Properties:

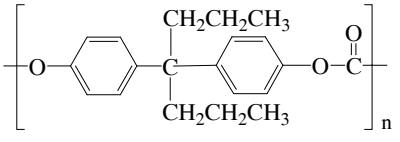
Refractive Index:

No.	Value	Note
1	1.4215	tetrafluoropropyl [2]

Polymer Stability:

Decomposition Details: Decomposition of the 2-bromoethyl ester below 500° yields monomer (>95%) as the major product with <1% of both CO_2 and vinyl bromide [14]. Decomposition of the 2,2,2-trifluoroethyl ester at room temp. under λ-irradiation yields many fluorinated products plus methane, carbon monoxide, MeOH and CO_2 [6]

Applications/Commercial Products:



Processing & Manufacturing Routes: 2-Bromoethyl ester polymer may be synth. by bulk polymerisation at 60°. The 2-cyanoethyl ester polymer may be synth. by free-radical polymerisation at 60° in acetonitrile using AIBN initiator [15]

Applications: Used in low surface energy or non-wettable coatings, and in electron lithography

Poly[4,4-heptane bis(4-phenyl)carbonate] P-286

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(1-propylbutylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-4,4-heptane-co-carbonic dichloride)*

Monomers: 4,4′-Dihydroxydiphenyl-4,4-heptane, Carbonic dichloride

Material class: Thermoplastic

Polymer Type: polycarbonates (miscellaneous)

CAS Number:

CAS Reg. No.
32243-07-5

Molecular Formula: $(C_{20}H_{22}O_3)_n$
Fragments: $C_{20}H_{22}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.16 g/cm^3	25° [2]

Melting Temperature:

No.	Value	Note
1	190–200°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	130°C	[3]
2	148°C	[2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. CH_2Cl_2, *m*-cresol, EtOAc, THF, C_6H_6, pyridine, DMF; swollen by cyclohexanone, Me_2CO [1]

Transport Properties:

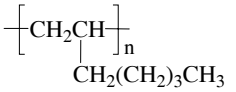
Gas Permeability:

No.	Gas	Value	Note
1	O_2	154 cm^3 mm/(m^2 day atm)	1.76 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25°, 1 atm [3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5602	25° [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used phosgenation approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [1]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. CH_2Cl_2). Catalysts are used to achieve high MWs [1,2]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2 with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,2]

Poly(1-heptene) P-287

Synonyms: *PHEP. Poly(1-pentylethylene). Poly(1-pentyl-1,2-ethanediyl)*
Monomers: 1-Heptene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25511-64-2	atactic
26746-83-8	isotactic

Molecular Formula: $(C_7H_{14})_n$
Fragments: C_7H_{14}
General Information: Sticky rubber [1]
Morphology: Two forms, c 0.645, helix 3_1 (probable) [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 0.863 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0006 K^{-1}	[3]	V

Melting Temperature:

No.	Value	Note
1	17°C	[1,7]

Glass-Transition Temperature:

No.	Value	Note
1	-31°C	[7]
2	-45°C	[8]

Transition Temperature:

No.	Value	Note	Type
1	-148°C	320 Hz [7]	β

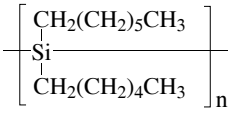
Transport Properties:

Polymer Solutions Dilute: [η] 0.51 dl g^{-1} (30°, C_6H_6) [11]. [η] 2.49 dl g^{-1} (25°, toluene) [12]. Other viscosity values have been reported [9]. Soln. props. have been reported [10]. Theta temp. has been reported [4]
Polymer Melts: Melt flow activation energy 71.2 kJ mol^{-1} (17 kcal mol^{-1}) [3,5]. Zero shear viscosity 4500 (80°) [13]. Melt props. have been reported [13]

Optical Properties:

Optical Properties General: Refractive index has been reported [9]
Transmission and Spectra: Ir [11], Raman [14,15], H-1 nmr [16] and C-13 nmr [17,18] spectral data have been reported
Total Internal Reflection: Stress optical coefficient -1000 [12]

Polymer Stability:



Environmental Stress: Undergoes oxidation [19]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_4Al(^i\text{-}Bu)_3$ in toluene at room temp. [17]

Poly(heptylhexylsilane) P-288

Synonyms: *Poly(heptylhexylsilylene). Dichloroheptylhexylsilane homopolymer. PHHS*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
120534-41-0

Molecular Formula: $(C_{13}H_{28}Si)n$
Fragments: $C_{13}H_{28}Si$
Molecular Weight: $0.5 \times 10^6 - 1 \times 10^6$ [1,3,5].
General Information: Similar to PDHS as both sets of chains are transplanar, as are the Si backbones [1].
Morphology: Two forms have been observed [1]. Forms a polymer with an *all-trans* arrangement of the Si backbone and hexagonal unit cell dimensions a = b = 1.53nm [2].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	-5°C	form 1 [1]
2	25°C	form 2 [1]

Surface Properties & Solubility:
Solubility Properties General: Soluble in common organic solvents such as toluene, THF and isooctane [1]

Transport Properties:
Transport Properties General: The spreading behavior of polysilanes at the air-H_2O interface of a Langmuir trough has been investigated and stable monomolecular layers have not been obtained [5].

Optical Properties:
Optical Properties General: Exhibits a thermochromic transition, two forms being observed, having absorbances at 350 and 370nm depending on the thermal history.
Raman band intensities bear a marked resemblance to those of PDHS. Both exhibit UV absorbances near 370nm. The lowering of the transition temperature for the 370nm form from 42°C for PDHS to 25°C for PHHS is understandable in light of the disorder introduced by the mismatch of side chain length. PHHS also exhibited an isolated absorption at 350nm when quenched to low temperatures [1,3].

Optical Properties:
Transmission and Spectra: Ir [1,2], Raman [1] and uv [1,3,4,6] spectra reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared from *n*-heptyl-*n*-hexyldichlorosilylene by condensation with Na metal in toluene at 110°C by the usual Wurtz-type reaction [1,5].
Applications:

Polyhexafluoropropene P-290

Synonyms: *Polyhexafluoropropylene. Hexafluoropropylene polymer. Poly(1,1,2,3,3,3-hexafluoro-1-propene). Polyperfluoropropylene. PHFP*
Related Polymers: Polyhexafluoropropylene copolymers
Monomers: Hexafluoropropene
Material class: Thermoplastic
Polymer Type: fluorocarbon (polymers)
CAS Number:

CAS Reg. No.	Note
25120-07-4	
27458-51-1	isotactic

Molecular Formula: $(C_3F_6)_n$
Molecular Weight: MW 3000 (approx.: plasma polymerised films); M_n 5700000 (max.)
General Information: Plasma polymerisation produces thin, well-defined polymer films with potential applications for coatings, dielectrics, sensors etc. Such materials have been extensively reported [1,2,3,4,5,7,11,14,15,16,17,18,20,21,22,30,37,43] The quality of films/surfaces can be modified by variations in RF duty

cycles when using pulsed RF plasmas [24]. A comprehensive study of the mechanism and kinetics of the polymerisation process has been reported. [18] Such films have a low coefficient of friction, low surface tension, thermal stability, biocompatability and chemical resistance. Their greatest commercial importance is as copolymers with other fluorine-containing comonomers, e.g. vinylidene fluoride (Viton rubber), or as terpolymers, with e.g. vinylidene fluoride and tetrafluoroethylene [19]. Can be white (chemically polymerised) [27] or yellow (plasma polymerised) [16,17] amorph. solid or transparent highly-adhering films (on various substrates) [5]

Morphology: Struct. has not been determined but claims of isotactic struct. with four-fold helix conformn. have been reported [19,28]. Theoretical studies involving calculations of conformational energies of isotactic form confirm such predictions. The most stable conformn. is helix with CCC valence angle close to 113°, with number of monomer units per turn of the helix being 3.83–3.91 [36] ESCA, F-19 nmr and ir studies of plasma polymerised films reveal high degree of branching: approx. 57% of tertiary C atoms in polymer are bonded with CF_3 groups [7,23]. Evidence for cross-linking has also been reported [11,16]

Miscellaneous: High quality (flawless) thin films, suitable as dielectrics, can be produced by low-pressure glow-discharge (approx. 10 kHz) plasma polymerisation [14]. Quality can be further improved by annealing in vacuum (e.g. 15 min at 250°) immediately afer deposition [17]. Chemical struct. of amorph. cross-linked material obtained by plasma polymerisation consists largely of similar amounts of C^*-CF, CF, CF_2 and CF_3 units [3,5,16,30]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.4–1.9 g/cm^3	plasma-polymerised films; determined optically [11]
2	d 2.2 g/cm^3	plasma-polymerised films; determined from deposition data [5,16]

Melting Temperature:

No.	Value	Note
1	110–120°C	crude polymer, obtained by Ziegler-Natta catalysis [28]

Glass-Transition Temperature:

No.	Value	Note
1	152°C	[39]

Transition Temperature General: Plasma-polymerised films can be sublimed at 350° [17]

Vicat Softening Point:

No.	Value	Note
1	225–250°C	chemically polymerised [27]

Transition Temperature:

No.	Value	Note
1	322°C	half-decomposition temp., plasma-polymerised films [21]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameters 5.2–5.6 $J^{1/2}$ $cm^{-3/2}$, (6.5–7.5 $cal^{1/2}$ $cm^{-3/2}$, calc) [42]

Solvents/Non-solvents: Plasma-polymerised films insol. common organic solvents. [17] γ-ray polymerised material sol. C_6H_6 (boiling), CCl_4 (boiling); slightly sol. Et_2O, Me_2CO, heptane, cyclohexanone, DMF; insol. MeOH, petrol (boiling), CH_2Cl_2 (boiling) [28]

Wettability/Surface Energy and Interfacial Tension: Work of adhesion between polymer and water, formamide, methylene iodide and hexadecane has been reported. [25] Contact angles for acrylic fibres coated with plasma-polymerised layers 116° (H_2O, advancing); 34° (H_2O, receding) [1]. Contact angles for plasma-polymerised polymer films deposited on glass slides, for both continuous and pulsed radiofrequency discharges 107° (continuous), 104° (pulsed). [18] Surface energy of plasma-polymerised films 18.5 mN m^{-1}, γ_p 0.02; γ_d 18.5; 21.2 mN m^{-1}, γ_p 0.07; γ_d21.1 (polymerised in H_2); 20.8 mN m^{-1}, γ_p 1.3; γ_d19.5 (polymerised in N_2) [16]; 18.6 mN m^{-1}, γ_p 0.05; γ_d18.5 (polymerised in Ar) [30]; 18.5 mN m^{-1}, γ_p 0.04; γ_d18.5 (polymerised in O_2) [30]. Basis of glueing in relation to welding has been reported, including the role of forces involved in wetting and adhesion [41]

Surface Tension:

No.	Value	Note
1	20 mN/m	plasma-polymerised film [17]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.10-0.13 dl g^{-1} (C_6H_6, 30°, Ziegler-Natta catalysis) [28]; 2 dl g^{-1} (γ-irradiated polymer) [39]

Permeability of Gases: Migration of plasma gas (e.g. N_2) into polymer films during plasma polymerisation process has been reported [21]

Permeability of Liquids: Plasma-polymerised thin films (250 nm thick) are impermeable to K_2SO_4/H_2SO_4 electrolytes [14]

Mechanical Properties:

Mechanical Properties Miscellaneous: Chemically polymerised material retains 82.5% of its stiffness when heated from room temp. to 90° [27]

Fracture Mechanical Properties: Pressed films are often brittle [38]

Electrical Properties:

Electrical Properties General: Plasma-polymerised films withstand electric fields of 300 V μm^{-1} [17]. Plasma-polymerised material has lower dielectric constant than chemically polymerised material, attributed to presence of oxygen impurities and correponding CO orientation effects

Dielectric Permittivity (Constant):

No.	Value	Note
1	1.5–1.9	plasma-polymerised [11]

Strong Field Phenomena General: Plasma-polymerised films have an electrical breakdown strength of 61 MV m^{-1}, which increases to 72 MV m^{-1} when polymerised in H_2, but decreases to 23 MV m^{-1} when polymerised in N_2 [16]. Electrical breakdown strength 68 MV m^{-1} (polymerised in Ar), 40 MV m^{-1} (polymerised in O_2) [30]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	100 kHz	plasma-polymerised [17]

Optical Properties:

Optical Properties General: Yellow colour of plasma-polymerised films (compared to white colour of chemically polymerised material) evidenced by strong absorption in uv and near-uv regions. This is explained by presence of unsaturation and fluorine-deficient sites [11]

Refractive Index:

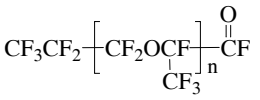
No.	Value	Note
1	1.39	plasma-polymerised [11]

Transmission and Spectra: Uv [11] and XPS spectral data [1,2,4,11,15] for plasma-polymerised films have been reported [2,4,5,7,15,16,23,30]. Ir, F-19 nmr [7,23] and esca [5,7,16,23,30,38] spectral data for plasma polymerised material have been reported. Esr spectral data for plasma polymerised films have been reported [7,18,20,22]. Ir spectral data for polymer obtained by Ziegler-Natta catalysis have been reported. [28] Reflection and Raman spectral data of plasma-polymerised films have been reported [37]

Polymer Stability:

Thermal Stability General: High-temp. ageing in air at 225° for 87h causes little change. Corresponding experiments *in vacuo* show light cross-linking occurs [40]
Environmental Stress: Plasma-polymerised material oxidised in air [11]. Chemically polymerised material slowly oxidised in air [24]. Commercially available films display excellent resistance to ozone [6]
Chemical Stability: Reacts with dilute fluorine (5% in He at 25°, 1 atm) [9,33]
Stability Miscellaneous: Can be electrochemically carbonised (reductive splitting of CF bonds) to give so-called electrochemical carbon [11,12]. Partial cleavage of CF bonds occurs during plasma-polymerisation process [1]. Plasma-polymerised films show good electrochemical stability during electrolysis in liq. solns. of both inert and redox electrolytes [37]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by either chemical or plasma polymerisation. A typical chemical process involves free-radical polymerisation of monomer in inert perfluorinated solvents. (e.g. perfluoroheptane or perfluorocyclobutane) at temps. above 200° and pressures ideally 2000–100000 atm. The absence of water and air is essential. Suitable free-radical initiators include $(F_3CS)_2$, lead tetrakis(perfluorocarboxylates) or mercury bis(perfluoroalkylmercaptide) [27]. Chemically polymerised material can be injection or compression moulded, or extruded above 250°. [27] Liq. and solid phase polymerisation using γ-irradiation at temps. between -196° and 30° gives low MW, high-boiling-point liq. polymers [19,34,35]; polymer with MW approx. 5000000 can be produced using γ-irradiation at high temps. and high pressures [24,32,39]; detailed kinetic studies (effects of temp., pressure and MW) have been reported. [24] Typical conditions for plasma polymerisation: AC glow- (450V, 10μA, 20 kHz) of 1:1 (by volume) mixture of monomer and Ar (pressure 40 Pa, flow rate 10 ml min^{-1}. [11] Use of Ziegler-Natta catalysts (CH_2Cl_2, 40°) produces highly crystalline, isotactic material [19,28]
Applications: Used as matrix for obtaining absorption spectra of molecular ions; in laminates, electrothermographic recording materials, optical recording media, sensors and secondary batteries; as phosphor compositions for lamps, electrical insulators, dielectrics (as plasma-polymerised thin films), chromatography columm packings (in reduced form); in mouldings, electrochemical applications, in electrical barrier coatings; in dry lubricants and release coatings and agents; in antiwear and non-stick coatings, biomedical applications (prosthetics and dental compositions), cation-exchange membranes; electrodes for fuel cells; electrocatalysis; fabric treatment (e.g. hydrophobic coating on acrylic fibres)

Poly(hexafluoropropylene oxide) P-292

Oligomer, 1 < n < 100, monofunctional

R_f is a completely fluorinated group (e.g. $CF(CF_3)OCF_2CF_2OCF(CF_3)$)
n ~ 100, functional

Synonyms: *Poly(hexafluoropropene oxide). Poly(trifluoro(trifluoromethyl)oxirane)*
Related Polymers: Propylene oxide elastomers, Poly(propylene oxide)
Monomers: trifluoro(trifluoromethyl)oxirane
Material class: Fluids, Synthetic Elastomers
Polymer Type: polyurethane, polyether-imide
CAS Number:

CAS Reg. No.
25038-02-2

Molecular Formula: $(C_3F_6O)_n$
Fragments: C_3F_6O
Molecular Weight: M_n 74000 (max.). M_w/M_n 1.02–1.40
General Information: Lower MW polymers are fluids. Cross-linking gives elastomeric networks, in which the type of link plays a significant part. At room temp., triazine-linked networks are invariably soft rubbers but urethane-linked networks can be tough rubbers. [2] Struct. obtained depends on catalyst system and reaction conditions. May be mono- or di-functional [2,3]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Thermal props., plotted against temp., pressure and MW for Krytox (100% hexafluoro-oxypropylene chain) [4] and Fomblin Y (95 mol% hexafluoro-oxypropylene chain), have been reported [5]
Glass-Transition Temperature:

No.	Value	Note
1	-60°C	Fomblin Y, extrapolated to infinite molar mass [2]

Transport Properties:

Polymer Melts: Rheological props. of Krytox (100% hexafluoro-oxypropylene chain) [4] and Fomblin Y (95 mol% hexafluoro-oxypropylene chain) have been reported [5]
Water Absorption:

No.	Value	Note
1	0.1 %	triazine-linked networks [2]
2	1 %	urethane-linked networks [2]

Mechanical Properties:

Mechanical Properties General: Mech. props. for cross-linked poly(hexafluoropropylene oxide) networks have been reported [2]
Tensile Strength Break:

No.	Value	Note	Elongation
1	0.21–0.25 MPa	triazine-linked networks [2]	160–550%
2	0.2–5.8 MPa	20°, urethane-linked networks [2]	160–300%

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.045–0.12 MPa	[2]	Shear modulus
2	0.04–0.06 MPa	triazine-linked networks [2]	Storage modulus
3	0.044–4.1 MPa	20°	Shear modulus
4	0.053–1.08 MPa	70°, urethane-linked networks [2]	Shear modulus

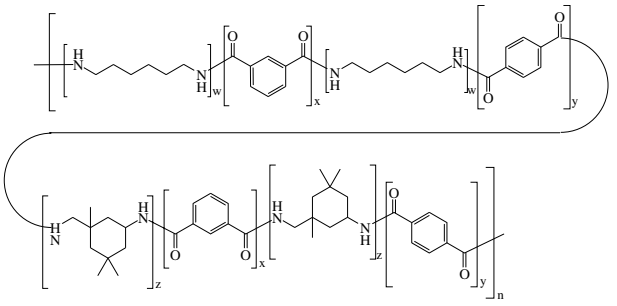
Polymer Stability:

Polymer Stability General: The large size of the fluorine atoms combined with the high strength of the CO bonds gives polymers which are generally thermally and chemically stable
Upper Use Temperature:

No.	Value	Note
1	300°C	triazine-linked networks, short term [2]
2	150°C	urethane-linked networks [2]
3	270°C	triazine cross-linked networks

Chemical Stability: Both triazine- and urethane-linked networks are highly resistant to paraffin and silicone oils. Triazine-linked networks are resistant to a wide range of organic liquids whereas urethane-linked networks are attacked by polar organic solvents. Both types are significantly attacked by fluorinated species [2]
Hydrolytic Stability: Water-resistant

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by one of two routes: anionic ring opening polymerisation of hexafluoropropylene oxide, by addition of fluoride ion to perfluorinated mono- or di-acid fluorides; or photo oxidation of hexafluoropropylene, by introduction of oxygen gas into liq. hexafluoropropylene at -40° and irradiating with uv light (below 300 nm) [2]
Applications: Thermally and chemically stable oils, greases and elastomers

Trade name	Details	Supplier
Fomblin	Various grades. Fomblin Y is homopolymer	Montefluoro
Krytox		DuPont

Synonyms: *6/IPD//I/T copolymer*
Related Polymers: Nylon 6
Monomers: Hexamethylene diamine, Terephthalic acid, Isophthalic acid, Isophorone diamine
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
Molecular Formula: $[(C_6H_{14}N_2).(C_{10}H_{20}N_2).(C_8H_4O_2)]_n$
Fragments: $C_6H_{14}N_2$ $C_{10}H_{20}N_2$ $C_8H_4O_2$
Molecular Weight: 15000–40000
General Information: Is amorph.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18 g/cm^3	7.5–33% isophoronediamine [1]

Glass-Transition Temperature:

No.	Value	Note
1	150°C	7.5–33% isophoronediamine

Deflection Temperature:

No.	Value	Note
1	130°C	7.5–33% isophoronediamine

Vicat Softening Point:

No.	Value	Note
1	150–217°C	7.5–33% isophoronediamine [2]

Surface Properties & Solubility:

Plasticisers: *p*-Toluenesulfonamide
Solvents/Non-solvents: Sol. sulfuric acid, formic acid, dimethylacetamide, *N*-methylpyrrolidone (containing 1–2% boric acid)

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	11 g/10 min	285°, 7.5–33% isophoronediamine, isophthalic acid:terephthalic acid (3:2)

Water Absorption:

No.	Value	Note
1	0.67 %	24h, 20°, 7.5–33% isophthalic acid:terephthalic acid (3:2)

Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	0.66–1.77 cm^3 mm/(m^2 day atm)	$10–27 \times 10^{-13}$ cm^3 cm cm^{-2} (s cm Hg)$^{-1}$; 7.5–33% isophoronediamine, isophthalic acid:terephthalic acid (3:2) [3]

Mechanical Properties:

Flexural Modulus:

No.	Value	Note
1	2500–3000 MPa	20°, 7.5–33% isophoronediamine [2]
2	2000 MPa	120°, 7.5–33% isophoronediamine [2]

Tensile Strength Break:

No.	Value	Note
1	95–102 MPa	20°, 7.5–33% isophoronediamine [2]
2	35 MPa	120°, 7.5–33% isophoronediamine [2]

Impact Strength: Falling weight impact strength 40–50 J (2mm disc, 0% failure rate, 7.5–33% isophoronediamine
Hardness: Rockwell R126 (7.5–33% isophoronediamine)
Friction Abrasion and Resistance: Taber abrasion resistance 0.29g (1000 cycles) $^{-1}$ (7.5–33% isophoronediamine)
Izod Notch:

No.	Value	Notch	Note
1	150 J/m	N	7.5–33% isophoronediamine, injection moulded [1]
2	32 J/m	Y	7.5–33% isophoronediamine, injection [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	67 kV.mm^{-1}	7.5–33% isophoronediamine

Arc Resistance:

No.	Value	Note
1	120s	7.5–33% isophoronediamine

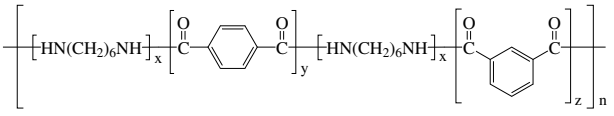
Optical Properties:

Transmission and Spectra: Transmits approx. 85% of visible light
Volume Properties/Surface Properties: Transparency transparent

Polymer Stability:

Thermal Stability General: Up to 36% of the polymer is oxidised at 270° (0.2 mm thick dry film)
Upper Use Temperature:

No.	Value	Note
1	80°C	7.5–33% isophoronediamine



Decomposition Details: Volatilisation of isophoronediamine occurs above 300°
Flammability: Limiting oxygen index 25% (approx.)
Environmental Stress: Ageing in air above 80° causes yellowing
Chemical Stability: Is resistant to most aliphatic and aromatic hydrocarbons. Injection moulded polymer is resistant to C_6H_6,

paraffin, oil, CCl_4; slightly cracked by petroleum ether, aq. alkali, hydrochloric acid, sulfuric acid and salt soln. Severe cracking caused by Me_2CO, lower alcohols, THF and brake fluid.
Hydrolytic Stability: Treatment with boiling H_2O causes crystallisation after 24h, and loss of tensile strength

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymer containing up to 80 mol% terephthalic acid is synth. by aq. melt polymerisation of nylon 6, isophoronediamine, isophthalic acid and terephthalic acid salts at up to 275° for 3h [3]
Applications: Potential applications due to impact toughness and general performance. Uses have not been investigated commercially

Poly(hexamethylenediamine-*co*-terephthalic acid-*co*-isophthalic acid) P-294

Synonyms: *Nylon-6, T/nylon-6, I copolymer. 6/T/I copolymer. Poly(caproamide-co-terephthalic acid-co-isophthalic acid)*
Monomers: Hexamethylenediamine, Isophthalic acid, Terephthalic acid
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
Molecular Formula: $[(C_6H_{14}N_2).(C_8H_4O_2)]_n$
Fragments: $C_6H_{14}N_2$ $C_8H_4O_2$
Molecular Weight: 15000–40000
General Information: Amorph. when the terephthalic acid content is less than 70 mol%

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.23 g/cm^3	isophthalic acid, terephthalic acid 2:1 [1]

Melting Temperature:

No.	Value	Note
1	310°C	isophthalic acid : terephthalic acid 2:1 [2]

Glass-Transition Temperature:

No.	Value	Note
1	165°C	isophthalic acid : terephthalic acid 2:1

Surface Properties & Solubility:
Plasticisers: *p*-Toluenesulfonamide
Solvents/Non-solvents: Sol. H_2SO_4, formic acid, dimethylacetamide, *N*-methylpyrrolidone (containing 1–2% boric acid)

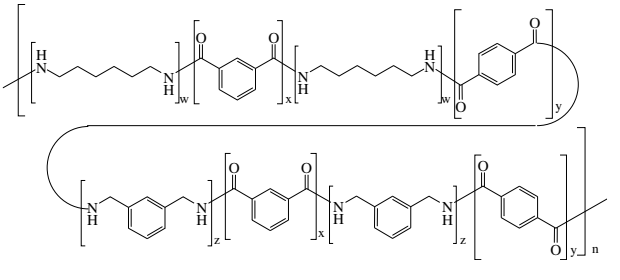
Transport Properties:
Water Content: 3.5% (21°, 65% relative humidity, terephthalic acid isophthalic acid 2:1) [1]

Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	0.47–0.98 cm^3 mm/(m^2 day atm)	$7.2–15 \times 10^{-13}$ cm^3 cm cm^{-2} (s cm Hg)$^{-1}$, terephthalic acid : isophthalic acid 2:1 [1]

Mechanical Properties:
Mechanical Properties General: Tenacity 0.22–0.44 N tex^{-1} (8–40% elongation) terephthalic acid : isophthalic acid 2:1 [2]
Tensile Strength Break:

No.	Value	Note
1	440 MPa	terephthalic acid : isophthalic acid 2:1, oriented fibre [3]



Electrical Properties:
Electrical Properties General: Has good electrical insulation props., particularly when dry

Polymer Stability:
Flammability: Limiting oxygen index 25% (approx.)
Environmental Stress: Ageing in air above 80° causes yellowing
Chemical Stability: Boiling H_2O causes crystallisation after 24h. Injection moulding polymer is resistant to C_6H_6, paraffin, oil, CCl_4; slight cracking caused by petroleum ether, aq. alkali, hydrochloric acid, sulfuric acid and salt soln. Severe cracking caused by Me_2CO, lower alcohols, THF and brake fluid. Is resistant to most aliphatic and aromatic hydrocarbons
Hydrolytic Stability: Boiling H_2O causes crystallisation after 24h

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymer containing up to 80 mol% terephthalic acid may be synth. by aq. melt polymerisation of nylon, isophthalic acid and terephthalic acid salts at up to 275° for 3h [1]
Applications: Applications due to excellent barrier props. Not exploited commercially

Poly(hexamethylenediamine-*co*-*m*-xylylenediamine-*co*-isophthalic acid-*co*-terephthalic acid) P-295

Synonyms: *6/MXD//I/T copolymer*
Related Polymers: Nylon 6
Monomers: Terephthalic acid, Hexamethylenediamine, Isophthalic acid, *m*-Xylylenediamine
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
Molecular Formula: $[(C_6H_{14}N_2).(C_8H_{10}N_2).(C_8H_4O_2)]_n$
Fragments: $C_6H_{14}N_2$ $C_8H_{10}N_2$ $C_8H_4O_2$

Molecular Weight: 15000–4000
General Information: Amorph. when the terephthalic acid content is less than 70 mol%

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.2 g/cm^3	7.5–10% *m*-xylylenediamine, isophthalic acid: terephthalic acid (3:2) [1]

Glass-Transition Temperature:

No.	Value	Note
1	178°C	35% *m*-xylylenediamine, isophthalic:terephthalic acid (1:1)
2	166°C	25% *m*-xylylenediamine, isophthalic:terephthalic acid (1:1)

Vicat Softening Point:

No.	Value	Note
1	140–145°C	7.5–10% *m*-xylylenediamine, isophthalic:terephthalic acid (3:2) [2]

Surface Properties & Solubility:

Plasticisers: *p*-Toluenesulfonamide
Solvents/Non-solvents: Sol. H_2SO_4, formic acid, dimethylacetamide, *N*-methylpyrrolidone (containing 1–2% boric acid)

Transport Properties:

Water Content: Has low water adsorption compared to aliphatic nylons
Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	0.36–1.12 cm^3 mm/(m^2 day atm)	5.517×10^{-13} cm^2 25% (s cm Hg)$^{-1}$, 25% *m*-xylylenediamine, isophthalic:terephthalic acid (1:1) [3]
2	[O_2]	0.16–0.2 cm^3 mm/(m^2 day atm)	$2.5–3.1 \times 10^{-13}$ cm^2 (s cm Hg)$^{-1}$, 35% *m*-xylylenediamine, isophthalic:terephthalic acid (1:1) [3]

Mechanical Properties:

Flexural Modulus:

No.	Value	Note
1	2600 MPa	20°, 7.5–10% *m*-xylylenediamine, isophthalic acid:terephthalic acid (3:2) [2]

Tensile Strength Break:

No.	Value	Note
1	106 MPa	7.5–10% *m*-xylylenediamine, isophthalic acid:terephthalic acid (3:2) [2]

Charpy:

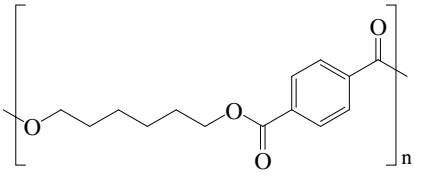
No.	Value	Notch	Note
1	38–50	Y	7.5–10% *m*-xylylenediamine, isophthalic:terephthalic acid (3:2)

Electrical Properties:

Electrical Properties General: Has good electrical insulation props., particularly when dry

Polymer Stability:

Decomposition Details: Volatilisation of *m*-xylylenediamine occurs above 300°
Flammability: Limiting oxygen index 25% (approx.)
Environmental Stress: Ageing in air above 80° causes yellowing
Chemical Stability: Is resistant to most aliphatic and aromatic hydrocarbons. Injection moulded polymer is resistant to C_6H_6, paraffin, oil, CCl_4; slight cracking caused by petroleum ether, aq., hydrochloric acid, sulfuric acid and salt soln. Me_2CO, lower alcohols, THF and brake fluid cause severe cracking
Hydrolytic Stability: Boiling H_2O may induce crystallisation after 24h



Applications/Commercial Products:

Processing & Manufacturing Routes: Polymer containing up to 80 mol% terephthalic acid synth. by aq. melt polymerisation of nylon, isophthalic acid and terephthalic acid salts at up to 275° for 3h [3]
Applications: Potential applications due to low gas permeability have been restricted by cost

3	43°C	[9]	$T_{\beta max}$
4	-95°C	[9]	$T_{\gamma max}$

Surface Properties & Solubility:

Solubility Properties General: Miscibility with the polyhydroxyether of bisphenol A has been reported [15]
Solvents/Non-solvents: Sol. CH_2Cl_2 [9], $CHCl_3$ [12], hexafluoroisopropanol [14]. Insol. MeOH [12]. Solubilities in EtOH and C_6H_6 have been reported [28]

Transport Properties:

Polymer Solutions Dilute: η_{inh} 0.77 dl g^{-1} (phenol/tetrachloroethane (60:40), 20°) [4]; [η] 1 dl g^{-1} ($CHCl_2$, 25°) [8]; [η] 0.404 dl g^{-1} (phenol/tetrachloroethane (50:50), 25°) [20]; [η] 1.05 dl g^{-1} (phenol/tetrachloroethane (60:40), 30°) [22]; η_{inh} 0.08 dl g^{-1} (1-methyl-2-pyrrolidinone, 30°) [24]; [η] 1.01 dl g^{-1} (2-chlorophenol, 35°) [32]. Other viscosity values have been reported [16]
Permeability of Liquids: D 7.7×10^{-6} cm^2 s^{-1} (1,2-dichloroethane, 240°), 5.3×10^{-6} cm^2 s^{-1} (1,4-dichlorobutane, 240°), 1.5×10^{-5} cm^2 s^{-1} (1,6-hexanediol, 240°) [18]

Mechanical Properties:

Mechanical Properties General: Shear modulus values have been reported [35]. Dynamic loss modulus and storage modulus have been reported [2]

Tensile (Young's) Modulus:

No.	Value	Note
1	0.75 MPa	[25]

Tensile Strength Break:

No.	Value	Note	Elongation
1	3 MPa	fibre [4]	9%
2	3.3 MPa	fibre [33]	37%
3	0.514 MPa	fibre [35]	854%

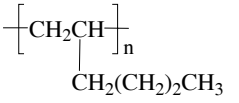
Miscellaneous Moduli:

No.	Value	Note	Type
1	43 MPa	fibre [4]	Modulus
2	5.135 MPa	fibre [35]	Modulus

Complex Moduli: Complex dynamic modulus has been reported in graphical form [36]
Impact Strength: Izod impact strength has been reported [32]
Viscoelastic Behaviour: Stress relaxation modulus has been reported in a graphical form [23]. Stress-strain curves, viscoelastic props. [25,35], stress relaxation and creep have been reported [26].

Electrical Properties:
Electrical Properties General: Dissipation factor values have been reported in graphical form [9]
Complex Permittivity and Electroactive Polymers: Complex permittivity has been reported [31]

Optical Properties:
Transmission and Spectra: Ir [6,19], C-13 nmr [13,14,20] and mass [24,29] spectral data have been reported
Molar Refraction: dn/dC 0.231 (hexafluoroisopropanol, 23°, 633 nm) [16]



Polymer Stability:
Decomposition Details: Thermal degradation details have been reported [24,29,37]. Max. rate of polymer decomposition at 405° [24]
Stability Miscellaneous: Effects of γ-irradiation have been reported [5,30]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by condensation polymerisation of dimethyl terephthalate and 1,6-hexanediol using tetraisopropyl titanate as a catalyst at 280° under vacuum [2,4,5,8,11,13,16,21,22,24,28]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: CED 262.9 J cm^{-3} (62.8 cal cm^{-3}) [32]
Solvents/Non-solvents: Sol. heptane, toluene, cyclohexane, CCl_4, decahydronaphthalene [19], THF [18]. Slightly sol. phenetole [18], CO_2 [20]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	12 g/10 min	approx., ASTM D1238-15T
2	20 g/10 min	approx., ASTM D1238-15T [21]

Polymer Solutions Dilute: η_{inh} 3.86 (decahydronaphthalene, 130°) [16]. [η] 3.29 dl g^{-1} (isotactic, toluene, 55°) [22]. [η] 3.22 dl g^{-1} (amorph., toluene, 55°) [22]. [η] 2.56 dl g^{-1} (toluene, 25°) [23], θ 61.3° (phenetole) [18]
Polymer Melts: Melt flow activation energy E* 71.2 kJ mol^{-1} [7], 75.4 kJ mol^{-1} [24], 50.7 kJ mol^{-1} [5], 46.1 kJ mol^{-1} [21]. Zero shear viscosity η_0 4400 (80°) [25]. Critical shear rate values have been reported [21]. Dynamic viscosity, dynamic rigidity and apparent viscosity results at various temps. have been reported [5]

Mechanical Properties:

Complex Moduli: Complex shear modulus [26] and complex tensile modulus [27] have been reported

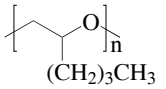
Electrical Properties:

Complex Permittivity and Electroactive Polymers: Complex permittivity 2.5 [23]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002–0.04	1–5 MHz	20–31° [23,27]

Optical Properties:

Optical Properties General: Light scattering results have been reported [18]
Transmission and Spectra: C-13 nmr [1,28,31] and ir [29,30] spectral data have been reported
Molar Refraction: dη/dC 0.12 (heptane, 20°) [23]
Total Internal Reflection: Stress optical coefficient -264–492 [22]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_4AlEt_3$ at 100° [20]

Poly(hexene oxide) P-298

Synonyms: *Poly[oxy(butyl-1,2-ethanediyl)]. Poly(butyloxirane). Poly(1,2-epoxyhexane). Poly(1,2-hexane oxide)*
Monomers: Butyl oxirane
Material class: Thermoplastic
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
26402-36-8	Homopolymer

Molecular Formula: $(C_6H_{12}O)_n$
Fragments: $C_6H_{12}O$
General Information: Semitransparent elastomer [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.925–0.97 g/cm^3	[2]

Melting Temperature:

No.	Value	Note
1	71–72°C	[2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy 50.5 kJ mol^{-1} [6]. Solubility parameters δ 36 $J^{1/2}$ $cm^{-3/2}$ (8.6 $cal^{1/2}$ $cm^{-3/2}$) [9], 35.1 $J^{1/2}$ $cm^{-3/2}$ (8.4 $cal^{1/2}$ $cm^{-3/2}$) [10], 31.4–33.5 $J^{1/2}$ $cm^{-3/2}$ (7.5–8 $cal^{1/2}$ $cm^{-3/2}$) [11]

Solvents/Non-solvents: Sol. isopropanol (>33°), 2-butanone [12]

Wettability/Surface Energy and Interfacial Tension: (dγ/dT) 0.062 mN m^{-1} K^{-1} (MV 52000) [2,13]. Contact angle 70° (H_2O, advancing) [14]

Surface Tension:

No.	Value	Note
1	30 mN/m	20°, MV 52000) [2,13]
2	22 mN/m	150°, MV 52000) [13]
3	18.9 mN/m	200°, MV 52000) [13]

Transport Properties:

Polymer Solutions Dilute: Molar volumes of amorph. forms, 25° van der Waal's 107.3 : cm^3 mol^{-1}, 107.2 (1,2,2-trimethylpropyl, 1,3-dimethylbutyl, 1-methylpentyl, 3,3-dimethylbutyl, 2-ethylbutyl). Glassy: 169.1 cm^3 mol^{-1}, 171.9 (1,2,2-trimethylpropyl), 169.5 (1,3-dimethylbutyl), 168.1 (1-methylpentyl), 170.1 (3,3-dimethylbutyl), 163.8 (2-ethylbutyl) [2]. Theta temps. 30° (butanone), 32.6° (isopropanol), 37° (propanol) [15,16,17], 25° (butanone; 2-ethylbutyl), 27.4° (isopropanol; 2-ethylbutyl) [15,18]. Poylmer-liquid interaction parameters, 0.91 (hexane), 0.81 (2-butanone), 1.47 (acetonitrile), 0.22 ($CHCl_3$), 1.36 (*n*-propanol), 1.2 (Me_2CO), 0.9 (EtOAc)

Permeability of Liquids: Diffusion coefficient [H_2O] 519 × 10^{-8} cm^2 s^{-1} (37°) [14]

Water Absorption:

No.	Value	Note
1	6.9 %	max. [14]

Mechanical Properties:

Mechanical Properties General: Plateau modulus 0.087 dyne cm^{-2}; 0.14 dyne cm^{-2} (2-ethylbutyl) [3]

Viscoelastic Behaviour: Williams-Landel-Ferry constants for temp. superposition and Vogel parameters have been reported [1,20,21]. Other viscoelastic props. have been reported [24]

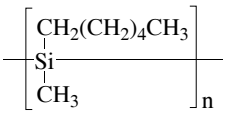
Hardness: Vickers (5 kg load) [8] 10 (1,3-dimethylbutyl), too rubbery (1-methylpentyl), 22 (3,3-dimethylbutyl)

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.481	[22]
2	1.474	1,3-dimethylbutyl [8]
3	1.478	1-methylpentyl [8]
4	1.468	20°, 3,3-dimethylbutyl [8]

Total Internal Reflection: Intrinsic segmental anisotropy -40 × 10^{-25} cm^3 (C_6H_6), -9.7 × 10^{-25} cm^3 (CCl_4) [23]



Polymer Stability:

Decomposition Details: Decomposition at 250° yields monomer and a small amount of olefin by side-chain cracking [8]

Poly(hexylmethylsilane) P-300

Synonyms: *Poly(hexylmethylsilylene). Hexylmethylsilane homopolymer, sru. PHMS. P61S. (HexMeSi)n. ME6*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
88003-15-0

Molecular Formula: $(C_7H_{16}Si)n$
Fragments: $C_7H_{16}Si$
Molecular Weight: 5,200–2.8×10^5 [1,2,11,12]
Morphology: Amorphous white solid [3,12]. The Si-backbone is dominated by the presence of an intermediate-; mixed transoid (T), deviant (D) and possibly ortho (O) conformations with a dihedral angle *ca.* $\pm 90°$. There is no evidence for a significant fraction of *all-anti* (A, i.e., *trans*-planar), *all-trans*, or *anti*-gauche conformers. The polymer incorporates a D/T-based Si backbone, and this, locally, approximates a D+T+D-T- motif. Displays a number of low-temperature polymorphic structures, one of which exhibits Bragg-like scattering features. Temperature-dependent uv absorption measurements of the polymer resolve 2 distinguishable isosbestic points and are indicative of mesomorphic behaviour [6]

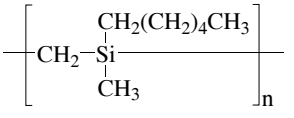
Surface Properties & Solubility:
Solubility Properties General: Readily soluble in common org. solvents [9]

Electrical Properties:
Electrical Properties General: The charge carrier mobility is $2x10^{-7}$ m^2/V s [3]

Optical Properties:
Optical Properties General: Uv-vis spectroscopic analysis shows a broad absorption with λ_{max} 305nm, consistent with an uninterrupted Si chain conjugation length greater than 30 Si atoms [1]. Exists as phase A at all temperatures. A small reversible thermochromic shift (from 325nm to 298nm) with an onset at *ca.* -23°C on heating has been reported, which is broadened over *ca.* 20°C. The presence of an isosbestic point indicates that the thermochromism is related to a structural transition and not a gradual shift to shorter wavelengths. The transition seems to take place in the polymer backbone only, since the material as a whole remains amorphous, only limited conformational changes of the silicon backbone are possible [3].
The dispersion interaction between the polarisable side chains and polysilane backbone appears to be important in this series. Thus the greater polarisability induced by the longer hexyl substituent in PHMS, increases V_D/ϵ to the point where a discontinuous transition is triggered (strong coupling). The polarisability of the side chain increases with the number of carbon atoms, leading to larger values of V_D/ϵ and a higher onset temperature of 10°C [7]

Optical Properties:
Transmission and Spectra: Ir [1,8,11], uv-vis [1,2,3,6,7,11] and nmr [1,4,8,11,13] spectra reported. The proton assignments in the PHMS spectrum have been assigned by means of 2D COSY spectroscopy, which clearly revealed the scalar coupling relations. From these assignments the 13C resonances were assigned by a 2D heterocorrelated spectrum [4].

Polymer Stability:
Thermal Stability General: The DSC of PHMS displays three endothermic features at temperatures near 0, -20, and -40°C. These have been assigned as follows: the 0°C endotherm to the first conformational change and a partial transition to the M phase. The second endotherm with formation of the K2 phase; since there are no overt signatures of a backbone conformational change, the underlying impetus for this partial crystallisation must arise from the influence of the alkyl side chains. The lowest temperature at -40°C therefore correlates with the second chain conformational change [6].
Heating: amorphous low temperature to amorphous high temperature ΔH=0kJ mol^{-1} [3]
Cooling: amorphous high temperature to amorphous low temperature ΔH=-20kJ mol^{-1}



Applications/Commercial Products:
Processing & Manufacturing Routes: The synthesis of PHMS was accomplished with high yields of up to 83% by performing Wurtz-type reductive coupling polymerisation of dichloromethyl-*n*-hexylsilane in THF at room temperature [1,4,8,14].
Polymerisation of *n*-hexylmethyldichlorosilane was carried out by the Kipping method with melted Na metal in toluene under vigorous stirring [2].

Applications/Commercial Products:
Applications: Pyrolysis to silicon carbides [8]. Efficient photoinitiators for free radical polymerisation of Methyl methacrylate and styrene [10].

Poly(hexyloctylsilane) P-302

Synonyms: *Poly(hexyloctylsilylene). Poly(n-octyl-n-hexylsilane). Dichlorohexyloctylsilane homopolymer. PHOS. POHS*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
120517-01-3

Molecular Formula: $(C_{14}H_{30}Si)n$
Fragments: $C_{14}H_{30}Si$
Molecular Weight: $> 5 \times 10^5$ [2,3].
General Information: Disruption of conformation due to the mismatch of the side-chain length [3].
Tacticity: Atactic sequences have been observed [3].
Morphology: Side chains are mainly planar, with higher *trans*-content in the backbone [3].

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	-5°C	[3]

Optical Properties:
Optical Properties General: Exhibits a thermochromic transition with two forms being observed, having absorbances at 350 and 320nm depending on the thermal history. Transition temperature is higher than for PHHS, which suggests more order in the low temperature phase; this is borne out by the presence of a more intense IR band at 689cm^{-1}, indicating a higher (35%±5%) *trans* content in the backbone [3].
Transmission and Spectra: Ir [3] and uv [1,2,3,4] spectra reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared from *n*-hexyl-*n*-octyldichlorosilylene by condensation with Na metal in toluene at 110°C (Wurtz reaction) [3].

Poly(hexylpentylsilane) P-304

Synonyms: *Poly(hexylpentylsilylene). Poly(pentylhexylsilane). PPHS. C5–C6*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
120517-00-2

Molecular Formula: $(C_{11}H_{24}Si)n$
Fragments: $C_{11}H_{24}Si$
Molecular Weight: $0.92 \times 10^6 – 2.6 \times 10^6$ [1,6].
Tacticity: A large conformational change occurs from the disordered conformation to an *all-trans* conformation [2].
Morphology: Hard, waxy and brittle. The diffraction pattern shows a sharp peak followed by a weak peak at 25°C. The ratio of these d-spacings is 1.76, slightly greater than 3x. Consequently, the structure is that which is expected at high temperatures: hexagonal, columnar with a = b = 1.51nm. X-ray diffraction pattern at -50°C is consistent with the monoclinic unit cell and *trans* backbone conformation [1,2,4,6].
Miscellaneous: The polymer chains pack in a hexagonal lattice, which is oriented such that the chains lie parallel to the surface. In addition, a remarkable degree of orientation order was found with the planes containing the neighbouring molecules lying in the surface plane. Parallel to the film surface, the average crystallite size is 600Å, while perpendicular to the surface, there is nearly perfect interchain stacking of the polymers throughout the thickness of the film [6].

Volumetric & Calorimetric Properties:

Glass Transition Temperature:

No.	Value	Note
1	-20–-13°C	[3,5]

Mechanical Properties:

Mechanical Properties General: The ability of the polymer to crystallise into a structure with an ordered (*all-trans*) backbone conformation does not influence its mechanical properties at ambient conditions.

Tensile (Young's) Modulus:

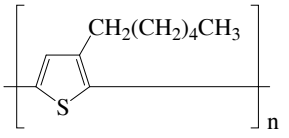
No.	Value	Note
1	4.33 MPa	at 23°C
2	4.3 MPa	at 100 °C

Optical Properties:

Optical Properties General: A discontinuous red shift in which the 314nm absorption band present at room temperature is replaced by a peak at 344nm is observed at -25°C upon cooling. This corresponds to the lower transition found for other polyalkylsilylenes [2].
Transmission and Spectra: Ir [3], Raman [3] and uv [1,2,3] spectra reported.

Polymer Stability:

Thermal Stability General: DSC reveals a broad single first-order thermal transition. The transition enthalpy is 6.9 cal g^{-1} (5.3kJ mol^{-1}). This indicates that a greater change in structure occurs for the first order transition for C5-C6 than for C5-C8. A transition onset temperature of -13°C (260K) and a peak at -6°C (267K) have been observed [1,2,5].



Applications/Commercial Products:

Processing & Manufacturing Routes: The monomer was formed by the reaction of *n*-pentylmagnesium bromide Grignard with hexyltrichlorosilane in THF under Ar. After isolation by two fractional distillations, the resulting dichlorosilane was polymerised by the usual Wurtz condensation reaction with Na in toluene at 110°C to better than 98% purity [2,3,4].
Applications: Electrophotographic photoreceptor having polysilane-containing excellent charge-transport layer and gives a low residual potential [7].

Poly(3-hexylthiophene) P-305

Synonyms: *P 3-HT*
Related Polymers: Poly(thiophene)
Monomers: 3-Hexylthiophene
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
104934-50-1

Molecular Formula: $(C_{10}H_{14}S)_n$
Fragments: $C_{10}H_{14}S$
Molecular Weight: Regiorandom P3HT [14,18,24] MW = 24400; M_n = 5650; PD = 4.32
Regioregular P3HT [14,18,24] MW = 37 680; M_n = 25500; PD = 1.48
Additives: Organically modified montmorillonite (om-MMT) clay. [18]
General Information: The chemistry of polythiophenes has been reviewed. [23]
P 3-HT is an important polymer because of its excellent electrical conducting conductivity, electroluminescence, and nonlinear optical properties. However, its physical, thermal, and properties are not very good and finds difficulty in many applications. Recently, polymer-clay composites (PNCs) have received significant research nano-composites attention for the large-scale improvement in the mechanical and physical properties. [18]
Morphology: Crystal form, a 17.4, b 3.9, c 7.8 [5]. Regioregular P 3-HT is a purple film, with a comb-like polymer having a pendent hexyl group with interchain lamella structure and a 98% head tail [18,21,22,24]. Both regioregular and regio random isomers have been isolated. [24]
Identification: Regioregular P 3-HT: Calc: C, 72.22; H, 8.49; S, 19.29; Found C, 71.91; H, 8.48; S, 18.73
Regiorandom P 3-HT: Calc: C, 72.22; H, 8.49; S, 19.29; Found: C, 71.50; H, 8.28; S, 19.77

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.02–1.5 g/cm^3	[15,16]

Thermodynamic Properties General: Enthalpy of fusion=4.5 J/g [18]
The thermodynamics of cocrystallization for the P 3-HT(R) and (P 3-HT-1) system have been observed [26]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	161°C	[17]
2	231°C	[18]
3	222°C	[22]

Glass Transition Temperature:

No.	Value	Note
1	33°C	[1]
2	10−30°C	[2,3,4]
3	20.3°C	[22]

Surface Properties & Solubility:

Solubility Properties General: The regiorandom polymer shows a rather higher solubility than the regioregular one [14]
Solvents/Non-solvents: Sol. $CHCl_3$ [6]

Transport Properties:

Polymer Solutions Dilute: [η] 0.91 dl g^{-1} (25°, $CHCl_3$) [5]

Mechanical Properties:

Mechanical Properties General: The storage modulus value indicates that there is a large mechanical reinforcement by the clay particles for all the PNCs versus P 3-HT. [18]

Electrical Properties:

Electrical Properties General: Electrical conductivity depends on method of synth. [1,7,8]. Solvent-cast films from chloroform show different behavior than that of the melt-cooled samples. The solvent cast films show a sharp increase followed by a decrease, whereas the melt-cooled films show only a sigmoidal increase [9]

Optical Properties:

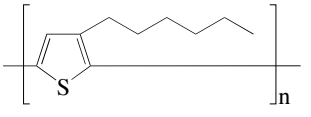
Transmission and Spectra: H-1 nmr [1,12,24], ir [11,18,24], x-ray, [8,11] epr, [13] uv, [7,8,9,10,18,20,23,24] and C-13 nmr spectral data [1,12,24] have been reported

Polymer Stability:

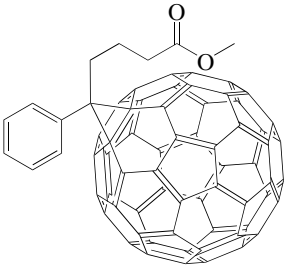
Polymer Stability General: Degradation temperature 428.6°C [18]
Thermal Stability General: In the thermogram there are two breaks - one at lower temperature (approx. -100°C) and the other at higher temperature (approx. 20°C), indicating two different types of transitions in the P 3-HT chains [18]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by polymerisation of the Grignard reagent of 2-halo-3-hexylthiophenes [12], or chemical or electrochemical oxidation polymerisation with various catalysts. Oxidative coupling polymerisation of P 3-HT with $FeCl_3$ to give regioregularity P 3-HT. As a result, both the polymerisation temperature and monomer concentration were effective to the regioregularity. The lower temperature and the lower concentration produced the polymer having the higher head-tail content [14,24]
2-bromo-5-(bromomagnesio)-3-alkylthiophene is polymerised with catalytic amounts of Ni(dppp)Cl_2 leading to 98% headtail couplings [21]



Applications/Commercial Products:



Applications: White LEDs using conjugated polymer blends [19]. Flexible photovoltaic devices [20]. Polymer thin film field effect transistors by friction-transfer technique [25]

Poly(3-hexylthiophene)/PCBM blend P-306

Synonyms: *Poly(3-hexylthiophene)/[6,6]-phenyl-C_{61}-butyric acid methyl ester blend. P3HT:PCBM*
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.	Note
104934-50-1	3-hexylthiophene homopolymer
110134-47-9	poly(3-hexyl-2,5-thiophenediyl)
160848-22-6	PCBM

Molecular Formula: $(C_{10}H_{14}S)n.(C_{72}H_{14}O_2)n$
Fragments: $C_{10}H_{14}S$ $C_{72}H_{14}O_2$
General Information: A blend of the conducting polymer poly(3-hexylthiophene) in regioregular (head-to-tail) form with the

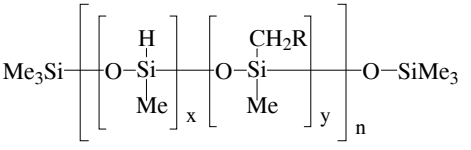
soluble fullerene PCBM in varying proportions, usually about 1:1 by weight. Films are cast from the solid mixture using organic solvents. The polymer acts as an electron donor and the PCBM as electron acceptor for heterojunction solar cell devices.
Morphology: Films of P3HT:PCBM (usually about 1:1 proportion by weight) in photovoltaic devices are usually subjected to thermal treatment (annealing) in the region of 90–150°C prior to use. Generally the morphology has a marked effect on performance, with annealing leading to increased photocurrent. After annealing the amorphous matrix is converted to one containing domains of P3HT crystallites [1,2,3,4,5], with the main chains parallel and the side chains perpendicular to the substrate in photovoltaic devices [1]. After annealing the PCBM is reported to form clusters or aggregates [1,3,6] or needle-like crystals [7] in the matrix. The annealed matrix has formed percolating pathways for charge transfer, where holes and electrons cannot easily recombine [6,8].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. 1,2-dichlorobenzene [9,10], xylene [3], chlorobenzene and chloroform [4,8] for film casting.

Electrical Properties:
Electrical Properties General: The blends are normally incorporated as films into solar cell devices, which would typically consist of an indium-tin oxide (ITO) anode, a layer of the hole transporter PEDOT-PSS, a thin film of the blend and a cathode such as aluminium. Annealing of the devices (90–150°C) increases in particular the hole mobility of the P3HT [5,10,11]. Application of an external voltage prior to use also increases photocurrent [12]. An increase in molecular weight of P3HT results in greater efficiency [3]. Power conversion efficiencies of 4–5% have been reported [2,10,13], with fill factors up to 67% [10], short-circuit current densities of 10–15 mA cm^{-2} and open-circuit voltages of about 0.6V.

Optical Properties:
Optical Properties General: Application of an external light source to the blend results in charge transfer from P3HT to PCBM. External quantum efficiencies of 60–70% have been reported [10,12]. Band gap of P3HT in the blend 2.14 eV [14]. Optical absorption (with λ_{max} in the region of 520nm) is increased by annealing [4,5,6,8,11] with some red shift of absorption maximum. Differences in absorption using chloroform and chlorobenzene as solvents have been reported [4,8]. The photoluminescence of P3HT alone is quenched on addition of PCBM [14,15], while annealing of the blend increases photoluminescence [11].
Transmission and Spectra: UV [6,8,9,10,15], photoluminescence [11,14,15], FT-IR [9], XPS [9] and x-ray diffraction [1,2] spectral data have been reported.

Polymer Stability:
Thermal Stability General: Blends are thermally stable in solar cell devices annealed at 150°C in nitrogen [2].



Applications/Commercial Products:
Processing & Manufacturing Routes: Regioregular P3HT is blended with PCBM usually in a weight ratio of about 1:1 and formed into films, normally by spin-casting in a suitable organic solvent, and incorporated into solar cell devices as described.
Applications: Blends are used in development of heterojunction solar cells. Other possible applications include field-effect transistors.

2	45°C	ester side chain copolymer	Nematic-isotropic temp.
3	89°C	ester side chain	Nematic-isotropic temp.
4	68°C	ester side chain copolymer [2]	Nematic-isotropic temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic hydrocarbons, THF, chlorinated hydrocarbons. Insol. alcohols, H_2O [1,2,3]

Transport Properties:

Transport Properties General: Gas permeability rises by a factor of about 50 as the polymer changes from glass state to isotropic state via a liq. cryst. phase. The rise in permeability is particularly marked as the polymer changes from glass state to liq. cryst. phase [3]

Permeability of Gases: Permeability of gases [O_2] 2.9×10^{-5}; [CO_2] 0.00016; [N_2] 9.5×10^{-5} cm^2 (s GPa)$^{-1}$ [3]

Permeability of Liquids: For liq. cryst. membrane below T_g membrane has low permeability to both H_2O and EtOH but is preferentially permeable to H_2O by a factor of about 10 because the rigid, disordered polymer has small volume. The membrane at temps. above T_g but below T_{NI} has higher permeability and is preferentially permeable to H_2O by a factor which decreases with increasing temp. At the isotropic temp. H_2O and EtOH have equal permeabilities. Above T_{NI} the flexible disordered polymer membrane is highly permeable and is preferentially permeable to EtOH by a factor of about 1.5 because of its higher solubility in a hydrophobic material. Between T_g and T_{NI} the relative permeability of the liq. cryst. membrane depends upon a balance between the effects of orientation of the mesogenic groups and the flexibility of the siloxane chain [2]. Permeability of liqs. has been reported [2]

Permeability and Diffusion General: Permeability of water 3×10^{-9} (10°); 4×10^{-8} (30°); 7×10^{-7} kg (m h)$^{-1}$ (80°). EtOH 2×10^{-11} (10°); 2×10^{-9} (30°); 1.2×10^{-7} kg (m h)$^{-1}$ (80°)

Polymer Stability:

Polymer Stability General: For high stability all SiH groups must be replaced, see Poly(dimethylsiloxanes) with liquid crystal sidechains, P-193

Thermal Stability General: Usable primarily at room temp.

Chemical Stability: If SiH groups are present then they can be oxidised quite readily causing crosslinking with elimination of hydrogen [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Side-chain substituted alkene and polymethylhydrogensiloxane are mixed together in dry toluene under nitrogen with platinum catalyst at 100° for about 48h. With excess alkene all SiH bonds may be substituted else'copolymers' are formed [1,2,3,7]

Poly(hydroxyalkanoate) P-308

Synonyms: *PHA*

Related Polymers: Poly(3-hydroxybutyrate-*co*-3-hydroxyvalerate), Poly(3-hydroxybutyrate)

Material class: Thermoplastic

Polymer Type: polyester

General Information: A group of biopolymers, the most commonly found example being poly(3-hydroxybutyrate). They are microbially derived materials, occurring as granules within the cytoplasm of cells. The physical properties of this material may be improved by increasing MW and by incorporating other hydroxyalkanoate units, e.g. 3-hydroxyvalerate. Mechanical properties can be modified to resemble elastic rubber or crystalline plastic.

Morphology: Data on variation of crystallinity with level and type of second PHA component in poly(3-hydroxybutyrate) copolymers is reported [2].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.24	poly(hydroxybutyrate) [3]
2	d 1.2	poly(hydroxyvalerate) [3]
3	d 1.02	poly(hydroxyoctanoate) [3]
4	d 1.03	poly(hydroxynonanoate) [3]
5	d 1.03	poly(hydroxydecanoate) [3]

Thermodynamic Properties General: Data on variation of T_m and T_g with level and type of second PHA component in poly(3-hydroxybutyrate) copolymers is reported [2].

Melting Temperature:

No.	Value	Note
1	180°C	poly(hydroxybutyrate) [3]
2	105–108°C	poly(hydroxyvalerate) [3]
3	61°C	poly(hydroxyoctanoate) [3]
4	54°C	poly(hydroxynonanoate) [3]
5	54°C	poly(hydroxydecanoate) [3]

Glass Transition Temperature:

No.	Value	Note
1	5°C	poly(hydroxybutyrate) [3]
2	-11°C	poly(hydroxyvalerate) [3]
3	-36°C	poly(hydroxyoctanoate) [3]
4	-39°C	poly(hydroxynonanoate) [3]
5	-40°C	poly(hydroxydecanoate) [3]

Mechanical Properties:

Mechanical Properties General: Data on variation of some mechanical properties with level and type of second PHA component in poly(3-hydroxybutyrate) copolymers have been reported [2,4].

Polymer Stability:

Decomposition Details: PHAs biodegrade in microbially active environments. In aerobic environments final products are water and carbon dioxide, in anaerobic environments methane is also produced.

Biological Stability: PHAs are biodegradable in natural environments. Decomposition occurs via enzymes secreted by microorganisms. The effects of structure and solid state on biodegradability have been reported [1].

Stability Miscellaneous: Data on deformation and morphology have been reported [4].

Applications/Commercial Products:

Processing & Manufacturing Routes: Production is performed via fermentation, and processing by conventional moulding and extrusion techniques is possible. The biosynthesis can be tailored to give polymers with specific properties and recent work has been directed towards the modification of the enzymes involved in PHA synthesis by genetic engineering [5]. Data on deformation and morphology are reported [4]. Recent work on PHA metabolic engineering has been reviewed [6].
Applications: PHAs have many potential uses: in medicine (controlled drug release, sutures, bone plates, wound care), personal hygiene products and packaging. Initial pricing was high compared to non-biopolymers but falling costs have meant increasing usage.

Poly(hydroxyalkyl methacrylate) P-309

Synonyms: *Poly(2-hydroxyethyl methacrylate). Poly(2-hydroxypropyl methacrylate)*
Related Polymers: Polymethacrylates General, Hydroxyalkyl methacrylate copolymers
Monomers: 2-Hydroxyethyl methacrylate, 2-Hydroxypropyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25249-16-5	2-hydroxyethyl
70614-47-0	2-hydroxyethyl, isotactic
70559-14-7	2-hydroxyethyl, syndiotactic
25703-79-1	2-hydroxypropyl

Molecular Formula: $(C_6H_{10}O_3)_n$ $(C_7H_{12}O_3)_n$
Fragments: $C_{10}H_{10}O_3$ $C_7H_{12}O_3$
General Information: Data refer to poly(2-hydroxyethyl methacrylate), unless stated otherwise
Tacticity: Isotactic and syndiotactic forms known
Miscellaneous: PHEMA when cross-linked (e.g. with ethylene diacrylate) forms pliable, soft hydrogels with a low network density and poor mechanical strength. The latter may be improved by incorporation of hydroxypropyl methacrylate into the network. The hydrophilicity of methacrylic hydrogels may be improved by the incorporation of a second hydroxyl group e.g. using 2,3-dihydroxypropyl methacrylate as a comonomer

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.274 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00026 K^{-1}	free-radical bulk polymerisation at 60°, $T > T_g$ [2]	V
2	0.000102 K^{-1}	free-radical bulk polymerisation at 60°, $T < T_g$ [2]	V

Equation of State: Equation of state information has been reported [16]
Glass Transition Temperature:

No.	Value	Note
1	55–100°C	[4,5,6]
2	25°C	isotactic [4]
3	109°C	syndiotactic [4]

Transition Temperature General: The presence of water or other plasticising additives, e.g. polyethylene glycol, lowers the T_g [3,4]
Transition Temperature:

No.	Value	Note	Type
1	50°C	[7]	T_δ

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density 39.1 J cm^{-3} [8], 39.5 J cm^{-3} (hydroxypropyl) [8]
Solvents/Non-solvents: Isotactic sol. H_2O (when not cross-linked). Syndiotactic, atactic insol. H_2O. Syndiotactic and atactic forms swollen by H_2O to form gels [1]
Wettability/Surface Energy and Interfacial Tension: Surface tension 37 mN m^{-1} (20°, dry) [9], 69 mN m^{-1} (40% wt. H_2O); γ_d 20.2; γ_p 48.8 [10]; 51.6 mN m^{-1}; γ_d 31.4; γ_p 20.2 [8]; 75.59 mN m^{-1} (10°, isotactic); γ_d 25.28; γ_p 50.31 [11]; 74.54 mN m^{-1} (10°, syndiotactic); γ_d 24.52; γ_p 50.02 [11]; 71.39 mN m^{-1} (20°, isotactic; γ_d 23.10; γ_p 48.29) [11]; 71.58 mN m^{-1} (20°, syndiotactic); γ_d 23.57; γ_p 48.01 [11]; 68.97 mN m^{-1} (40°, isotactic); γ_d 22.06; γ_p 46.91 [11]; 71.08 mN m^{-1} (40°, syndiotactic); γ_d 24.64; γ_p 46.44 [11]; 62.88 mN m^{-1} (60°, isotactic); γ_d 18.13; g_p 44.75 [11]; 66.83 mN m^{-1} (60°, syndiotactic); γ_d 24.92; γ_p 43.91 [11]; 49.7 mN m^{-1} (hydroxypropyl); γ_d 33.1; γ_p 16.6 [8]. Contact angle 15° (air, 40% H_2O) [10], 16° (Me_2CO, 40% H_2O) [10], 20° (dodecane, 40% H_2O) [10]. Hamilton contact angle 148 [12]. Surface energy 51.6 mN m^{-2}; γ_p 20.2; γ_d 31.4 [12]. Interfacial tension 0.06–0.09 mN m^{-1} (solid/H_2O, 40% H_2O) [10]

Transport Properties:

Polymer Solutions Dilute: η_{inh} 1.48 dl g^{-1} (2-methoxyethanol, 25°, MW 34000), 3.26 dl g^{-1} (2-methoxyethanol, 25°, MW 529000) [13], 1.935 dl g^{-1} (DMF, isotactic, MW 816000), 0.356 dl g^{-1} (H_2O, isotactic, MW 816000), 1.011 dl g^{-1} (MeOH, isotactic, MW 816000), 0.652 dl g^{-1} (EtOH, isotactic, MW 816000), 0.52 dl g^{-1} (propanol, isotactic, MW 816000), 1.31 dl g^{-1} (*tert*-butanol, isotactic, MW 816000) [14]. Viscosity increases with increasing MW [13] and with electrolyte [15]. Theta temps. 15.3° (H_2O), 15.8° (EtOH), 32.1° (propanol), 14° (2-propanol), 3.7° (2-butanol) [14]. The polymer-solvent interaction parameter has been related to the level of cross-linking (in diethylene glycol at 25°) [17]

Permeability of Gases: Permeability coefficient [O_2] 29.5×10^{-6}–0.00295 mol (m s Pa)$^{-1}$ (10^{-11}–10^{-9} cm^2 (s cmHg)$^{-1}$) [19]; [CO_2] 29.5×10^{-6}–0.00295 mol (m s Pa)$^{-1}$ (10^{-11}–10^{-9} cm^2 (s cmHg)$^{-1}$) [18,19]
Water Content: 44% (10°, isotactic), 41.2% (20°, isotactic); 37.5% (10°, syndiotactic), 32.4% (20°, syndiotactic); 37.5% (40°, isotactic), 36.7% (40°, syndiotactic); 35.5% (60°, isotactic), 38.7% (60°, syndiotactic) [11]. Water content decreases with increasing level of cross-linking agent [1]
Water Absorption:

No.	Value	Note
1	36.4 %	MW 1500000 [20]
2	20–70 %	[19]
3	21.3 %	hydroxypropyl [20]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	500–2600 MPa	dehydrated [8]
2	1.9–7.6 MPa	37.6% water [8]

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.49–2.94 MPa	5–30 kg cm^{-2} [19]	100–300%

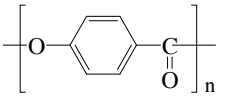
Miscellaneous Moduli:

No.	Value	Note	Type
1	200–1000 MPa	dehydrated [8]	rigidity modulus
2	0.5–2.4 MPa	37.6% water [8]	rigidity modulus

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5119	[21]

Polymer Stability:
Decomposition Details: Decomposition at 375–500° yields 20% monomer (at 500°), 6% ethylene dimethacrylate (at 500°) as major products. CO_2 and carbon monoxide are liberated [22]



Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by radical polymerisation with a cross-linking agent (e.g., ethylene dimethacrylate) present [19]
Applications: Applications increasing in medicine; particularly hydrogels. Uses include soft contact lenses, implant matrices, burn wound dressings and drug delivery systems

Compressive Strength:

No.	Value	Note
1	110 MPa	ASTM D695 [32]
2	265 MPa	38500 psi [33]

Viscoelastic Behaviour: Stress-strain curves have been reported [35]
Friction Abrasion and Resistance: Coefficient of friction 0.10–0.16 [9]. Other coefficient of friction values have been reported [27]. Specific wear rate 0.12 $mm^3\ kg^{-1}\ km^{-1}$ [27]

Electrical Properties:

Electrical Properties General: Other dielectric constants have been reported [15,18,32]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.8		[33]
2	2.958	100 Hz	25°
3	2.982	100 Hz	100° [1]

Dielectric Strength:

No.	Value	Note
1	0.66 $kV.mm^{-1}$	0.125" thick [33]

Strong Field Phenomena General: Breakdown temp. 360° (110V, 60 Hz) [25]
Dissipation (Power) Factor:

No.	Value	Note
1	0.000198	[33]

Optical Properties:

Transmission and Spectra: Ir [2,17,19,21,22], C-13 nmr [3,30], H-1 nmr [4,36] and mass spectral data [12,22] have been reported

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	315°C	[32]
2	270–300°C	[32]

Decomposition Details: Thermal degradation has been studied [2,10,12,22,29]. Max. decomposition temp. 542° (815K) [22]. 1% Weight loss at 425° (698K) [10], 260° (2000h) [33]. 5% Weight loss at 520° (793K) [10]. 10% Weight loss at 545° (818K) [10], 482° (in air), [12] 454° (in N_2) [12]
Flammability: Flammability rating V0 (UL94) [32]. Limiting oxygen index 36% [34]
Chemical Stability: Attacked by trifluoromethanesulfonic acid [14]. Resistant to most aromatic and chlorinated hydrocarbons [32], dilute acids [33], dilute alkalis [33], conc. phosphoric acid [33] and trifluoroacetic acid [33]. Attacked by hot, conc. sulfuric acid or sodium hydroxide soln. [33]
Biological Stability: Biodegradation has been reported [28]
Stability Miscellaneous: Resistant to radiation (100 Grad) [32]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by ionic polymerisation of the phenyl ester of *p*-hydroxybenzoic acid or by polymerisation of *p*-acetoxybenzoic acid at 250° [1,11,21,23]
Mould Shrinkage (%):

No.	Value	Note
1	0.7%	ASTM D955 [32]

Applications: Metal coatings, plasma coatings, liquid crystals, antifriction materials. Used in plasma-sprayed coatings in bearings, abradable seals, rotors or vanes in processing pumps

Trade name	Supplier
Ekonol	Carborundum Corporation
	Sumitomo Chem Co

Poly(4-hydroxybenzoate-*co*-6-hydroxy-2-naphthalenecarboxylate P-311

Synonyms: *Poly(4-hydroxybenzoate-co-2-oxy-6-naphthoyl). HBA/HNA*
Monomers: 4-Hydroxybenzoic acid, 6-Hydroxy-2-naphthalenedicarboxylic acid
Material class: Copolymers
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
81843-52-9	
106004-41-5	block copolymer

Molecular Formula: $[(C_7H_4O_2).(C_{11}H_6O_2)]_n$
Fragments: $C_7H_4O_2$ $C_{11}H_6O_2$
Molecular Weight: 25000-45000
Additives: Wollastonite and glass fibre
Morphology: Electron microscopy studies have been reported [1]. Polymer containing 75% HBA has two polymorphic forms: orthorhombic a 0.76, b 0.57 and orthorhombic (pseudohexagonal) a 0.92, b 0.52, c 1.26 [2]. Polymer containing 70% HBA orthorhombic a 0.796, b 0.549, c 1.354 [35]. Cryst. struct. has been reported [27,36]. Morphological studies have been reported [19,25]. Hexagonal crystal form has been reported. [3] The polymer chains self-align in the direction of processing to create a self-reinforcing network

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.393–1.395 g/cm^3	58% HBA [9]
2	d 1.4 g/cm^3	73% HBA [12,23,41]
3	d 1.43 g/cm^3	70% HBA [35]
4	d 1.14 g/cm^3	fibre [43]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00023 K^{-1}	20-95°, 58% HBA	V
2	0.00043 K^{-1}	95-205°, 58% HBA [9]	V
3	0.0008 K^{-1}	>205°, 58% HBA [9]	V
4	7×10^{-6} K^{-1}	-173° [7]	V
5	2.7×10^{-5} K^{-1}	73% HBA, flow [42]	V
6	2.7×10^{-5}–5.4×10^{-5} K^{-1}	73% HBA, transverse [42]	V
7	1×10^{-5} K^{-1}	[44]	L

Thermodynamic Properties General: Other thermodynamic props. have been reported [10]. Variation of thermal conductivity with temp. has been reported [7]
Latent Heat Crystallization: ΔH_f 1.82 kJ mol^{-1}, ΔS_f 3.19 J mol^{-1} K^{-1} (58% HBA) [9]. Other ΔH_f values (fibres) have been reported [16]. ΔH_f 1.57 J g^{-1} (73% HBA) [23]. Other values of C_p, ΔH, ΔS and ΔG have been reported [8,37]. ΔC_p 32 J mol^{-1} K^{-1} (75% HBA) [8]. Values of C_v over temp. range of -271°–-173° have been reported [7]
Melting Temperature:

No.	Value	Note
1	285°C	73% HBA [15]
2	279°C	[16]
3	291°C	[16]
4	280°C	film [21]
5	278°C	73% HBA [23]
6	295°C	[33]
7	330°C	fibre [43]

Glass Transition Temperature:

No.	Value	Note
1	110°C	[5]
2	152°C	75% HBA [8]
3	100°C	58% HBA [9]
4	110°C	film [21]
5	103°C	73% HBA [23]
6	160°C	dynamic mech. anal.

Transition Temperature General: Other transition temps. have been reported. [7,36] Forms a nematic thermotropic phase above 280°
Deflection Temperature:

No.	Value	Note
1	180°C	1.82 MPa, 73% HBA [41]
2	240–250°C	1.82 MPa [45]
3	222°C	0.46 MPa, A950 grade, ASTM D648

Transition Temperature:

No.	Value	Note	Type
1	50°C	[5]	β temp.
2	75°C	75% HBA [6]	β temp.
3	29°C	73% HBA [23]	β temp.
4	-40°C	[5]	γ temp.
5	-25°C	75% HBA [6]	γ temp.
6	280°C	75% HBA [6]	High temp. transition
7	278°C	73% HBA [14]	High temp. transition
8	282°C	75% HBA [8]	Disordering transition temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. pentafluorophenol, 3,5-bis(trifluoromethyl)phenol [28], 4-chlorophenol, pentafluorophenol, trifluoroacetic acid at high temp. Insoluble in and inert to many solvents owing to high crystallinity and polyester struct.

Transport Properties:

Transport Properties General: Rheological props. have been reported [4,32]
Polymer Solutions Dilute: $[\eta]_{inh}$ 5.37 dl g^{-1} (pentafluorophenol/4-chlorophenol 60/40) [25]. [η] 5.3 dl g^{-1} (pentafluorophenol, 60°) [33]. $[\eta]_{inh}$ 7.57 dl g^{-1} (73% HBA, film), 5.7 dl g^{-1} (73% HBA, fibre) [42]
Polymer Melts: Melt viscosity has been reported in graphical form. [24] Melt viscosity 600 P (300°, 1000 s^{-1}) [46]
Permeability of Liquids: Water diffusion coefficient has been reported [39]
Water Absorption:

No.	Value	Note
1	0.02–0.03 %	24h, ASTM D570 [43,44]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.03 cm^3 mm/(m^2 day atm)	47 × 10^{-15} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]
2	N_2	0.197 cm^3 mm/(m^2 day atm)	3 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]
3	CO_2	0.046 cm^3 mm/(m^2 day atm)	70 × 10^{-15} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]
4	He	10.8 cm^3 mm/(m^2 day atm)	16400 × 10^{-15} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]
5	H_2	3.01 cm^3 mm/(m^2 day atm)	4590 × 10^{-15} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]
6	Ar	0.007 cm^3 mm/(m^2 day atm)	9.9 × 10^{-15} cm^2 (s cmHg)$^{-1}$, 35°, 73% HBA [23]

Mechanical Properties:

Mechanical Properties General: General mech. props. have been reported in graphical form [4]. Other mech. props. have been reported [36]. Self-alignment of the polymer chains under shear in the melt creates exceptionally good mech. props., with stiffness and notched impact strength resistance much greater than those of conventional glass-fibre reinforced engineering resins. It has a fibrous nature but its props. are very anisotropic. May be glass reinforced to obtain adequate strength in the transverse direction. Self-reinforcement nature and high orientation are achieved during draw-down of fibres giving extremely high mech. stiffness and strength. Sonic modulus as a function of draw-down ratio has been reported in graphical form [14]. Variation of dynamic tensile modulus [13,25,26,31] and shear modulus [31] with temp. has been reported in graphical form. Elastic moduli have been reported. [20] Tensile modulus decreases with increaing sample thickness [11]. Elongation at break 1.8% (A950 grade, ASTM D882). [5] Tensile storage and loss moduli decrease with increasing temp. [47,53,54]

Tensile (Young's) Modulus:

No.	Value	Note
1	72900 MPa	fibre [43]
2	60000 MPa	fibres [16]
3	100000 MPa	-80° [36]
4	25000 MPa	130° [36]
5	9600–38000 MPa	73% HBA [42]
8	9700–10500 MPa	23°, direction of orientation, ASTM D638 [44,45,55]
9	11100 MPa	0°, direction of orientation, ASTM D638 [44,45,55]
10	14600 MPa	-140°, direction of orientation, ASTM D638 [44,45,55]
11	19300 MPa	Vectra B950

Flexural Modulus:

No.	Value	Note
1	8970 MPa	73% HBA [41]
2	9000 MPa	23°, A950 grade, ASTM D790 [44]
3	15200 MPa	23°, B950 grade, ASTM D790 [44]

Tensile Strength Break:

No.	Value	Note	Elongation
1	1100 MPa	fibres [16]	2%
2	3200 MPa	fibre [43]	3.8%
3	207 MPa	30% glass fibre [42]	
4	138–241 MPa	73% HBA [42]	
5	160–165 MPa	23°, A950 grade, ASTM D638 [45]	
6	180 MPa	0°, A950 grade, ASTM D638 [45]	
7	165 MPa	-140°, A950 grade, ASTM D638 [45]	
8	165 MPa	-200°, A950 grade, ASTM D638 [45]	
9	188 MPa	B950 grade	1.3%

Flexural Strength at Break:

No.	Value	Note
1	151–296 MPa	73% HBA [42]
2	169 MPa	23°, A950 grade, ASTM D790 [43]
3	118 MPa	50°, A950 grade
4	55 MPa	100°, A950 grade
5	31 MPa	150°, A950 grade
6	245 MPa	23°, B950 grade, ASTM D790 [43]

Compressive Modulus:

No.	Value	Note
1	6300 MPa	A950 grade, ASTM D695
2	2620 MPa	B950 grade, ASTM D695

Flexural Strength Yield:

No.	Value	Note
1	140 MPa	3% elongation, axial stress [55]

Compressive Strength:

No.	Value	Note
1	70 MPa	A950 grade, ASTM D695 [44]
2	84 MPa	B950 grade, ASTM D695 [44]

Miscellaneous Moduli:

No.	Value	Note
1	5000 MPa	bulk modulus [7]
2	200–1600 MPa	-80°–-130°, shear modulus [37]

Viscoelastic Behaviour: Creep props. (73% HBA) have been reported. [26] Flexural creep 8200 MPa (10h, 23°, 50 MPa stress), 6100 MPa (1000h, 23°, 50 MPa stress) [48]
Hardness: Rockwell M60 (A950 grade, ASTM D785), M100 (B950 grade, ASTM D785)

Failure Properties General: Shear strength 105 MPa (A950 grade, ASTM D732), 129 MPa (B950 grade, ASTM D732) [43]
Fracture Mechanical Properties: Fracture toughness 3 NM $m^{-3/2}$ [26]
Friction Abrasion and Resistance: Coefficient of friction 0.12 (dynamic, metal), 0.14 (static, metal) [43]. Tabor abrasion 56 mg $(1000 \text{ cycles})^{-1}$ (ASTM D1044) [43]
Izod Notch:

No.	Value	Notch	Note
1	690 J/m	Y	23°, A950 grade [45]
2	505 J/m	Y	-200°, A950 grade [45]
3	520 J/m	N	A950 grade [44]
4	415 J/m	N	B950 grade [44]
5	50 J/m	N	[55]
6	520 J/m	Y	ASTM D256 [26]
7	534 J/m	Y	73% HBA [41]
8	53–534 J/m	Y	73% HBA [42]

Electrical Properties:

Electrical Properties General: Variation of tan δ with temp. has been reported in graphical form [5,12,13,25,26]. Variation of dielectric constant with temp. has been reported [5,6,12]. Variation of dielectric constant with temp. has been reported in graphical form [15]. Has excellent dielectric strength. Electrical props. may be enhanced using fillers
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.6	1 kHz	ASTM D150 [46]
2	3.3	1 kHz	ASTM D150 [43]

Dielectric Strength:

No.	Value	Note
1	39 $kV.mm^{-1}$	23°, 50% relative humidity, 1.5 mm thick, short term, A950 grade [43,46]
2	32 $kV.mm^{-1}$	23°, 50% relative humidity, 1.5 mm thick, short term, B950 grade [43,46]

Arc Resistance:

No.	Value	Note
1	137s	A950 grade, ASTM D495 [43,46]
2	74s	B950 grade, ASTM D495 [43,46]

Complex Permittivity and Electroactive Polymers: Comparative tracking index 175 V (A950 grade, ASTM D3636), 150 V (B950 grade, ASTM D3636) [43,46]
Static Electrification: Impedance behaviour has been reported [38]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004	1 kHz	ASTM D150
2	0.004	1 GHz	ASTM D150

Optical Properties:

Transmission and Spectra: H-1 nmr [3,18,22,40], C-13 nmr [11,12], ir [14,17,29], esr [30] and mass spectral [29] data have been reported
Total Internal Reflection: Birefringence has been reported [34]

Polymer Stability:

Polymer Stability General: Has excellent stability; chemical, mech. and electrical props. are retained. Has good dimensional stability to temp. and moisture
Thermal Stability General: Has excellent thermal stability
Upper Use Temperature:

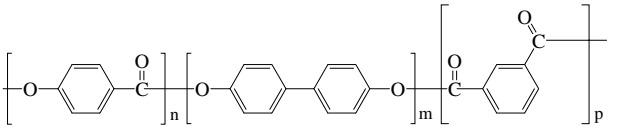
No.	Value
1	325°C

Decomposition Details: Decomposition temp. 450° [8]; max. decomposition temp. 522° [29]
Flammability: Limiting oxygen index 28% (fibre) [43], 35% (A950 grade), 50% (B950 grade)[43]. Flammability rating V0 (0.8 mm thick, UL94) [43]. Smoke generation conforms to proposed FAA standards [49]
Environmental Stress: Has excellent weathering resistance even after 2000h exposure (ASTM D2565) [46]
Chemical Stability: Polymer containing 73% HBA is inert for 30 days to 80% formic acid (216°), 37% HCl (190°), 10% NaOH soln. (190°), Me_2CO (133°), CH_2Cl_2 (148°), EtOAc (131°), gasoline (250°), Skydrol (160°) [41]. Is resistant to strong acids and bases, alcohols, hydrocarbons, aromatics, esters and ketones. Is not stress-crazed by solvents even at elevated temps. [49]
Hydrolytic Stability: Stable after 200h exposure at 110° [46]
Recyclability: Vectra is claimed to be 100% recyclable. Up to 25% regrind can be incorporated into virgin feed for processing [49]
Stability Miscellaneous: Stable to γ-irradiation of up to 500 Mrad [46] and microwave radiation of 2.45 kHz

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by melt polycondensation of the acetoxy derivatives of 4-hydroxybenzoic acid and 6-hydroxy-2-naphthalenecarboxylic acid at 340° [11,33] Vectra may be processed by thermoforming, ultrasonic forming, pultrusion, metallising (sputter coating) or injection moulding [49,56]. Care must be taken in injection moulding to avoid weld lines. Vectra moulds easily in thin-walled moulds, but in thick-walled moulds, fibres align only in the surface layer and not in the core. Moulding and weld line problems may be overcome using multi-live feed injection moulding [50]. Vectra is processed by extrusion into sheets, tubes, films, extrusion coatings, rods or strands.
Mould Shrinkage (%):

No.	Value	Note
1	0.006%	73% HBA [42]
2	0.1%	[44]
3	0.1%	A950 grade, flow direction [43]
4	0.6%	A950 grade, transverse direction [43]
5	0.2%	B950 grade, flow direction [43]
6	0.4%	B950 grade, transverse direction [43]



Applications: Applications include injection moulding resin used in electronics, fibre optics, automotive industry, aircraft/aerospace industry, in consumer products, chemical processing and manufacturing fields. Applications due to exceptionally low ion content as an encapsulant for integrated circuits, transistors and hybrid electronic components. Other uses include medical components, safety equipment, leisure goods, watch components, chemical analysis equipment

Trade name	Details	Supplier
SRP2	discontinued material	ICI, UK
Vectra	Wollastonite and glass fibre filled grades available	Hoechst Celanese
Vectra	A950/B950	Hoechst
Vectran	Wollastonite and glass fibre filled grades available	Kuraray Co

Poly(4-hydroxybenzoate-*co*-isophthalic acid-*co*-4,4′-dihydroxydiphenylether) P-312

Synonyms: *Poly(1,3-benzenedicarboxylic acid-co-1,1′-biphenyl-4,4′-diolco-4-hydroxybenzoic acid)*
Monomers: 4-hydroxybenzoic acid, isophthalic acid, 4,4′-dihydroxydiphenyl ether
Material class: Copolymers
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
52724-09-1	
113214-02-1	block copolymer

Molecular Formula: $[(C_7H_4O_2)\ (C_{12}H_8O_2)\ (C_8H_4O_2)]_n$
Fragments: $C_7H_4O_2$ $C_{12}H_8O_2$ $C_8H_4O_2$

Transport Properties:
Water Content: Water absorption values have been reported

Mechanical Properties:
Mechanical Properties General: Mechanical props. have been reported

Optical Properties:
Transmission and Spectra: Mass spectral [1] data has been reported

Polymer Stability:
Thermal Stability General: Resistance to heat has been reported [3]
Decomposition Details: Thermal degradation and degradation activation energies [1]. 10% weight loss temp., 486° (air), 504° (N_2 [1], 50% weight loss temp., 523° (air), 575° (N_2 [1], have been reported
Recyclability: α Irradiation resistance has been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by slurry polymerisation of acetylated isophthalic acid 4,4′-biphenol and 4-hydroxybenzoic acid at 300–350°
Applications: Used as an injection moulding resin for electrical, aerospace, automotive and lighting applications

Trade name	Supplier
Ekkcel 1000	Sumitomo Chem. Co.

Poly(4-hydroxybenzoate-*co*-terephthalic acid-*co*-4,4′-dihydroxydiphenyl ether) P-313

Synonyms: *Poly(1,4-benzenedicarboxylic acid-co-1,1′-biphenyl-4,4′-diol-co-4-hydroxybenzoic acid)*
Monomers: 4-Hydroxybenzoic acid, Terephthalic acid, 4,4′-Dihydroxydiphenyl ether
Material class: Thermoplastic, Copolymers
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
31072-56-7	
96218-35-8	from terephthaloyl chloride

Molecular Formula: $[(C_7H_4O_2).(C_{12}H_8O_2).(C_8H_4O_2)]_n$
Fragments: $C_7H_4O_2$ $C_{12}H_8O_2$ $C_8H_4O_2$
Additives: Glass fibre
General Information: Stiffness, thermal stability and melting point increase with increasing Bisphenol content
Morphology: X-ray studies [5,7,8,16,19] have been reported. Two polymorphic forms exist both pseudo-orthorhombic [6]. Orthorhombic a 0.788, b 0.557, c 1.255 [8]. Has liq. crystal phase

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

2	d 1.35 g/cm^3	Xydar SRT-300 [17]
3	d 1.6 g/cm^3	Xydar G-930, ASTM D792 [23]
4	d 1.35 g/cm^3	Xydar [24]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.88×10^{-5} K^{-1}	1.6×10^{-5}°F^{-1} [10]	L
2	3×10^{-6}–7×10^{-6} K^{-1}	Xydar G-630, ASTM D696 [23]	L

Volumetric Properties General: Other density values have been reported [21]
Latent Heat Crystallization: ΔH_f 10.5 J g^{-1} [6]
Melting Temperature:

No.	Value	Note
1	380°C	[2]
2	427°C	[6]
3	430°C	[7]
4	421°C	[8]
5	425°C	[10]
6	420°C	[11,23]

Glass Transition Temperature:

No.	Value	Note
1	115°C	DSC, KR4002
2	200°C	HX2000

Deflection Temperature:

No.	Value	Note
1	265°C	1.82 MPa, ASTM D648 [2]
2	293°C	Ekkcel C2000 [3]
3	355°C	1.82 MPa, ASTM D648 [17]
4	240–260°C	1.82 MPa, Xydar - glass fibre reinforced [24]
5	271°C	1.82 MPa, ASTM D648, Xydar G-830 [23]

Vicat Softening Point:

No.	Value	Note
1	369°C	Xydar SRT-300 [17]
2	358°C	Xydar [24]

Transition Temperature:

No.	Value	Note	Type
1	100°C	[6]	cryst. transition
2	472°C	[6]	Nematic-isotropic transition
3	0°C	[8]	T_β

Surface Properties & Solubility:

Solubility Properties General: Blend with polyether ether ketone has been reported [11]
Solvents/Non-solvents: Insol. all organic solvents [10]. Xydar SRT-300 sol. 3,5-bis(trifluoromethyl)phenol (25°), pentafluorophenol (40°) [12]

Transport Properties:

Polymer Solutions Dilute: [η] 16.8 dl g^{-1} (3,5-bis(trifluoromethyl)phenol, 25°, Xydar SRT-300) [12]; [η] 14.5 dl g^{-1} (pentafluorophenol, 40°, Xydar SRT-300) [12]
Polymer Melts: Rheological props. have been reported [11]
Water Absorption:

No.	Value	Note
1	0.1 %	max., 24h, ASTM D570, Xydar G-930 [23]

Mechanical Properties:

Mechanical Properties General: Other mech. props. have been reported [18,21]. Dynamic mech. modulus has been reported [19]

Tensile (Young's) Modulus:

No.	Value	Note
1	2460 MPa	350 kpsi, Ekkcel C2000 [10]
2	8300 MPa	Xydar [24]
3	15800 MPa	2300 kpsi, ASTM D638, Xydar G-830 [23]

Flexural Modulus:

No.	Value	Note
1	10500 MPa	1520 kpsi, ASTM D790 [2]
2	4800 MPa	700 kpsi, 23°, Ekkcel C2000 [3]
3	7000 MPa	Xydar SRT-300 [11]
4	16200 MPa	235 kpsi, 260°, Ekkcel C2000 [10]
5	13400 MPa	1950 kpsi, ASTM D790, Xydar G-930 [23]

Tensile Strength Break:

No.	Value	Note	Elongation
1	156.5 MPa	22700 psi, ASTM D1708 [2]	9%
2	96.5 MPa	14000 psi, Ekkcel C2000 [3]	8%
3	135 MPa	Xydar SRT-300 [11]	
4	138 MPa	20000 psi, Xydar SRT-300 [17]	4.9%
5	135 MPa	ASTM D638, Xydar G-930 [23]	1.6%

Flexural Strength at Break:

No.	Value	Note
1	117 MPa	17000 psi, 23°, Ekkcel C2000 [10]
2	28 MPa	4000 psi, 260°, Ekkcel C2000 [10]
3	131 MPa	19000 psi, Xydar SRT-300 [17,24]
4	172 MPa	ASTM D790, Xydar G-930 [23]

Impact Strength: Impact strength 200 J m^{-1} (Xydar SRT-300) [11]. Other values of impact strength have been reported [21]
Viscoelastic Behaviour: Stress-strain curves for Xydar SRT-300 have been reported [11]. Viscoelastic props. have been reported [13]
Izod Notch:

No.	Value	Notch	Note
1	27 J/m	Y	0.5 ft lb in^{-1}, ASTM D256 method A [2]
2	53 J/m	N	1 ft lb in^{-1}, Ekkcel C2000 [3]
3	130 J/m	N	2.4 ft lb in^{-1}, Xydar SRT-300 [17]
4	454 J/m	N	Xydar [24]
5	587 J/m	Y	Xydar G-930 [23]
6	208 J/m	Y	Xydar [24]
7	95 J/m	Y	Xydar G-930, ASTM D256 [23]
8	425 J/m	N	Xydar G-930, ASTM D256 [23]

Electrical Properties:

Electrical Properties General: Dielectric props. have been reported [13]. Variation of dielectric loss with temp. has been reported in graphical form [8]. Dissipation factor for Xydar SRT-300 has been reported [11]. Dielectric constant and strength have been reported [22]. Other resistivity values have been reported [21]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4.2	60 Hz	ASTM D150, Xydar G-930 [23]
2	3.9	1 MHz	ASTM D150, Xydar G-930 [25]

Dielectric Strength:

No.	Value	Note
1	0.6 kV.mm^{-1}	Xydar SRT-300 [17]
2	39 kV.mm^{-1}	1000 V mil^{-1}, 1.6 mm, ASTM D149, Xydar G-930 [23]

Arc Resistance:

No.	Value	Note
1	>300s	min., UL-746A, Xydar G-930 [23]

Strong Field Phenomena General: Electrical breakdown characteristics have been reported [15]
Static Electrification: Electrical conduction of Xydar SRT-300 has been reported [14]

Optical Properties:

Transmission and Spectra: C-13 nmr [1,7], mass [4,9], nmr [20] and ir [20] spectral data have been reported

Polymer Stability:

Thermal Stability General: Heat resistance has been reported [18]
Upper Use Temperature:

No.	Value
1	330°C

Decomposition Details: Activation energy of thermal degradation has been reported. [4] 10% Weight loss at 475° (air), 482° (N_2) [4]; 50% weight loss at 514° (air), 514° (N_2) [4]. Main products of pyrolysis include C_6H_6 and phenol. [9] Other decomposition details have been reported [20,22]
Flammability: Flame retardance has been reported. [22] Flammability rating V0 (Xydar SRT-300, UL 94) [17], V0 (Xydar G-930, UL 94) [23]
Environmental Stress: Possesses good weathering resistance [23]. Stable to high levels of uv and microwave radiation [23]
Chemical Stability: Exhibits resistance to most chemicals, acids, solvents, hydrocarbons. [23]
Hydrolytic Stability: Resistant to boiling water [23]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by the slurry polymerisation of acetylated terephthalic acid, 4,4′-biphenol, and 4-hydroxybenzoic acid at 300–350° [6]. Xydar G-930 resin should be dried before use at 150° for 8h. Processed by injection moulding (melt temp. 280–360°, mould temp. 65–95°). Excellent flow characteristics enable them to fill long, thin moulds
Mould Shrinkage (%):

No.	Value	Note
1	0%	ASTM D955 [2]
2	1.2%	Ekkcel C2000 [3]

Applications: Used as an injection moulding resin for electrical, aerospace, automotive and lighting applications. Applications include usage in electrical and electronic connectors, surface interconnection devices, sockets, memory card frames. Other applications involve the aerospace industry, automotive industry and in machinery and equipment

Trade name	Details	Supplier

Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), Carbon fibre filled P-314

Synonyms: *Poly(4-hydroxybenzoic acid-co-2-oxy-6-naphthoic acid), carbon fibre filled*
Related Polymers: Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), glass fibre filled, Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), mineral filled
Monomers: 4-Hydroxybenzoic acid, 6-Hydroxy-2-naphthoic acid
Material class: Copolymers, Polymer liquid crystals, Composites
Polymer Type: polyester
CAS Number:

CAS Reg. No.
81843-52-9

Additives: Carbon fibre (30%)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.5 g/cm^3	A230 and B230 grades [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2×10^{-6} K^{-1}	A230 grade, flow direction [1]	L
2	3×10^{-6} K^{-1}	B230 grade, flow direction [1]	L
3	6.5×10^{-5} K^{-1}	A230 grade, transverse to flow [1]	L
4	4.5×10^{-5} K^{-1}	B230 grade, transverse to flow [1]	L

Melting Temperature:

No.	Value	Note
1	260°C	A230 grade [1]
2	280°C	B230 grade [1]

Deflection Temperature:

No.	Value	Note
1	221°C	1.82 MPa, A230 grade, ASTM D648 [1]
2	225°C	1.82 MPa, B230 grade, ASTM D648 [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.03 %	ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Specific moduli are similar to those of aluminium. Has greater stiffness than for example, Nylon 6 and Nylon 6,6. Flexural modulus and flexural strength at break decrease with increasing temp. [2] and sample thickness [3]. Tensile storage modulus decreases with increasing temp. [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	31000 MPa	A230 grade, ASTM D638 [1]
2	37000 MPa	B230 grade, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	24000 MPa	A230 grade [1]
2	32000 MPa	B230 grade [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	165 MPa	A230 grade [1]	1.2%
2	161 MPa	B230 grade [1]	1.1%

Flexural Strength at Break:

No.	Value	Note
1	255 MPa	A230 grade [1]
2	317 MPa	B230 grade [1]

Compressive Modulus:

No.	Value	Note
1	17200 MPa	A230 grade [1]
2	33100 MPa	B230 grade [1]

Compressive Strength:

No.	Value	Note
1	124 MPa	A230 grade [1]
2	238 MPa	B230 grade [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	<800 MPa	max, 80° [1]	tensile loss modulus

Fracture Mechanical Properties: Shear strength 121 MPa (A230 grade, ASTM D732) [1]

Electrical Properties:

Electrical Properties General: Has poor dielectric and insulating props. owing to the presence of carbon fibre

Polymer Stability:

Flammability: Has low smoke emission and low flammability [1]
Chemical Stability: Has good resistance to chemicals [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Suitable for injection moulding
Mould Shrinkage (%):

No.	Value	Note
1	0%	flow direction [1]
2	0.15%	transverse direction [1]

Applications: Applications due to low weight in injection moulding controlled surfaces; as replacement for aluminium and zinc parts in automotive and aerospace industries

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.02 %	A and C resin
2	0.01 %	24h, B resin, ASTM D792

Mechanical Properties:

Mechanical Properties General: Tensile storage moduli of all grades decrease with increasing temp. when measured in a N_2 atmosphere [6,7,8,9,10,11]. Flexural modulus and flexural strength all grades decrease with increasing sample thickness [4] and temp.

Tensile (Young's) Modulus:

No.	Value	Note
1	16600 MPa	A130 grade, ASTM D790 [1]
2	22000 MPa	A150 grade, ASTM D638 [1]
3	24100 MPa	B150 grade, ASTM D638 [1]
4	14500 MPa	C130 grade, ASTM D638 [1]
5	21000 MPa	C150 grade, ASTM D638 [1]
6	13800 MPa	E130 grade, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	12750–23100 MPa	0.79–6.35 mm thick, A130 grade [4]
2	18430–27360 MPa	0.79–6.35 mm thick, B130 grade [4]
3	10500–16600 MPa	0.79–6.35 mm thick, C130 grade [4]
4	3700–19450 MPa	23–220°, B130 grade
5	4400–21400 MPa	23–220°, B150 grade
6	3900–13200 MPa	23–220°, C130 grade
7	15000 MPa	A130 grade, ASTM D790 [1]
8	20000 MPa	A150 grade, ASTM D790 [1]
9	19000 MPa	B130 grade and C150 grade, ASTM D790 [1]
10	13100 MPa	C130 grade, ASTM D790 [1]
11	13800 MPa	E130 grade, ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note
1	161 MPa	C130 grade, ASTM D638 [1]
2	165 MPa	C150 grade, ASTM D638 [1]
3	124 MPa	E130 grade, ASTM D638 [1]
4	207 MPa	A130 grade, ASTM D638 [1]
5	180 MPa	A150 grade, ASTM D638 [1]
6	221 MPa	B130 grade, ASTM D638 [1]

Flexural Strength at Break:

No.	Value	Note
1	254 MPa	A130 grade, ASTM D790 [1]
2	248 MPa	A150 grade, ASTM D790 [1]
3	300 MPa	B130 grade, ASTM D790 [1]
4	212 MPa	C130 grade, ASTM D790 [1]
5	288–396 MPa	0.79–6.35 mm thick, B130 grade [4]
6	165–273 MPa	0.79–6.35 mm thick, C130 grade [4]
7	24.8–276 MPa	50–200°, B130 and B150 grades, ASTM D790 [5]
8	17.3–324 MPa	23–220°, B130 grade, ASTM D790
9	15.9–290 MPa	23–220°, B150 and C150 grades, ASTM D790
10	220 MPa	C150 grade, ASTM D790 [1]
11	172 MPa	E130 grade, ASTM D790 [1]
12	208–335 MPa	0.79–6.35 mm thick, A130 grade [4]

Compressive Modulus:

No.	Value	Note
1	12000 MPa	A130 grade [5]

4	20600 MPa	B150 grade [5]
5	12000 MPa	A130 grade, ASTM D790 [1]
6	15000 MPa	A150 grade, ASTM D790 [1]
7	20000 MPa	B130 and C130 grades, ASTM D790 [1]

Compressive Strength:

No.	Value	Note
1	195 MPa	B130 grade [5]
2	198 MPa	B150 grade [5]
3	124 MPa	C130 and C150 grades, ASTM D790 [1]
4	142 MPa	A130 grade [5]
5	156 MPa	A150 grade [5]
6	140 MPa	A130 grade, ASTM D790 [1]
7	155 MPa	A150 grade, ASTM D790 [1]
8	192 MPa	B130 grade, ASTM D790 [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	<750 MPa	max., 1060°, B150 grade [9]	tensile loss modulus
2	<500 MPa	max., 80°, C130 grade [10]	tensile loss modulus
3	<450 MPa	max., 80 °, C150 grade [11]	tensile loss modulus
4	<600 MPa	max., 60°, A130 grade [6]	tensile loss modulus
5	<600 MPa	max., 80°, A150 grade [7]	tensile loss modulus
6	<900 MPa	max., 95°, B130 grade [8]	tensile loss modulus

Hardness: Rockwell M80 (A resins, ASTM D785), M98 (B resins, ASTM D785), M75 (C resins, ASTM D785) [1]
Fracture Mechanical Properties: Shear strength 123 MPa (A130 grade, ASTM D695) [1], 132 MPa (B130 grade, ASTM D695) [1]
Friction Abrasion and Resistance: Tabor abrasion resistance 7.4 mg (1000 cycles)$^{-1}$ (A130 grade, ASTM D1044) [1]. Dynamic coefficient of friction 0.14 (against metal, A130 grade), 0.19 (against metal, A150 grade); static coefficient of friction 0.19 (against metal, A130 grade), 0.16 (against metal, A150 grade)
Izod Notch:

No.	Value	Notch	Note
1	150 J/m	Y	A130 grade, ASTM D256 [1,2]

2	90 J/m	Y	A150 and B130 grades, ASTM D256 [1,2]
3	125 J/m	Y	C130 grade, ASTM D256 [1,2]
4	85 J/m	Y	C150 grade, ASTM D256 [1,2]
5	107 J/m	Y	E150 grade, ASTM D256 [1,2]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4.1–4.3	1 kHz	
2	3.7–3.9	1 MHz-1 GHz	all grades, ASTM D150 [1]
3	3.7	1 kHz	E130 grade, ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	42–43 kV.mm^{-1}	23°, 50% relative humidity, short-term, 1.5 mm thick, 30% filled, ASTM D149

Arc Resistance:

No.	Value	Note
1	137–140s	30% filled, ASTM D495 [1,2]
2	181s	50% filled, ASTM D495 [1,2]

Dissipation (Power) Factor:

No.	Value	Note
1	0.006	A and E resins
2	0.004	C resin

Polymer Stability:

Flammability: Flammability rating V0 (0.8 mm thick, UL94) V0 (0.4 mm thick, B resin, UL94) [1,2]. Limiting oxygen index 37% (ASTM D2863)

Applications/Commercial Products:

Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), Mineral filled P-316

Synonyms: *Poly(4-hydroxybenzoic acid-co-2-oxy-6-naphthoic acid), mineral filled*
Related Polymers: Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), glass fibre filled, Poly(4-hydroxybenzoic acid-*co*-6-hydroxy-2-naphthoic acid), carbon fibre filled
Monomers: 4-Hydroxybenzoic acid, 6-Hydroxy-2-naphthoic acid
Material class: Composites, Polymer liquid crystals, Copolymers
Polymer Type: polyester
CAS Number:

CAS Reg. No.
81843-52-9

Additives: Wollastonite
Miscellaneous: Special bearing and wear grades are available. These are filled with various materials and give improved wear resistance and load-bearing props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.76 g/cm^3	A540 grade
2	d 1.89 g/cm^3	C550 grade

Thermal Expansion Coefficient:

Poly(3-hydroxybutyrate) P-317

Synonyms: *PHB. Poly(α-hydroxybutyrate). Poly(3-hydroxybutanoate)*
Related Polymers: Poly(3-hydroxybutyrate-*co*-3-hydroxyvalerate)
Monomers: 3-Hydroxybutanoic acid
Material class: Thermoplastic
Polymer Type: polyester
CAS Number:

CAS Reg. No.	Note
26063-00-3	homopolymer

Molecular Formula: $(C_4H_6O_2)_n$
Fragments: $C_4H_6O_2$
Molecular Weight: MW up to 500000
Additives: Glass fibre acts as a strengthening agent, increasing flexural modulus and softening point and decreasing tensile strength
Tacticity: Biosynth. material is isotactic, with the β-carbon in the chain having an *R*-configuration
Morphology: Prevalent in aerobic and anaerobic bacteria in a range of structs., used as a storage material, in membranes and in physiological processes [5,6]. Biosynthetic pathway involves stereoselective reduction and polymerase enzymes [7]. Cryst. struct. orthorhombic, unit cell a 5.76, b 13.2, c 5.96 [9]. Exists in a helical conformation and forms lamellar crysts. Crystallation kinetics have been reported [10]. Partial melting and crystallisation (self seeding) gives rise to smaller spherulites and better mech. props. [24]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.177 g/cm^3	amorph. [24]
2	d 1.243 g/cm^3	81% cryst. [23]
3	d 1.25 g/cm^3	80% cryst. [4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6×10^{-5} K^{-1}	[23]	L

Thermodynamic Properties General: Thermodynamic props. have been reported [24]

Melting Temperature:

No.	Value	Note
1	174–177°C	optically active [2]
2	167–169°C	racemic [2]
3	179°C	injection moulded [24]
4	175°C	80% cryst. [4]

Glass Transition Temperature:

No.	Value	Note
1	9°C	DSC study [23]
2	15°C	80% cryst. [29]

Deflection Temperature:

No.	Value	Note
1	157°C	injection moulded [24]

Vicat Softening Point:

No.	Value	Note
1	160°C	[23]

Surface Properties & Solubility:

Plasticisers: Polar compounds can act as plasticisers. Only the amorph. phase of the polymer is affected
Solvents/Non-solvents: Sol. $CHCl_3$, trifluoroethanol, dichloroethane, dichloroacetic acid, CH_2Cl_2, pyridine. Insol. MeOH, hexane, Et_2O

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink equation parameters have been reported for a range of solvents [24,25]
Polymer Melts: Unstable in melt. Melt viscosity 15000 NS m^{-2} (calc.) [24]
Permeability of Gases: Less gas permeable than poly(ethylene terephthalate) by a factor of five [2]
Water Absorption:

No.	Value	Note
1	0.13 %	23°, 1 month [24]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	45 cm^3 mm/(m^2 day atm)	film [24]

Mechanical Properties:

Mechanical Properties General: Young's modulus decreases with increasing temp. [23]. Processing methods affect mech. props., spherulites and cracks result in brittle polymers, these defects can be removed by rolling and melt processing

Tensile (Young's) Modulus:

No.	Value	Note
1	5500 MPa	-150° [23]
2	4500 MPa	10° [23]

3	1500 MPa	100° [23]
4	3500 MPa	unnucleated moulding [24]
5	3200 MPa	self seeded moulding [24]
6	4000 MPa	film [24]

Flexural Modulus:

No.	Value	Note
1	9000 MPa	30% glass filled [24]
2	4000 MPa	80% cryst. [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	28 MPa	[24]	7%
2	30 MPa	45% cold rolled [24]	180%
3	40 MPa	injection moulded [4,24]	6%
4	10 MPa	0°, amorph. [24]	1140%
5	0.2 MPa	23°, amorph. [24]	130%
6	700 MPa	film [24]	75%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	20 MPa	5%	amorph. [24]
2	11.4 MPa		7°, amorph. [24]

Mechanical Properties Miscellaneous: Other dynamic mech. props. have been reported [23]
Izod Notch:

No.	Value	Notch	Note
1	20 J/m	Y	unnucleated moulded [24]
2	65 J/m	Y	self seeded moulded [24]
3	50 J/m	Y	injection moulded [24]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	3	room temp. [24]

Complex Permittivity and Electroactive Polymers: Piezoelectric; produces a voltage when deformed, or deforms when an external voltage is applied [22,24]

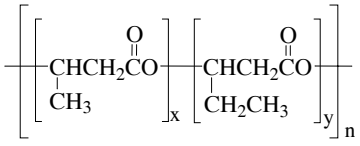
Optical Properties:

Transmission and Spectra: Nmr and ir [24] spectral data have been reported [26,27]
Total Internal Reflection: Optical rotation varies with wavelength, max. in uv range
Volume Properties/Surface Properties: Films are transparent with good clarity

Polymer Stability:

Decomposition Details: Decomposes to crotonic acid and oligomers (dimers, trimers) up to 340°. Above this CO_2 and other volatile products are liberated. Degradation occurs via random scission
Environmental Stress: Has good resistance to uv radiation
Chemical Stability: Has good stability to motor oil, but poor stability to chlorinated solvents [24]. Has moderate stability to alcohols
Hydrolytic Stability: Stable for several months in water but surface modification occurs resulting in hydrolysis and degradation of films by crystallisation [19]. Unstable to base and hot conc. acid [24]
Biological Stability: Undergoes biological attack within the cell as a consequence of normal biological processes. Processed polymer is also attacked by bacteria, fungi and algae [20]. Degradation occurs rapidly in moist soil, where bacteria dissolve the polymer before metabolising it. Degradation is negligible in air, anaerobic conditions dramatically increase degradation rate. Degrades *in vivo* to the monomer which is a natural metabolite
Recyclability: Biodegradability outweighs usefulness of recycling, though may possibly be recycled with other polymers [21]

Applications/Commercial Products:



Processing & Manufacturing Routes: Isol. from a range of bacterial species [28] including *Alcaligenes eutrophus*, *Pseudomonas oleovorans* [1], *Bacillus megaterium* [13], *Pseudomonas cepacia* [14] among others, fed with a suitable carbon source *e.g.* fructose, glucose, MeOH, AcOH, CO_2 [11,12]. The biosynth. polymer is removed from the bacteria in one of three ways. Solvent extraction [15] involves dissolving the polymer from the cells using $CHCl_3$, CH_2Cl_2 or other chlorinated hydrocarbons, followed by filtration to remove cell material, then precipitation. High MW polymers are obtained but large solvent quantities are involved. Sodium hypochlorite [16] is also used to digest bacteria, degrading cell walls and non-polymeric material. Washing the intact polymer with an organic solvent such as Et_2O leaves the pure polymer. The alkalinity of the hypochlorite can cause degradation of the polymer and lower MW. Biochemical degradation of the bacteria using enzymes [17] followed by drying or solvent extraction also is used to purify the polymer. MW can be controlled. May be melt processed at temp. $<190°$ for short time. Can be blow-moulded and injection-moulded
Applications: Applications include degradable packaging, bottles and films. Useable in surgery for implants and sutures due to low toxicity, slowly degraded *in vivo*. Piezoelectric props. may also be useful in bone fracture healing. May be used as a chiral organic building block or as a stationary phase in chromatography

Poly(3-hydroxybutyrate-*co*-3-hydroxyvalerate) P-318

Synonyms: *PHBV. Poly(α-hydroxybutyrate-co-α-hydroxyvalerate). Poly(3-hydroxybutanoate-co-3-hydroxypentanoate)*
Related Polymers: Poly(3-hydroxybutyrate)
Monomers: 3-Hydroxybutanoic acid, 3-Hydroxypentanoic acid
Material class: Thermoplastic, Copolymers
Polymer Type: polyester
CAS Number:

CAS Reg. No.
80181-31-3

Molecular Formula: $[(C_4H_6O_2)_x(C_5H_8O_2)_y]_n$
Fragments: $C_4H_6O_2$ $C_5H_8O_2$
General Information: Increasing amount of hydroxyvalerate decreases transition temps., improves flexibility and increases toughness [7]
Tacticity: Biosynth. confers inherent tacticity, every β-carbon has *R*-configuration [5]
Morphology: Displays isodimorphism, where the comonomer components crystallise in the same crystal lattice, the crystal lattice for either hydroxybutyrate or hydroxyvalerate [5]. This co-crystallisation enhances toughness, and increases melting point due to higher lattice energies and an increase in the *a* cell parameter [2,3,9]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.231 g/cm^3	11% hydroxyvalerate [21]
2	d 1.2045 g/cm^3	28% hydroxyvalerate [21]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8×10^{-5} K^{-1}	28% hydroxyvalerate [14,21]	L

Thermodynamic Properties General: Thermal expansion coefficient increases with increasing hydroxyvalerate content [21]
Melting Temperature:

No.	Value	Note
1	160°C	10% hydroxyvalerate [2]
2	85°C	32% hydroxyvalerate [2]
3	105°C	86% hydroxyvalerate [21]
4	112–127°C	18% hydroxyvalerate [9]
5	68–90°C	55% hydroxyvalerate [9]

Glass Transition Temperature:

No.	Value	Note
1	2°C	11% hydroxyvalerate
2	-8°C	28% hydroxyvalerate [14,21]

Transition Temperature General: T_m decreases with increasing hydroxyvalerate content to a min. at 30 mol %, then increases with increasing hydroxyvalerate content [2]. T_m also depends on cryst. temp. Racemic polymer has lower T_m. T_g decreases with increasing hydroxyvalerate content [21]
Deflection Temperature:

No.	Value	Note
1	140°C	3% hydroxyvalerate [7]
2	112°C	14% hydroxyvalerate [7]
3	92°C	25% hydroxyvalerate [7]

Vicat Softening Point:

No.	Value	Note
1	90°C	28% hydroxyvalerate [7]

Surface Properties & Solubility:

Plasticisers: Polar compounds may be used as plasticisers [7]. 3-Hydroxyvalerate acts as an internal plasticiser for polyhydroxybutyrate
Solvents/Non-solvents: Sol. $CHCl_3$, CH_2Cl_2, dichloroethane, pyridine, trifluoroethanol. Insol. MeOH, Et_2O, hexane
Surface Tension:

No.	Value	Note
1	48 mN/m	37°, 12% hydroxyvalerate [15]

Transport Properties:

Polymer Solutions Dilute: [η] 1.03 (4% hydroxyvalerate, MV 113000) ; 3.42 (17% hydroxyvalerate, MV 526000); 1.49 (32% hydroxyvalerate, MV 181000, synthetic) [2]
Polymer Melts: Unstable in the melt
Gas Permeability:

No.	Gas	Value	Note
1	O_2	60 cm^3 mm/(m^2 day atm)	film, 17% hydroxyvalerate [7]

Mechanical Properties:

Mechanical Properties General: Tensile strength and Young's modulus decrease with hydrolytic degradation [16] and with increasing temp. [21]. Increasing hydroxyvalerate content decreases tensile props. and increases impact strength

Tensile (Young's) Modulus:

No.	Value	Note
1	1300 MPa	14% hydroxyvalerate [16]
2	3500 MPa	-150°, 28% hydroxyvalerate [21]

3	1500 MPa	10°, 28% hydroxyvalerate [21]
4	700 MPa	25% hydroxyvalerate [7]

Tensile Strength Break:

No.	Value	Note	Elongation
1	113 MPa	14% hydroxyvalerate [16]	42%
2	38 MPa	3% hydroxyvalerate [7]	
3	30 MPa	25% hydroxyvalerate [7]	

Mechanical Properties Miscellaneous: Dynamic mech. props. have been reported [19,20,21]. Dynamic modulus decreases with increasing temp. [20]. Copolymer fibres have been reported [7]
Izod Notch:

No.	Value	Notch	Note
1	60 J/m	Y	3% hydroxyvalerate [7]
2	120 J/m	Y	14% hydroxyvalerate [7]
3	400 J/m	Y	25% hydroxyvalerate [7]

Electrical Properties:

Complex Permittivity and Electroactive Polymers: Piezoelectric: produces a voltage when deformed, and is deformed by an applied voltage [10]

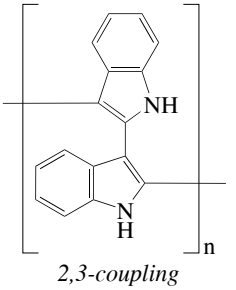
Optical Properties:

Transmission and Spectra: H-1 nmr, C-13 nmr [2,5], ir [5] and uv [5] spectral data have been reported

Polymer Stability:

Thermal Stability General: Is susceptible to thermal degradation
Decomposition Details: Pyrolysis yields crotonic acid and pentenoic acid derivatives (250°) [14]
Hydrolytic Stability: Increasing hydroxyvalerate content and increasing temp. decrease hydrolytic stability [13]. Random chain scission occurs decreasing MW and thus mech. props. [16]
Biological Stability: Degraded via surface attack of bacteria, algae and fungi [10], which dissolve and metabolise the polymer to CO_2 and H_2O. Decompositon rates are increased in moist anaerobic conditions such as in soil, compost, sewage and landfill sites. Degradation is negligible in air
Recyclability: Degradability outweighs any merits of recycling

Applications/Commercial Products:



Processing & Manufacturing Routes: Isol. from *Alcalgeus entrophus* fed with acetate and propionate sources, such as fructose, glucose and propionic acid [4,5,6]. This produces a random copolymer, the composition of the two components is controlled by the amount of feedstock materials. The polymer is then extracted from the bacterial broth using one of three methods. Solvent extraction [11] involves dissolving the polymer from the bacterial cells using chlorinated solvents, followed by filtration to remove cell material, then precipitation. This yields high MW polymers, but large quantities of solvent are required. Sodium hypochlorite [12] digests bacteria, degrading all walls and non-polymeric material. The polymer remains intact and is washed with an organic solvent. This process may degrade the polymer due to the alkalinity of the hypochlorite, leading to lower MW. Biochemical degradation of the bacteria using enzymes [13], followed by drying or solvent extraction is also used. MW may be controlled by the enzymes and conditions used. May be produced synthetically from butyrolactone and valerolactone polymerisation with a stereoselective aluminoxane catalyst. Melt processing must be carried out below 165°
Applications: Used in biodegradable packaging such as bags, films and bottles. Used also for items which are difficult to recycle such as sanitary and food products. Used as an impermeable coating for paper, to increase biodegradability for use in liquid carriers. Possible uses include biodegradable capsules for pharmaceuticals and insecticides, as biocompatible medical and veterinary materials, sutures, dressings and fibres. Applications due to piezoelectricity such as bone fracture healing and in electronics

Trade name	Supplier
Biopol	Monsanto Chemical

Polyindole P-319

2,3-coupling

Synonyms: *1H-Indole homopolymer*
Monomers: Indole
Material class: Thermoplastic
Polymer Type: polyindole
CAS Number:

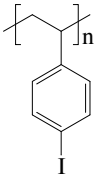
CAS Reg. No.
82451-55-6

Molecular Formula: $(C_8H_5N)n$
Fragments: C_8H_5N
Additives: Dopant ions such as tetrafluoroborate, perchlorate, hexafluorophosphate and chloride are present in the oxidised form obtained electrochemically or chemically.
General Information: Conductive polymer with electrochromic properties. In oxidised (doped) form the polymer obtained as film or powder is usually dark green in colour, while in reduced (de-doped) form it is golden-yellow.
Tacticity: 2,3-Coupling has been established as the most likely form of unit coupling in the polymer [1,2], with regular, statistical or random 2,2-, 2,3-, or 3,3-links possible.
Morphology: Morphology of films is dependent on experimental conditions [3].

Surface Properties & Solubility:
Solubility Properties General: Polymer is usually insoluble in common organic solvents, although electrochemically prepared samples using some supporting electrolytes such as boron trifluoride diethyl etherate exhibit limited solubility in MeCN, THF, Me_2CO, and DMSO [4].

Electrical Properties:
Electrical Properties General: Undoped polymer is an insulator but its conductivity increases considerably when doped, for example with $PF_6^{\ominus}$ (0.6 S cm^{-1}) [5], boron trifluoride diethyl etherate (up to 0.1 S cm^{-1}) [4], $ClO_4^{\ominus}$ (0.03 S cm^{-1}) [6] or $BF_4^{\ominus}$ (0.01 S cm^{-1}) [7]. Samples prepared electrochemically have higher levels of dopant and are more conductive than those prepared by chemical oxidation [3].

Optical Properties:
Optical Properties General: Polymer films exhibit an absorption band in UV region with λ_{max} *ca*. 400nm; fluorescence bands at longer wavelength have also been reported [4].
Transmission and Spectra: Pmr [2], FT-IR [1,2,4,8,9,10,11], Raman [1,11], uv [4,8,9,10] and esr [8,9,10] spectral data of doped and de-doped polymer have been reported.



Polymer Stability:
Polymer Stability General: Doped polymers are stable at r.t. [3].
Thermal Stability General: Polymer is stable up to *ca*. 400°C with small weight loss due to dopant only. Decomposition with rupture of polymer backbone occurs between 400°C and 650°C in air [6,12]. Dedoped polymer undergoes 50% weight loss at 544°C in air and 681°C in nitrogen [6].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. mainly by electrochemical anodic oxidation of indole in a suitable solvent such as acetonitrile [1,3,11] or dichloromethane [5] with a supporting electrolyte such as lithium perchlorate [1,3,11], boron trifluoride etherate [4] or tetraethylammonium tetrafluoroborate [10]. The polymer obtained is in the doped form and can be dedoped by treatment with, for example, sodium hydroxide. A chemical method of producing polyindole has been reported [3,13], where indole is treated with a suitable oxidising agent such as $FeCl_3$, $CuCl_2$ or KIO_3 in a solvent such as acetonitrile or an alcohol (with $FeCl_3$).
Applications: Potential applications as anode material in batteries and for corrosion protection coatings of metals.

Poly(isobutyl cyanoacrylate) P-321

Synonyms: *Isobutyl cyanoacrylate polymer*
Related Polymers: Poly(alkyl cyanoacrylate), Poly(methyl cyanoacrylate), Poly(ethyl cyanoacrylate), Poly(allyl cyanoacrylate)
Monomers: Isobutyl cyanoacrylate
Material class: Thermoplastic, Gums and resins
Polymer Type: acrylic, acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
26809-38-1

Molecular Formula: $(C_8H_{11}NO_2)_n$
Morphology: Amorph.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.125 g/cm^3	20° [2]

Melting Temperature:

No.	Value	Note
1	192°C	[5]

Glass Transition Temperature:

No.	Value	Note
1	130°C	differential scanning calorimetry [2]
2	51°C	dilatometry [4]

Transition Temperature General: T_g varies with composition of polymer and impurities

Vicat Softening Point:

No.	Value	Note
1	107°C	[5]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 11 J$^{1/2}$ cm$^{-3/2}$

Wettability/Surface Energy and Interfacial Tension: Contact angle 55° [3]

Mechanical Properties:

Mechanical Properties General: Is a good adhesive for bone fractures; tensile strength is max. with addition of 10% hydroxyapatite [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	20.4 MPa	2960 psi, steel, ASTM D638 [5]	2%
2	8.3 MPa	bone [3]	

Mechanical Properties Miscellaneous: Tensile shear strength 9.79 MPa (1420 psi, steel-steel, Al-Al, ASTM D1002) [7]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value
1	4.2

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.26	20°

Polymer Stability:

Polymer Stability General: Is unstable at temps. above 150° (approx.)

Decomposition Details: Depolymerisation occurs at increased temp.

Environmental Stress: Unsuitable for use in situations of high heat, high impact, moisture or outdoor conditions

Hydrolytic Stability: Degraded by alkali; unstable to moisture

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by polymerisation of isobutyl cyanoacrylate monomer when exposed to base. Forms nanoparticles if polymerised in dilute soln. in presence of surfactant [1]. Particle size up to 50 nm

Applications: Instant adhesive, may be used for bone fractures. Nanoparticles may be used for drug transport if polymerisation occurs in a dilute soln. of pharmacological agent, which can be used for targetted therapy

No.	Value	Note
1	d^{20} 1.045 g/cm^3	[1]
2	d^{20} 1.088 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0006 K^{-1}	M_n 912000, T > T_g [3]	V
2	0.00026 K^{-1}	M_n 912000, T g [3]	V

Equation of State: Mark-Houwink constants have been reported [18,19]

Specific Heat Capacity:

No.	Value	Note	Type
1	223.4 kJ/kg.C	27°, melt [4]	P

2	109 kJ/kg.C	-43°	P
3	137.7 kJ/kg.C	27°	P
4	207 kJ/kg.C	127°	P

Glass Transition Temperature:

No.	Value	Note
1	48°C	bulk polymerisation, 60°; M_n 912000 [3]
2	53°C	atactic [5]
3	53°C	free-radical polymerisation, 44–60° [6]
4	120°C	syndiotactic [5,7]
5	8°C	isotactic [5,7]
6	8°C	anionic polymerisation/non-polar solvent [6]
7	55°C	[2]

Vicat Softening Point:

No.	Value	Note
1	67°C	[1]

Transition Temperature:

No.	Value	Note	Type
1	-148°C	[8]	γ-transition

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy 38.3–62.7 kJ mol-*1* [9], 41500 J mol^{-1} [5]. Cohesive energy density 313 J cm^{-3} (74.8 cal cm^{-3}) (35°) [10]. δ 35.6–46.5 $J^{1/2}$ $cm^{-3/2}$ (8.5–11.1 $cal^{1/2}$ $cm^{3/2}$, poor H-bonding solvents) [11], 35.6–41.4 $J^{1/2}$ $cm^{-3/2}$ (8.5–9.9 $cal^{1/2}$ $cm^{-3/2}$) (moderate H-bonding solvents) [11], 39.8–47.7 $J^{1/2}$ $cm^{-3/2}$ (9.5–11.4 $cal^{1/2}$ $cm^{-3/2}$) (strong H-bonding solvents) [11], 16.8–21.5 $J^{1/2}$ $cm^{-3/2}$ [9], 35.7 $J^{1/2}$ $cm^{-3/2}$ (8.53 $cal^{1/2}$ $cm^{-3/2}$) [12] 29.9 $J^{1/2}$ $cm^{-3/2}$ (7.15 $cal^{1/2}$ $cm^{-3/2}$) [13], 36.2 $J^{1/2}$ $cm^{-3/2}$ (8.65 $cal^{1/2}$ $cm^{-3/2}$) [14]; γ_d 20.4, $\gamma_{p\ 3.3}$

Solvents/Non-solvents: Sol. hexane, cyclohexane, gasoline, Nujol (hot), turpentine, castor oil (hot), linseed oil (hot), CCl_4, EtOH (hot), isopropanol (>23.7°), Et_2, Me_2CO. Insol. formic acid, EtOH (cold) [15].

Wettability/Surface Energy and Interfacial Tension: Contact angle 73° (advancing, H_2O) [16]; (dγ/dT) 0.06 mN $m^{-1}k^{-1}$ [17].Interfacial tension 5.5 mN m^{-1} (polyethylene, branched; 20° [17].

Surface Tension:

No.	Value	Note
1	30.9 mN/m	20°; MV 35000 [17]
2	23.7 mN/m	140°; MV 35000 [17]
3	21.3 mN/m	180°; MV 35000 [17]

Transport Properties:

Polymer Solutions Dilute: Theta temps. 48.1° (DMF isotactic), 115.6° (methyl carbitol), 74.9° (methyl cellosolve) [19,20]

Permeability of Liquids: Diffusion coefficient [H_2O] 24.3 × 10^{-8} cm^2 s^{-1} (37°) [16]

Water Content: 0.4% (max.) [2]

Water Absorption:

No.	Value	Note
1	0.4 %	max. [16]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	25 MPa	23° [2]	1%

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.29 MPa	[21]	Bulk modulus

Viscoelastic Behaviour: Longitudinal sound speed 2140 m s^{-1} (room temp., 1 MHz) [22], 2350 m s^{-1} [23]. Shear sound speed 945 m s^{-1} (room temp., 1 MHz) [22]

Hardness: Knoop number 8 (Tukon) [2]. Vickers 9 (5 kg load) [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.477	20° [9]

Polymer Stability:

Decomposition Details: Decompostion at 250° yields monomer [1]

Applications/Commercial Products:

Trade name	Details	Supplier
Acryloid (Paraloid)	B67	Rohm and Haas
Elvacite	2045	ICI, UK
Standard Samples	MW 200000–500000	Aldrich
Standard Samples		Scientific Polymer Products Inc.

Poly(isobutyl vinyl ether) P-323

Synonyms: *Poly(2-methylpropyl vinyl) ether. PIBVE. PiBVE. Poly(2-methylpropoxyethene). Poly(isobutoxyethene). Poly(vinyl isobutyl ether). Poly(vinyl 2-methylpropyl ether)*
Related Polymers: Poly(vinyl ethers), Poly(vinyl isobutyl ether-*co*-maleic anhydride
Monomers: Isobutyl vinyl ether
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
28853-85-2	homopolymer
28299-00-5	*S*-(-)-homopolymer
9003-44-5	

Molecular Formula: $(C_6H_{12}O)_n$
Fragments: $C_6H_{12}O$
General Information: Polymerisation can give rise to (*S*)-(-)-form and an (*R,S*)-form
Tacticity: Isotactic and isotactic (*S*)-form have been reported
Morphology: (*S*)-(-)-form crystallises with 17/5 helix [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 0.916 g/cm^3	[2,9]
2	d^{25} 0.93 g/cm^3	rubbery [40]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.26×10^{-5} K^{-1}	T >-22° [1]	L
2	1.26×10^{-5} K^{-1}	-22° >T >-63°	L
3	1.14×10^{-5} K^{-1}	-63° >T >-121°	L
4	1.03×10^{-5} K^{-1}	T <-121° [1]	L
5	0.0007922 K^{-1}	20° [17]	V

Volumetric Properties General: Molar volume V_r 107.6 cm^3 mol^{-1} [40]
Equation of State: Tyagi-Deshpande equation of state information has been reported [17]
Thermodynamic Properties General: Thermodynamic props. have been reported [41]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.63 kJ/kg.C	3° [42]	P
2	1.68 kJ/kg.C	23° [42]	P

Melting Temperature:

No.	Value	Note
1	165°C	[4]
2	120–130°C	[43]

Glass Transition Temperature:

No.	Value	Note
1	-19°C	[2]
2	-24°C	[5]

Vicat Softening Point:

No.	Value	Note
1	65–76°C	[5]

Transition Temperature:

No.	Value	Note	Type
1	-63°C	[1]	T_{gg}
2	-121°C	[1]	T_{gg}
3	-7°C	[2]	Inflection temp.
4	<-10°C	max. [2]	Low temp. stiffening

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameter 31.5 J$^{1/2}$ cm$^{-3/2}$ (7.5 cal$^{1/2}$ cc$^{-1/2}$) [2]. δ 38 J$^{1/2}$ cm$^{-3/2}$ (9.07 cal$^{1/2}$ cm$^{-3/2}$) [26]
Solvents/Non-solvents: Mod. sol. 2-butanone, heptane, C_6H_6, THF [3]. Insol. MeOH, Me_2CO [3]. Isotactic form insol. heptane, C_6H_6 [4]; isotactic (*S*)-form insol. methyl isobutyl ketone, 2-butanone, nitrobenzene [9]. Amorph. sol. C_6H_6, halogenated hydrocarbons, butanol, 2-butanone, cyclohexanone, cyclohexane, heptane, Et_2O [27], insol. EtOH, 2-ethoxyethanol. Crystalline sol. $CHCl_3$ (50°), insol. heptane, hot 2-propanol, 2-butanone
Surface Tension:

No.	Value	Note
1	29 mN/m	23° [12]

Transport Properties:

Polymer Solutions Dilute: [η] 0.11–0.12 dl g^{-1} (C_6H_6, 30°) [35], 0.197 dl g^{-1} (C_6H_6, 30°, isotactic) [36], 0.193 dl g^{-1} (C_6H_6, 30°, atactic) [36], 0.0067 dl g^{-1} (6.7 ml g^{-1}, atactic) [17], 0.0089 dl g^{-1} (8.9 ml g^{-1}, isotactic) [17]. η_{inh} 4 dl g^{-1} [1], 0.28 dl g^{-1} ($CHCl_3$, 30°) [30]. η_{sp} 0.19–0.28 dl g^{-1} (C_6H_6, 30°) [31]. Other viscosity values have been reported [4,5,32,33,34]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	2.96 MPa	430 psi [5]

Elastic Modulus:

No.	Value	Note
1	3.51–4.56 MPa	509–661 psi [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.94–1.08 MPa	137–157 psi [5]	100% modulus

Hardness: Shore A55 [5], A35 (24h) [29]. Rockwell 55 [5]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.3214–2.3362	25°, isotactic [26]
2	2.3115–2.3422	25°, atactic [26]
3	2.2683–2.2822	50°, isotactic [36]
4	2.2625–2.2919	50°, atactic [36]

Magnetic Properties: 1.16D (25°, isotactic), 1.07 (25°, atactic) [36], 1.21D (50°, isotactic), 1.11 (50°, atactic) [36], 0.976–0.983D (atactic), 0.983–0.987D (isotactic) [36]. Average dipole moment of polymer per monomeric unit has been reported [33]

Dissipation (Power) Factor:

No.	Value	Note
1	0.00016	[37]

Optical Properties:

Optical Properties General: Forms an optically active homopolymer

Refractive Index:

No.	Value	Note
1	1.4507	30° [2]
2	1.3965	20° [4]

Transmission and Spectra: C-13 nmr [8] and H-1 nmr spectral data of poly (*R,S*)-form have been reported [22]. Broad-banded uv spectrum between 185–200 nm for (*S*)-(-)-form [22]has been reported. Ir [25,38,39] and vibrational circular dichroism spectral data have been reported [23,25]. H-1 nmr spectral data have been reported [38,39]

Molar Refraction: Molar refraction 29.41 [2]

Total Internal Reflection: $[\alpha]_D^{25}$ +0.425 (plate, low crystallinity) [9]; $[\alpha]_D^{14}$ +209 ((*S*)-form, *p*-xylene) [15]

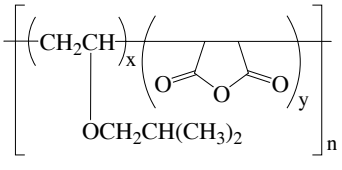
Polymer Stability:

Polymer Stability General: Oxidatively degraded by air. Also degraded by γ-radiation [14]

Decomposition Details: Decomposes by oxidative chain degradation [14]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerised mainly by the use of aluminium catalysts [3,21,24,25], or by using calcinated iron(*II*) sulfate [7,11,12]. Stereospecific polymerisation achieved with vanadium pentoxide [6]. Has also been prepared by using zeolites [16,19] and Ziegler-Natta catalysts [10]. May also be prepared by catalysis using boron trifluoride [18,20]



Applications: Used in adhesives, lubricants, greases and surface coatings

1,2-Polyisoprene P-325

Synonyms: *Polyisoprene. Vinyl-polyisoprene. 1,2-Poly(2-methyl-1,3-butadiene)*
Monomers: Isoprene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-31-0

cis-1,4-Polyisoprene P-326

Synonyms: *cis-Polyisoprene. cis-1,4-Poly(2-methyl-1,3-butadiene). IR*
Related Polymers: Natural rubber
Monomers: Isoprene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-31-0

General Information: Polyisoprene with >90% *cis*-1,4 microstruct. is rubbery. Inferior props. to natural rubber, poor retention at high temp. and may be difficult to compound. Easier to process, and generally has more consistent props. than natural rubber
Morphology: The less *cis* content in the polymer, the less crystalline it is, and the less like natural rubber

4	-72°C	98.3% *cis*-1,4, 1.4% *trans*-1,4, 0.3% 3,4 [2]
5	-71°C	100% *cis* [1]
6	-68°C	70% *cis*, 23% *trans*, 7% 3,4 [1]
7	-52°C	50% *cis*, 27% *trans*, 24% 3,4 [1]

Transition Temperature General: T_g varies with composition, increasing with increasing 3,4-polymer content [32]. Other T_g values have been reported [3]

Surface Properties & Solubility:
Solubility Properties General: *Cis*-1,4-polyisoprene gives the closest approximation to ideal mixing with poly-1,2-butadiene rubber [26]
Cohesive Energy Density Solubility Parameters: Solubility parameter δ 16.9 $J^{1/2}$ $cm^{-3/2}$ [21]
Solvents/Non-solvents: Sol. THF, hydrocarbons; insol. alcohols, esters, nitromethane
Surface Tension:

No.	Value	Note
1	32 mN/m	20° [3]

Transport Properties:
Polymer Solutions Dilute: θ temp. 31.2° (dioxane, 96% *cis*) [4]; 16.5° (methyl isobutyl ketone, 94% *cis*) [5]; 12–34° (dioxane, branched butanones) [6,7,8]. Mark-Houwink constants have been reported [24,45,46]

Mechanical Properties:
Mechanical Properties General: Mech. props. compared to other rubbers have been reported [24]
Tensile Strength Break:

No.	Value	Note	Elongation
1	26 MPa	Natsyn [24]	480%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	2.35 MPa	630%	Natsyn [24]

Viscoelastic Behaviour: Williams-Landel-Ferry equation parameters for viscoelastic response have been reported [11,12,13]. Other viscoelastic props. have been reported [28,29]. Zero shear viscosity 2.55 MPa s (Natsyn) [33], 0.68 MPa s (Cariflex) [33]. Longitudinal speed of sound 1550 m s^{-1} (MHZ, *cis*) [17]
Mechanical Properties Miscellaneous: Tear strength 72.3 kN m^{-1} (Natsyn) [24]. Compression set 17% (Natsyn, 22h, 70°) [24]
Friction Abrasion and Resistance: MST abrasion resistance 168 (Natsyn) [24]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.519	25° [23]

Transmission and Spectra: Ir spectral data have been reported [10]

Polymer Stability:

Polymer Stability General: Has similar resistance to natural rubber, and Guayule rubber, though lacks the natural antioxidants of *Hevea* rubber [25]
Thermal Stability General: Degrades at moderate temp.
Upper Use Temperature:

No.	Value	Note
1	60–80°C	[15]

Decomposition Details: Thermal degradation yields volatile, low MW hydrocarbons [19]; may also produce hydroxyl, ether and carbonyl functionalised compounds and polynuclear aromatic compounds [25]. 50% Volatilisation occurs at 325° [19]. Depolymerisation activation energy 234–264 kJ mol^{-1} [20]
Flammability: Limiting oxygen index 18.5% [14]. High volatile loss, low char polymer. Aluminium trihydrate acts as flame and smoke retardant. Decomposition volatiles are flammable [19,27]
Biological Stability: Stability to soil cultures has been reported [16]
Stability Miscellaneous: γ-Radiation reduces level of unsaturation, producing free radicals, and also produces hydrogen gas release [30]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by Ziegler-Natta or alkyl lithium catalysis of isoprene. Has good moulding props. and often used as processing aid
Applications: More expensive alternative to natural rubber. Has better moulding props. but poorer mech. and green strength props. Used in similar applications, *e.g.* footwear, hoses, flexible mounts

Trade name	Supplier
Cariflex IR	Shell Chemicals
Isolene	Hardman
Kuraray IR	Kuraray Co
Natsyn	Goodyear
Nipol IR	Nippon Zeon

trans-1,4-Polyisoprene P-327

Synonyms: *trans-Polyisoprene. trans-1,4-Poly(2-methyl-1,3-butadiene)*
Related Polymers: Natural balata, *cis*-1,4-Polyisoprene
Monomers: Isoprene
Material class: Synthetic Elastomers, Thermoplastic
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-31-0

General Information: >90% *trans*-1,4 struct. is crystalline

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.96 g/cm^3	99% *trans*-1,4, 0.2% 3,4 [1]

Melting Temperature:

No.	Value	Note
1	67°C	99% *trans*-1,4, 0.2% 3,4 [1]

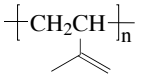
Surface Properties & Solubility:
Surface Tension:

No.	Value	Note
1	31 mN/m	20° [2]

Transport Properties:
Polymer Solutions Dilute: Theta temps. θ 47.7° (dioxane, 96%*trans*) [3,4], 250.5° (toluene, propanol) [3,4]. Mark Houwink constants have been reported [3,4]
Permeability of Gases: Gas permeability increases markedly at approx. 45° [6].
[H_2] (11×10^8 cm^2 (s atm)$^{-1}$, 25°, vulcanised) [6]
[O_2] (4.7×10^8 cm^2 (s atm)$^{-1}$, 25°, vulcanised) [6]
[N_2] 1.65×10^8 cm^2 (s atm)$^{-1}$, 25°, vulcanised) [6]
[CO_2] (27×10^8 cm^2 (s atm)$^{-1}$, 25°, vulcanised) [6]

Transport Properties:
Gas Permeability:

No.	Gas	Note
1	[H_2]	25°, vulcanised [6]
2	[O_2]	25°, vulcanised [6]
3	[N_2]	25°, vulcanised [6]
4	[CO_2]	25°, vulcanised [6]



Mechanical Properties:
Friction Abrasion and Resistance: Good resistance to abrasion, scuffing and cutting

Polymer Stability:
Thermal Stability General: Thermal degradation occurs at moderate temp. [7]
Decomposition Details: Decomposition yields volatile MW hydrocarbons [7]; 50% volatilisation temp. 325° [7]
Flammability: Volatile degradation productss are flammable [7]
Hydrolytic Stability: Softens in hot water

3,4-Polyisoprene P-328

Synonyms: *Polyisoprene. 3,4-Poly(2-methyl-1,3-butadiene)*
Monomers: Isoprene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene

CAS Number:

CAS Reg. No.
9003-31-0

General Information: Amorph.
Tacticity: Syndiotactic and isotactic forms

Polyisoprene star polymers P-329

Synonyms: *Poly(2-methyl-1,3-butadiene) star polymers. Star-branched polymer of polyisoprene*
Monomers: 2-Methyl-1,3-butadiene
Material class: Synthetic Elastomers
Polymer Type: polydienes, polybutadiene
CAS Number:

CAS Reg. No.	Note
9003-31-0	Polyisoprene

Volumetric & Calorimetric Properties:
Glass Transition Temperature:

No.	Value	Note
1	-60.8–-59.5°C	4-arm star, varying MW [9]
2	-60.5–-59.9°C	18-arm star, varying MW [9]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. dioxane, toluene, cyclohexane

Transport Properties:
Polymer Solutions Dilute: Dilute soln. props. and chain dimensions in good solvents and in theta solvents have been reported [7]. Intrinsic viscosity [4,7,11] 0.354 dl g^{-1} (toluene, 3-branch star, MW 35200), 0.958 dl g^{-1} (toluene, 3-branch star, MW 137000), 1.85 dl g^{-1} (toluene, 3-branch star, MW 322000), 0.193 dl g^{-1} (dioxane, 4-branch star, MW 37800), 0.476 dl g^{-1} (dioxane, 4-branch star, MW 215000), 1.112 dl g^{-1} (toluene, 4-branch star, MW 215000), 1.47 dl g^{-1}(dioxane, 4-branch star, MW 1950000), 5.7 dl g^{-1} (toluene, 4-branch star, MW 1950000). Values for higher branching have been reported [4,7,11]. Huggins coefficients and second virial coefficients have been reported [7]. Theta temps. [1,3,7] 34.1° (dioxane, linear star), 33.4° (4-arm star), 33.5° (6-arm star), 32.8° (8-arm star, MW (arm) 39000, MW (star) 276000), 33.5° (8-arm star, MW (arm) 760000, MW (star) 5900000), 28.7° (12-arm star, MW (arm) 21800, MW (star) 250000), 33.0° (12-arm star, MW (arm) 445000, MW (star) 5260000), 24.5° (18-arm star, MW (star) 64000), 33.2° (18-arm star, MW (star) 6800000). The conformn. of star polymers with up to 128 arms in a good solvent has been reported [2,7]
Polymer Melts: The dynamic mech. spectra of polyisoprenes show that the terminal relaxation times of the star polymers are more sensitive to temp. changes than are the linear polymers [8]. Terminal relaxation times of star molecules are determined by the length not the number of arms [9]
Permeability and Diffusion General: Diffusion coefficients Cyclohexane 2.4×10^{-7} cm^2 s^{-1} (23°, 3-branch star, MW 137000), 1.87×10^{-7} cm^2 s^{-1} (23°, 4-branch star, MW 173000), 0.52×10^{-7} cm^2 s^{-1}(23°, 4-branch star, MW 1760000), 0.89×10^{-7} cm^2 s^{-1} (23°, 12-branch star, MW 810000), 0.305×10^{-7} cm^2s^{-1} (23°, 12-branch star, MW 5280000), 1.88×10^{-7} cm^2 s^{-1} (23°, 18-branch star, MW 384000), 0.455×10^{-7} cm^2 s^{-1} (23°, 18-branch star, MW 3570000) [7]

Optical Properties:
Transmission and Spectra: H-1 nmr and C-13 nmr spectral data have been reported [12]

Total Internal Reflection: Refractive index increments for a series of polymers in cyclohexane with degree of branching 3.9–18.1 and varying MW have been reported. Dn/dc appears independent of branching above the critical weight with the exception of 18-arm stars where dn/dc increases slightly [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by anionic methods using coupling agents such as divinyl benzene and chlorosilane. For example, 1,2-bis(dichloromethylsilyl)ethane and 1,2-bis(trichlorosilyl)ethane are used to make 4-arm and 6-arm stars. Tetra(methyldichlorosilylethane)silane and tetra(trichlorosilylethane)silane are used to synth. 8-arm and 12-arm stars [4,6]

Poly(*N*-isopropylacrylamide) P-330

Synonyms: *PNIPAM. Poly(N-(1-methylethyl)-2-propenamide)*
Monomers: *N*-Isopropylacrylamide
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
25189-55-3

Molecular Formula: $(C_6H_{11}NO)_n$
Fragments: $C_6H_{11}NO$
General Information: Much of the interest in this polymer centres on its unusual behaviour of its aq. soln. during heating. Can be made in a number of forms including macroscopic gels, microgels, latexes, films, coatings, and fibres [1]. Is a fast-response, temp.-sensitive hydrogel
Morphology: Can exist in both cryst. and amorph. forms. The gel has an opaque microporous struct., with a fibrous network consisting of fine fibres of diameter less than 5μm

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.07 g/cm^3	amorph. [5,22]
2	d 1.118 g/cm^3	cryst. [22]

Equation of State: Mark-Houwink-Sakurada equation of state parameters have been reported [8]
Melting Temperature:

No.	Value	Note
1	170–200°C	cryst. [22]
2	100–125°C	amorph. [22]

Glass Transition Temperature:

No.	Value	Note
1	134°C	M_n 190000–882000 [2]

Transition Temperature:

No.	Value	Note
1	33°C	LCST

Surface Properties & Solubility:

Solubility Properties General: Exhibits inverse solubility on heating [1]. The polymer can be solubilised in water at temps. above its cloud point by the addition of surfactants [7,30]. Mechanism of solubilisation for poly(*N*-isopropylacrylamide)/sodium alkyl sulfafte has been studied. [23,24] Microporous gel swells by factor of approx. 1.7 (by wt) in H_2O at room temp. It swells below and shrinks above its LCST (33°). A complete contraction (in less than 2 min) is observed when gel is immersed in hot H_2O (50°). Its original size/shape is recovered when shrunk gel is immersed in cold H_2O (10°). Rapid/reversible volume change observed; thermal volume change repeatable between 10° and 50°. MeOH/H_2O mixtures (less than 64.4% (v/v) MeOH) are non-solvents at certain temps. Aq. solns. of other org. solvents e.g. Me_2CO, THF, dioxane, DMSO and EtOH may also be non-solvents. Phase diagram and interaction parameters for MeOH/H_2O system have been reported. Hydrogen bond breaking agents such as urea or LiCl cause precipitation from aq. soln. [6,7,25,26]. Forms a strong interpolymer complex with polyacrylic acid) with a poly(*N*-isopropylacrylamide):polyacrylic acid) ratio of 1.5:1 [27]
Cohesive Energy Density Solubility Parameters: Cohesive energy density 393 J cm^{-3} [2]
Solvents/Non-solvents: Sol H_2O, MeOH, THF, Me_2Co, CHCl3 [6,7,13]
Surface and Interfacial Properties General: Solns. of poly(*N*-isopropylacrylamide) give steady-state surface tensions independent of concentration but varying with temp [15,16]
Wettability/Surface Energy and Interfacial Tension: The contact angle of water on water-swollen poly(*N*-isopropylacrylamide) gels is very temp.-sensitive. Contact angle increases by approx. 60° between 30° and 40° [17]

Transport Properties:

Polymer Solutions Dilute: The effect of anionic surfactant on the coil-to-globule transition has been reported. Coil-to-globule and globule-to-coil transitions for a single chain have been studied and the radius of gyration through both transitions has been reported [18,20]. Spinodal decomposition of aq. solns. occurs at temps just above the cloud point. Kinetics of spinodal decomposition have been reported [4,10]. The plateau adsorbed amount of films at the air-water interface is lower at 16° than at 31.3° but the thickness of the adsorbed layer is larger at the lower temp. At the interface the polymer does not undergo a phase change between 25 and 40° [13,14,15,16]. Adsorption onto silica has been studied as a function of temp.; there is a steep increase in the amount adsorbed at approx. 30° [12]. Aq. solns. are shear-thinning: the viscosity curve changing with temp. [21]. Drag reduction props. of the polymer in aq. soln have been reported [26]. The presence of fairly low levels of surfactant can cause a large increase in the intrinsic viscosity [7,21]. Intrinsic viscosity 4.4 dl g^{-1} (H_2O, 20°, MW 138000); 0.16 dl g^{-1} (H_2O, 20°, MW 652000); 16.7 dl g^{-1} (H_2O, 20°, MW 1630000); 3.8 dl g^{-1} (MeOH, 25°, MW 72300); 8.4 dl g^{-1} (MeOH, 25°, MW 225000); 24.2 dl g^{-1} (MeOH, 25°, MW 1250000) [8,9,28]
Polymer Solutions Concentrated : Conc. solns. display spinnability and Weissenberg effect; no negative thixotropy. Above approx. 28° conc. solns. form a stiff gel [7]
Water Content: 7.8% (film prepared by redox catalysis) [5]

Mechanical Properties:

Mechanical Properties Miscellaneous: The gel is very elastic and flexible in the swollen state. Shrunk gel can be deformed by

mechanical stress; the original state is not recovered, even after removal of stress (plastic deformation)

Optical Properties:
Transmission and Spectra: H-1 nmr and C-13 nmr spectral data have been reported [3,28]

Polymer Stability:
Decomposition Details: Decomposition is a single-stage process with the main weight loss occurring at approx. 420°. Dimers or trimers are liberated and possibly, low MW oligomers [11]

Applications/Commercial Products:
Processing & Manufacturing Routes: The gel is prepared by soln. polymerisation of aq. *N*-isopropylacrylamide using α-irradiation for 15.3h). May be synth. by free-radical initiation in organic solvent; by redox initiation in aq. soln. by ionic polymerisation or radiation polymerisation [1]
Applications: Used in oil recovery; as thickener (food and coatings applications); in paper finishing; as a viscosity control agent; in immunoassay technology, and in drug-delivery systems

Poly(isopropyl acrylate) P-331

Synonyms: *Poly[1-(2-propoxycarbonyl)ethylene]. Poly(1-methylethyl 2-propenoate)*
Monomers: Isopropyl acrylate
Material class: Natural elastomers
Polymer Type: acrylic

CAS Number:

CAS Reg. No.
26124-32-3

Molecular Formula: $(C_6H_{10}O_2)_n$
Fragments: $C_6H_{10}O_2$
Molecular Weight: The MW can range from 10000–5000000
Additives: Soap-urea, activated thiol, soap sulfur, lead thiourea, thiourea, diamine, carbon black, trithiocyanuric acid, etc.
General Information: A soft, tacky polymer. Only used as a copolymer

Volumetric & Calorimetric Properties:
Density:

No.	Value
1	d^{25} 1.08 g/cm^3

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00022–0.00026 K^{-1}	glass	V
2	0.00061–0.00063 K^{-1}	liq.	V

Volumetric Properties General: Molar volume 19.3 cm^3 mol^{-1}. Van der Waals volume 66.33 cm^3 mol^{-1}
Glass Transition Temperature:

No.	Value	Note
1	-6–-3°C	conventional
2	-2–7°C	syndiotactic
3	-11°C	isotactic

Transition Temperature General: There is very little change in T_g with changes in tacticity

Surface Properties & Solubility:
Solubility Properties General: Solubility of acrylate ester polymers is dependent on the alcohol derived side group. Short chain groups dissolve in polar solvents, whereas longer chains are sol. in non-polar solvents
Cohesive Energy Density Solubility Parameters: δ 17.8–22.5 J$^{1/2}$ cm$^{-3/2}$ CED 37.8–60.4 kJ mol^{-1}
Plasticisers: Thiokol TP-759, Plastolein 9720, Admex 760
Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, THF, esters, ketones, DMF. Insol. aliphatic hydrocarbons, hydrogenated naphthalenes, Et_2O, alcohols

Transport Properties:
Permeability of Gases: Has moderate permeability to gases

Mechanical Properties:
Mechanical Properties General: Mech. props. improve with increasing MW up to MW 100000–200000
Impact Strength: Has poor impact resistance
Fracture Mechanical Properties: Has fair flexural cracking resistance and fair to good tear resistance
Friction Abrasion and Resistance: Has good abrasion resistance

Optical Properties:
Molar Refraction: dn/dc -0.103 (bromobenzene, 436 nm), -0.087 (bromobenzene, 546 nm), 0.124 (TFP, 546 nm, isotactic, atactic)

Polymer Stability:
Thermal Stability General: Decomposes in oxygen rich atmospheres under extreme heat
Decomposition Details: Depolymerises much less readily than other polymethacrylates. Between 300 and 500° decomposes to give isopropene, isopropanol and CO_2

Flammability: Highly flammable
Environmental Stress: Very stable to weathering and resistant to oxygen and ozone. Fair resistance to radiation and synthetic lubricants
Chemical Stability: When heated in presence of free radical initiators, may undergo cross-linking and degradation. Under extreme conditions it can undergo chemical reaction on the ester group
Hydrolytic Stability: Resistant to acid and alkaline hydrol.

Applications/Commercial Products:

Processing & Manufacturing Routes: Commercially it is manufactured by free radical emulsion polymerisation or free radical soln. polymerisation. It is used to produce paints, lacquers and adhesives. It is usually processed by injection moulding, blow moulding, extrusion and thermoforming. Stearic acid, TE-80 and Vanfone APL are added as processing aids
Applications: Acrylics are widely used in paints, coatings and lacquers; in paper industry; as radiation curable systems; adhesives and sealing compds.; in gaskets for the automotive industry and in the textile and leather industries

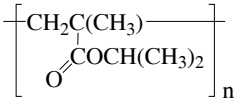
Polyisopropylbutadiene P-332

Synonyms: *Poly(2-isopropyl-1,3-butadiene)*
Monomers: 2-Isopropyl-1,3-butadiene
Material class: Synthetic Elastomers
Polymer Type: polydienes



Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation in an emulsion system has been reported [4]. Stereoregular polymers are prepared by inclusion polymerisation in deoxycholic acid and apocholic canals [5]

Poly(*N*-isopropyl-*N'*-phenyl-*p*-phenylenediamine) P-334

Synonyms: *N-(1-Methylethyl)-N'-phenyl-1,4-benzenediamine homopolymer. Poly(PrPPD)*
Monomers: *N*-Isopropyl-*N'*-phenyl-*p*-phenylenediamine
Polymer Type: polyaniline
CAS Number:

CAS Reg. No.
108443-86-3

Molecular Formula: $(C_{15}H_{18}N_2)_n$
Fragments: $C_{15}H_{18}N_2$
Morphology: Structure substantially identical to polyaniline. In the formation of polyaniline, the radical cations of semiquinone type were assumed to play an important role [2].
Identification: Chloride derivative: $C_{6.6}H_{5.7}NCl_{0.67}$ [2].

Electrical Properties:
Electrical Properties General: σ=0.13 S cm^{-1} [3]

Optical Properties:
Transmission and Spectra: Ir [1,2], esr [2] spectra reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synthesised from PrPPD using ammonium persulfate as oxidising agent [1,2,3]
Applications: Secondary batteries, which maintain a high charging and discharging efficiency [4,5]

12	174.8°C	L-form [50]

Glass Transition Temperature:

No.	Value	Note
1	110–115°C	L(+)-form [1]
2	57°C	[11]
3	55°C	L-form [12]
4	56°C	[20]
5	58°C	L-form [22]
6	57°C	(±)-form [22]
7	64°C	L-form [29]
8	59.2°C	[39]
9	55.5°C	L-form [50]
10	49.1°C	DL-form [50]

Transition Temperature:

No.	Value	Note	Type
1	188°C	461K [9]	T°_m
2	215°C	L-form [12]	T°_m

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(ethylene glycol) [21,43], poly(ε-caprolactone) [43]. Immiscible with poly(vinyl chloride) [23] and poly(β-hydroxybutyrate) [44]
Cohesive Energy Density Solubility Parameters: Solvent interaction parameters (120°) pentane 1.6, hexane 2.0, heptane 2.0, EtOAc 0.46, Me_2CO 0.56, 2-butanone 0.53, CCl_4 (DL-form) 0.89, $CHCl_3$ 0.32, CH_2Cl_2 0.99, C_6H_6 0.52 [23]
Solvents/Non-solvents: Sol. $CHCl_3$ [2,6,34], trichloroethane [2,6], CH_2Cl_2 [2,6,34], *m*-cresol [2], dichloroacetic acid [2,6], conc. H_2SO_4 [2], dioxane [6,34], acetonitrile [6], glycol sulfite [6], hexafluoroacetone sesquihydrate [6], hexafluoroisopropanol [6], DMF [34], pyridine [34]. Insol. petrol [7], MeOH [13,34], hexane [34]
Wettability/Surface Energy and Interfacial Tension: Fold surface free energy 2450 J mol^{-1} (585 cal mol^{-1}) [9]. Surface free energy 0.0265 J m^{-2} (26.5 erg cm^{-2}) [9]. Surface free energy 0.075 J m^{-2} (L-form) [12]

Transport Properties:

Polymer Solutions Dilute: [η] 0.295 dl g^{-1} (bromobenzene, 85°, L-form) [3]; [η] 0.016 dl g^{-1} (C_6H_6, 30°) [16]; $[\eta]_{inh}$ 1.34 dl g^{-1} (dioxane, 30°) [7]; $[\eta]_{inh}$ 1.23 dl g^{-1} ($CHCl_3$, 30°) [10]. Other viscosity values have been reported [13,36,41]
Water Absorption:

No.	Value	Note
1	1.2 %	30° [18]
2	0.5 %	24h, 23°, L-form [50]
3	0.4 %	24h, 23°, DL-form [50]

Mechanical Properties:

Mechanical Properties General: Variation of tensile storage modulus, [29] loss modulus and tensile strength [19,40] with temp. has been reported in graphical form [22]. Flexural storage and Young's moduli of the L and DL-forms have been reported [40]

Tensile (Young's) Modulus:

No.	Value	Note
1	6000–10000 MPa	L-form [14]
2	1720 MPa	L-form [50]
7	1930 MPa	DL-form [50]

Flexural Modulus:

No.	Value	Note
1	6160 MPa	plates, L-form [51]

Tensile Strength Break:

No.	Value	Note	Elongation
1	59.5 MPa	[39]	
2	260–1000 MPa	L-form [14]	12–26%

Tensile Strength Yield:

No.	Value	Note
1	42–51 MPa	DL-form [51]

Flexural Strength Yield:

No.	Value	Note
1	109 MPa	L-form, plates [51]
2	180 MPa	L-form, rods [51]

Impact Strength: Dynstat impact strength 12.7–13.5 kJ m^{-2} (unnotched) [39]
Viscoelastic Behaviour: Stress-strain curves (L-form) have been reported [14,39,50]. Stress relaxation [38] has been reported
Hardness: Shore D77 [50].
Fracture Mechanical Properties: Shear strength 110 MPa (L-form, rods) [51]
Izod Notch:

No.	Value	Notch	Note
1	40 J/m	Y	[39]

Electrical Properties:

Electrical Properties General: Variation of tan δ with temp. has been reported in graphical form. [29] Dielectric constant of the L-form has been reported [42]
Static Electrification: Piezoelectrical props. (L-form) have been reported [42]

Optical Properties:

Optical Properties General: Optical props. have been reported [30]
Refractive Index:

No.	Value	Note
1	1.47	(R)-form and (S)-form, carbon disulfide-*n*-butanol [46]

Transmission and Spectra: Ir [2,5,8,17,21,26,36,45,47], nmr [36], esr [49], H-1 nmr [2,5,31,45], C-13 nmr [8,15,31,45,50], Raman [26,47], mass spectrum [10,45] and XPES [27,48] spectral data have been reported
Molar Refraction: dn/dC -0.06 (bromobenzene, 85°) [3]
Total Internal Reflection: $[\alpha]_D$ -150° ($CHCl_3$, 25°, L-form) [3]. $[\alpha]_D^{26}$ -144° ($CHCl_3$, L-form) [7]; $[\alpha]_D$ -162.8° (CH_2Cl_2, 25°, *S*-form) [13]; $[\alpha]_D^{25}$ -155° ($CHCl_3$, L-form) [24]; $[\alpha]_D^{25}$ +157° ($CHCl_3$, D-form) [24]. Other [α] values have been reported. [2,5,14,45] Circular dichroism has been reported [46]

Polymer Stability:

Decomposition Details: Thermal degradation details have been reported [10,11,17]. Max. decomposition temp. 365° [10]. Thermal degradation activation energy 92–105 kJ mol^{-1} (22–25 kcal mol^{-1}) [17]. Decomposition temp. 190° [22], 127° [37]
Hydrolytic Stability: Hydrolytic degradation details have been reported [1,33,39]
Biological Stability: Biodegrades to give lactic acid, CO_2 and H_2O. Polymer has a half-life of 3 months. [32] Self-reinforced fibres degrade faster *in vivo* than *in vitro* [52]
Stability Miscellaneous: γ-Irradiation in air at room temp. causes simultaneous chain scission and cross-linking; crystallinity is decreased [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by ring opening polymerisation of lactide using tin catalysts at 130° [1,3,7,11,13,14,24,34,36,39,45]
Applications: Used as surgical sutures and internal bone fracture fixation devices

Trade name	Details	Supplier
PLA	Also reinforced grades (CMPA fibre, Ca/P-based fibres and carbon fibre)	Purac

Poly(lactide-*co*-glycolide) P-337

Synonyms: *PLA-PGA. PGLA. Poly(lactic acid-co-glycolic acid)*
Related Polymers: Poly(lactide)
Monomers: Lactide, Glycolide
Material class: Copolymers
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.	Note
26780-50-7	Poly(lactide-*co*-glycolide
34346-01-5	Poly(lactic acid-*co*-glycolic acid
30846-39-0	L(-) lactide
31213-75-9	DL (±) lactide
57579-59-6	*cis*-lactide
107131-73-7	*cis*, block
120682-19-1	*trans*
153439-97-5	alternating lactic acid-glycolic acid

Molecular Formula: $[(C_3H_4O_2).(C_2H_2O_2)]_n$
Fragments: $C_3H_4O_2$ $C_2H_2O_2$
Morphology: Orthorhombic, a 0.525, b 0.624, c 0.702 [2]. Other details of struct. have been reported [14,19]
Miscellaneous: Unless otherwise specified, data refer to polymer containing 92% glycolic acid, 8% lactic acid

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.548 g/cm^3	[1]

Volumetric Properties General: Other density values have been reported [14]
Latent Heat Crystallization: Thermodynamic props (-273–57°) have been reported [15]. ΔH_f 20 J g^{-1} (75% LA, 25% GA). [21] Other enthalpy values have been reported [9]
Melting Temperature:

No.	Value	Note
1	215–217°C	[1,2]
2	210°C	[6]
3	178.5°C	5.7% GA
4	147°C	25% GA, 75% LA [21]
5	147°C	26.6% GA [9]

Glass Transition Temperature:

No.	Value	Note
1	37°C	90% GA, 10% LA [4]
2	43°C	[6]
3	58.5°C	5.7% GA
4	45.5°C	26.6% GA [9]

Transition Temperature General: Other T_m values have been reported [14]
Transition Temperature:

No.	Value	Note	Type
1	65°C	[1]	Softening temp.

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(3-hydroxybutyric acid-*co*-3-hydroxyvaleric acid), poly(3-hydroxybutyric acid), polycaprolactone, poly(mandelic acid), poly(propylene fumarate) [11]
Solvents/Non-solvents: Sol. hot γ-butyrolactone [1], $CHCl_3$ [9], hexafluoro-2-propanol [9]

Transport Properties:

Polymer Solutions Dilute: [η] 0.87 dl g^{-1} (trichlorophenol/phenol (7:10), 30°) [1]; viscosity values for 5.7–53.7% GA have been reported [9]; [η] 0.65 dl g^{-1} (hexafluoroisopropanol, 30°, 35% GA) [11]. Rheological props. have been reported [19]. Calculated values for viscosity have been reported [18]
Water Absorption:

No.	Value	Note
1	1.5 %	60h, 37°, 26.6% GA [9]

Mechanical Properties:

Mechanical Properties General: The decrease in tensile strength after immersion of the polymer in phosphate buffer soln. has been reported in graphical form [8]. Other tensile strength values have been reported [13]
Flexural Modulus:

No.	Value	Note
1	2070 MPa	300 kpsi, 30°, ASTM 1043-51 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	87.6 MPa	12700 psi [1]	8.4%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	116.5 MPa	4.6%	16900 psi [1]

Viscoelastic Behaviour: Stress-strain curves have been reported [13]

Optical Properties:

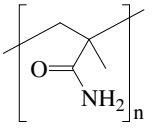
Transmission and Spectra: Mass [3,12,20], H-1 nmr [4,5,7], nmr [17,19], C-13 nmr [7,9], XPES [20], esr [10] and ir [14,19] spectral data have been reported
Total Internal Reflection: Birefringence has been reported [6]. Optical rotations for polymer synth. from varying mole ratios and catalysts have been reported [7]
Volume Properties/Surface Properties: Slightly yellow and opaque [1]

Polymer Stability:

Decomposition Details: Decomposition temp. 240° [1]. Cyclic oligomers formed [3]. 50% Weight loss at 360° [1]
Hydrolytic Stability: Hydrol. of the ester bonds occurs causing rapid loss of mech. props. and a colour change from amber to white [9]
Biological Stability: Biodegradation details have been reported [19]
Stability Miscellaneous: γ-Irradiation causes degradation by unzipping, with the decrease in M_n more rapid than that of MW [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by ring opening copolymerisation of lactide and glycolide at 110° using tin octoate as a catalyst [1,4,7,9,14,17,18,19,21]



Applications: Used as surgical suture material

Trade name	Details	Supplier
Polyglactin 910	92% GA, 8% LA	Ethicon Inc.
Vicryl	92% GA, 8% LA	Ethicon Inc.

Polymethacrylamide P-338

Synonyms: *Poly(2-methyl-2-propenamide). PMAM. PMAAm*
Related Polymers: Poly(methyl methacrylate)
Monomers: Methacrylamide
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25014-12-4	
28157-21-3	(-)-form
28157-24-6	(+)-form

Molecular Formula: $(C_4H_7NO)_n$
Fragments: C_4H_7NO

Molecular Weight: 133000
Morphology: Forms micelles in aq. soln. [5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.34–1.86 g/cm^3	Rohacell [8]

Thermodynamic Properties General: Other values of C_p have been reported [18]. Heat capacity parameters have been reported [20]
Specific Heat Capacity:

No.	Value	Note	Type
1	0.0025–1.395 kJ/kg.C	0.2127–118.7 J mol^{-1} K^{-1}, -263–27°, glass [28]	P

Melting Temperature:

No.	Value	Note
1	317°C	[20]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameter data have been reported [12]
Solvents/Non-solvents: Sol. MeOH, H_2O, ethylene, glycol, Me_2CO aq. [26], AcOH (above 50°), formamide (above 50°), formic acid, 2*M* urea, 0.4*M* magnesium perchlorate [29]. Insol. tetrafluoropropanol, DMSO, DMF, cresol [29]

Transport Properties:

Polymer Solutions Dilute: Viscosity of aq. solns. may be reduced by the addition of formic acid, MeOH and formaldehyde in amounts of approx. 10% [16]. [η] 1.214 dl g^{-1} (8*M* urea, MW 950000), 0.61 dl g^{-1} (8*M* urea, MW 380000), 0.78 dl g^{-1} (0.4*M* magnesium perchlorate, MW 1380000) [29], 1.74 dl g^{-1} (25°, H_2O) [31]

Mechanical Properties:

Mechanical Properties General: Mech. props. of foams as a function of density have been reported [8]. Temp. dependence of the loss modulus of polymer swollen by H_2O has been reported [25]

Tensile (Young's) Modulus:

No.	Value	Note
1	3600 MPa	Rohacell [8]

Tensile Strength Yield:

No.	Value	Note
1	360 MPa	Rohacell [8]

Viscoelastic Behaviour: Ultrasonic velocity increases linearly with increasing polymer concentration in aq. soln. whereas adiabatic compressibility decreases [31]. Compressive stress of rigid foams is constant for applied strains below approx. 0.75 [8]

Electrical Properties:

Electrical Properties General: Studies on dielectric relaxation in aq. soln. have been reported [32]
Magnetic Properties: Studies on paramagnetism have been reported [14]

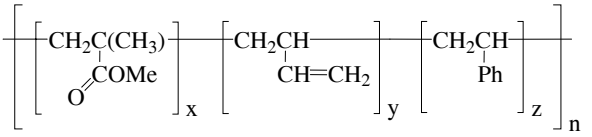
Optical Properties:

Transmission and Spectra: XPS [7], H-1 nmr [13], C-13 nmr [13] and esr [17] spectral data have been reported

Polymer Stability:

Decomposition Details: Thermal degradation above 340° [30] yields cyclic imides [21]. Details of char yield have been reported [22]. Thermal degradation is a two-step process; evolution of gaseous material at low temps., with extensive chain scission between 360° and 450° [24]. The only volatile products formed below 340° are NH_3 and H_2O [30]
Chemical Stability: The rate of production of NH_3 upon hydrol. with sodium hydroxide decreases markedly at approx. 66–67% of the theoretical NH_3 content [23]
Stability Miscellaneous: γ-Irradiation causes cleavage of the amide group followed by main chain cleavage [27]

Applications/Commercial Products:



Processing & Manufacturing Routes: May be synth. by electropolymerisation using sodium acetate as a supporting electrolyte [1]; by aq. polymerisation [2,4,6]. Polymerisation is retarded by the presence of VCl_3 or $MoCl_3$ [3]. Also synth. by vibratory milling [9], plasma-initiated polymerisation [10], high pressure extrusion [11] and ultrasound irradiation in aq. soln. [19]. Optically active material may be synth. using barium and calcium salts of amyl alcohol [15]
Applications: In beads used in hplc columns for chiral resolution and as a flocculant. Possible use in biomedical applications, and as a positive working resist in lithographic applications

Poly(methacrylate-*co*-butadiene-*co*-styrene) P-339

Related Polymers: Polymethacrylates General, Poly(methyl methacrylate) General, Poly(methyl methacrylate-*co*-acrylonitrile-*co*-butadiene-*co*-styrene), Polystyrene, Polyacrylonitrile, Polybutadiene
Monomers: Methyl methacrylate, Butadiene, Styrene
Material class: Thermoplastic
Polymer Type: acrylic copolymers
CAS Number:

CAS Reg. No.	Note
25053-09-2	
105935-35-1	block
114180-16-4	block, graft
107080-92-2	graft

Molecular Formula: $(C_5H_8O_2)_m(C_4H_6)_n(C_8H_8)_o$
Fragments: $C_5H_8O_2$ C_4H_6 C_8H_8
Additives: Polyorganosiloxanes to increase toughness
General Information: Is available in a range of colours and transparencies, with good clarity, heat resistance and ageing props. but poor toughness. The terpolymer is two-phase as the components are only partly compatible

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.07 g/cm^3	ASTM D792 [2]
2	d 1.11 g/cm^3	R1183 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6×10^{-5}–0.0001 K^{-1}	ASTM D696 [1]	L
2	9×10^{-5} K^{-1}	ASTM D696 [2]	L

Volumetric Properties General: Specific volume 0.000975 m^3 kg^{-1}, 27 (in^3 lb^{-1}, ASTM D792) [1]
Thermal Conductivity:

No.	Value	Note
1	0.19–0.34 W/mK	0.00045–0.0008 cal s^{-1} cm^{-1} °C^{-1}, ASTM C177 [1]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.257–1.676 kJ/kg.C	0.3–0.4 cal g^{-1} $°C^{-1}$ [1]	P

Deflection Temperature:

No.	Value	Note
1	102–107°C	1.82 MPa, annealed, ASTM D648 [1]
2	107–110°C	0.455 MPa, annealed, ASTM D648 [1]
3	85°C	1.82 MPa [2]

Vicat Softening Point:

No.	Value	Note
1	95°C	[2]
2	96–99°C	[3]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.3–0.6 g/10 min	ASTM 1110 [2]

Water Absorption:

No.	Value	Note
1	0.5 %	24h, ASTM D570 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2280–2550 MPa	330–370 kpsi, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	2000–2200 MPa	[2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	41.4–55.2 MPa	6000–8000 psi, ASTM D638 [1]	20–60%
2	42–55 MPa	[3]	15–18%

Compressive Modulus:

No.	Value	Note
1	1034–1724 MPa	150–250 kpsi, ASTM D695 [1]

Elastic Modulus:

No.	Value	Note
1	2275–2551 MPa	330–370 kpsi, ASTM D790 [1]

Tensile Strength Yield:

No.	Value	Note
1	41–45 MPa	R527 [2]

Flexural Strength Yield:

No.	Value	Note
1	68.9–82.7 MPa	10–12 kpsi, ASTM D790 [1]
2	66–70 MPa	[2]

Compressive Strength:

No.	Value	Note
1	65.5–148.2 MPa	9.5–21.5 kpsi, ASTM D695 [1]

Impact Strength: Izod 320–427 J m^{-1} (6.0–8 ft lb in^{-1}) (notched, $\frac{1}{2}$" × $\frac{1}{8}$" bar, ASTM D256) [1]. Charpy 60 kJ m^{-2} (unnotched, 23°) [2]; 34 kJ m^{-2} (unnotched, -40°) [2]; 6.5 kJ m^{-2} (notched, 23°) [2]; 4.9 kJ m^{-2} (notched, -20°) [2]
Mechanical Properties Miscellaneous: Loss factor 0.029 [3]
Hardness: Rockwell R102-108 (ASTM D785) [1]. Ball indentation 105 (2039-1) [2]

Electrical Properties:

Electrical Properties General: Specific resistivity 2.7 × 10" Ω cm
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3–4	60 Hz	ASTM D150 [1]
2	3–3.8	1 kHz	ASTM D150 [1]
3	3–3.5	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	13.7–19.7 kV.mm^{-1}	350–500 V mil^{-1}, short time, $\frac{1}{8}$" thick, ASTM D149 [1]
2	14.2–15.5 kV.mm^{-1}	360–400 V mil^{-1}, step-by-step, $\frac{1}{8}$" thick, ASTM D149 [1]

Dissipation Power Factor: tan δ 0.02–0.05 (60 Hz, ASTM D150) [1]; 0.02–0.04 (1 kHz, ASTM D150) [1]; 0.02–0.03 (1 MHz, ASTM D150) [1]
Static Electrification: Arc resistance no track (ASTM D495) [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.538	25°, ASTM D542 [1]
2	1.535	25° [3]

Transmission and Spectra: Transmission 85% (DIN 5036) [2]; 89% [3]

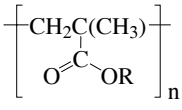
Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	71–93°C	continuous [1]

Environmental Stress: Shows good resistance to prolonged exposure to sunlight
Chemical Stability: Has good chemical resistance especially to oils, fats and petrol
Stability Miscellaneous: Has good resistance to uv and gamma irradiation

Applications/Commercial Products:



Processing & Manufacturing Routes: Processed by compression and injection moulding
Applications: Refrigerator/freezer drawers, writing instruments, blister-packaging for medical supplies, disposable medical instruments, containers for medicines, cosmetics etc. Large scale use as an additive to increase toughness in PVC (5–15% by weight of the copolymer is added to PVC to improve the clarity and impact strength for use in the manufacture of films and bottles)

7	45°C	2-nitratoethyl ester [5]
8	68°C	trimethylsilyl ester, isotactic [2]
9	27°C	trimethylsilyl ester, syndiotactic [2]

Surface Properties & Solubility:

Solubility Properties General: The syndiotactic trimethylsilyl ester has very poor solubility in most solvents
Cohesive Energy Density Solubility Parameters: 39.31 $J^{1/2}$ $cm^{-3/2}$ (9.39 $cal^{1/2}$ $cm^{-3/2}$) (diethylaminoethyl ester) [6]
Surface Tension:

No.	Value	Note
1	36 mN/m	20°, dimethylaminoethyl ester [7]
2	34 mN/m	20°, *tert*-butylaminoethyl ester [7]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.53	(ethylthio)ethyl ester [4]

Transmission and Spectra: Nmr spectral data have been reported [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: The trimethylsilyl ester is synth. using butyl lithium in toluene for the isotactic form and in THF for the syndiotactic [2]
Applications: Used in the manufacture of dialysis membranes and as fuel additives

37624-88-7	(Butyl methacrylate-*co*-methacrylic acid, ammonium salt)

Morphology: Poly(methyl methacrylate-*co*-methacrylic acid) is an amorph., glassy polymer. Morphology has been studied by dynamic mechanical themal analysis and small-angle x-ray scatttering [1]
Identification: Contains only C, H,O

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.01 g/cm^3	methyl methacrylate-*co*-methacrylic acid, 70% methacrylic acid, MV 30500 [2]
2	d 1.13 g/cm^3	methyl methacrylate-*co*-methacrylic acid, 85% methacrylic acid, MV 28530 [2]

Glass Transition Temperature:

No.	Value	Note
1	113°C	methyl methacrylate-*co*-methacrylic acid [1]
2	163°C	methyl methacrylate-*co*-methacrylic acid, 6 mol% Na salt [1]
3	244°C	methyl methacrylate-*co*-methacrylic acid, 6 mol% Na salt [1]
4	123–143°C	methyl methacrylate-*co*-methacrylic acid, 15–30% methacrylic acid, MW 430000–474000 [3]
5	111–115°C	methacrylic acid-*co*-ethyl acrylate, 20–25% methacrylic acid [4]

Transition Temperature General: Ionomers with an ion content between certain values can show two glass-transition temps. corresponding to ion-rich clusters and ion-poor matrix [1]. T_g is affected by composition and MW [3]
Transition Temperature:

No.	Value	Note	Type
1	37°C	methyl methacrylate-*co*-methacrylic acid, 6 mol % Na salt	First order transition temp.
2	50°C	methyl methacrylate-*co*-methacrylic acid, 12.4 mol % Na salt	First order transition temp.
3	85°C	methyl methacrylate-*co*-methacrylic acid, 6 mol % Na salt	Second order transition temp.
4	112°C	methyl methacrylate-*co*-methacrylic acid, 12.4 mol % Na salt [1]	Second order transition temp.

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	5 g/10 min	177°, methacrylic acid-*co*-ethyl acrylate, 25% methacrylic acid
2	5.5 g/10 min	177°, methacrylic acid-*co*-ethyl acrylate, 22.2% methacrylic acid
3	8 g/10 min	177°, methacrylic acid-*co*-ethyl acrylate, 20% methacrylic acid [4]

Polymer Solutions Dilute: For butyl methacrylate, methacrylic acid-*co*-methacrylic acid in DMF soln. a polyelectrolyte expansion effect is seen at low concentrations. Unravelling of chains tends to increase with the degree of neutralisation [5]. Huggins constants of butyl methacrylate-*co*-methacrylic acid tend to increase with the level of neutralisation. Only the acid form and ionomers with a low level of ionic groups give "normal" Huggins constants, *i.e.*, 0.3–0.5. Others are around unity or higher [5]
Permeability and Diffusion General: Methyl methacrylate-*co*-methacrylic acid membranes are permeable to sodium chloride, urea and creatinine. Permeability was not affected by the addition of $Zn^{2\oplus}$ ions [6]
Water Content: Water absorption of methyl methacrylate-methacrylic acid copolymer decreases with increasing methacrylic acid content [2]
Water Absorption:

No.	Value	Note
1	1.96 %	48h, 52% relative humidity, methyl methacrylate-*co*-methacrylic acid, 70% methacrylic acid
2	9.88 %	624h, 52% relative humidity, methyl methacrylate-*co*-methacrylic acid, 70% methacrylic acid [2]
3	0.54 %	48h, 52% relative humidity, methyl methacrylate-*co*-methacrylic acid, 85% methacrylic acid
4	4.35 %	624h, 52% relative humidity, methyl methacrylate-*co*-methacrylic acid, 85% methacrylic acid [2]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	846 cm^3 mm/(m^2 day atm)	methacrylic acid-*co*-ethyl acrylate, 25% methacrylic acid [4]
2	O_2	931 cm^3 mm/(m^2 day atm)	methacrylic acid-*co*-ethyl acrylate, 20% methacrylic acid [4]

Mechanical Properties:

Mechanical Properties General: The tensile strength of the methyl methacrylate/methacrylic acid copolymers increases on annealing, rising with annealing time to a plateau value

Tensile (Young's) Modulus:

No.	Value	Note
1	758.3 MPa	110 kpsi, methacrylic acid-*co*-ethyl acrylate, 25% methacrylic acid
2	213.7 MPa	31 kpsi, methacrylic acid-*co*-ethyl acrylate, 20% methacrylic acid [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	24 MPa	3480 psi, methyl methacrylate -*co*-ethyl acrylate, 25% methylacrylic acid [4]	200%
2	20.9 MPa	3040 psi, methyl methacrylate-*co*-ethyl acrylate, 22.2% methacrylic acid [4]	250%
3	9.1 MPa	1320 psi, methyl methacrylate-*co*-ethyl acrylate, 20% methacrylic acid [4]	290%
4	269.3 MPa	methyl methacrylate-*co*-methacrylic acid, 70% methacrylic acid, MV 28530 [2]	133%
5	40 MPa	methyl methacrylate-*co*-methacrylic acid, 0.85% methacrylic acid, unannealed [7]	approx. 0.2–0.4%
6	60 MPa	methyl methacrylate-*co*-methacrylic acid, 0.85% methacrylic acid, annealed [7]	approx. 0.2–0.4 %

Failure Properties General: Heat-treated methyl methacrylate-*co*-methacrylic acid, Na salt ionomers with 6–12 mol % Na salt deform by crazing with shear. Ionomers with >12 mol % Na salt content deform by shear only. This trend towards shear deformation makes the polymers increasingly fracture resistant [1]

Electrical Properties:

Electrical Properties General: Zeta potential -43.4–-38.8 mV (methyl methacrylate-*co*-methacrylic acid 85:15), -36–-32.2 mV (methyl methacrylate-*co*-methacrylic acid 97:3)

Optical Properties:

Refractive Index:

No.	Value	Note
1	0.12	methyl methacrylate-*co*-methacrylic acid, 70% methacrylic acid, MV 30500 [2]
2	0.1	methyl methacrylate-*co*-methacrylic acid, 85% methacrylic acid, MV 28530 [2]

Polymer Stability:

Polymer Stability General: The stability of methacrylic acid-*co*-ethyl acrylate depends greatly on the carboxylate content
Decomposition Details: Methacrylic acid/*tert*-butyl methacrylate copolymers decompose at 250° to give mainly polymethylacrylic anhydride with the anhydride bonds being intra rather than intermolecular. At 200° the copolymer is converted into primarily methacrylic acid/*tert*-butyl methacrylate/methacrylic anhydride terpolymers [8]. The copolymers undergo an intramolecular cyclisation at moderate temps. (130–230°) to give terpolymers with anhydride moieties [9]
Environmental Stress: Methacrylic acid/ethyl acrylate copolymers with high acid group content are broken down readily in the soil by rainwater. Resins with high acid group content are swollen upon outdoor exposure and eventually disintegrate completely [4]
Chemical Stability: Methacrylic acid/ethyl acrylate copolymers with high acid group content dissolve readily in brine [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by partial hydrol. in conc. sulfuric acid [3]. Poly(butyl methacrylate-*co*-methacrylic acid) is synth. by partial hydrol. of poly(butyl methacrylate) followed by refluxing the product with hydrogen chloride in THF, then hydrol. with base in isopropanol [5]. Methyl methacrylate/methacrylic acid copolymer salt ionomers can be synth. by hydrol. of poly(methyl methacrylate) with sodium hydroxide in THF/H_2O (50:50) followed by precipitation into MeOH. Ionomers with higher salt content can be synth. by neutralisation of poly(methyl methacrylate)/methacrylic acid random copolymers [1]
Applications: Used in heat-resistant pressure-sensitive adhesives, coatings, photoresists; as a binder in inks; in dental cements, drug-delivery systems and in microlithographic resists. Applications due to biodegradability include short-term packaging for foodstuffs; as disposable labels, and in agricultural applications. Other uses include, specialised moulding applications where solubility of the mould is required

Polymethacrylate/polybutadiene blends P-342

Synonyms: *Polybutadiene/PMMA blends. PMMA/polybutadiene interpenetrating networks. Poly(butadiene)/poly(methyl methacrylate) blends. Poly(methyl methacrylate)/ABS blends. ABS/PMMA blends. PMMA/ABS blends*
Related Polymers: Poly(methyl methacrylate), Polybutadiene, Polystyrene, Polyacrylonitrile
Monomers: Methyl methacrylate, 1,3-Butadiene, Acrylonitrile, Styrene
Material class: Thermoplastic, Blends
Polymer Type: polydienes, acrylic

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.056–1.075 g/cm^3	poly(butadiene)/poly(methyl methacrylate) 65:35 [1]
2	d 1.065–1.081 g/cm^3	poly(butadiene)/poly(methyl methacrylate) 50:50 [1]
3	d 1.075–1.103 g/cm^3	poly(butadiene)/poly(methyl methacrylate) 35:65 [1]

Mechanical Properties:

Mechanical Properties General: Fully interpenetrating networks of poly(methyl methacrylate)/poly(butadiene) show better tensile strength, modulus and tear strength than do semi-interpenetrating networks. The latter show improved toughness and elongation at break [1]. Tensile strength, flexural modulus, flexural strength and impact strength of poly(methyl methacrylate)/ABS blends vary with composition [2]

Flexural Modulus:

No.	Value	Note
1	2334 MPa	23800 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10 [2]
2	3192 MPa	32545 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]
3	2477 MPa	25255 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10 [2]
4	3082 MPa	31425 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	46.8 MPa	477 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10, PMMA MW 66000 [2]	
2	63.5 MPa	648 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]	
3	45.6 MPa	465 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10 [2]	
4	56.5 MPa	576 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]	
5	6.6–8.2 MPa	poly(butadiene)/poly(methyl methacrylate) 65:35 [1]	425–270%
6	11.5–13.1 MPa	poly(butadiene)/poly(methyl methacrylate) 50:50 [1]	310–185%
7	14–15.7 MPa	poly(butadiene)/poly(methyl methacrylate) 35:65 [1]	210–72%

Flexural Strength at Break:

No.	Value	Note
1	65.2 MPa	665 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10 [2]
2	94.2 MPa	961 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]
3	64.5 MPa	658 kg cm^{-2}, ABS/poly(methyl methacrylate) 90:10 [2]
4	87.1 MPa	888 kg cm^{-2}, ABS/poly(methyl methacrylate) 35:75 [2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.82–0.98 MPa	poly(butadiene)/poly(methyl methacrylate) 65:35 [1]	50% modulus
2	3.5–5.1 MPa	poly(butadiene)/poly(methyl methacrylate) 50:50 [1]	50% modulus
3	12–14.5 MPa	poly(butadiene)/poly(methyl methacrylate) 35:65 [1]	50% modulus

Impact Strength: 150.2 J m^{-1} (15.3 kg cm cm^{-1}, ABS/poly(methyl methacrylate) 90:10) [2], 31.4 J m^{-1} (3.2 kg cm cm^{-1}, ABS/poly(methyl methacrylate) 35:75) [2], 148.9 J m^{-1} (15.21 kg cm cm^{-1}, ABS/poly(methyl methacrylate) 90:10) [2], 28.7 J m^{-1} (2.92 kg cm cm^{-1}, ABS/poly(methyl methacrylate) 35:75) [2]
Hardness: Rockwell 20.7 (ABS/poly(methyl methacrylate) 90:10) [2], 74.4 (ABS/poly(methyl methacrylate) 35:75) [2], 17.7 (ABS/poly(methyl methacrylate) 90:10) [2], 64.8 (ABS/poly(methyl methacrylate) 35:75) [2]
Fracture Mechanical Properties: Tear strength 10.1–12.3 N mm^{-1} (poly(butadiene)/poly(methyl methacrylate) 65:35) [1], 16.0–20.7 N mm^{-1} (poly(butadiene)/poly(methyl methacrylate) 50:50) [1], 22.8–26.1 N mm^{-1} (poly(butadiene)/poly(methyl methacrylate) 35:65) [1]. Toughness 0.7924–0.982 MPa (poly(butadiene)/poly(methyl methacrylate) 65:35) [1], 1.080–1.925 MPa (poly(butadiene)/poly(methyl methacrylate) 50:50) [1], 1.080–1.925 MPa (poly(butadiene)/poly(methyl methacrylate) 35:65) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polybutadiene rubber is masticated and cured with varying levels of dicumyl peroxide. The resulting polymer sheet is swollen with methyl methacrylate; benzoyl peroxide is added together with varying amounts of divinylbenzene. The methyl methacrylate is then allowed to polymerise slowly

Polymethacrylate/polycarbonate blends P-343

Synonyms: *Poly(methyl methacrylate)/polycarbonate blends. Poly(phenyl methacrylate)/polycarbonate blends. Polycarbonate/acrylic blend. Polycarbonate/acrylic alloy. PMMA/PC blends. PC/PMMA blends*
Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate), Poly(phenyl methacrylate), Poly(2,2-propanebis(4-phenyl)carbonate)
Monomers: Methacrylic acid, Bisphenol A, Carbonic dichloride, Acrylic acid
Material class: Thermoplastic, Blends
Polymer Type: acrylic/polycarbonate
General Information: High-impact grades are available
Morphology: The blends are single phase but phase separation occurs on heating above the cloud point temp. [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.188 g/cm^3	poly(methyl methacrylate)/polycarbonate 3:7, as blended
2	d 1.161	poly(methyl methacrylate)/polycarbonate 3:7, heated at 230° for 30 min.

Volumetric Properties General: Density of a single phase blend decreases on heating above its cloud point [1]
Glass Transition Temperature:

No.	Value	Note
1	147°C	90% poly(phenyl methacrylate) [5]
2	134°C	50% poly(phenyl methacrylate) [5]
3	125°C	10% poly(phenyl methacrylate) [5]
4	375°C	50% PMMA
5	369°C	90% PMMA [4]
6	416°C	90% PMMA [4]
7	376°C	10% PMMA [4]
8	422°C	10% PMMA [4]
9	419°C	50% PMMA

Transition Temperature General: Although most blends of poly(methyl methacrylate) and polycarbonate show two glass-transition points the two polymers have been found to be miscible [2,3]. T_g varies with composition [4]

Mechanical Properties:

Mechanical Properties General: Tensile props. of a single phase blend deteriorate due to phase separation on heating [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	2610 MPa	50% PMMA [4]
2	2420 MPa	10% PMMA [4]
3	2800 MPa	90% PMMA [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	62.5 MPa	90% PMMA [4]	13.8%
2	52.4 MPa	50% PMMA [4]	19.9%
3	59.8 MPa	10% PMMA [4]	63.2%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	68.6 MPa	11.5%	90% PMMA [4]
2	66 MPa	11.8%	50% PMMA [4]
3	66.8 MPa	11.8%	10% PMMA [4]

Miscellaneous Moduli:

No.	Value	Note	Type
1	969–1321 MPa	30°, 10–90% PMMA	Storage shear modulus
2	4.5–589.4 MPa	125°, 10–90% PMMA	Storage shear modulus

Optical Properties:

Transmission and Spectra: Blends can have glass-like transparency [5]
Total Internal Reflection: Birefringence-free alloy is obtained at a ratio of poly(phenyl methacrylate) to polycarbonate of 12:88 [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Blends can be made by soln. (e.g. in THF), melt mixing at approx. 250° or by precipitation methods (using THF and *n*-hexane) [1,5]
Mould Shrinkage (%):

No.	Value
1	0.4–0.6%

Applications: Has applications in optics

Trade name	Details	Supplier
Acrolex 40001 NA	PMMA/PC alloy	Ferro Corporation
SD-9100	9101, 9104 (modified acrylic/PC alloy)	Polysar

Polymethacrylate/polyethylene oxide blends P-344

Synonyms: *PMMA/PEO blends*
Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate), Poly(ethylene oxide)
Monomers: Methyl methacrylate, Ethylene oxide
Material class: Thermoplastic, Blends
Polymer Type: acrylic, polyalkylene ether
General Information: Blending is preferred with isotactic polymethacrylate rather than with syndiotactic polymethacrylate as polyethylene oxide is more compatible and therefore more stable with the former [1]
Morphology: Polyethylene oxide adopts a planar zig-zag struct. [1]. Blends with a polyethylene oxide content below 20% are amorph. and miscible, showing only one glass-transition temp. [3]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	39.2–58.1°C	[4]

Glass Transition Temperature:

No.	Value	Note
1	96–98°C	5% polyethylene oxide, MW 600–600000 [3]
2	84–91°C	10% polyethylene oxide, MW 600–600000 [3]
3	78°C	15% polyethylene oxide, MW 20000 [3]
4	70°C	20% polyethylene oxide, MW 400–50000 [3]

Transition Temperature General: The melting temp. and glass-transitions of polyethylene oxide in interpenetrating networks are affected by the presence of cross-linker, the polymerisation temp. and the MW of the polyethylene oxide [4]

Surface Properties & Solubility:

Solubility Properties General: Compatibility in the melt state has been reported [2]

Mechanical Properties:

Viscoelastic Behaviour: Williams-Landel-Ferry parameters have been reported [3]

Optical Properties:

Transmission and Spectra: Ir [1,3] and nmr [2] spectral data have been reported

Applications/Commercial Products:

Processing & Manufacturing Routes: Semi-interpenetrating polymer networks can be made by polymerising a soln. of polyethylene oxide in methyl methacrylate [4]

Polymethacrylate/polyvinyl blends P-345

Synonyms: *Poly(methyl methacrylate)/poly(vinyl chloride). Poly(methyl methacrylate-co-methyl acrylate)/poly(vinyl chloride). Poly(methyl methacrylate-co-ethyl acrylate)/poly(vinyl chloride). Poly(methyl methacrylate-co-butyl acrylate)/poly(vinyl chloride). Poly(methyl methacrylate-co-ethylhexyl acrylate)/poly(vinyl chloride). Poly(methyl methacrylate)/poly(vinyl chloride-co-vinyl acetate). Poly(ethyl methacrylate)/poly(vinyl chloride-co-vinyl acetate). Poly(butyl methacrylate)/poly(vinyl chloride-co-vinyl acetate). Poly(methyl methacrylate)/nitrile rubber/poly(vinyl chloride). Poly(ethyl methacrylate)/nitrile rubber/poly(vinyl chloride). Poly(butyl methacrylate)/nitrile rubber/poly(vinyl chloride). PMMA/PVC blends. PVC/PMMA blends. PMMA/NBR/PVC blends. NBR/PMMA/PVC blends. PVC/NBR/PMMA blends*
Related Polymers: Polymethacrylate, General, Poly(methyl methacrylate), Poly(ethyl methacrylate), Poly(butyl methacrylate), Poly(ethylhexyl methacrylate), Poly(vinyl chloride), Poly(vinyl acetate), Poly(acrylonitrile)
Monomers: Methyl methacrylate, Ethyl methacrylate, Butyl methacrylate, Ethylhexyl methacrylate, Vinyl chloride, Vinyl acetate, Acrylonitrile
Material class: Thermoplastic, Blends
Polymer Type: acrylic/PVC

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3 g/cm^3	poly(methyl methacrylate)/PVC, moulding grade, ASTM D792 [4]
2	d 1.35 g/cm^3	poly(methyl methacrylate)/PVC, sheet [4,5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6.3×10^{-5} K^{-1}	poly(methyl methacrylate)/PVC, sheet, ASTM D696 [4,5]	L

Thermal Conductivity:

No.	Value	Note
1	6.7 W/mK	0.98 Btu (h ft^2 in)$^{-1}$, PMMA/PVC moulding [4]
2	7 W/mK	1.01 Btu (h ft^2 in)$^{-1}$, PMMA/PVC sheet [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.23 kJ/kg.C	0.293 Btu lb^{-1} °F^{-1}, poly(methyl methacrylate)/PVC, extruded sheet [4]	P

Glass Transition Temperature:

No.	Value	Note
1	90°C	50–70% PMMA/poly(vinyl chloride-*co*-vinyl acetate) [1]
2	52–70°C	50–70% poly(ethyl methacrylate)/poly (vinyl chloride-*co*-vinyl acetate)
3	40–50°C	50–70% poly(butyl methacrylate)/poly (vinyl chloride-*co*-vinyl acetate
4	70–90°C	poly(methyl methacrylate)/PVC, <60% poly(methyl methacrylate) [6]
5	70–78°C	poly(methyl methacrylate-*co*-methyl acrylate)/PVC, 80% PVC [8]
6	62–78°C	poly(methyl methacrylate-*co*-ethyl acrylate)/PVC, 80% PVC [8]
7	60–76°C	poly(methyl methacrylate-*co*-butyl acrylate)/PVC, 80% PVC [8]
8	58–68°C	poly(methyl methacrylate-*co*-ethylhexyl acrylate)/PVC, 80% PVC [8]

Transition Temperature General: T_g of poly(methyl methacrylate)/PVC blends is higher than that of PVC alone. T_g of syndiotactic poly(methyl methacrylate)/PVC blends decreases as the level of poly(methyl methacrylate) increases. Two T_gs are observed when the amount of poly(methyl methacrylate) exceeds 60% [6]. Blends of poly(vinyl alcohol) and poly(ethyl methacrylate) become more brittle as the amount of poly(ethyl methacrylate) increases [3]. Poly(methyl methacrylate)/PVC blends with up to 50% by weight poly(methyl methacrylate) have improved heat distortion temps.
Deflection Temperature:

No.	Value	Note
1	82°C	0.45 MPa, poly(methyl methacrylate)/PVC, moulding grade, ASTM D648 [4]
2	77°C	1.81 MPa, poly(methyl methacrylate)/PVC, moulding grade, ASTM D648 [4]
3	80.5°C	0.45 MPa, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D648 [4,5]
4	71°C	1.81 MPa, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D648 [4,5]

Surface Properties & Solubility:

Solubility Properties General: Syndiotactic poly(methyl methacrylate) is miscible with PVC at up to 60% poly(methyl

methacrylate). Isotactic poly(methyl methacrylate) is immiscible with PVC over the whole range of compositions; the blends are opaque and show two glass-transition temps. Blends of a vinyl chloride/vinyl acetate copolymer with simple polymethacrylates are homogeneous and transparent [1]. Blends of poly(methyl methacrylate) and poly(vinyl alcohol) prepared from $CHCl_3$ and cyclohexane soln. are miscible over the range of compositions. Blends prepared from THF soln. are opaque and show two glass-transition temps. which indicates phase separation [2]. Poly(ethyl methacrylate) and poly(vinyl alcohol) form compatible blends over a wide range of compositions although there is a tendency for phase separation where the MW of poly(vinyl alcohol) is very high [3]. Blends of poly(vinyl acetate) and poly(methyl methacrylate) prepared from $CHCl_3$ and cyclohexane solns. show lower critical soln. temp. behaviour on heating [2]. Literature reports suggest syndiotactic poly(methyl methacrylate) and PVC may only be miscible up to 10% poly(methyl methacrylate) and that MW is an important factor [7]

Transport Properties:

Transport Properties General: The melt-flow behaviour of PVC is improved by addition of a poly(methyl methacrylate-*co*-acrylate) copolymer [8]

Water Absorption:

No.	Value	Note
1	0.13 %	24h, poly(methyl methacrylate)/PVC, moulding grade, ASTM D570 [4]
2	0.06 %	24h, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D570 [4]
3	0.1 %	24h, poly(methyl methacrylate)/PVC, sheet, ASTM D570 [5]

Mechanical Properties:

Mechanical Properties General: The ductility of poly(methyl methacrylate-*co*-acrylate)/PVC blends is improved relative to that of PVC [8]. Elongation at break 150% (poly(methyl methacrylate)/PVC, moulding grade, ASTM D638), 100% (min.) (poly(methyl methacrylate)/PVC, extruded sheet, ASTM D638) [4]. Blends of poly(vinyl acetate) and poly(methyl methacrylate) have high-impact strength with the poly(vinyl acetate) content and its MW being important factors in determining the impact strength of the blend. The optimum level of poly(vinyl acetate) is 20% [2]. The tensile strength has a max. value at approx. 20% poly(ethyl methacrylate). It decreases as the poly(ethyl methacrylate) content increases before increasing from approx. 50% poly(ethyl methacrylate). The elongation at break follows a similar pattern with a max. value of approx. 340% at 20% poly(ethyl methacrylate) decreasing to approx. 100% at 80–100% poly(ethyl methacrylate). Tensile strength increases with increasing MW of poly(ethyl methacrylate) but decreases as poly(vinyl acetate) MW increases [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	1895 MPa	275 kpsi, poly(methyl methacrylate)/PVC, moulding grade, ASTM D638 [4]
2	2308 MPa	335 kpsi, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D638 [4]
3	2300 MPa	poly(methyl methacrylate)/PVC, sheet, ASTM D638 [5]

Flexural Modulus:

No.	Value	Note
1	2067 MPa	300 kpsi, poly(methyl methacrylate)/PVC, moulding grade, ASTM D790, [4]
2	2756 MPa	400 kpsi, poly(methyl methacrylate)/PVC, extruded sheet [4]
3	2760 MPa	poly(methyl methacrylate)/PVC, sheet, ASTM D790 [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	39.52 MPa	403 kg cm^{-2}, 50% poly(methyl methacrylate)/PVC-*co*-vinyl acetate [1]	3%
2	33.15 MPa	338 kg cm^{-2}, PVC-*co*-vinyl acetate, 50% poly(ethyl methacrylate) [1]	4%
3	29.71 MPa	303 kg cm^{-2}, PVC-*co*-vinyl acetate, 50% poly(butyl methacrylate) [1]	5%
4	29.11 MPa	PVC/nitrile rubber, 58% poly(methyl methacrylate) [1]	50%
5	14.41 MPa	PVC/nitrile rubber, 55% poly(ethyl methacrylate) [1]	110%
6	4.12 MPa	PVC/nitrile rubber, 58% poly(butyl methacrylate) [1]	206%
7	44.8 MPa	6500 lb in^{-2}, poly(methyl methacrylate)/PVC, sheet, ASTM D638 [9]	100%

Flexural Strength at Break:

No.	Value	Note
1	59.9 MPa	8.7 kpsi, poly(methyl methacrylate)/PVC, moulding grade, ASTM D790 [4]
2	73.7 MPa	10.7 kpsi, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D790 [4,5]

Compressive Modulus:

No.	Value	Note
1	27560 MPa	4000000 lb in^{-2}, poly(methyl methacrylate)/PVC, sheet, ASTM D695 [9]

Tensile Strength Yield:

No.	Value	Note
1	37.9 MPa	5.5 kpsi, poly(methyl methacrylate)/PVC, moulding grade, ASTM D638 [4]
2	44.8 MPa	6.5 kpsi, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D638 [4,5]

Flexural Strength Yield:

No.	Value	Note
1	73.7 MPa	10700 lb in^{-2}, poly(methyl methacrylate)/PVC, sheet, ASTM D790 [9]

Compressive Strength:

No.	Value	Note
1	42.7 MPa	6.2 kpsi, poly(methyl methacrylate)/PVC, moulding grade, ASTM D695 [4]
2	57.9 MPa	8.4 kpsi, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D695 [4]

Impact Strength: Poly(methyl methacrylate-*co*-acrylate)/PVC blends have slightly improved impact strength compared to PVC [8]
Mechanical Properties Miscellaneous: Storage modulus varies with blend composition [1]
Hardness: R104 (poly(methyl methacrylate)/PVC, moulding grade, ASTM D785) [4], R105 (poly(methyl methacrylate)/PVC, extruded sheet, ASTM D785) [4], R105 (poly(methyl methacrylate)/PVC, sheet, ASTM D789) [5]
Friction Abrasion and Resistance: Taber abrasion resistance 0.0058 mg g^{-1} loss $(1000 \text{ cycles})^{-1}$ (CS-10 wheel, poly(methyl methacrylate)/PVC, moulding grade, ASTM D1044) [4], 0.073 mg g^{-1} loss $(1000 \text{ cycles})^{-1}$ (CS-10 wheel, poly(methyl methacrylate)/PVC, extruded sheet, ASTM D1044) [4]
Izod Notch:

No.	Value	Notch	Note
1	800 J/m	Y	15 ft lb in^{-1}, poly(methyl methacrylate)/PVC, moulding grade and extruded sheet, ASTM D638 [4,5]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4	60 Hz	poly(methyl methacrylate)/PVC, moulding grade [4]
2	3.4	1 MHz	poly(methyl methacrylate)/PVC, moulding grade [4]
3	3.9	60 Hz	poly(methyl methacrylate)/PVC, sheet, ASTM D150 [4,5]
4	3.4	1 MHz	poly(methyl methacrylate)/PVC, sheet, ASTM D150 [4,5]

Dielectric Strength:

No.	Value	Note
1	0.4 $kV.mm^{-1}$	poly(methyl methacrylate)/PVC, moulding grade, short time, ASTM D149 [4]
2	>0.429 $kV.mm^{-1}$	min., poly(methyl methacrylate)/PVC, extruded sheet, short time, ASTM D149 [4]
3	17 $kV.mm^{-1}$	poly(methyl methacrylate)/PVC, sheet, ASTM D149 [5]

Arc Resistance:

No.	Value	Note
1	25s	poly(methyl methacrylate)/PVC, moulding grade, ASTM D495 [4]
2	80s	poly(methyl methacrylate)/PVC, extruded sheet, ASTM D495 [4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.037	60 Hz	poly(methyl methacrylate)/PVC, moulding grade [4]
2	0.031	1 MHz	poly(methyl methacrylate)/PVC, moulding grade [4]
3	0.076	60 Hz	poly(methyl methacrylate)/PVC, extruded sheet [4]
4	0.094	1 MHz	poly(methyl methacrylate)/PVC, extruded sheet [4]
5	0.002	60 Hz	poly(methyl methacrylate)/PVC, sheet, ASTM D150 [5]
6	0.03	1 MHz	poly(methyl methacrylate)/PVC, sheet, ASTM D150 [5]

Optical Properties:

Volume Properties/Surface Properties: Transparency opaque (poly(methyl methacrylate)/PVC, sheet, ASTM D542), (poly (methyl methacrylate)/PVC, 3 mm sheet, ASTM D1003-61) [4,5]. The optical clarity of poly(methyl methacrylate-*co*-acrylate)/PVC blends is reduced on blending with the acrylic homopolymer [8]. Blends of poly(vinyl acetate) and poly(methyl methacrylate) have good optical transparency [2]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	71°C	160°F, poly(methyl methacrylate)/PVC, extruded sheet [4]

Flammability: Poly(methyl methacrylate)/PVC does not burn (ASTM D635) [4]
Environmental Stress: Poly(methyl methacrylate)/PVC sheet is unaffected by sunlight [9]
Chemical Stability: Poly(methyl methacrylate)/PVC has excellent resistance to acids, bases and oils but is attacked by esters, ketones, aromatic hydrocarbons and chlorinated hydrocarbons [9]

Applications/Commercial Products:

Processing & Manufacturing Routes: Poly(methyl methacrylate)/PVC blends may be processed by injection-moulding at 171 –193° [4]
Mould Shrinkage (%):

No.	Value	Note
1	0.7%	[4]

Applications: Poly(methyl methacrylate)/PVC blends have applications in machine housings, safety helmets, boxes/trays, corrosion-resistant ducting, luggage, power tool housing, sports goods, leather-finishing. Poly(methyl methacrylate-*co*-acrylate)/PVC blends containing 1–4% wt of the copolymer are used in the manufacture of bottles

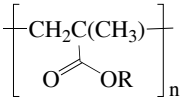
Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5381	20°, furfuryl, [1]
2	1.5096	20°, tetrahydrofurfuryl, [1]

Transmission and Spectra: Ir spectral data have been reported [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical polymerisation. The monomers are mixed in dry toluene with AIBN as initiator, and polymerised at 60° for 48h [3]. May also be synth. by mixing monomers in dry THF in the presence of BuLi and prepolymer such as polymethylacryloylchloride and polymerising at room temp. for 3h [3]
Applications: The carbazole polymers (and their copolymers with alkyl methacrylates) are used as photoconducting polymers in the reprographic industry

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.74–3.1 dl g^{-1} (C_6H_6, bornyl, MW 146017–1920184) [10], 6.2–29 dl g^{-1} (C_6H_6, isobornyl, MW 106219–250956) [10], 2.53 dl g^{-1} (30°, THF, isobornyl), 13.1 dl g^{-1} (39.6°, 1-octanol, isobornyl) [8]. Theta temp. 39.6 (1-octanol, isobornyl, MW 90000–1200000) [8]
Water Absorption:

No.	Value	Note
1	0.2 %	norbornyl

Optical Properties:

Optical Properties General: norbornyl [11]
Refractive Index:

No.	Value	Note
1	1.5059	bornyl 20° [1]
2	1.5	isobornyl 20° [1,2]
3	1.512	norbornyl [11]

Transmission and Spectra: Transmittance 92% (norbornyl) [11]. Nmr spectral data have been reported [5,6]

Polymer Stability:

Decomposition Details: Initial decomposition temp. of the adamantyl ester 254°; max. decomposition occurs at 304° [5]. Initial decomposition temp. of bornyl ester 252°, with three maxima at 307°, 382° and 434°. Decomposition yields monomer. Initial decomposition temp. of isobornyl ester 264°, with two maxima at 314° and 436°. At 264° camphene is produced; at 290° both camphene and monomer are produced. Initial decomposition temp. of decahydronaphthyl ester 212°, with three maxima at 296°, 350°, and 442°[6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical polymerisation using AIBN initiator in C_6H_6 at 60°. Polymers isol. by precipitation from MeOH [5,6]

Polymethacrylate/vinylidene halide blends P-348

Synonyms: *PMMA/PVDF blends. PVDF/PMMA blends. PVF_2/PMMA blends. PMMA/PVF_2 blends*
Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate), Poly(ethyl methacrylate), Poly(vinylidene fluoride)
Monomers: Methacrylic acid, 1,1-Difluoroethylene
Material class: Thermoplastic, Blends
Polymer Type: PVDF, acrylic
Morphology: Blends of poly(vinylidene fluoride) with atactic, isotactic and syndiotactic poly(methyl methacrylate) are completely compatible. The interactions of poly(vinylidene fluoride) segments are stronger for blends with isotactic poly(methyl methacrylate) than for those with syndiotactic poly(methyl methacrylate) [1]. Poly(ethyl methacrylate)/poly(vinylidene fluoride) blends are amorph. and miscible at poly(ethyl methacrylate) levels of 80% or more. Crystallisation of poly(vinylidene fluoride) occurs when the amount of poly(ethyl methacrylate) is low. The microstruct. of the blends depends on preparation and treatment [2]. Poly(methyl methacrylate)/poly(vinylidene fluoride) blends are amorph. when amount of poly(vinylidene fluoride) is lower than 40% [4]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Heat capacity decreases with increasing poly(vinylidene fluoride) content [3]
Melting Temperature:

No.	Value	Note
1	157°C	40% PVDF/PMMA [3]
2	173°C	90% PVDF/PMMA [3]

Glass Transition Temperature:

No.	Value	Note
1	55°C	60% PVDF/PMMA [3]
2	80°C	20% PVDF/PMMA [3]
3	55–105°C	PMMA/PVDF, 60–0% PVDF [3]

Transition Temperature General: T_m increases with increasing poly(vinylidene fluoride) content [4]. Multiple melting occurs in poly(ethyl methacrylate)/poly(vinylidene fluoride) blends with up to four transitions observed in some blends [2,5]. T_g increases with decreasing poly(vinylidene fluoride) content [3]
Transition Temperature:

No.	Value	Note	Type
1	-26–-25°C	PMMA/PVDF, 33–100% [6], 33–100% poly(vinylidene fluoride)	

Volumetric & Calorimetric Properties:
Transition Temperature Miscellaneous:

No.	Value	Note	T_β	°C	

Surface Properties & Solubility:
Solubility Properties General: Upper and lower critical soln. temp. behaviour has been reported for blends of the two polymers [7]

Transport Properties:
Permeability of Gases: Diffusion coefficient [CO_2] 8.53 $\times$ 10^{-9} cm^2 s^{-1} (35°, 90% poly(vinylidene fluoride)), 3.17 $\times$ 10^{-9} cm^2 s^{-1} (35°, 20% poly(vinylidene fluoride)) [3]

Mechanical Properties:
Impact Strength: An abrupt increase in Izod impact strength of poly(methyl methacrylate)/poly(vinylidene fluoride) blends is found when the amount of poly(methyl methacrylate) is 20%; for greater amounts relatively little change occurs. Annealing increases the impact strength slightly [4]
Viscoelastic Behaviour: Longitudinal sonic velocity increases with decreasing poly(vinylidene fluoride) content [6]

Optical Properties:
Transmission and Spectra: Nmr spectral data have been reported [8]

Poly(methacrylic acid) P-349

Synonyms: *Poly(2-methyl-2-propenoic acid). PMA*
Related Polymers: Polymethacrylates General, Poly(methacrylic acid), salts
Monomers: 2-Methyl-2-propenoic acid
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25087-26-7	
25750-36-1	(syndiotactic)
25068-55-7	(isotactic)

Molecular Formula: $(C_4H_6O_2)_n$
Fragments: $C_4H_6O_2$
General Information: PMAA is a weak acid
Miscellaneous: Forms complexes with basic polymers, e.g. poly(4-vinylpyridine) [21]

Volumetric & Calorimetric Properties:
Specific Heat Capacity:

No.	Value	Note	Type
1	112.5 kJ/kg.C	27° [1]	P
2	1.23 kJ/kg.C	-263° [1]	P
3	94.16 kJ/kg.C	-33° [1]	P
4	40.91 kJ/kg.C	-183° [1]	P

Glass Transition Temperature:

No.	Value	Note
1	228°C	[3]
2	149.7°C	[2]

Transition Temperature General: The presence of water or other plasticising additives lowers the T_g [2]

Surface Properties & Solubility:
Solubility Properties General: δ 0 (poor H-bonding solvents); δ 20.3 $J^{1/2}$ $cm^{-3/2}$ (moderate H-bonding solvents); δ 26.0–29.7 $J^{1/2}$ $cm^{-3/2}$ 26.0–29.7 (strong H-bonding solvents) [4]
Solvents/Non-solvents: Sol. alcohols, H_2O, aq. HCl (0.002M, 30°), dil. aq. NaOH. Insol. hydrocarbons, carboxylic acids, esters [5,6,7]
Wettability/Surface Energy and Interfacial Tension: Surface energy 57 mN m^{-2}; γ_p 23.6; γ_d 33.4 [22] Hamilton contact angle 151° [22]

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	5.8 g/10 min	[8]

Polymer Solutions Dilute: The intrinsic viscosity and Huggins coefficients in acidified EtOH show unusually large variations with two minima and two maxima seen in the plot of viscosity vs. mole fraction of EtOH. A similar variation was found in the behaviour of mixtures of other acidified aliphatic alcohols. Propanol showed the greatest variation and ethanediol the least. The dependence of viscosity on MW varied with alcohol concentration [9]. Mark-Houwink constants have been reported [7,10]. Theta temps. 30° (0.002 *M* HCl) [11], 25° (aq. NaCl) [12], 36.9° (0.5 *M* NaCl) [12], 68° (0.05 *M* NaCl) [12]. Intrinsic viscosity constant K_θ 0.066 $cm^{3/2}$ $mol^{1/2}$ $g^{1/2}$. Second virial coefficients have been reported [13]
Polymer Solutions Concentrated : Aq. solns. at concentrations in the region of 8–15% form stiff gels at room temp. At lower concentrations they form solns. which are converted into gels on heating, reverting to a soln. of the original consistency on cooling. Such solns. exhibit negative thixotropy i.e., they can show a large increase in consistency on stirring or shaking and can set to a firm gel [14]

Water Absorption:

No.	Value	Note
1	73.5 %	equilib. [22]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	23.4 MPa	[8]	553%

Tensile Strength Yield:

No.	Value	Note
1	6.1 MPa	[8]

Miscellaneous Moduli:

No.	Value	Type
1	0.00024 MPa	Rigidity modulus

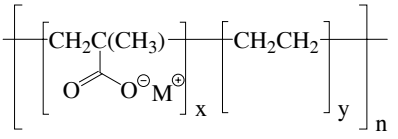
Viscoelastic Behaviour: Longitudinal sound speed 3350 m s^{-1}, room temp., 1 MHz

Optical Properties:

Total Internal Reflection: Birefringence. Intrinsic segmental anisotropy 50 $\times$ 10^{-25} cm^3 (MeOH), 150 $\times$ 10^{-25} cm^3 (0.002 *M* HCl) [16]
Volume Properties/Surface Properties: Clarity hazy

Polymer Stability:

Decomposition Details: Initial decomposition temp. 200°. At 200° decomposition yields, almost quantitatively, water with traces of monomer and a residue of polymethacrylic anhydride [18]. At low temps. monomer is released with CO_2 and H_2O and the anhydride is formed. At higher temps. the decomposition is more complex [19]. Thermal degradation is a two stage process: decomposition to the anhydride (activation energy 40.5 kcal mol^{-1}) and fragmentation of the anhydride (activation energy 37.4 kcal mol^{-1}) [20]



Applications/Commercial Products:

Trade name	Supplier
Daxad 34	WR Grace
Tamol	Rohm and Haas

Poly(methacrylic acid salt-*co*-ethylene) P-350

Synonyms: *Ionomer*
Related Polymers: Polymethacrylates General, Poly(methacrylic acid), Poly(methacrylic acid salts), Polyethylene, Poly(methacrylic acid-*co*-styrene) and methacrylate salts
Monomers: Methacrylic acid salt, Ethylene
Material class: Thermoplastic
Polymer Type: acrylic copolymers
CAS Number:

CAS Reg. No.	Note
25608-26-8	
108644-30-0	salt with complex cation Zn-BAC

Molecular Formula: $(C_4H_5MO_2)_m(C_2H_4)_n$
Fragments: $C_4H_5MO_2$ C_2H_4
General Information: Ethylene-methacrylic ionomers are usually supplied in pellet form, typically contain 3–10% methacrylic acid and are neutralised to a level between 20% and 80%. The polymers described above are tough, transparent, solvent resistant materials which possess characteristics of both thermoplastics and thermosets. They have very good resilience, flexibility at low temps., high elongation, impact strength and melt viscosities plus good adhesion and abrasion props. and outstanding hot tack. Of great interest for practical applications is the reduction in haze which occurs on neatralisation. Generally, there are strong similarities between the physical props. of polymers with inorganic cations and those with organic cations. The soln. and melt props., however, can be completely different. Aliphatic amines will react with ethylene-methacrylic acid copolymers to form salts but most aromatic amines are too weak for successful reaction [1]
Morphology: The ethylene chain has pendant anionic carboxy groups with metal cations. Chains are linked by electrostatic forces arising because of the metal ions. When temp. increases these forces are overcome allowing the polymer to be physically deformed using conventional techniques. The ionic groups in ionomers neutralised with metal cations tend to separate from the polymer matrix to form ionic clusters (ordered assemblies of ionic groups) which have a profound effect on the physical props. With amine cations replacing some of the metal ions, however, there can be changes to the polymer behaviour and props. The orderliness of the ionic clusters depends on the cation; those with a coordination number higher than the second shell have a greater degree of order [2,3,12,13]

Identification: Contains only C. H, O and metal. Characterised by ir and x-ray scattering [1,14,15]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.93–0.94 g/cm^3	[4]
2	d 0.93–0.96 g/cm^3	[5]
3	d 0.94–0.96 g/cm^3	Zn salt [16]
4	d 0.94–0.96 g/cm^3	Na salt [16]
5	d 0.93–0.96 g/cm^3	moulding grade [21]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00058–0.00078 K^{-1}	0–60% neutralisation	L
2	0.00047–0.000506 K^{-1}	0–60% neutralisation, 0–97% BAC	L
3	0.0001–0.00012 K^{-1}	[6]	L
4	0.00014 K^{-1}	Na salt	L
5	0.00016 K^{-1}	Zn salt	L

Volumetric Properties General: Coefficient of thermal expansion for the Zn salt varies with the degree of neutralisation and the amount of added 1,3-bis(aminomethyl)cyclohexane (BAC). Specific volume for the Zn salt ranges from 1.008–1.0368 cm^3 g^{-1} (degree of neutralisation 0–60, no added BAC) and 1.0632–1.037 cm^3 g^{-1} (degree of neutralisation 0–60, 0.97% BAC) at 25°
Thermodynamic Properties General: Ionomers have good heat-sealing props. and very good hot tack
Thermal Conductivity:

No.	Value	Note
1	0.24 W/mK	DIN 52612 [7]
2	0.22–0.26 W/mK	0.00053–0.00062 cal cm^{-1} s^{-1} °C^{-1} [6]
3	0.24 W/mK	[5]

Specific Heat Capacity:

No.	Value	Note	Type
1	2303 kJ/kg.C	0.55 cal °C^{-1} g^{-1} [8]	P
2	2554 kJ/kg.C	0.61 cal °C^{-1} g^{-1} [6]	P

Melting Temperature:

No.	Value	Note
1	94°C	Na salt
2	81–96°C	Na salt [16]
3	90–95°C	Zn salt [12]
4	81–98°C	Zn salt [16]
5	89–91°C	Zn-BAC salt [12]
6	99–100°C	Na salt, 4.1 mol% MAA [17]

Transition Temperature General: Mechanical relaxations for acid and Na salts (4.1 mol% MAA) [17]

Deflection Temperature:

No.	Value	Note
1	0.45°C	40–47° [7]
2	0.455°C	43.3°, ASTM D648 [8]
3	0.455°C	40°, Na salt
4	0.455°C	41°, Zn salt
5	1.82°C	37.8–48.9°, ASTM D648 [8]
6	0.45°C	41°, moulding grade, ASTM D648 [21]

Vicat Softening Point:

No.	Value	Note
1	40–47°C	1525/306 [7]
2	70–90°C	[6]

Brittleness Temperature:

No.	Value	Note
1	-112–-50°C	ASTM D746 [7]
2	>-100°C	min. [6]
3	-140–-100°C	ASTM D746 [14]
4	-107°C	moulding grade, ASTM D746-57T [21]

Transition Temperature:

No.	Value	Note	Type
1	-120°C	approx., virtually independent of level of ionisation	γ
2	-10°C	approx., absent from acid copolymre and increases with increasing ionisastion	β
3	23°C	approx., decreases with increasing ionisation	β
4	29°C	3.61% acid: 100% ethylene	β relaxation temp.
5	54°C	6.80% acid: 100% ethylene	β relaxation temp.
6	-120°C	3.61% acid: 100% ethylene	γ relaxation temp.
7	-112°C	6.80% acid: 100% ethylene [11]	γ relaxation temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Solubility in organic solvents decreases as ionic bonding with metal ions increases. Ionomers can usually be swollen by certain solvents e.g., aromatic hydrocarbons at elevated temps. The resistance to solvent surface etching is normally high

Transport Properties:

Transport Properties General: Melt flow index for samples containing 10% wt. methacrylate increases with ionic charge on the metal ion [5] and decreases with increasing degree of neutralisation [14,18]. Melt viscosity is unaffected by neutralisation with diamines [1]
Melt Flow Index:

No.	Value	Note
1	0.7–14 g/10 min	10 min. [7]
2	1.3 g/10 min	10 min., Na salt

3	0.9–2.8 g/10 min	10 min., Na salt [16]
4	5.5 g/10 min	10 min., Zn salt
5	0.7–14 g/10 min	10 min., Zn salt [16]
6	2–10 g/10 min	moulding grade, ASTM D1238

Polymer Solutions Dilute: Dispersions of ionomer in water can range from water-like to paste-like depending on the amount of solid and the acid level. The viscosity of Na ionomers, but not Zn ionomers is reduced by free acid groups [19]. Na and Zn ionomers exhibit Newtonian behaviour at low shear rates [19]. Zero shear viscosity increases with increasing neutralisation for the Na and Zn salts

Permeability of Gases: [O_2] 5 $\times$ 10^{-10} cm^2 (s cmHg)$^{-1}$ (25°) [6], 130–229 $\times$ 10^{-10} cm^3 mm m^2 day atm. (0.051 mm film, Na salt) [16], 134–233 $\times$ 10^{-10} cm^3 mm m^2 day atm. (0.051 mm film, Zn salt) [16]; [N_2] 0.9 t 10^{-10} cm^2 (s cmHg)$^{-1}$ (25°); [CO_2] 6 $\times$ 10^{-10} cm^2 s^{-1} (cmHg)$^{-1}$ (25°); [H_2O] 0.3 $\times$ 10^{-10} cm^2 s^{-1} (cmHg)$^{-1}$ (1 mm film, 25°, 90% relative humidity), 0.51–0.95 $\times$ 10^{-10} g m m^2 day (0.051 mm film, Na salt) [16], 0.47–0.79 g mm m^2 day (o.051 mm film, Zn salt) [16]

Permeability of Liquids: Acid polymers are more resistant to oil permeation than the ethylene homopolymer and the difference increases greatly when the ionomer is neutralised

Water Content: 0.04–3.47% (increases with increasing relative humidity, and after immersion). Increase in water content reduces the stiffness of the ionomer; this is particularly marked for Na and K salts [18]

Water Absorption:

No.	Value	Note
1	0.1–1.4 %	24h [5]
2	0.1–0.4 %	24h, moulding grade, ASTM D570

Mechanical Properties:

Mechanical Properties General: Ionomer films remain flexible down to approx. -100° [3] The moulding grade remains flexible down to -105°. Both stiffness and yield point increase, irrespective of the nature of the cation, as the polymer is progressively neutralised with a diamine, but the ultimate tensile strength shows little change [1]. Neutralisation with metal ions has a significant effect on the ultimate tensile strength however

Tensile (Young's) Modulus:

No.	Value	Note
1	192–276 MPa	28–40 kpsi [9]
2	138–413 MPa	20–60 kpsi, ASTM D638 [8]
3	193–517 MPa	19.7–52.7 kg f mm^{-2} [6]

Flexural Modulus:

No.	Value	Note
1	70–380 MPa	[7]
2	220 MPa	Na salt
3	130 MPa	Zn salt
4	180 MPa	moulding grade, ASTM D790

Tensile Strength Break:

No.	Value	Note	Elongation
1	35.8 MPa	Na salt, 4.8% wt. cross-linking agent	330%
2	33.9 MPa	Li salt, 2.8% wt. cross-linking agent	317%
3	33.9 MPa	Ba salt, 9.6% wt. cross-linking agent	370%
4	40.4 MPa	Mg salt, 8.4% wt. cross-linking agent	326%
5	29.7 MPa	Zn salt, 12.8% wt. cross-linking agent	313%
6	22 MPa	Al salt, 14% wt. cross-linking agent	347%
7	21–35 MPa	R 527 [7]	280–529%
8	24.1–37.9 MPa	[4]	
9	24.1–37.9 MPa	3.5–5.5 kpsi [9]	300–450%
10	24.1–38 MPa	2.46–3.87 kg f mm^{-2} [6]	200–600%
11	24.1–34.4 MPa	[5]	350–450%
12	29.6–40 MPa	Na salt, ASTM D882 [16]	300–500%
13	24.1–35.8 MPa	Zn salt, ASTM D882 [16]	200–450%
14	28 MPa	moulding grade, ASTM D638	450%

Tensile Strength Yield:

No.	Value	Note
1	13.2 MPa	Na salt, 4.8% wt. cross-linking agent
2	13.1 MPa	Li salt, 2.8% wt. cross-linking agent
3	13.4 MPa	Ba salt, 9.6% wt. cross-linking agent
4	15 MPa	Mg salt, 8.4% wt. cross-linking agent
5	13.2 MPa	Zn salt, 12.8% wt. cross-linking agent
6	7.1 MPa	Al salt, 14% wt. cross-linking agent [5]
7	9–29 MPa	R527 [7]
8	13.8–17.2 MPa	[4]
9	7.6–19 MPa	Na salt, ASTM D882 [16]
10	9–25.5 MPa	Zn salt, ASTM D882 [16]

Miscellaneous Moduli:

No.	Value	Note	Type
1	69–372 MPa	Na salt, ASTM D882 [16]	Secant modulus
2	90–400 MPa	Zn salt, ASTM D882 [16]	Secant modulus

Impact Strength: Tensile impact strength 7.6–12.8 $\times$ 10^{22} kJ m^{-2} (23°, 180) [7], 560–1180 kJ m^{-2} (-40°, 180) [7]. Izod 304–694 J m^{-1} (notched, 5.7–13 ft lb in^{-1}, ½″ bar) [9]; 320–800 J m^{-1} (notched) [5]; 610 J m^{-1} (notched, Na salt); no break (notched, Zn salt). Spencer 0.12–0.22 J m^{-1} (Na salt, ASTM D3420) [16]; 0.08–0.27 J m^{-1} (Zn salt, ASTM D3420) [16]

Mechanical Properties Miscellaneous: Stiffness 190.3 MPa (Na salt, 4.8% wt. cross-linking agent), 206.8 MPa (Li salt, 2.8% wt. cross-linking agent), 223.4 MPa (Ba salt, 9.6% wt. cross-linking agent), 164.1 MPa (Mg salt, 8.4% wt. cross-linking agent), 208 MPa (Zn salt, 12.8% wt. cross-linking agent), 103.4 MPa (Al salt, 14% wt. cross-linking agent) [5]. Elmendorf tear resistance 630–6457 g mm^{-1} (Na salt, ASTM D1922) [16]; 315–5118 g mm^{-1},(Zn salt, ASTM D1922) [16]. Graves tear strength 400–760 g (Na salt, ASTM D1004) [16]; 500–800 g (Zn salt, ASTM D1004) [16]

Hardness: Shore D56-68 (DIN 53505) [7], D60-65 [6], D60 (Na salt), D54 (Zn salt), D56-68 (moulding grade)

Friction Abrasion and Resistance: Ionomers have good abrasion resistance

Izod Notch:

No.	Value	Notch	Note
1	450–700 J/m	Y	moulding grade, ASTM D256

Electrical Properties:

Electrical Properties General: The majority of ionomers have good dielectric props. over a broad range of frequencies. Despite the presence of ionic groups there is not a great difference between the electrical props. of an ionomer and its parent polyethylene [20]. Surface resistivity generally increases with increasing degree of neutralisation

Surface/Volume Resistance:

No.	Value	Note	Type
2	0.0001×10^{15} Ω.cm	70% neutralisation	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.4	60 Hz	[10]
2	2.5		Zn salt [14]
3	2.4–2.5	60 Hz	moulding grade

Dielectric Strength:

No.	Value	Note
1	1 $kV.mm^{-1}$	1 kV mm^{-1} [10]
2	402 $kV.mm^{-1}$	kV mm^{-3}, 40.2 V mm^{-1}, Zn salt [14]
3	25.5 $kV.mm^{-1}$	kV mm^{-1}, moulding grade, ASTM D149

Dissipation Power Factor: tan δ 0.0018 (Zn salt) [14]

Static Electrification: High static charges can be generated on some ionomer surfaces but those highly neutralised with alkali-metal cations exhibit anti-electrostaticity. The effect is thought to be due to the higher equilibrium water content of these ionomers [20]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001–0.005	60 Hz	moulding grade

Optical Properties:

Optical Properties General: Formation of salts (e.g., with diamines) results in increased transparency. The level of change is related to both carboxylate content and the degree of neutralisation - at 3.5 mol% methacrylic acid the ionomer must be completely neutralised for transparency to be achieved whereas at 5.5 mol% only 70% neutralisation is necessary [1]

Refractive Index:

No.	Value	Note
1	1.51	moulding grade, ASTM D542

Transmission and Spectra: Transmittance 75–85% (ASTM D1003) [5]

Volume Properties/Surface Properties: Haze 3–17% [8]; 1–7% (Na salt, ASTM D1003-61) [16]; 1–9% (Zn salt, ASTM D1003-61) [16]. Clarity 10–80% (Na salt, ASTM D1746) [16]; 20–70% (Zn salt, ASTM D1746) [16]. Transparent (moulding grade). Gloss 20–90 (Na salt, 20°, ASTM D5236) [16]; 20–90 (Na salt, 45°, ASTM D5236) [16]; 10–90 (Zn salt, 20°, ASTM D5236) [16]; 20–90 (Zn salt, 45°, ASTM D5236) [16]

Polymer Stability:

Thermal Stability General: An amide cross-linked polymer can be formed from a diamine salt by heating to 275° under nitrogen followed by a period under vacuum. The product is clear and colourless but has a much lower tensile strength and elongation than the free acid precursor; stiffness and yield are little changed. Diamine salts are stable at 190° but cross-linking oxidation and yellowing occur at higher temps. [1]

Upper Use Temperature:

No.	Value	Note
1	60°C	140°F, continuous [9]
2	71–82°C	160–180°F, no load [10]
3	70°C	moulding grade [21]

Decomposition Details: Combustion products are CO_2 and H_2O. At low oxygen levels combustion can yield CO, unsaturated hydrocarbons and trace amounts of acrolein [5]

Flammability: Burning rate 2.54 cm min^{-1} (ASTM D635) [8], 23–28 mm min^{-1} (moulding grade, ASTM D635)

Environmental Stress: Exposure to uv light and weather can cause deterioration of both optical and mechanical props. Incorporation of a stabiliser can give an outdoor lifetime of up to one year with no deterioration; addition of carbon black can provide uv resistance

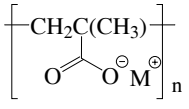
Chemical Stability: Ionomers are resistant to fats, oils, (Na salt better than Zn), alkalis, alcohols and ketones; many other organic solvents can cause swelling. Resistance to acids is poor and the polymer is degraded by oxidising agents such as bromine or nitric acid [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: The copolymer is usually manufactured in an autoclave with comonomers and initiator supplied by continuous feed. Temps. of 150–280° and pressures above 100 MPa are used. Due to reactivity of methacrylic acid rapid end-over-end stirring is best employed. After polymerisation the acid copolymer is neutralised using an appropriate metal salt. Neutralisation using the melt process has proved useful in obtaining purified ethylene ionomers [15]. Processed by thermoforming, injection moulding, blow-moulding or extrusion. Ionomers have unusually high resistance to tear-off in high-speed extrusion operations. The very high melt strength permits the use of ionomers in situations where the molten polymer comes into contact with a sharp metal object, e.g., in the packaging of fishhooks etc. Ionomers also have superior performance where good hot tack strength is required

Mould Shrinkage (%):

No.	Value
1	0.003–0.02%



Applications: Major use in the manufacture of films and coatings where formability, visual appearance and toughness are important. other applications include golf ball covers and other sporting uses, automobile bumper guards, bottles, tubes, hoses, heat-sealing applications, food packaging, blister wrap and metal-coated articles

60088-51-9	Zn salt
54193-36-1	Na salt
29297-91-4	Li salt
29297-93-6	K salt

Molecular Formula: $(C_4H_5O_2M)_n$
Fragments: $C_4H_5O_2M$

Volumetric & Calorimetric Properties:

Glass Transition Temperature:

No.	Value	Note
1	310°C	Na salt [1]
2	490°C	Mg salt [1]

Transport Properties:

Polymer Solutions Dilute: Viscosity in aq. soln. 2.561 cm s^{-1} (c, 0.1 g dl^{-1}), 1.38 cm s^{-1} (c, 0.01 g dl^{-1}), 1.051 cm s^{-1} (c, 0.001 g dl^{-1}) [2]. The hydrogen-bonding of water molecules to polymer becomes weaker as temp. decreases [3]
Permeability of Liquids: Diffusion coefficients of aq. sodium chloride at 20° 1.15 × 10^7 cm^2 s^{-1} (c, Na ions/PMA 4 mol dm^{-3}, MW 237000), 0.602 × 10^7 cm^2 s^{-1} (c, Na ions/PMA 59 mol dm^{-3}, MW 1014000) [4]

Electrical Properties:

Electrical Properties General: Suspensions of PMAA salts can show high electrorheological activity; for example, yield stress increases with electric field strength, average particle diameter or acid content of salt. Electrorheological activity of suspensions increases in the order: Li salt > Na salt > K salt > NH_4 salt [5]

Optical Properties:

Total Internal Reflection: Intrinsic segmental anisotropy 150 × 10^{-25} cm^3 (Na salt, 0.012*M* NaCl, pH 7) [6]; 400 × 10^{-25} cm^3 (Na salt, 0.0012*M* NaCl, pH 7) [6]; 56–300 × 10^{-25} cm^3 (Na salt, H_2O) [7]

Polymer Stability:

Polymer Stability General: In dil. aq. soln. sodium polymethacrylate can undergo a two-stage degradation process during viscosity measurement. The first stage is a mechanochemical degradation due to shear stress and the action of oxygen, and the second is due to oxidation and photolysis [2]
Decomposition Details: The Na, Li, K and Cs salts decompose at approx. 350°, whereas the Mg and other alkaline earth metal salts decompose at 500°. Similar products including ethylene, Me_2CO, 1-butene and various ketones are produced [8,9]. The NH_4 salt decomposes via cyclisation followed by fragmentation at higher temps. At 320° products include NH_3 and H_2O; at 500° they include isocyanic acid and HCN [8]

Polymer Stability:

Upper Use Temperature:

No.	Value
1	160°C

Decomposition Details: Decomposes at approx. 240°
Flammability: Details of flammability have been reported [5]. Burns, but emits little smoke [6]. Oxygen index 20 [6]
Chemical Stability: Is resistant to organic solvents but attacked by alkalis [6]. Resistant at 20° (DIN standard 53428) to Me_2CO, Et_2O, C_6H_6, diesel oil, EtOAc, 2-propanol, 2-butanone, petrol, 10% sulfuric acid, styrene, supergrade gasoline, CCl_4, toluene, trichloroethene. Has moderate resistance to dibutyl phthalate. Attacked by MeOH, AcOH, THF and 5% NaOH [8]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. from cast sheets of methacrylic acid-*co*-methacrylonitrile at approx. 200° [2]
Applications: Applications in aircraft industry (landing flaps, landing gear doors, engine cowling, helicopter rotor blades). Other uses in core materials for x-ray tables, mammography cassettes and in cores of golf clubs, skis and tennis rackets. Applications due to excellent dielectric props. in antennae and radar domes

Trade name	Details	Supplier
Rohacell	various grades	Rohm and Haas

Polymethacrylonitrile P-353

Synonyms: *Poly(2-methyl-2-propenenitrile). PMAN. PMCN*
Related Polymers: Polyacrylonitrile
Monomers: Methacrylonitrile
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
25067-61-2

Molecular Formula: $(C_4H_5N)_n$
Fragments: C_4H_5N
Molecular Weight: MW 4000000, M_n 25000, M_w/M_n 2.2 (radical polymerisation). M_n 16000–49000, M_w/M_n 1.71–1.78 (radical polymerisation), M_n 500000 (from membrane osmometry), MW 1330000 (from gpc), MW 13000 (degree of polymerisation 190, clathrate polymerised), MW 7000 (degree of polymerisation 100, clathrate polymerised)
General Information: Has good mech. strength and high resistance to solvents, acids and alkalis. It softens at a lower temp. than its analogue polyacrylonitrile, but discolours at temps. required for moulding
Tacticity: 2-Dimensional spectral techniques have proved usesful in determining tacticity [7,9]. An enhanced isotactic-heterotactic struct. is possessed by polymer produced by γ-irradiation of induced complex of methacrylonitrile with cyclotriphosphazene (clathrate polymerisation system [5,8]
Miscellaneous: Can be soln. blended (using DMSO) with polyvinyl alcohol [34]. Grafting of polymer to metallic surfaces (e.g. Ni, Pt) has been achieved by electrochemical polymerisation (cathodic polarisation) [2,11,13,20,22]; various spectroscopic techniques suggest strong chemical bonds betweeen carbon and metal atoms [20,22]. Studies of nitrogen levels (bulk and surface) using neutron activation analysis and proton track counting have been reported. [32] Highly monodisperse polymer beads of varying size and cross-link density have been reported [18]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	>200°C	min. [36]

Glass Transition Temperature:

No.	Value	Note
1	118°C	approx. [40,45]
2	120°C	[41]
3	104°C	[19]

Transition Temperature General: T_g and its correlation with cohesive energy density and chain-stiffness parameter (Flory ratio) has been reported [19]
Vicat Softening Point:

No.	Value	Note
1	115°C	approx. [36]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density 440 J cm^{-3} (105 cal cm^{-3}) [19]. Solubility parameters 7.2 $J^{1/2}$ $cm^{-3/2}$ 12.4 $cal^{1/2}$ $cm^{-3/2}$), 6.6–7.3 $J^{1/2}$ $cm^{-3/2}$ (10.4–12.8 $cal^{1/2}$ $cm^{-3/2}$) [26]
Solvents/Non-solvents: Sol. DMSO [17], Me_2CO [17,40], cyclohexanone [30,40], THF [25], acetonitrile [11], trifluoroacetic acid [1], CH_2Cl_2 [5,8], C_6H_6 (hot) [5], xylenes (hot) [8]. Sl. sol. diethylketone [41], methyl propyl ketone [41], DMF [47]. γ-Irradiated (bulk) material insol. THF (non-clathrate material) [8]. Insol. MeOH [17,40], hexane [5,8], nitromethane [43], hexane [5,8]. Sl. sol. diethylketone [40], methyl propyl ketone [40], DMF [46].The solubility and swelling behaviour of homopolymer in more than 50 liqs. have been reported [26,27]

Transport Properties:

Permeability and Diffusion General: Diffusion coefficient [O_2] 1.1×10^{-8} cm^2 s^{-1} (after γ-irradiation and exposure to air). Diffusion coefficient shows an inverse dependence on dose [23]

Mechanical Properties:

Mechanical Properties General: Has high mech. strength

Optical Properties:

Transmission and Spectra: H-1 nmr [9], C-13 nmr [9] and xps spectral data have been reported. Xps, ups [2,20,22] and electrochemical impedance spectral data for electrochemically polymerised material have been reported. C-13 nmr spectral data for γ-irradiated, clathrate-polymerised material (inclusion complex with cyclotriphosphazene) have been reported [5,8]. Finely resolved C-13 nmr spectral data for atactic and syndiotactic-rich polymer have been reported [7,21]

Polymer Stability:

Thermal Stability General: Thermal degradation behaviour has been reported [1,12,21,31,33,37,38]. Depending on experimental conditions, polymer can either undergo a low-temp. coloration reaction or undergo almost qualitative depolymerisation to monomer [12]. The coloration reaction can be eliminated if polymer is prepared *in vacuo* using carefully purified monomer and AIBN initiator [12,37,38]
Decomposition Details: Thermal degradation occurs by depolymerisation process to give greater than 90% monomer; nitrile groups appear to prevent intramolecular H-transfer reactions [31].

Degradation to monomer occurs above 200° and is complete at 270° [33]. Anal. of pure polymer (prepared using AIBN or benzoyl peroxide) shows almost quantitative degradation to monomer, with trace quantities of isobutene and HCN; 2-stage decomposition process with onset of decomposition above 250° [12]. Other studies show two initiation processes for polymer degradation in N_2, namely chain-end and random-scission initiation; internal cyclisation reaction leads to formation of thermally stable residue having conjugated polyimine struct. [1,16]. Recent studies indicate the formation of at least two additional cyclic forms

Hydrolytic Stability: Alkaline hydrol. [21] (aq. NaOH soln.) of polymer in DMSO leads to formation of cyclic sequences [14,35,40]. Hydrol. of nitrile groups in aq. alkali solns. leads to formation of carboxylates and acid groups (water sol.) [14]

Stability Miscellaneous: Irradiation using high-energy radiation leads to main-chain scission without simultaneous cross-linking [30]. Sensitivity to X-rays has been reported [40].The effects of radiation in the absence of O_2 at room temp. have been reported [24]. The predominant reaction is main-chain scission [24,44,45]. γ-Irradiation of thin polymer sheets and exposure to air has been reported [23]. Radicals produced by γ-irradiation are primarily the result of main-chain scission, hydrogen atom addition and abstraction [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Generally produced by free-radical polymerisation of methacrylonitrile in a similar way to polyacrylonitrile [36]. However, methacrylonitrile polymerises less readily so polymerisation is performed in emulsion. Anionic polymerisation using Grignard reagents gives stereoregular polymer [17]. Using BuLi as catalyst at 0° gives atactic product [1,46] whereas Et_2Mg at 80° gives isotactic rich product [1,7] free-radical initiators such as benzoyl peroxide, potassium persulfate and AIBN can also be used. Living polymerisation process [6] using aluminium porphyrin initiators has been reported. [3] Inclusion polymerisation, e.g. within cyclophosphazene clathrates, using γ-irradiation has been reported [5,8]; can be used to control stereochemistry of polymer [8]. Free-radical polymerisation using the *tert*-butylthiyl radical as initiator has also been reported [10]. Electrochemical polymerisation on metal surfaces has been reported [2,11,13,20,22]. Preparative laser photolysis, using dianisoyl as initiator, gives narrow-banded atactic oligomeric products (degree of polymerisation 3–26) plus insol. glassy polymer [25]. Methacrylonitrile can also be polymerised by group transfer polymerisation using (2-trimethylsilyl)isobutyronitrile as initiator, either with [24] or without [28] coinitiators (e.g. tetraethylammonium cyanide, or tetrabutylammonium fluoride). This is a living polymerisation reaction giving material of almost random tacticity, [28] which is of limited practical importance on account of severe side reactions which reduce conversions and MW [29]. Highly monodisperse polymethacrylonitrile beads have been prepared by emulsion copolymerisation of monomer and allyl methacrylate in the absence of emulsifier using potassium persulfate initiator [18]. Polymers wth narrow MW distribution are obtained using BulLi as initiator [46]

Applications: Uses include electrode compositions, fuel cells, optical recording media, electrophotography, magnetorhelogical compositions, electromagnetic materials, sensors, (lubricating) oils, films/fibres, paints/coatings, adhesives, resists (photoresists in x-ray lithography) integrated circuits, insulating compositions, conducting composites, thermal printing, lithography, photographic compositions, mouldings, biomedical applications. Blends with poly(vinyl alcohol) have potential applications in porous, permselective membranes; copolymers with fluorinated comonomers have potential applications as photo(x-ray and electron-beam) resists, as well as copolymers containing methyl methacrylate. Thin films, produced by electrochemical polymerisation techniques, have potential applications in electronics, catalysis, corrosion inhibition, etc.

Poly[methane bis(4-phenyl)carbonate] P-354

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylenemethylene-1,4-phenylene]. Poly(4,4′-dihydroxydiphenylmethane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxydiphenylmethane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
9070-69-3
28935-53-7

Molecular Formula: $(C_{14}H_{10}O_3)_n$
Fragments: $C_{14}H_{10}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.22 g/cm^3	20°, amorph. [3]
2	d 1.28 g/cm^3	cryst. [3]

Melting Temperature:

No.	Value	Note
1	223–225°C	[2]
2	236–253°C	amorph. [3]
3	275–278°C	cryst. [3]

Glass Transition Temperature:

No.	Value	Note
1	147°C	[2]
2	102°C	[1]

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends with Bisphenol A polycarbonate, tetramethylpolycarbonate, and polymethylacrylate [1]; it forms immiscible blends with polystyrene, [1]
Solvents/Non-solvents: Swollen by MeCl, *m*-cresol, pyridine, DMF; insol. EtOAc, Me_2CO, cyclohexanone, THF, C_6H_6 [2]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve shows a viscoelastic region up to the yield point, followed by a stress drop and then necking behaviour (at approx. constant stress); finally the stress increases to the break point [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1770 MPa	18000 kg cm^{-2}, amorph. [4]
2	1960 MPa	20000 kg cm^{-2}, cryst. [4]

Tensile Strength Break:

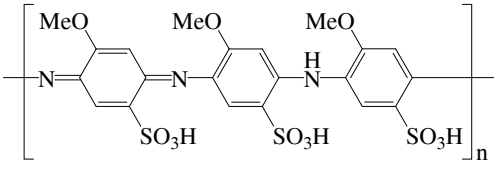
No.	Value	Note	Elongation
1	68 MPa	6.9 kg mm^{-2}, amorph. [4]	180%
2	79 MPa	8 kg mm^{-2}, cryst. [4]	176%

Tensile Strength Yield:

No.	Value	Note
1	54.9 MPa	5.6 kg mm^{-2} [4]

Optical Properties:

Refractive Index:



No.	Value	Note
1	1.608	calc. [1]

Transmission and Spectra: Ir spectral data have been reported [2]

Poly(2-methoxyaniline-5-sulfonic acid) P-355

Synonyms: *3-Amino-4-methoxybenzenesulfonic acid homopolymer. PMAS*
Material class: Thermoplastic
Polymer Type: polyaniline
CAS Number:

CAS Reg. No.
167860-86-8

Molecular Formula: $(C_7H_7NO_4S)n$
Fragments: $C_7H_7NO_4S$
General Information: Water-soluble conductive polymer with self-doped properties, in which the backbone has a polyemeraldine structure analogous to polyaniline [1,2]. Prod. as yellow-green solid or aqueous soln.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. water; sparingly sol. EtOH; insol. MeCN [2]

Electrical Properties:

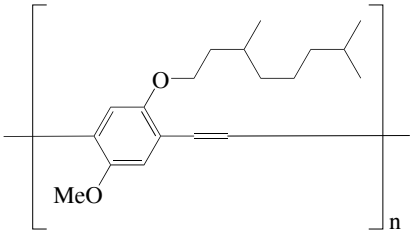
Electrical Properties General: Conductivity of self-doped polymer up to 0.04 S cm^{-1} reported [1]. The conductivity remains fairly constant even in 2*M* NaOH [3].

Optical Properties:

Optical Properties General: Polymer has characteristic absorptions in uv-vis region with λ_{max} *ca*. 330 and 475nm [4,5,6]. An optically active form of the polymer has been prepared with UV absorption band centred at *ca*. 483nm [6]. The yellow-brown aqueous soln. of the ammonium salt changes to a blue colour on addition of NaOH, with the appearance of absorption bands with λ_{max} *ca*. 350 and 750nm [3].
Transmission and Spectra: Uv [4,5,6] and ftir [4] spectral data have been reported.

Polymer Stability:

Thermal Stability General: Polymer is stable up to 215°C [2].



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mainly by oxidation of 2-methoxyaniline-5-sulfonic acid with ammonium peroxydisulfate in basic media such as aqueous pyridine [1,5]. It has also been prepared electrochemically from the same monomer in ammonium hydroxide soln. [4]. Optically active polymer has been prepared chemically using an optically active peroxydisulfate salt [6].
Applications: PMAS has been evaluated in electrochemical biosensors for hydrogen peroxide using horseradish peroxidase [7,8].

Poly[2-methoxy-5-(3′,7′-dimethyloctyloxy)-1,4-phenylene vinylene] P-356

Synonyms: *Poly[[[2-(3,7-dimethyloctyl)oxy]-5-methoxy-1,4-phenylene]-1,2-ethenediyl]. Poly[[[(3,7-dimethyloctyl)oxy]methoxy-1,4-phenylene]-1,2-ethenediyl]. MDMO-PPV. OC_1C_{10}-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
177716-59-5	poly[[[2-(3,7-dimethyloctyl)oxy]-5-methoxy-1,4-phenylene]-1,2-ethenediyl]
250164-11-5	poly[[[(3,7-dimethyloctyl)oxy]methoxy-1,4-phenylene]-1,2-ethenediyl]

Molecular Formula: $(C_{19}H_{28}O_2)n$
Fragments: $C_{19}H_{28}O_2$
Additives: The polymer is blended with the soluble methanofullerene PCBM, usually in the ratio of about 1:3, for photovoltaic applications [1,2,3].
General Information: Photoluminescent and electroluminescent polymer with hole conducting properties. Prod. as red or orange solid.
Morphology: The morphology has been reported. Circular features are indicative of aggregation in films [12].

Volumetric & Calorimetric Properties:

Glass Transition Temperature:

No.	Value	Note
1	48–50°C	[4]

Surface Properties & Solubility:

Solubility Properties General: Polymer films cast with chlorobenzene as solvent give best results for photovoltaic cells and field-effect transistors [5,6].
Solvents/Non-solvents: Sol. THF, toluene, xylene, chlorobenzene [4,5,6].

Electrical Properties:

Electrical Properties General: Polymer can act as electron donor (ionisation potential 5.33eV [7]) in combination with the electron acceptor PCBM in heterojunction photovoltaic cells [1,2,3]. The hole mobility of pure polymer is increased in the MDMO-PPV/PCBM blend [1,2]. MDMO-PPV can also be used as emissive layer in LEDs with turn-on voltages of 2.5–3.5V [4].

Optical Properties:

Optical Properties General: Polymer exhibits photoluminescence and electroluminescence in orange-red region of spectrum with λ_{max} at about 600nm, and band gap of about 2.4 eV [3,4,7]. Birefringence exhibited in region of 600 nm with in-plane refractive index much higher than out-of-plane index [8].
Transmission and Spectra: pmr [4,9], cmr [4], ir [4,9], uv and photoluminescence [3,4,7,10,12], electroluminescence [4] and esr [11] spectral data have been reported.

Polymer Stability:

Thermal Stability General: Initial loss of weight above *ca*. 315°C. Longer side-chain degradation from 330–450°C [4].

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymer prod. mainly by Gilch method from 1,4-bis(halomethyl)-2-methoxy-5-(3′,7′-dimethyloctyloxy)benzene with *tert*-BuOK, or by sulfinyl route from 1-(chloromethyl)-2-(3′,7′-dimethyloctyloxy)-5-methoxy-4-(alkylsulfoxymethyl)benzene [4,9,10]. Polymer prod. by the sulfinyl route is reported to have greater efficiency in blends for photovoltaic cells [13]. Polymer produced by the Gilch route has up to 2% tolane-bisbenzyl defects [14].
Applications: Mainly used as blends with the methanofullerene PCBM for development of solar cells. Also possible applications in light-emitting diodes and field-effect transistors.

Poly[2-methoxy-5-(2′-ethylhexyloxy)-1,4-phenylene vinylene] P-357

Synonyms: *Poly[[2-[(2-ethylhexyl)oxy]-5-methoxy-1,4-phenylene]-1,2-ethenediyl]. Poly[[[(2-ethylhexyl)oxy]methoxy-1,4-phenylene]-1,2-ethenediyl]. MEH-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
133030-00-9	poly[[2-[(2-ethylhexyl)oxy]-5-methoxy-1,4-phenylene]-1,2-ethenediyl]
138184-36-8	poly[[[(2-ethylhexyl)oxy]methoxy-1,4-phenylene]-1,2-ethenediyl]

Molecular Formula: $(C_{17}H_{24}O_2)_n$
Fragments: $C_{17}H_{24}O_2$
Additives: Dopants such as I_2 have been added to increase conductivity. The polymer has been blended with fullerenes for use in photovoltaic devices.
General Information: Stable conductive photoluminescent and electroluminescent polymer with greater solubility in organic solvents compared to poly(*p*-phenylene vinylene). The polymer is prod. as an orange-red solid.
Morphology: Orthorhombic unit cell, a = 7.12, b = 20.89, c = 6.47 Å. Chain orientation is anisotropic, with the polymer backbones mainly parallel to film planes [1]. Nematic-like phases in the region of 200–260°C detected [2]

Volumetric & Calorimetric Properties:

Glass Transition Temperature:

No.	Value	Note
1	57–67°C	[2,3]

Transition Temperature General: Nematic region 200–260°C with isotropic transition at about 290°C [2].

Surface Properties & Solubility:

Solubility Properties General: High molecular weight fractions and gelated forms obtained during production are insoluble in solvents such as THF and toluene [4,5,6].
Solvents/Non-solvents: Sol. chlorobenzene, toluene, xylene, 1,1,2,2-tetrachloroethane, $CHCl_3$, CH_2Cl_2, THF, 1,4-dioxan [5,7].

Mechanical Properties:

Mechanical Properties General: Mechanical properties of fibres spun from THF and drawn fibres have been reported [8].

Electrical Properties:

Electrical Properties General: Polymer is used as emissive layer in LEDs [9,10,11,12,26] with low turn-on voltages and also has photovoltaic properties. Electron mobility in polymer is comparable to hole mobility [13].

Optical Properties:

Optical Properties General: Polymer has band gap (2.2–2.3eV) [25] lower than that of poly(*p*-phenylene vinylene). Films exhibit photoluminescence and electroluminescence in the red-orange region of the spectrum with λ_{max} values in the region of 590–630nm [5,12,14]. The longer-wavelength maximum is dependent on spinning speed for film casting [14]. Efficiency of photoluminescence is markedly reduced on increase of pressure [15]. Birefringence is exhibited in region of 550–700nm, with in-plane refractive index higher than out-of-plane index [16].
Transmission and Spectra: Pmr [7,24], cmr [7], ir [7,12,17,18,22,24], uv and photoluminescence [7,10,12,17,18,19], electroluminescence [9,10,12,14], esr [20], UPS and XPS [21,22] and x-ray diffraction [1,2] spectral data have been reported.

Polymer Stability:

Polymer Stability General: Polymer undergoes oxidative degradation on exposure to UV radiation and with heat treatment [3,22].
Thermal Stability General: Polymer is much more unstable on heating in air compared with nitrogen. For polymer films, lifetime to 5% weight loss at 200°C is 2.32min. (air), 71h (nitrogen) [3].

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mainly by modified Gilch reaction of 1,4-bis(halomethyl)-2-methoxy-5-(2-ethylhexyl)benzene with a base such as *tert*-BuOK. The formation of insoluble gel form can be avoided by the addition of 4-*tert*-butylbenzyl chloride [4,24], tetrabutylammonium bromide [12], 4-methoxyphenol [23] or with DMF as a solvent [6]. Also prod. by condensation of 1,4-bis(diethoxyphosphonomethyl)-2-methoxy-5-(2-ethylhexyloxy)benzene with the corresponding 1,4-dialdehyde in a Horner-type reaction [7].
Applications: The principal application is as an emissive polymer in light-emitting diodes, also potential applications for lasers and photovoltaic cells.

Poly(3-methoxypropylene oxide) P-358

Synonyms: *Poly[oxy(methoxymethyl)-1,2-ethanediyl]. Oxirane, (methoxymethyl), homopolymer, 9CI. Poly[(methoxymethyl)oxirane]. Poly(methylglycidyl ether). Poly(1,2-epoxy-3-methoxypropane). Poly(3-methoxy-1,2-epoxypropane)*
Monomers: (Methoxymethyl)oxirane
Material class: Thermoplastic
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
137597-55-8	
28325-89-5	homopolymer

Molecular Formula: $(C_4H_8O_2)_n$
Fragments: $C_4H_8O_2$
Molecular Weight: M_n 610; M_w/M_n 1.07 and 1.8 [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.095 g/cm^3	[3]

Melting Temperature:

No.	Value	Note

Poly[2-methoxy-5-(3-sulfopropoxy)-1,4-phenylene vinylene] P-360

M=Na, Li or NH_4

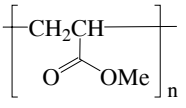
Synonyms: *Poly[[2-methoxy-5-(3-sulfopropoxy)-1,4-phenylene]-1,2-ethenediyl]. MPS-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
125714-87-6	Na salt
258531-40-7	Li salt
125714-86-5	

Molecular Formula: $(C_{12}H_{13}O_5S.M)n$
Fragments: $C_{12}H_{13}O_5S.M$

General Information: Water-soluble polyelectrolyte exhibiting strong fluorescence in soln. Forms red aqueous solns. and black films [1].

Electrical Properties:
Electrical Properties General: Conductivity of ammonium salt reaches 10^{-2} S cm^{-1} [1].



Optical Properties:
Optical Properties General: Exhibits strong fluorescence in aqueous soln. which is quenched by cationic reagents such as methyl viologen [2]. Broad fluorescence band in region of 500-550nm exhibits red shift and an increase in photoluminescence quantum efficiency when dendrimer assemblies are added to aqueous solns. [3]. Quantum efficiency is also enhanced in different polyelectrolytes, particularly anionic ones [4]. Band gap for aqueous polymer *ca.* 2 eV [1].
Transmission and Spectra: Ir [1], uv and photoluminescence [1,2,3,4] spectral data have been reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. as different salts *via* precursor polymer derived from 5-methoxy-2-(3-chlorosulfonyl)-propoxy-1,4-xylene-α,α′-bis(tetrahydrothiophenium chloride) [1].
Applications: The amplified quenching effect with cationic reagents is utilised for assay of proteins such as avidin, employing a biotin-methyl viologen ligand [2,5,6].

Poly(methyl acrylate) P-361

Synonyms: *PMA. Poly(methyl 2-propenoate). Poly[1-(methoxy carbonyl)ethylene]. Methylacrylate polymer*
Related Polymers: Poly(ethylene-*co*-methylacrylate) (EMA)
Monomers: Methyl acrylate
Material class: Natural elastomers
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
9003-21-8

Molecular Formula: $(C_4H_6O_2)_n$
Fragments: $C_4H_6O_2$
Molecular Weight: MW 1000–5000000
Additives: Soap-urea, activated thiol, lead thiourea, diamines, soap sulfur, carbon black, trithiocyanuric acid, ethylene thiourea. Plasticisers include: Thiokol TP-759, Plastolein 9720 and Admex 760. Process aids include: TE-80 and Vanfre AP-2. Antioxidants include sodium alkyl sulfate, inorganic and organic phosphates, diphenylamine, Agerite stalites
General Information: Poly(methyl acrylate) is an elastomer belonging to a family called acrylic elastomers, acrylic ester polymers or simply polyacrylates (ACM's), known since early 1940's. When compounded with additives they offer some unique props. which make them useful where other elastomers (rubbers)

fail. Among speciality elastomers this ranks above all except silicon and fluorinated hydrocarbon elastomers. It is a tough, rubbery polymer with low T_g. It is water-sensitive but resistant to swelling in oils and non-polar liqs., with good thermal stability. T_g changes with tacticity. It is inherently resistant to uv radiation, oxygen, ozone and heat. In the absence of oxygen thermal degradation does not occur until approx. 300°. A tough, rubbery polymer with low T_g. It is water-sensitive but resistant to swelling in oils and non-polar liqs., and has good thermal stability. Its T_g changes with tacticity. It has a saturated backbone struct. which makes it inherently resistant to uv radiation, oxygen, ozone and heat. In the absence of oxygen, thermal degradation does not occur until 300° approx. Specialised automotive needs have been the key to most of its applications. Copolymers with suitable co-monomers and small amounts of proper cure site monomers constitute the building blocks of current acrylic elastomers. This greatly increases the range and value of the physical props. for a variety of applications. These polymers are further compounded with typical additives and ingredients to produce a commercial product. A general recipe includes polymer, stearic acid, processing aid, antioxidant, filler, plasticiser amd cure system. This recipe depends upon the cure site present and the application requirements

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.22 g/cm^3	25°

Thermodynamic Properties General: ΔC_p 42.3 kJ kg^{-1} K^{-1}
Latent Heat Crystallization: ΔG_1^{α} 8.0–8.8 kJ mol^{-1}; ΔH_1^{α} 9.8–11 kJ mol^{-1}
Specific Heat Capacity:

No.	Value	Note	Type
1	1340 kJ/kg.C	115 J mol^{-1} K^{-1}, 25°, solid	P
2	1800 kJ/kg.C	155 J mol^{-1} K^{-1}, 25°, liq.	P

Glass Transition Temperature:

No.	Value	Note
1	10–11°C	
2	5°C	syndiotactic, head-to-tail
3	31°C	isotactic, head-to-tail

Brittleness Temperature:

No.	Value
1	0–6°C

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: E_{coh} 27800–31800 J mol^{-1}; CED 396.57 J cm^{-3}; δ 19.9–21.3 J$^{1/2}$ cm$^{-3/2}$
Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, THF, esters, ketones, glycolic ester ethers, phosphorus trichloride. Insol. aliphatic hydrocarbons, hydrogenated naphthalenes, Et_2O, alcohols, CCl_4
Wettability/Surface Energy and Interfacial Tension: γ_s 45 mN m^{-1} (calculated)

Transport Properties:

Polymer Melts: Critical Molar Mass M_{cr} 24000. Critical value of the number of chain atoms in the polymer molecule Z_{cr} 560. Unperturbed viscosity coefficient K_θ 0.065 cm^3 mol$^{1/2}$ g$^{3/2}$ $K_\theta M_{cr}^{1/2}$ 10 cm^3 g^{-1}

Mechanical Properties:

Mechanical Properties General: Exhibits acceptable compressive strength

Tensile (Young's) Modulus:

No.	Value
1	6.9 MPa

Mechanical Properties Miscellaneous: Elongation 350%. Elongation at break 750%
Hardness: Shore A40-A95 (Durometer)
Friction Abrasion and Resistance: Exhibits good abrasion resistance

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	31.5 kV.mm^{-1}	800 V mil^{-1}

Complex Permittivity and Electroactive Polymers: Dielectric relaxation frequency 1.8 GHz (25°, toluene). Electrical temp. 15° (1s)
Dissipation (Power) Factor:

No.	Value
1	0.2

Optical Properties:

Refractive Index:

No.	Value	Note
2	1.479	25°

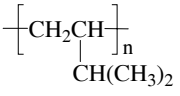
Polymer Stability:

Polymer Stability General: Has excellent shelf life when stored under normal dry conditions. Suitably formulated and cured polymer systems are resistant to oils and greases, ozone, aliphatic hydrocarbons at low and elevated temps., and sunlight discoloration and weathering. Shelf life of compounded polymer depends on the activity of the cure system employed. Generally, aged compounds should be mill-freshened prior to processing
Thermal Stability General: Temp. for half life of 30 min 330°
Upper Use Temperature:

No.	Value	Note
1	<80°C	max., homopolymer
2	190–204°C	70h max., compounded
3	163–177°C	1000h max.

Decomposition Details: $T_{½}$ 328° (601K), 332° (605K)
Flammability: Ignites and burns quite readily and completely to leave no residue
Environmental Stress: Acrylic polymers are not sensitive to normal uv degradation since the primary uv absorption of acrylics occurs below the solar spectrum of 290 nm
Chemical Stability: Resistant to oxygen and only decomposes slowly under extreme conditions, e.g. high temp. in an oxygen atmosphere. Does not readily depolymerise on heating. Decomposes at 292–399° to produce mainly MeOH and carbon dioxide
Hydrolytic Stability: Resistant to both acidic and alkaline hydrol.

Applications/Commercial Products:



Processing & Manufacturing Routes: Commercially poly(methyl acrylate) is prod. by soln. and emulsion polymerisation. It is processed by injection moulding, blow moulding, extrusion and thermoforming. Co-polymers with suitable co-monomers and small amounts of proper cure site monomers constitute the building blocks of the current acrylic elastomers, greatly increasing the range and value of the physical props. for a variety of applications. These polymers are further compounded with typical additives and ingredients to produce a commercial product: typically this includes polymer, stearic acid, processing aid, antioxidant, filler, plasticiser and cure system. This recipe depends upon the cure site present and the application requirements
Applications: The chief market for acrylic elastomers is automotive industry. Main applications are as seals, gaskets, actuating diaphragms, valve seats, adhesives, coating industry caulks, sealants, textile back coatings, hoses, paper saturation and leather finishing. Actuating disphragms, valve seats etc.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: CED 282.6 J cm^{-3} (67.5 cal cm^{-3}) [20]. δ 33.0–36.3 J$^{1/2}$ cm$^{-3/2}$ (7.88–8.68 cal$^{1/2}$ cm$^{-3/2}$) [31]
Solvents/Non-solvents: Slightly sol. *o*-dichlorobenzene [23], C_6H_6 [19]. Insol. Et_2O, heptane [6,19]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.8 g/10 min	320°, 2.16 kg load [43]

Polymer Solutions Dilute: [η] 3 dl g^{-1} (135°, tetrahydronaphthalene) [15]
Gas Permeability:

No.	Gas	Value	Note
1	N_2	656660 cm^3 mm/ (m^2 day atm)	1×10^{-6} cm^2 $(s\ cmHg)^{-1}$ [44]

Mechanical Properties:

Mechanical Properties General: Mech. props. have been reported [8,40,44]. Dynamic [40], shear [11] and dynamic elastic moduli [10] have been reported in graphical form. Dynamic tensile storage modulus and loss modulus have been reported [45]
Flexural Modulus:

No.	Value	Note
1	3380 MPa	490 kpsi [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	12.4 MPa	1800 psi, 100° [6]	
2	34.5 MPa	5000 psi, 25° [6]	3% extension

Flexural Strength Yield:

No.	Value	Note
1	47.6 MPa	6900 psi [6]

Viscoelastic Behaviour: Stress relaxation has been reported [8]
Izod Notch:

No.	Value	Notch	Note
1	16 J/m	Y	0.3 ft lb in^{-1}, 25° [6]
2	74.7 J/m	N	1.4 ft lb in^{-1}, 25° [6]

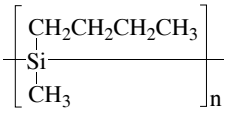
Optical Properties:

Optical Properties General: Thermoluminescence has been reported [42]
Transmission and Spectra: Ir [13,22,46], Raman [29,30], esr [4], H-1 nmr [21,22,23] and C-13 nmr [24,25,26,27] spectral data have been reported

Polymer Stability:

Thermal Stability General: Undergoes rapid oxidative degradation above 100° [8,39]. Thermal degradation has been reported [39]
Decomposition Details: Initial decomposition 340–400° [41]. E_{act} 84.6 kJ mol^{-1} (20.2 kcal mol^{-1}, cryst., decomposes) [39]. E_{act} 63.6 kJ mol^{-1} (15.2 kcal mol^{-1}, amorph., decomposes) [39]. E_{act} 193 kJ mol^{-1} (46 kcal mol^{-1}, decomposes) [41]
Flammability: Pyrolysis produces isopentane as the main product, caused by 'unzipping' [38]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3AlEt_2Cl$ in *n*-heptane at 70°
Mould Shrinkage (%):

No.	Value	Note
1	5%	approx. [6]

Poly(methyl-*n*-butylsilane) P-363

Synonyms: *Poly(butylmethylsilylene). pMeBuSi. ME4*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
88003-14-9

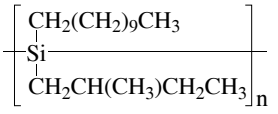
Molecular Formula: $(C_5H_{12}Si)n$
Fragments: $C_5H_{12}Si$
Molecular Weight: 5.4×10^3–1.0×10^5 [3,4].
General Information: The polymer is an asymmetrical substituted methyl-substituted polysilylene.
Morphology: Amorphous white solid [1,3]. Si backbone dominated by the presence of mixed transoid (T), deviant (D) and, possibly, ortho (O) conformations with dihedral angles approximating 155°, corroborating the formation of a T+D+T-D- Si backbone [1].
There is no evidence for a significant fraction of *all-anti* (A, i.e., *trans*-planar), *all-trans*, or *anti*-gauche conformers [1].

Volumetric & Calorimetric Properties:
Transition Temperature General: Melts without decomposition [8]

Surface Properties & Solubility:
Solubility Properties General: Readily soluble in common organic solvents [8]

Optical Properties:
Optical Properties General: Modest 25nm blue shift on warming with no evidence of an isosbestic point [1]. The temperature-dependent uv spectra of the polymer showed only a continuous bathochromic shift (302nm to 313nm). The short side chain interacts weakly with the polysilane chromophore, resulting in a gradual bathochromic shift with decreasing temperature [2].
Transmission and Spectra: Ir [4], uv [1,2,4], and nmr [4,5,6] spectra reported.

Polymer Stability:
Polymer Stability General: Does not form an ordered phase [1]
Thermal Stability General: The thermogram shows three endotherms at 0, -20, and -40°C: The first endotherm at 0°C has been assigned to a first conformational change and to a partial transition to the M phase (the most thermodynamically stable). The second endotherm with formation of the metastable K2 phase, since there are no signs of change in the backbone conformation. The third endotherm at -40°C correlates with a second chain conformational change [1,2].



Applications/Commercial Products:
Processing & Manufacturing Routes: Synthesised from dichloromethyl-*n*-butylsilane by dehalogenative coupling reaction with Na under standard conditions for Wurtz polysilane synthesis [1,2,7,8].
Synthesised in yields of 51–60% from 1,2-dichloro-1,1-isobutyl-2,2-dimethyldisilane or dichloro-1,2-dimethyl-1,2-dibutyldisilane using 3,3′,5,5′-tetramethylbiphenyl anion radical as a reducing agent, which shows a remarkable chemoselectivity in the polymerisation reaction [3]

Applications/Commercial Products:
Applications: X-ray lithography [7].

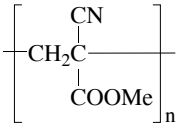
Poly[(2-methylbutyl)undecylsilylene] P-364

Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
162844-16-8

Molecular Formula: $(C_{16}H_{34}Si)n$
Fragments: $C_{16}H_{34}Si$
Molecular Weight: 45,600–51,000 [1,2]



Volumetric & Calorimetric Properties:
Transition Temperature General: Bp 135-136°C (at 0.4 mmHg) [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerisation of methyl[(*S*)-2-methylbutyl]undecylsilane dichloride in Et_2O in the presence of Na and 18-crown-6 [1,2].
Applications: Useful as enantio-recognitive material in chromatography and as standard materials in 1-dimensional semiconductor-quantum wire structures [1].

Poly(methyl cyanoacrylate) P-365

Synonyms: *Methyl cyanoacrylate polymer*
Related Polymers: Poly(alkyl cyanoacrylates), Poly(ethyl cyanoacrylate), Poly(isobutyl cyanoacrylate), Poly(allyl cyanoacrylate)
Monomers: Methyl 2-cyanoacrylate
Material class: Thermoplastic, Gums and resins
Polymer Type: acrylic, acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
25067-29-2

Molecular Formula: $(C_5H_5NO_2)_n$
Fragments: $C_5H_5NO_2$
Molecular Weight: Up to 75000
Additives: Adhesive strength and toughness can be improved by addition of additives
General Information: Amorph.

Morphology: Clear, hard resin with good adhesive props., though with low peel and impact strength. Most polar alkyl cyanoacrylate polymer

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	[14]
2	d^{20} 1.283 g/cm^3	[2]

Melting Temperature:

No.	Value
1	205°C

Glass Transition Temperature:

No.	Value	Note
1	96°C	dynamic mechanical analysis [1]
2	-36°C	differential scanning calorimetry [2]
3	100°C	dilatometry [3]

Transition Temperature General: T_g may vary with polymerisation conditions and presence of contaminants

Deflection Temperature:

No.	Value	Note
1	157–163°C	free-radical polymerisation [13]

Vicat Softening Point:

No.	Value	Note
1	165°C	[4]

Surface Properties & Solubility:

Solubility Properties General: Incompatible with poly(allyl-2-cyanoacrylate) [8] δ 11.8 J$^{1/2}$cm$^{-3/2}$ (calc) [14]

Solvents/Non-solvents: Sol. acetonitrile, DMSO, DMF, nitromethane, *N*-methylpyrrolidone, pyridine. Insol. hexane, toluene, MeOH, EtOAc, THF, Me_2CO, CH_2Cl_2 [9], C_6H_6, $CHCl_3$, H_2O, Et_2O

Transport Properties:

Water Absorption:

No.	Value	Note
1	5.2 %	[1]

Mechanical Properties:

Mechanical Properties General: Strengtheners and toughenners have been reported [10]. Storage modulus decreases with increasing temp.

Flexural Modulus:

No.	Value	Note
1	3654–3840 MPa	530–557 kpsi [13]
2	3399 MPa	493 kpsi, ASTM D790

Tensile Strength Break:

No.	Value	Note	Elongation
1	43 MPa	bone-bone [13]	
2	31 MPa	4500 psi, ASTM D638 [4]	2%
3	13.2 MPa	135 kg cm^{-2} [2]	

Flexural Strength at Break:

No.	Value	Note
1	104–122 MPa	15.1–17.7 kpsi, ASTM D790 [13]

Miscellaneous Moduli:

No.	Value	Note	Type
1	15000 MPa	25° [1]	Storage modulus

Impact Strength: Impact shear strength 213–533 J m^{-1} (4–10 ft lb m^{-1}, ASTM D950) [4]

Mechanical Properties Miscellaneous: Tensile shear strength 22.1 MPa (3200 psi, steel-steel) [4]; 17.24 MPa (2500 psi, Al-Al) [4]. Overlap shear strength 21.5 MPa (cold rolled steel); 16 MPa (Al); 25 MPa (copper) [14]. Peel strength 0.11 kg cm^{-1} [14]. Loss factor values have been reported [4]. For polymer-polymer bonds, substrate failure occurs before bond failure [4]

Hardness: Rockwell M65

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.34	1 MHz	[4]
2	3.98		[14]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.45	20° [4]
2	1.49	[14]

Polymer Stability:

Polymer Stability General: Poor heat resistance due to degradation at substrate/adhesive interface, leading to loss of adhesion [4]

Upper Use Temperature:

No.	Value
1	80°C

Decomposition Details: Above 260° depolymerisation is virtually complete. Decomposition onset at 160° (N_2), 148° (air) [8]

Environmental Stress: Unsuitable for use in situations of high temp, high impact, long-term moisture and for outdoor use

Chemical Stability: Shows generally good resistance to solvents, oils, etc [4]. Degraded by Me_2CO

Hydrolytic Stability: Degrades more rapidly in water than other cyanoacrylate polymers [12]

Stability Miscellaneous: Degraded by radiation [13]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by spontaneous polymerisation of methyl cyanoacrylate monomer catalysed by base see poly(alkyl cyanoacrylates)

Applications: Instant one pot adhesive, used for a range of applications including production line product assembly

Trade name	Details	Supplier
Cyanolib	100 series	Panacol Elosol

Plus C910	100 series	Permabond
Pronto CA	7	3M
Sicomet	85,99,7000	Sichel Henhel
Tb	1701,1702,1703	Threebond

Poly(γ-methyl-L-glutamate) fibre P-366

Synonyms: *Poly(4-methyl-L-glutamic acid) fibre*
Related Polymers: Proteins
Monomers: 4-Methyl-L-glutamic acid
Material class: Proteins and polynucleotides, Fibres and Films
CAS Number:

CAS Reg. No.	Note
29967-97-3	homopolymer

Molecular Formula: $C_6H_{11}NO_4$
Morphology: Contains predominantly the β-form [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.29–1.33 g/cm^3	stretched fibre [1]

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. CH_2Cl_2 (spun thread) [2]

Transport Properties:

Water Absorption:

No.	Value	Note
1	2.4 %	20°, 80% relative humidity [1]
2	3.5 %	20°, 100% relative humidity [1]

Mechanical Properties:

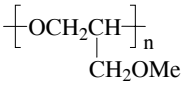
Mechanical Properties General: Tenacity 3.1 g den $^{-1}$ (11.8% elongation) 2.23 g den $^{-1}$ (12.8% elongation, stretched fibre, dry), 2.02 g den $^{-1}$ (16.8% elongation, stretched fibre, wet) [1], 2.7 g den^{-1} (15% elongation, wet). [2] Tensile modulus 41.2 g den^{-1} [1]

Optical Properties:

Transmission and Spectra: Ir and X-ray spectral data have been reported [1]
Volume Properties/Surface Properties: Dyeability can be improved by treatment with hydrazine or copolymerisation with L-methionine [1]

Polymer Stability:

Hydrolytic Stability: Unstable to alkali



Applications/Commercial Products:

Processing & Manufacturing Routes: Poly (γ-methyl-L-glutamate) in CH_2Cl_2/dioxane (80:20 v/v) soln. is spun into Me_2CO. The resultant fibre is rolled, then stretched to 1.7 times its length in a water-bath at room temp., before being rolled again at 110° [1]
Applications: Potential application as synthetic silk. Its use in the manufacture of fabrics has been retarded owing to the instability to alkali of the resultant fabric

Poly(6-methyl-1-heptene) P-369

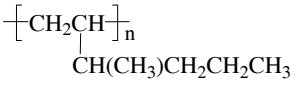
Synonyms: *Poly(1-(4-methylpentyl)-1,2-ethanediyl)*
Monomers: 6-Methyl-1-heptene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
77136-88-0
95831-09-7

Molecular Formula: $(C_8H_{16})_n$
Fragments: C_8H_{16}
General Information: Soft tacky rubber [1]

Volumetric & Calorimetric Properties:
Transition Temperature:

No.	Value	Note	Type
1	180°C	[1]	Polymer melt temp.
2	-34°C	[2]	Softening point



Transport Properties:
Polymer Solutions Dilute: $[\eta]_{inh}$ 2.37 (decahydronaphthalene, 130°) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as VCl_3-$AlEt_3$ at 50° [2]

Bibliographic References

Poly(3-methyl-1-hexene) P-370

Synonyms: *P3MH. Poly(1-(1-methylbutyl)-1,2-ethanediyl)*
Monomers: 3-Methyl-1-hexene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
112265-74-4	
25721-71-5	(*S*)-form

Molecular Formula: $(C_7H_{14})_n$
Fragments: C_7H_{14}
General Information: Powder [2]

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	>350°C	min. [3]
2	285°C	[5]

Transition Temperature:

No.	Value	Note	Type
1	210–215°C	[2]	Softening point

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. MeOH [2], cyclohexane [1]

Transport Properties:
Polymer Solutions Dilute: $[\eta]_{inh}$ 1.05 dl g^{-1} [2]

Optical Properties:
Total Internal Reflection: $[\alpha]_D^{25}$ -3.7–-16 ((*R*)-form) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as VCl_3-$AlEt_3$ in C_6H_6 at 75° [1,2,5]

5	234°C	[22]
6	238–240°C	[18]

7	210–215°C	*S*-form [8]
8	228–238°C	*S*-form [23]
9	190–195°C	(±)-form [24]
10	147°C	syndiotactic [11]

Transition Temperature General: Other T_m measurements have been reported [6,9,25]
Transition Temperature:

No.	Value	Note	Type
1	196°C	[2]	Polymer melt temp.

Surface Properties & Solubility:

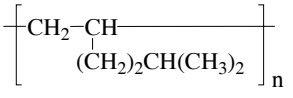
Solvents/Non-solvents: Sol. boiling C_6H_6, heptane. Mod. sol. C_6H_6. Slightly sol. Et_2O [16,24]. Insol. boiling Me_2CO (*S*-form, (±)-form), EtOAc (*S*-form, (±)-form) [25]

Transport Properties:

Polymer Solutions Dilute: Theta temp. θ 165° (*o*-chloronaphthalene, *S*-isotactic), θ 133° (*o*-dichlorobenzene, *S*-isotactic) [23]. [η] 4.97 dl g^{-1} (135°, decahydronaphthalene) [18]; [η] 3.18 dl g^{-1} (120°, decahydronaphthalene) [8]. Other viscosity values dependent upon method of synth. have been reported [26]. Dilute soln. props. have been reported [23,27]
Polymer Melts: Melt viscosity 3100 [22]

Optical Properties:

Optical Properties General: Optical props. have been reported [12,14,28,29,30]. Vibrational circular dichroism has been reported [31,32,33]
Transmission and Spectra: Ir [6,14,34] and C-13 nmr [1,7,26,35,36,37,38] spectral data have been reported
Molar Refraction: dn/dC 0.0714 (80°, methylcyclohexane, (±)-isotactic) [23]; dn/dC 0.0643 (80°, methylcyclohexane, (*S*)-isotactic), 0.0672 (60°, 2-methyltetrahydrofuran, (*S[h0]-isotactic), 0.0684 (50°, 2,5-dimethyltetrahydrofuran, (S)-isotactic), 0.0911 (70°, 2,5-dimethyltetrahydrofuran, (S)-isotactic) [23]*
Total Internal Reflection: $[M]_D^{21}$ 249° (*S*-form) [20], $[M]_D^{25}$ 260° (*S*-form) [13], $[M]_D^{25}$ 278° (*S*-form) [24,39], $[M]_D^{25}$ 279–288° (*S*-form) [19], $[M]_D^{25}$ 286° (*S*-form) [23,39], $[M]_D^{25}$ 288 (*S*-form) [8,10], $[M]_D^{25}$ -40° ((*S*)-isotactic) [3]. Other molar optical rotation values have been reported [3,15,40]. Variation in optical rotation with different methods of synth. has been reported [26]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catayst, such as $TiCl_4Al(^i\text{-}Bu)_3$ at 60° [1]

Poly(5-methyl-1-hexene) P-372

Synonyms: *Poly(1-(3-methylbutyl)-1,2-ethanediyl)*
Monomers: 5-Methyl-1-hexene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25302-96-9	atactic
28962-82-5	isotactic

Molecular Formula: $(C_7H_{14})_n$
Fragments: C_7H_{14}
Morphology: Somewhat rubbery, but crystalline [1]. Isotactic, monoclinic, a 1.762, b 1.017, c 0.633, helix 3_1 [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.85 g/cm^3	[3]
2	d 0.84 g/cm^3	[2]

Melting Temperature:

No.	Value	Note
1	110°C	[4]
2	130°C	isotactic [5]

Glass Transition Temperature:

No.	Value	Note
1	-15°C	isotactic [6]

Transition Temperature:

No.	Value	Note
1	138°C	polymer melt temp. [1]
2	-14°C	softening point [4]

Surface Properties & Solubility:
Solvents/Non-solvents: V. sol. boiling C_6H_6 [3]. Sol. C_6H_6, $CHCl_3$, boiling heptane. Slightly sol. boiling Et_2O. Insol. Me_2CO [2]

Transport Properties:
Polymer Solutions Dilute: [η] 6.5 dl g^{-1} (tetrahydronapthalene, 120°) [2]. η_{inh} 2.62 (decahydronapthalene, 130°) [1]

Optical Properties:
Transmission and Spectra: Ir (CH_2 rocking frequency) [7] has been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3Al(Bu^i)_3$ in pentane at -20° [2]

Polymethylhydrogen siloxane P-373

Synonyms: *Polymethylsiloxane. Poly[oxy(methylsilylene)]*
Related Polymers: PDMS fluid, Poly(methylhydrogensiloxane-*co*-dimethylsiloxane) fluid, Poly(hydrogenmethylsiloxanes) with liquid crystal sidechains
Monomers: Dichloromethylsilane, Cyclic methylhydrogensiloxane
Material class: Fluids
Polymer Type: silicones
CAS Number:

CAS Reg. No.
49718-23-2

Molecular Formula: $[CH_4OSi]_n$
Fragments: CH_4OSi
Molecular Weight: MW 1000–10000

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.98 g/cm^3	[1]

Glass Transition Temperature:

No.	Value	Note
1	-138°C	large values of *n* [4,6]

Surface Properties & Solubility:
Surface and Interfacial Properties General: Strongly water repelling [3]
Wettability/Surface Energy and Interfacial Tension: γ_c 20 mJ m^{-2} (20 dyne cm^{-1}) [1]

Transport Properties:
Polymer Melts: Viscosity 0.25 St (25°) [1,4]. Viscosity temp. coefficient 0.5

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.2	[2,5]

Dielectric Strength:

No.	Value	Note
1	15 kV.mm^{-1}	[2]

Dissipation (Power) Factor:

No.	Value	Note
1	1×10^{-5}	[2]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.397	[1]

Polymer Stability:
Polymer Stability General: Unstable at elevated temps. and in the presence of water
Decomposition Details: Cross-linking of chains occurs with elimination of hydrogen [3]
Flammability: Fl. p. 125° (260°F) [1]
Chemical Stability: Oxidation causes cross-linking and elimination of hydrogen
Hydrolytic Stability: In aq. soln. cross-linking of chains occurs with elimination of hydrogen [3]. Mild acid conditions increase stability in water [6]
Recyclability: Not recyclable

Applications/Commercial Products:
Processing & Manufacturing Routes: For low viscosity fluids methylhydrogendichlorosilane is hydrolysed under slightly acid conditions with small quantities of trimethylchlorosilane. For high viscosity fluids cyclic methylhydrogen polysiloxanes are equilibrated together under acid catalysis with traces of hexamethyl disiloxane

Applications: Used to provide a water repellent coating and used in textile processing. Polymethyl hydrogen siloxane is used as a cross-linking agent with low viscosity vinyl methyl gums to prod. rubber by the liq. silicone process see (vinylmethyl silicone rubber (heat vulcanised)). Can be used in the addition of mesogens by hydrosilation

Molecular Formula: $(C_5H_8O)_n$
Fragments: C_5H_8O
General Information: Light sensitive. Used as a positive photoresist in place of poly(methyl methacrylate). Varying polymerisation conditions leads to different polymer forms [8,9]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.11–1.15 g/cm^3	[5]
2	d^{20} 1.116 g/cm^3	[7]

Melting Temperature:

No.	Value	Note
1	240°C	[8]
2	160°C	anionic polymerised [9]
3	200–220°C	crystalline-form [9]

Deflection Temperature:

No.	Value	Note
1	95°C	approx., 1.82 MPa, (264 psi) [10]

Transition Temperature:

No.	Value	Note	Type
1	60–80°C	[5,8]	Softening range
2	114°C	[8]	Softening point

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. Me_2CO, dioxane, esters, $CHCl_3$, nitrobenzene. Slightly sol. dioxane, pyridine. Insol. EtOH, C_6H_6, cyclohexane, petrol, octane [5,7,8,9,10]. Solubility depends on method of polymerisation

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity values derived from Staudinge-Kuhn relation have been reported [6]
Water Absorption:

No.	Value	Note
1	0.3 %	24h, 20° [5]
2	0.67 %	7 d, 20° [5]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	68.94 MPa	approx., 10 kpsi [10]

Flexural Strength at Break:

No.	Value	Note
1	117.19 MPa	approx., 17 kpsi [10]

Compressive Strength:

No.	Value	Note
1	130.99 MPa	approx., 19 kpsi [10]

Hardness: Brinell 20 (approx.) [5]. Rockwell M98 (approx.) [10]
Izod Notch:

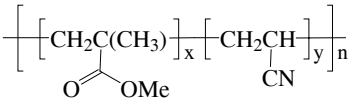
No.	Value	Notch	Note
1	18.11 J/m	Y	0.34 ft lb in^{-1} [10]

Optical Properties:

Refractive Index:

No.	Value
1	1.5212

Transmission and Spectra: Ir [1,9] and x-ray [8,9] spectral data have been reported



Polymer Stability:

Polymer Stability General: Exhibits poor thermal and photochemical stability [10]
Decomposition Details: The polymer cyclises via an Aldol condensation eliminating water easily at 250° [1]. Above 170° the polymer changes colour [1] and the ir spectrum begins to alter. The crystalline form decomposes faster than the amorph. form
Environmental Stress: Compression moulded disks become dark and brittle after 22h exposure in a weatherometer [10]. Undergoes photolytic decomposition. Stability can be improved by reducing carbonyl groups with lithium aluminium hydride; disks of this modified polymer can withstand 200h in weatherometer [10]
Chemical Stability: Rapidly cyclised by hot alkali [3]. Decomposed by acids [9,10]

Poly(methyl methacrylate-*co*-acrylonitrile-*co*-butadiene-*co*-styrene) P-377

Synonyms: *MABS*
Related Polymers: Polymethacrylates - General, Poly(methyl methacrylate) General, Poly(methyl methacrylate-*co*-butadiene-*co*-styrene), Polystyrene, Polyacrylonitrile, Polybutadiene
Monomers: Methyl methacrylate, Acrylonitrile, Butadiene, Styrene
Material class: Thermoplastic
Polymer Type: acrylic copolymers
CAS Number:

CAS Reg. No.	Note
9010-94-0	
125638-62-2	(block)
109216-34-4	(block, graft)
107592-06-3	(graft)

Molecular Formula: $[(C_5H_8O_2)_w(C_3H_3N)_x(C_4H_6)_y(C_8H_8)_z]_n$
Fragments: $C_5H_8O_2$ C_3H_3N C_4H_6 C_8H_8
General Information: A tough, transparent, thermally formable polymer with good impact resistance and chemical resistance, available in pellet form and in a wide range of colours
Morphology: The copolymer is amorph. and shows no sign of crystalline zones. It has a butadiene rubber phase submicroscopically embedded in an S/A/M matrix
Identification: Contains only C, H, N and O

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.08 g/cm^3	DIN 53479; ISO 1043 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8×10^{-5}–0.00011 K^{-1}	linear, DIN 53752 [1]	L
2	6×10^{-5}–9×10^{-5} K^{-1}	linear, CI77 [2]	L

Thermodynamic Properties General: The substitution of α-methyl styrene gives copolymers with higher heat distortion temps. [2]
Thermal Conductivity:

No.	Value	Note
1	0.17 W/mK	W^{-1}K^{-1}, DIN 52612 [1]

Transition Temperature General: The highest second order transitions occur around 93° and the polymers become fluid above 149° [2]

Deflection Temperature:

No.	Value	Note
1	77–91°C	15.6 MPa, ASTM D648 [2]
2	87–90°C	1.8 MPa, ISO 75 [1]
3	93–94°C	0.45 MPa, ISO 75 [1]

Vicat Softening Point:

No.	Value	Note
1	105°C	VST/A/50, ISO 306 [1]
2	87–91°C	VST/B/50, ISO 306 [1]

Surface Properties & Solubility:

Solubility Properties General: Incompatible with other thermoplastics; opalescence may occur

Transport Properties:

Permeability of Gases: High levels of acrylonitrile improve resistance of the copolymer to gas penetration [2]
Water Absorption:

No.	Value	Note
1	0.35 %	24h, saturated, DIN 53495/11, DIN 53495/1 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1900–2000 MPa	DIN 53457, ISO 527 [1]
2	1998–2963 MPa	290–430 kpsi, ASTM D638 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	42–48 MPa	DIN 53455, ISO 527 [1]	4%
2	38–55 MPa	5600–8000 psi, ASTM D638 [2]	

Flexural Strength at Break:

No.	Value	Note
1	60–70 MPa	DIN 53452, ISO 178 [1]
2	65.5–89.6 MPa	9500–13000 psi, ASTM D790 [2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	800 MPa	DIN 53445; ISO 537 [1]	shear modulus
2	207–276 MPa	30–40 kpsi, ASTM D790 [27]	flexural modullus
3	1250 MPa	DIN 53444, ISO 899 [1]	tensile creep modullus

Impact Strength: Izod 60 kJ m^{-2} (23°, ISO 180/C) [1], (-30°, ISO 180/C) [1], 7 kJ m^2 (notched, 23°, ISO 180/1A) [1], 2 kJ m^2 (notched, -30°, ISO 180/1A) [1], 213.6–267 J m^{-1} (notched, high-impact grade, ASTM D256) [2], 80.1–160.2 J m^{-1} (notched, medium impact grade, ASTM D256) [2], 37.4–53.4 J m^{-1}

(notched, high modulus grade, ASTM D256) [2]. Charpy 50–65 kJ m^2 (23°, DIN 53453) [1], 20–30 kJ m^2 (-20°, DIN 53453) [1], 3 kJ m^{-2} (23°, DIN 53453) [1], 1 kJ m^{-2} (-40°, DIN 53453) [1]
Hardness: Ball indentation 70–75 MPa (ISO 2039-1) [1]. Rockwell R98–119 (ASTM D785)

Electrical Properties:

Electrical Properties General: Comparative tracking index CTI 600 (ISO 112/A; DIN 0303T1) [1]; CTI 600M (ISO 112A, DIN 0303 T1) [1]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$0.01–0.1 \times 10^{15}$ Ω.cm	(ISO 93, DIN 303-T30) [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.8–3	100 Hz-1 MHz	ISO 250, DIN 0303-T4 [1]
2	2.8–3.2	1 MHz	ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	77–85 kV.mm^{-1}	kV mm^{-1} (ISO 243/1; DIN 0303-T21) [1]

Dissipation Power Factor: tan δ 0.013–0.016 (100 Hz–1 MHz, ISO 250, DIN 0303-T4) [1]; 0.015–0.02 (1 MHz), ASTM D150) [2]
Static Electrification: MABS can be supplied with an antistatic finish

Optical Properties:

Optical Properties General: The reflective indices of matrix and elastomer phases differ at high temps. causing the polymer to become cloudy. Clarity is restored on cooling
Refractive Index:

No.	Value	Note
1	1.51–1.54	(ISO 489, ASTM D542) [1,2]

Transmission and Spectra: Transmission 80–87% (D1003) [2]. Haze 6–12% (D1003) [2]

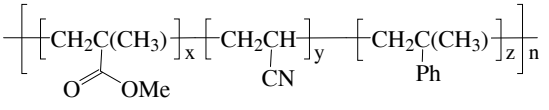
Polymer Stability:

Polymer Stability General: Hot water causes irreversible hazing
Thermal Stability General: Is thermally stable up to 260° [2]
Upper Use Temperature:

No.	Value	Note
1	75°C	few hours [1]

Flammability: Flammability rating HB (UL94) [1]; BH3 rating (DIN VDE 0304/3) [1]
Environmental Stress: Intense uv radiation, atmospheric oxygen at elevated temps. or prolonged outdoor exposure can cause yellowing and lead to a reduction in impact resistance [1,2]
Chemical Stability: Resistant to saturated hydrocarbons, vegetable and animal fats and oils, H_2O, dilute acids and alkalis and aq. solns. of salts. It is attacked by aromatic hydrocarbons, chlorinated hydrocarbons, esters, ethers and ketones [1]
Recyclability: Can be recycled providing that it is not contaminated. Production waste can be reground and reused, although preferably not for high quality uses
Stability Miscellaneous: γ-Irradiation at the levels required for sterilisation purposes (e.g. 2.5–3.5 Mrad) has very little effect on mechanical props. but can cause slight yellowing [1]

Applications/Commercial Products:



Processing & Manufacturing Routes: Two general routes; bulk or bulk suspension polymerisation. Rubber is dissolved or dispersed in the monomer mix before polymerisation. This gives a linear copolymer (continuous phase) and a graft copolymer (disperse phase) or styrene/butadiene or butadiene latexes can be emulsion polymerised together with styrene, methyl methacrylate and acrylonitrile. Again part of the monomers graft onto the rubber to give a dispersed phase. May be processed by injection moulding or extrusion. The polymer is hygroscopic and may require drying before use in extrusion or moulding applications [1]
Applications: Used in medical applications (equipment housings and parts, inhaler mouthpieces, containers), food (containers, lids, packaging), cosmetics (containers, toothbrushes), writing accessories, watches, toys, household items (trays/baskets for freezers/refrigerators, containers, video cassette housing), office materials (machinery covers, containers). 5–15% by weight of the copolymer is added to PVC to improve the clarity and impact strength for use in the manufacture of films and bottles

Poly(methyl methacrylate), cast sheet, rods, and tubes P-379

Related Polymers: Methacrylates General, Poly(methyl methacrylate) General
Monomers: Methyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Molecular Weight: M_n 300000–6000000
General Information: Cast sheet is available in a wide range of colours (transparent, translucent and opaque) and sizes (up to approx. 1.2 × 2.4 m for cell cast and reels and 183 × 2.75 m for continuous cast). Available thicknesses 0.75–250 mm (cell cast); 9.4 mm (continuous cast). A range of special surface finishes including matt, mirror-finish, satin, rippled, stippled and abrasion resistant are available. Special grades including heat resistant, uv impermeable, flame-retardant and improved chemically resistant grades are available. ASTM D4802 specifies three categories of cast PMMA sheet; A1 (cell cast sheet), A2 (continuous cast sheet), B1 (continuous manufactured sheet). ASTM D5436 specifies four categories for cast PMMA rods, tubes and shapes; type UVA (uv absorbing), type UVT (uv transmitting), finish 1 (smooth) and finish 2 (rough or unfinished)

4	82–93°C	180–200°F, general purpose type II, no load [6]
5	80°C	continuous use [3,5]
6	75–80°C	thermoformings [4]
7	80–85°C	flat sheet [4]
8	75–80°C	thermoformings [4]

Flammability: Flammability rating B2 (DIN 4102) [3,5]; B1 (flame retardant) [5]; HB (UL94) [3]; Class 3 (BS 466, part 7) [3]. Ignition temp. 425° (DIN 51794) [5]
Environmental Stress: Outdoor weathering causes very slight yellowing after 1015 days (ASTM D1435) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by bulk polymerisation, which involves an initial partial polymerisation to produce a syrup containing 10–30% polymerised material. Plasticiser, colouring agents, uv absorbers etc., may be added to the syrup prior to its use. The syrup may be refrigerated if not immediately required. A typical syrup preparation might involve heating monomer (with about 0.5% initiator, e.g., benzoyl peroxide) at 90° for about 8 mins. with agitation and then cooling to room temp. An alternative, simpler route for the manufacture of a syrup is to dissolve polymer in monomer and add peroxide to the soln. The syrup is then used in the casting process, its viscosity making it easier to contain. The partial polymerisation reduces both the reaction time and the amount of shrinkage in the cell. Polymerisation is carried out at 40° for 4 h in an inert gas atmosphere or in a full cell to avoid oxygen inhibition followed by reaction at 100° for 30 mins. The reaction rate and product are affected by the presence of oxygen because of methacrylate peroxide side reactions. The production of rods requires the use of special techniques to overcome the problem of shrinkage. Vertical aluminium tubes are filled with syrup and slowly lowered into a bath held at 40°. Thus the syrup is polymerised from the bottom of the tube up allowing gradual contraction to take place without creating voids or distortions in the finished product. Tubes are manufactured by rotating an aluminium tube containing a set amount of syrup at a constant rate with heating. Polymerisation takes place on the walls of the tube. Processed by thermoforming
Applications: Cast sheet is used mainly in building applications and glazing; in illuminated signs and shopfittings; in technical components, functional models; in furniture; in bathroom suites and fittings; in medical products (incubators, X-ray tubes, spectacles etc.) and in specialist glazing applications (aircraft, museums/art galleries)

Trade name	Details	Supplier
Perspex	VA (uv absorbing), IM (impact resistant), AS (acoustic screening), AG, CQ, SW, ME, SW (speciality grades)	ICI, UK
Plexiglas	GS209 (uv impermeable), GS237 (flame retardant)	Rohm and Haas

Poly(methyl methacrylate), Extruded sheet P-380

Related Polymers: Polymethacrylates General, Poly(methyl methacrylate) General
Monomers: Methyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Molecular Weight: M_n 100000–200000
General Information: Extruded sheet is available in a wide range of colours (transparent, translucent and opaque) and thicknesses of 1.5–18 mm. Mullet-skin sheets are available if thicker grades are required. Special grades are available for specific requirements, e.g. heat resistant, uv-impermeable, flame-retardant, improved chemical resistance, etc. ASTM D4802 specifies the category B2 for extruded PMMA sheet and details the property requirements

Poly(methyl methacrylate), General P-381

Synonyms: *Poly(methyl 2-methyl-2-propenoate). Poly[1-(methoxycarbonyl)-1-methyl ethylene]. Acrylic. PMMA*
Related Polymers: Polymethacrylates-General, Moulding and Extrusion Compounds, Cast Sheet (rods and tubes), Extruded Sheet, Butyl methacrylate copolymer
Monomers: Methyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
9011-14-7	general
25188-98-1	isotactic
25188-97-0	syndiotactic

Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Molecular Weight: M_n 300000–6000000 (cast material); 100000–200000 (moulded or extruded material); 252000 (GPC determined); MW 481000 (GPC determined); MZ 766000 (GPC determined); MZ +1 1196000 (GPC determined)
Additives: PMMA materials may contain residual monomer or processing additives. Typical additives used in the manufacture of PMMA by suspension polymerisation (usually for moulding and extrusion compounds) include suspending agents, buffering agents, chain transfer agents (to control MW), lubricants and emulsifier. A number of additives may be blended with PMMA, perhaps the most important being dyes and pigments. Listings of commonly used colorants for PMMA have been reported. [1] Sucrose-based additives improve heat stability. Plasticisers are sometimes used with PMMA, e.g. in moulding compositions to enhance the melt flow. Levels vary from 1–50%; 5% is typical. Lubricants reduce heat dissipation during machining or polishing. Some commercial grades contain uv absorbers (290–350 nm). This both screens the user from sunburn, e.g. in glazing applications, and protects the polymer against long term degradation from light. Typical levels are in the range 0.001–2%. Alumina hydrate is used as a flame-retardant filler in some forms of PMMA used for bathroom fittings, kitchen worktops and 'synthetic marble'. Fillers and reinforcements are not often used although chalk is sometimes incorporated, e.g. for opaque illuminated panels in advertising displays. PMMA can be reinforced, e.g. with glass fibre, polyethylene, Kevlar or carbon to ensure high mechanical strength at temps. around 100°. Polystyrene (0.2–5%) may be added as an opalescent. Rubber particles increase toughness
General Information: PMMA may be fractionated by means of supercritical fluid chromatography. [3] Commercially the most important member of the acrylate/methacrylate group of polymers, PMMA was first introduced in 1936 and is available as cast and extruded sheet, tubes, rods, powders, pellets, solns, dispersions and emulsions. In addition to its use in sheet form, PMMA is also suitable for many extrusion and moulding applications, coating and surface treatments and has many industrial uses. It is non-toxic, odourless and tasteless. Nothing is extracted from PMMA by oil or water. PMMA may be coloured to give transparent, translucent or opaque forms. It is possible to texture the surface of PMMA products during moulding or by later embossing and products may be further decorated by spray-painting, vacuum-metallising, hot stamping etc. It is a clear, colourless, hard, brittle, fairly rigid material which can be drilled, carved or sawn and has exceptional optical clarity and reistance to degradation by uv light. The hardest and most heat resistant PMMA materials are the cast sheet products, followed by continuous cast materials, then the extruded or moulded products. Its total internal reflection permits a wide light beam to be transmitted through long lengths of PMMA and around corners with little loss provided that the radius of curvature of the sheet or rod is three times its thickness. Has good electrical insulating props. at low frequencies. Above its glass-transition temp. PMMA is tough, pliable, extensible and easily bent or formed into complex shapes; at high temps., however, it is very susceptible to depolymerisation. It is a polar material and will absorb some moisture but is resistant to alkali, detergent, oils and dilute acids. Although PMMA has comparatively limited impact resistance this can be improved by copolymerisation, e.g. Butyl acrylate/MMA or acrylonitrile/MMA, or by blending e.g. with Poly(*n*-butyl acrylate) or a butadiene copolymer. PMMA has low flammability, a high melt viscosity, low resistance to creep at temps. only a little above room temp., poor solvent resistance and a comparative lack of abrasion resistance
Tacticity: Although nominally atactic, conventionally produced PMMA is more syndiotactic than atactic. Differences in the adsorption behaviour of atactic and tactic polymers have been reported: isotactic PMMA is absorbed onto silica (from acetonitrile soln.) whereas atactic PMMA is not. [4] Stereoregular polymers may be prod. in soln. by use of anionic catalysts, e.g. organolithium compounds or Grignard reagents. Isotactic polymers tend to be prod. in non-polar solvents and syndiotactic in polar solvents. The change in composition of the product polymer in a series of reactions carried out in various toluene/dimethoxyethane mixtures using *n*-butyl lithium as initiator at -30° has been reported. [5] Stereoregular PMMA can be made by living polymerisation in toluene using *tert*-butyl MgBr (for isotactic) or *tert*-butyl lithium aluminium alkyl (for syndiotactic). Living polymerisation also allows the preparation of star and comb-like polymers with stereoregular main and side chains, e.g. isotactic main chain and syndiotactic side chain [13,14]
Morphology: Commercial grades are normally amorph. Isotactic: orthorhombic a 41.96Å, b 24.34Å, c 10.50Å, α 92.9°, β 88.2°, γ 90.6° containing eight double-strand 10/1 helices per cell. [6,7,8] Repeat unit volume 87-89 $cm^3\ mol^{-1}$ [9]; 89.3 $cm^3\ mol^{-1}$. [10] The head-to-head polymer has been reported [11]
Identification: Contains only C, H and O. The surface of any acrylic plastic is immediately fogged or crazed by Me_2CO

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 1.19 g/cm^3	conventional [18,19,20]
2	d^{30} 1.19 g/cm^3	syndiotactic [18]

4	d^{23} 1.19 g/cm^3	cast and extruded grades, 50% relative humidity, ISO 1183 [20]
5	d^{25} 1.23 g/cm^3	cryst. [2]
6	d^{25} 1.17 g/cm^3	amorph. [2,21]
7	d^{25} 1.15–1.23 g/cm^3	[2,6,18,19,22,23]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00053–0.000575 K^{-1}	$T > T_g$, 1 atm, free radical polymerisation	V
2	0.000225–0.000295 K^{-1}	$T < T_g$, 1 atm, free radical polymerisation [26]	V
3	4.8×10^{-5}–8×10^{-5} K^{-1}	impact modified, ASTM D696 [24]	L
4	7×10^{-5} K^{-1}	cast and extruded grades, 0–50°, DIN 53752-A [20]	L
5	5×10^{-5}–6×10^{-5} K^{-1}	general purpose, cast sheet, ASTM D696 [24]	L

Volumetric Properties General: Molar volumes at 25° [2]: 56.1 cm^3 mol^{-1} van der Waals, 86.5 cm^3 mol^{-1} glassy, 81.8 cm^3 mol^{-1} cryst.
Equation of State: Tait, Bruce-Hartmann, Sanchez and Lacombe, Spencer-Gilmore and Smka-Somcynsky equation of state information has been reported [27,28,29,30,31,32,33]
Thermodynamic Properties General: Thermal conductivity varies with both temp. and pressure although at ordinary pressure the variation is quite small. Control over thermomechanical props. can be improved by the addition of low MW poly(butyl methacrylate) or poly(butyl-*co*-methyl methacrylate). [35]. Molar heat capacity data for amorph. PMMA has been reported [42]
Latent Heat Crystallization: Enthalpy of melting 9.6 kJ mol^{-1}. [2] Entropy data for a range of temps. and pressures have been reported. [28] Entropy, enthalpy and Gibbs free energy data for temps. -263–13° have been reported in a graphical form [36]
Thermal Conductivity:

11	12°C	isotactic [50]
12	38°C	isotactic, crystalline [50]

Surface Properties & Solubility:

Solubility Properties General: The solubility of PMMA can vary with tacticity, e.g. highly syndiotactic polymer is insol. in C_6H_6 whereas the atactic material dissolves [52]. In some solvents, e.g. 2-butanone, butyl acetate, 2-ethoxyethanol, syndiotactic PMMA will only dissolve molecularly above 70°. Below this temp. aggregation occurs and , eventually, precipitation. Isotactic PMMA also precipitates but at lower temps. which vary significantly with solvent. Atactic PMMA does not precipitate from soln. even when cooled to -70° [52]. When solns. of syndiotactic and isotactic PMMA are mixed gelation results, probably as a result of stereocomplex formation. the solvents used exert a major influence on the formation of the stereocomplexes and the resultant effects on viscosity and associated props. [52]. Crystalline syndiotactic PMMA forms complexes with chloroacetone and other solvents. The solvent is necessary to maintain crystallinity [53]

Cohesive Energy Density Solubility Parameters: 29.90–59.4 kJ mol^{-1} [2]; 29.058–31.471 kJ mol^{-1} (25–35°) [54]; 347 J cm^{-3} [55]; 346–374 J cm^{-3} (25–35°) [54]. Solubility parameter, δ 18.2–26 $J^{1/2}$ $cm^{-3/2}$ (poor H-bonding solvents), 17.4–27.2 $J^{1/2}$ $cm^{-3/2}$ (moderate H-bonding solvents), 0 (strong H-bonding solvents), [56] 38.7 $J^{1/2}$ $cm^{-3/2}$, [57] 23.1 $J^{1/2}$ $cm^{-3/2}$, [2] 18.6–26.3 $J^{1/2}$ $cm^{-3/2}$,18.0–23.1 $J^{1/2}$ $cm^{-3/2}$ [9], δ_d 15.6–18.6 [9], 18.8 [2]. δ_p 1.4–10.6 [9], 10.2, [2] δ_h 1–7.8, [9] 8.6. [2]

Internal Pressure Heat Solution and Miscellaneous: π 266 MPa (42.9°, M_n 15000), 400 MPa (114.1°, M_n 15000) [58]

Plasticisers: Dimethyl phthalate, diethyl phthalate, dibutyl phthalate, benzyl butyl phthalate, dibutyl sebacate, diethylhexyl sebacate, phosphates are used as plasticisers. Antiplasticisation can occur. [59,60] The presence of plasticisers affects uptake of water [83]

Solvents/Non-solvents: Sol. C_6H_6 (atactic) [52], xylene, CH_2Cl_2, $CHCl_3$, chlorobenzene, isobutanol (hot), cyclohexanol (hot), ethoxyethanol, dioxane, 2-butanone, cyclohexanone, AcOH, isobutyric acid, EtOAc, cyclohexyl acetate, EtOH aq, EtOH/CCl_4, isopropanol/2-butanone (1:1, >25°), formic acid, nitroethane, Me_2CO, isopropyl methyl ketone, *o*-dichlorobenzene, cyclopentanone, pyridine, *o*-toluidene. Insol. hexane, cyclohexane, gasoline, Nujol, castor oil, MeOH, ethylene glycol, glycerol, formamide, turpentine, linseed oil, hydrogenated naphthalenes, CCl_4, EtOH, butylene glycol, Et_2O, higher esters, *m*-cresol, Freon-215, isopentane, isooctane, *n*-pentane, *n*-octane, methyl cyclohexane, *n*-propanol, *n*-amyl alcohol, C_6H_6 (highly syndiotactic) [52,61,62]

Surface and Interfacial Properties General: The surface props. of PMMA can be altered by modification of the surface using graft copolymerisation [62] or by the incorporation of a surfactant into the polymer matrix. [63] PMMA forms an extremely viscoelastic condensed monolayer. At a surface conc. of 5×10^{-5} mg cm^{-2} PMMA enters a biphasic state when small patches of condensed material develop [64]. Monolayer and surface viscosity parameters have been reported. [64] The nature of spread films at an air-water interface determined by neutron reflectometry has been reported [155,156,157]

Wettability/Surface Energy and Interfacial Tension: Contact angle, θ 80° (H_2O, advancing, 20°) [65,66]; 58° (H_2O, advancing) [84]; 41° (methylene iodide, 20°) [65]; 59° (air, 3% H_2O present) [69]; 89° (Me_2CO, 3% H_2O present) [69]. Surface energy Parachlor 224 [67], MacLeod's 4.2 (MV 3000) [68]. Polarity 0.281 (MV 3000) [68]. -dγ/dT 0.076 mN m^{-1} K^{-1} (MV 3000) [68]. Critical surface tension 40 mN m^{-1} [65], 39 mN m^{-1} [66]. Interfacial tension 11.9 mN m^{-1} (polyethylene, linear, 20°) [68], 3.2 mN m^{-1} (polystyrene, 20°) [68], 3.4 mN m^{-1} (poly *n*-butyl methacrylate, 20°) [68], 3 mN m^{-1} (poly *tert*-butyl methacrylate, 20°) [71], 23.6–24.1 mN m^{-1} (H_2O, 3% H_2O present) [69]

Surface Tension:

No.	Value	Note
1	27–44 mN/m	[2]
2	60.1–61.8 mN/m	3% H_2O present [69]
3	62 mN/m	after contact with H_2O [70]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.5–24 g/10 min	230°, 3.8 kg, MEC, ASTM D1238, DIN 53735, ISO 1133 [22,23,72]

Polymer Solutions Dilute: Intrinsic viscosity [73]. η_{inh} 850 dl g^{-1} (25°, C_6H_6), 190 dl g^{-1} (25°, $CHCl_3$), 560 dl g^{-1} (25°, DMF), 530 dl g^{-1} (25°, EtOAc), 90–4140 dl g^{-1} (25°, toluene). Viscosity is not greatly affected by tacticity but varies with MW [74]. Theta temps. -126° (Me_2CO), -223° (C_6H_6), 27° (CCl_4), -273° ($CHCl_3$), -98° (EtOAc), 5–85° (propanol), -65° (toluene) [58,75]

Polymer Melts: The melt viscosity of MEC compounds is usually higher than that of most other polymers. Newtonian viscosity 50 kN s m^{-2} (200°). PMMA has a small consistency index and so the viscosity is very sensitive to temp. changes. Control over the viscosity of PMMA can be improved by the addition of low MW poly(butyl methacrylate) or poly(butyl-*co*-methyl methacrylate) [35]. Because of its small power law index [76] PMMA is very sensitive to shear rate [77]

Permeability of Gases: Permeability [20] [H_2O] 2.3 × 10^{-10} g cm cm^{-2} h^{-1} Pa^{-1} (cast and extruded grades); [O_2] 2 × 10^{-14} (cast and extruded grades); [N_2] 4.5 × 10^{-15} (cast and extruded grades); [CO_2] 1.1 × 10^{-13} (cast and extruded grades); [air] 8.3 × 10^{-15} (cast and extruded grades). Permeability coefficient, P [78,79]; [O_2] 0.032–0.105 × 10^{-10} cm^3 cm^{-2} s^{-1} $(cmHg)^{-1}$, 35°, 1–2 atm; [He] 3.75–9.57 × 10^{-10}; [H_2] 1.29–4.7 × 10^{-10}; [N_2] 0.0014–0.013 × 10^{-10}; [Ar] 0.0047–0.0308 × 10^{-10}; [CH_4] 0.00098–0.0064 × 10^{-10}; [CO_2] 0.050–0.415 × 10^{-10}

Permeability of Liquids: Diffusion coefficients [Me_2CO] 2.2–6.8 × 10^{-7} cm^2 s^{-1} (20°, MW 201000–6350000); [*n*-butyl chloride] 14.9–22.4 × 10^{-7} (34.5°, MW 29000–16000), 1.15–7.18 × 10^{-7} (35.6°, 6550000–200000); [EtOAc] 2.34–7.21 × 10^{-7} (20°, 931000–79000); [methyl methacrylate] 1.51–1.95 × 10^{-7} (MW 454000-370000); [toluene] 5.8 × 10^{-7} (20°, MW 115000); [H_2O] 51 × 10^{-7} (37°), 1.3 × 10^{-7} (50°) [84,85]; [H_2O] 5.2 g cm cm^{-2} h^{-1} $(mmHg)^{-1}$ (25°) [82]

Permeability and Diffusion General: Isotactic PMMA is less permeable to gases than is the syndiotactic form [78]

Water Content: Water absorption decreases with increasing amount of plasticiser. 0.3–0.36% (MEC, ASTM D570, DIN 53495, ISO R-62) [22,23]

Water Absorption:

No.	Value	Note
1	0.2–0.4 %	ISO 62 [25]
2	0.1–0.4 %	24h, ASTM D570 [24]
3	0.2–0.6 %	24h, impact modified, ASTM D570 [24]
4	0.2–0.4 %	24h, cast sheet, ASTM D570 [24]
5	2.3 %	max. [84]

Mechanical Properties:

Mechanical Properties General: The deformation of PMMA is temp. dependent. Increasing temp. leads to greater elongation but reduced strength. The temp. dependence of the viscoelastic props. is due to the temp. dependence of the α and β relaxation times which are in turn controlled by the rate of molecular movement of the side group (β process) and the backbone (α process). The temp. at which these movements start corresponds to a change in failure mode from brittle to ductile. The storage modulus is affected by the presence of plasticiser [87]. The tensile strength of PMMA can be increased when the polymer is drawn into fibres. A sixfold increase compared to the bulk resin has been found at high draw ratios, with the Young's modulus of the polymer increasing tenfold [88]. Fibre reinforcement can greatly improve the tensile strength at elevated temps.

Tensile (Young's) Modulus:

No.	Value	Note

4	103 MPa	extruded, ISO 604 [20]
5	82.7–96.5 MPa	12–14 kpsi, 2% offset, cast, type I [96]
6	96.5–124.1 MPa	14–18 kpsi, 2% offset, cast, type II [96]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1000–1500 MPa	1.0–1.5 × 10^{-9} N m^{-2} [28]	shear modulus
2	1700 MPa	cast and extruded grades, 10 Hz, ISO 527 [20]	shear modulus
3	6000 MPa	approx. 6 GN m^{-2} [98]	bulk modulus
4	5100 MPa	0.51 dynes cm^{-2} [92]	bulk modulus
5	5930 MPa	Plexiglas, no pressure [94]	bulk modulus

Complex Moduli: Compressive modulus 25.51–32.75 × 10^{-8} MPa (3.70–4.75 × 10^{-5} psi, ASTM D695)[97]
Impact Strength: Instrumented falling weight impact strength 0.3–0.6 J (MEC, ISO R-6603/2) [23]. There is some loss of impact strength at low temps. but it remains high enough for use at -40°
Viscoelastic Behaviour: Creep compliance data for the atactic form have been reported [100]. Compressibility at a given pressure increases with increasing temp. [105]. Other viscoelastic props. have been reported [154]
Mechanical Properties Miscellaneous: Williams-Landel-Ferry constants for temp. superposition [100,101,102], Vogel parameters [101], entanglement MW [2,98,103] and relative entanglement moduli [104] have been reported. Failure strength (alternating bending test) 1000000 cycles [20], 40 MPa (cast, unnotched), 30 MPa (extruded, unnotched) 20 MPa (cast, notched), 10 MPa (extruded, notched)
Hardness: Rockwell M38-M102 [2,106,107], R125 [2]. Ball indentation hardness 172 MPa (17.2 × 10^{7} N m^{-2}) [2]; 200 MPa (ISO 2039-1) [108]; 175 MPa (cast and extruded grades, ISO 2039-1) [20]. Moh hardness 2–3 [106,107]; Brinell hardness 20 [106,107]. Vickers hardness 5 [106], 17.1 (0.500" thick), 17.9 (0.125" thick), 19 (0.060" thick) [107]. Knoop hardness 16 [106], 17.7 (MW 45000), 18.6 (MW 64000), 20.4 (MW 123000), 21.3 (MW 393000), 21.8 (MW 1615000) [107]. Barcol hardness 80 [106], 87 (sheet), 85 (MEC grade 8), 80 (MEC grade 6), 77 (MEC grade 5), 56 (high impact) [107]. Shore 90 [106], 85 [2], 90 (sheet), 90 (MEC grade 8), 88 (MEC grade 6), 87 (MEC grade 5), 77 (high impact) [107]. Schleroscope 99 [106,107]. Sward rocker 46 [107]. Kohinoor pencil 9H [107]. Bierbaum scratch 16.4 [107]
Failure Properties General: Craze resistance 30–3600 s (min.) to break (MEC, ICI cantilever test, isopropanol) [23]. When the temp. is below the brittle-ductile transition point, PMMA fails by brittle fracture. Above this temp. it undergoes general yielding [109]. The presence of sorbed water at levels below 1% reduces the fatigue resistance of both cast and extruded PMMA. At levels above 1% there is little further loss of resistance. [109] For both high and low MW PMMA the strain to fracture increases to a max. and then drops to low values as the water content rises [109]. In low MW PMMA craze-dominated fracture occurs at all water content levels whereas in high MW resins this is only true for water-saturated material. [109] PMMA mouldings usually show considerable molecular orientation and it has been noted that a moulding with a high degree of 'frozen-in' orientation is stronger and tougher in the direction parallel to the orientation than in the transverse direction. When stress is applied parallel to the orientation direction the resistance to crazing is high; when stress is applied at 90° to this direction resistance to crazing is low. Large numbers of short, thin crazes are prod. in the former case and a comparatively small number of long, thick crazes in the latter [110]
Fracture Mechanical Properties: Fracture surface energy per unit area, γ, 300 J m^{-2} (3 × 10^{5} erg cm^{-2}, M_n 3000000) [111], 200–400 J m^{-2} [112], 120 J m^{-2} (1.2 × 10^{5} erg cm^{-2}) [113]. Fracture surface energy increases with decreasing temp. and varies with MW. The value of γ is lowered significantly by cross-linking. 80 J m^{-2} (lightly cross-linked, 80000 erg cm^{-2}) [113]; 46 J m^{-2} (cross-linked-PMMA/EGDMA, 46500 erg cm^{-2}) [114]; 23 J m^{-2} (densely cross-linked, 23000 erg cm^{-2}) [113]. Critical stress intensity factor (fracture toughness), K_c 1.1 M_n $m^{-3/2}$, 1.21 MPa $m^{1/2}$ (MW 1600000, 23°) [90], 0.7–1.6 M_n $m^{-3/2}$ [98]; 1.76 MPa $m^{1/2}$ (in water, 37°, MW 1600000), 1.21 MPa $m^{1/2}$, (air value) [90]. Because of the dependence of its K_c value on crack velocity PMMA is prone to time-dependent failure during periods of prolonged loading
Friction Abrasion and Resistance: Coefficients of friction 0.4–0.8 (self), 0.5 (steel) [1,20,115], 0.45 (steel) [1,20]. Abrasion resistance

0.025 N (Martens method, cast and extruded grades) [20]. Data for falling abrasive methods have been reported [107]

Izod Notch:

No.	Value	Notch	Note
1	15–64 J/m	Y	MEC, ASTM D256, ISO R180-4a [22]

5	2–7	Y	MEC, DIN 53453, ISO R179-2C [22]

Electrical Properties:

Electrical Properties General: PMMA has a low electrical conductivity, good arc resistance and high dielectric strength. The electrical props. are hardly affected by the absorption of water or the presence of plasticiser. PMMA is about midway in the triboelectric series for polymers [115].The dielectric constant and dissipation factor of PMMA vary with both temp. and frequency. The effects of ion-implantation on the props. of PMMA can be quite extensive [116].

Surface/Volume Resistance:

No.	Value	Note	Type
1	1×10^{15} Ω.cm	DIN 53482 [1]	S
2	0.1×10^{15} Ω.cm	MEC, ASTM D257, DIN 53482 [22]	S
3	0.1×10^{15} Ω.cm	cast sheet, IEC 93 [25]	S
4	0.05×10^{15} Ω.cm	cast and extruded grades, DIN VDE 0303, part 3 [20]	S
5	600×10^{15} Ω.cm	cast, ASTM D257 [51]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.2–3.7		ASTM D150 [2]
2	3.6	50 Hz	25° [118]
3	3.6	50 Hz	23°, cast, DIN VDE 0303, part 4 [20]
4	3.7	50 Hz	23°, extruded, DIN VDE 0303, part 4 [20]
5	3.7–3.9	50 Hz	MEC, ASTM D150, DIN 53483 [22]
6	3	1 kHz	25° [118]
7	2.7	100 kHz	23°, cast, DIN VDE 0303, part 4 [20]
8	2.8	100 kHz	23°, extruded, DIN VDE 0303, part 4 [20]

10	2.57	30 GHz	25° [119,120]
11	2.59	138 GHz	25° [120]

Dielectric Strength:

No.	Value	Note
1	15–20 $kV.mm^{-1}$	ASTM D149, DIN 53581, IEC 243 [22,25]
2	16–20 $kV.mm^{-1}$	ASTM D149 [24]
3	15–20 $kV.mm^{-1}$	impact modified, ASTM D149 [24]
4	18–22 $kV.mm^{-1}$	cast sheet, ASTM D149 [24]
5	30 $kV.mm^{-1}$	cast and extruded grades, 1 mm thick, DIN VDE 0303, part 2 [20]

Arc Resistance:

No.	Note
1	no track, ASTM D495

Strong Field Phenomena General: The dielectric strength of PMMA is high at low temps. but falls rapidly at the critical temp., T_c (approx. 20°) [121]

Static Electrification: The high surface resistance can give rise to a surface static charge but this can be prevented by the application of an anti-static surface coating [51]

Magnetic Properties: Magnetic susceptibility, c 0.59×10^6 cm^3 g^{-1} [122]. The effect of ion-implantation on the props. of PMMA can be quite extensive [116]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.062	50 Hz	25° [118]
2	0.06	50 Hz	23°, cast and extruded grades, DIN VDE 0303, part 4 [20]
3	0.055	1 kHz	25° [118]
4	0.02	100 kHz	23°, cast, DIN VDE 0303, part 4 [20]
5	0.03	100 kHz	23°, extruded, DIN VDE 0303, part 4 [20]
6	0.014	1 MHz	25° [118]
7	0.04	1 MHz	MEC, ASTM D150, DIN 53483 [22]
8	0.0056	30 GHz	25° [119,120]
9	0.01	138 GHz	25° [120]

Optical Properties:

Optical Properties General: Temp. coefficient of refractive index -0.001°. Extinction modulus 55000 mm^{-1} (647 nm) [124]; 50000 mm^{-1} (633 nm) [117]; 19000 mm^{-1} (514 nm) [124]; 23000 mm^{-1} (488 nm) [124]; 10000 mm^{-1} (400 nm) [117]. PMMA exhibits the Kerr effect with a Kerr constant of 0.2×10^{-14} mV^2 (25°, commercial cast grade) [125]. Stress optical coefficient -160×10^{12} Pa^{-1} [126]. Large heterogeneities in PMMA give rise to light-scattering loss. Light-scattering loss 13 dB km^{-1} (633 nm; polymer with no heterogeneities prepd. by radical polymerisation above T_g) [127,128]

Refractive Index:

No.	Value	Note
1	1.49	589 nm [2,20,22,23,129]
2	1.4831	633 nm, syndiotactic [130]
3	1.4832	633 nm, isotactic [130]
4	1.488	656 nm, n_c [129]
5	1.496	486 nm, n_f [129]

Transmission and Spectra: Nmr [12,13,14], Raman [15], ir [16], esr [123] and time-of-flight negative ion mass [17] spectral data have been reported. PMMA transmits light in the range 360–1000 nm; at a thickness of 2.54 cm or less it absorbs virtually no visible light; above 2800 nm essentially all ir radiation is absorbed. λ_{max} 213 nm (syndiotactic, extinction coefficient 170–173 M^{-1} cm^{-1}, 16.5–65°) [131]; λ_{max} 207 nm, with shoulders at 211.5 and 216.5 nm (isotactic, 17.5°) [131]. Deuteration of the monomer prior to polymerisation can extend the transmission window and improve the loss of a resin, the degree of improvement depending on the level of deuteration [132]. Deuterated PMMA has a lower optical absorption coefficient than PMMA in both the visible and the near infrared regions [133]. Water in PMMA causes some loss of transmission around 950 nm but otherwise has little effect on the absorption props. Water in deuterated PMMA, however, has a much greater effect [133]. The transparency of PMMA to X-rays is similar to that of human flesh or water. Finely-divided inorganic salts have been added to PMMA to render it opaque to X-rays but there is a detrimental effect on the mechanical props. Bismuth and barium-containing glasses have been similarly used but again the mechanical props. suffer with the polymer increasing in weight and becoming brittle. PMMA can be made radio-opaque by the incorporation of heavy metal salts during polymerisation. The presence of the salt can sometimes raise the T_g of the polymer [134]. Sheets are opaque to α-particles and for thicknesses above 6.35 nm they are essentially opaque to β-radiation. PMMA sheet may be used as a neutron stopper. Most colourless sheet formulations have high transmittance to standard broadcast and TV waves and most radar bands. Total energy transmittance 85% (cast and extruded grades, DIN 67507) [20]

Molar Refraction: Dispersion 57.8 [129]. The complex refractive index of syndiotactic and isotactic PMMA over the ir region has been calculated [130]

Total Internal Reflection: Critical angle 42° (air, 5893Å) [46,51]. Intrinsic segmental anisotropy, 2×10^{25} cm^3 (C_6H_6, atactic), 25×10^{25} cm^3 (C_6H_6, isotactic) [135]

Volume Properties/Surface Properties: Haze 20–30% (Taber method, ISO 9352, cast and extruded grades). Clarity 90–92% transmission (D1003, DIN 5036) [20,22,23]. Haze 0.4–2.5% (max., D1003, DIN 5036) [22,23]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	80°C	continuous use, cast sheet [25]
2	80–85°C	flat sheet [41]
3	85–100°C	[1]
4	80°C	cast [20]
5	75–80°C	thermoformings [41]
6	70°C	extruded [20]
7	65–90°C	[1]

Decomposition Details: On heating the polymer above 300° an unzipping process occurs giving monomer at >95% yield. The main prods. of combustion in a well-ventilated atm. are CO_2 and CO [136,137,138,139,140]. k_{350} 5.2% min^{-1} [46]. Heat of combustion 16600 kJ kg^{-1} [140]. Char yield 0% [98]

Flammability: Burns slowly with a blue, crackling flame and little smoke; liable to drip. Burns to completion if not extinguished. Flame-retardant grades are available. Limiting oxygen index 17.3% [2,141]. Flammability rating HB (UL 94) [25]. Ignition temp. 425° [1], 425° (cast, DIN 51794) [20], 430° (extruded, DIN 51794) [20], 350° (moulding powder) [51]

Environmental Stress: Can last up to 20 years with little appreciable loss of props. After a period of 17 years' exposure in New Mexico a sample of sheet was found to have reduced flexural strength (-51%) and strain at rupture (-66%). The material had a slightly reduced glass-transition temp. and was also more brittle, although the brittleness was attributed partly to crack initiation by surface roughness. The sheet was still transparent and the loss in transmission less than 10%. The original degree of transmission could be almost completely restored by polishing, showing that the loss was due to surface roughness rather than degradation of the polymer [142]. Is more stable to photolysis in air than in a vacuum [143]. Outdoor weathering causes very slight yellowing after 1095 days (general purpose/cast sheet, ASTM D1435) and embrittlement after 730 days (ASTM D1435) [24]. Rain drops may cause ring cracks [144]. Resistance to environmental stress cracking may be improved by annealing

Chemical Stability: Resistant to oxidation at ambient temps. May be crazed by solvents and organic compounds [98]. Cast sheet may be rendered opaque by MeOH [145]. Unaffected by weak acids and alkalis. Attacked by strong acids [24]. Ozonolysis causes degradation [146]

Hydrolytic Stability: There is a marked difference between crystallisable and non-crystallisable forms. Conventional (i.e., free-radical bulk polymerised) and syndiotactic polymers hydrolyse more slowly than isotactic [147]. The config. of the polymer is unchanged by hydrol.

Biological Stability: PMMA with a small amount of *N*-benzyl-4-vinylpyridinium chloride in the main chain shows a reduction in MW after time in the aeration tank of a sewage works

Recyclability: May be recycled via pyrolysis at 720° when depolymerisation yields monomer at 97% or better

Stability Miscellaneous: Uv irradiation of thin films at 25° can cause a rapid decrease in MW with small amounts of volatile prods. formed [148]. The carbonyl group absorbs at 215 nm leading to chain scission and consequent degradation. Large doses of ionising radiation can cause brittleness, loss of strength and

general reduction in props. Main chain fracture occurs during irradiation; deterioration of props. is due to lowering of MW. Non-heat resistant grades distorted by boiling H_2O. High energy radiation causes irreversible yellowing but no change in mechanical or electrical props. γ-Irradiation causes chain rupture [149] leading to decrease in T_g and intrinsic viscosity [150]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by bulk (sheet, rod or tube), suspension, soln. or dispersion [152] polymerisation. Free-radical polymerisation can be initiated by AIBN or a peroxide at 100°, by bacteria and yeast [151],or by heat or microwave-inducement [158]. Stereoregular material is made by living polymerisation using metal alkyl catalysts [153]. Processed by manipulation (sheet, rod, tube) or by extrusion and injection moulding

Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.7%	[23]
2	0.2–0.6%	ASTM D955 [25]

Applications: Applications in consumer goods; in medicine as dental cements/resins, hard contact lenses and in bone reconstruction. Also used in the manufacture of membranes for dialysis and ultrafiltration. Used as a positive photoresist both with uv (at 215 nm) and with an electron beam, although its sensitivity to the latter is low. Also used as a low-profile additive to eliminate polymerisation shrinkage in sheet moulding compounds and bulk moulding formulations e.g., in PVC

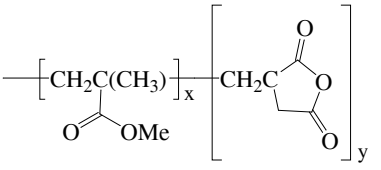
Poly(methyl methacrylate-*co*-itaconic acid) P-382



Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate)
Monomers: Methyl methacrylate, Itaconic acid
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_5H_7O_4)_y]_n$
Fragments: $C_5H_8O_2$ $C_5H_7O_4$

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. MeOH, EtOH, THF; insol. H_2O, cyclohexanone, 2-butanone, $CHCl_3$, CCl_4, octanol [1]

Polymer Stability:
Stability Miscellaneous: Irradiation causes decrease in MW [1]

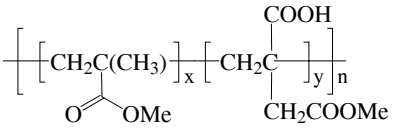
Bibliographic References
[1] Parsonage, E.E. and Peppas, N.A., *Br. Polym. J.,* 1987, **19,** 469

Poly(methyl methacrylate-*co*-itaconic anhydride) P-383

Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate)
Monomers: Methyl methacrylate, Itaconic anhydride
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_5H_4O_3)_y]_n$
Fragments: $C_5H_8O_2$ $C_5H_4O_3$

Volumetric & Calorimetric Properties:
Glass Transition Temperature:

No.	Value	Note
1	<170°C	max. [1]



Transition Temperature General: T_g increases with increasing itaconic anhydride content [1]

Polymer Stability:
Thermal Stability General: Thermal stability increases with decreasing itaconic anhydride content [1]. Heating at 170° causes cross-linking [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by free-radical polymerisation [1]
Applications: Applications in electron beam resists

Bibliographic References
[1] Miles, A.F. and Cowie, J.M.G., *Eur. Polym. J.,* 1991, **27,** 165

Poly(methyl methacrylate-*co*-methyl itaconate) P-384

Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate)
Monomers: Methyl methacrylate, Methyl itaconate
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_6H_8O_4)_y]_n$
Fragments: $C_5H_8O_2$ $C_6H_8O_4$

Volumetric & Calorimetric Properties:

Transition Temperature General: T_g increases with increasing methyl itaconate content. Precise measurement is not possible owing to cross-linking [1]

Polymer Stability:

Thermal Stability General: Thermal stability decreases as the methyl itaconate content increases [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical polymerisation [1]
Applications: Applications in electron beam resists

Bibliographic References

Poly(methyl methacrylate), Moulding and extrusion compounds P-385

Related Polymers: Methacrylates General, Poly(methyl methacrylate) General
Monomers: Methyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$
Molecular Weight: M_n 100000–200000
General Information: Compounds are classified according to ASTM standard D788. This comprises three groups (unmodified, impact modified and heat resistance modified). Each group is subdivided into a number of classes, which in turn are divided into grades (grade 1: general purpose; grade 2: uv transmitting; grade 3: uv stabilised; grade 4: impact modified). Low levels of acrylate comonomers may be incorporated to modify the melt flow and thermal stability props. Available in granule or bead (600 µm) form with a full range of transparent, translucent and opaque colours

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15–1.19 g/cm^3	ASTM D792, DIN 53479, ISO R1183 [1,2,3]
2	d 1.18–1.19 g/cm^3	ASTM D788 [4]
3	d 1.12–1.16 g/cm^3	high impact grade [3,4]
4	d 1.02–1.1 g/cm^3	modified [4]
5	d^{23} 0.67 g/cm^3	DIN 53466 [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6.5×10^{-5}–0.0001 K^{-1}	ASTM D696, DIN 53752A [1]	L
2	3×10^{-5}–4×10^{-5} K^{-1}	ASTM D788 [4]	L
3	4×10^{-5}–6×10^{-5} K^{-1}	high impact grade [4]	L
4	4.4×10^{-5}–4.5×10^{-5} K^{-1}	modified [4]	L
5	7×10^{-5} K^{-1}	0–50°, ASTM D788, DIN 52612, VDE 0304 [3,5]	L
6	9.5×10^{-5}–0.00011 K^{-1}	impact modified, DIN 52612 [3]	L

Thermal Conductivity:

No.	Value	Note
1	0.21 W/mK	1.44 Btu (h ft^2 °F in)$^{-1}$, high impact, ASTM D788 [4]
2	0.23 W/mK	1.56 Btu (h ft^2 °F in)$^{-1}$, modified [4]
3	0.19 W/mK	ASTM D788, VDE 0304/1 [5]
4	0.18 W/mK	[3]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.5 kJ/kg.C	ISO 1006 [3]	P

Deflection Temperature:

No.	Value	Note
1	74–121°C	166–250°F, 1.8 MPa, general purpose [4]
2	74°C	1.82 MPa, general purpose, ASTM D648 [6]
3	75–98°C	1.8 MPa, ISO 75 [3]
4	80–103°C	0.45 MPa, ISO 75 [3]
5	80°C	1.82 MPa, general purpose, ASTM D648 [6]
6	90–102°C	1.82 MPa, general purpose, ASTM D648 [6]
7	87–114°C	0.46 MPa, ISO 75 [7]
8	82–109°C	1.82 MPa, ISO 75 [7]
9	88–102°C	ISO 75A [2]
10	91–106°C	ISO 75B [2]
11	91°C	195°F, 1.8 MPa, modified [4]
12	75–93°C	1.8 MPa, impact modified, ISO 75 [3]
13	80–98°C	0.45 MPa, impact modified, ISO 75 [3]
14	76–96°C	169–205°F, 1.8 MPa, high impact grade [4]
15	68–92°C	1.82 MPa, high impact grade, ISO 75 [7]
16	76–106°C	1.82 MPa [1,2,8]
17	74°C	1.85 MPa, general purpose, ASTM D788, DIN 525, DIN 53461 [5]
18	82°C	1.85 MPa, general purpose, ASTM D788, DIN 526, DIN 53461 [5]
19	90°C	1.85 MPa, DIN 527, DIN 53461 [5]
20	98°C	1.85 MPa, general purpose, ASTM D788, DIN 528, DIN 53461 [5]

21	79°C	0.46 MPa, general purpose, ASTM D788, DIN 525, DIN 53461 [5]
22	87°C	0.46 MPa, general purpose, ASTM D788, DIN 526, DIN 53461 [5]
23	95°C	0.46 MPa, DIN 527, DIN 53461 [5]
24	103°C	0.46 MPa, general purpose, ASTM D788, DIN 528, DIN 53461 [5]
25	69–79°C	1.82 MPa, ASTM D788
26	80–86°C	1.82 MPa, ASTM D788
27	87°C	1.82 MPa, ASTM D788

Vicat Softening Point:

No.	Value	Note
1	80–118°C	ASTM D1525, DIN 53460, ISO R306 [1,2,8]
2	109–112°C	[8]
3	86°C	general purpose, ASTM D788, DIN 525, DIN 53460 [5]
4	94°C	general purpose, ASTM D788, DIN 526, DIN 53460 [5]
5	102°C	DIN 527, DIN 53460 [5]
6	110°C	general purpose, DIN 528, DIN 53460 [5]
7	75–98°C	ISO 306 [3]
8	76–106°C	high impact grade, DIN 53460 [7]
9	98–106°C	impact modified, ISO 306 [3]

Surface Properties & Solubility:

Plasticisers: Plasticisers are sometimes used in moulding compositions, e.g. to enhance the melt flow. Levels vary from 1–50% although 5% is most common. Phthalates (e.g. dimethyl, diethyl, dibutyl, butyl benzyl), sebacates (e.g. dibutyl, diethylhexyl) and phosphates are some of the more common plasticisers

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.9–3 g/10 min	standard grades, 230°, 3.8 kg, DIN 53735 [7]
2	24 g/10 min	grade 5, ASTM D1238 [6]
3	17 g/10 min	grade 6, ASTM D1238 [6]
4	2–8 g/10 min	grade 8, ASTM D1238 [6]
5	6 g/10 min	low level acrylic-base impact modification [6]
6	3.2–9 g/10 min	medium level acrylic-base impact modification [6]
7	1–3.5 g/10 min	high level acrylic-base impact modification [6]
8	0.1–2.6 g/10 min	high impact grade, 230°, 3.8 kg, DIN 53735 [7]

Permeability of Gases: [H_2O] 0.8–1 g m^{-2} d^{-1} (DIN 53122) [3], 0.8–1.1 (impact modified, DIN 53122) [3]
Water Content: 0.3–0.36% (ASTM D570, DIN 53495, ISO R62) [1,2]
Water Absorption:

No.	Value	Note
1	0.3–0.4 %	24h, general purpose grades, ASTM D788 [4]
2	0.2–0.3 %	24h, high impact grade [4]
3	0.3 %	24h, modified [4]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2930 MPa	425 kpsi, general purpose grades, ASTM D788 [4]
2	1750–2200 MPa	280 kpsi, high impact grade [3,4]
3	2758 MPa	400 kpsi, modified [4]

Flexural Modulus:

No.	Value	Note
1	2900–3400 MPa	ASTM D790, DIN 53452, ISO R178 [1,2]
2	2930 MPa	425 kpsi, general purpose grades, ASTM D788 [4]
3	2137 MPa	310 kpsi, high impact grade [4]
4	2622 MPa	low level acrylic-base impact modification, ASTM D790 [6]
5	2484 MPa	medium level acrylic-base impact modification, ASTM D790 [6]
6	1863 MPa	high level acrylic-base impact modification, ASTM D790 [6]
7	2250 MPa	375 kpsi, modified [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	38–85 MPa	ASTM D638, DIN 53455, ISO R257 [1,2]	4–40%
2	64 MPa	ASTM D788, DIN 525, DIN 53455 [5]	2.5%

3	0.03–0.04	60 Hz	high impact grade [4]
4	0.026–0.029	60 Hz	modified [4]
5	0.02–0.03	1 MHz	general purpose grades, ASTM D788 [4]
6	0.01–0.02	1 MHz	high impact grade [4]
7	0.022–0.025	1 MHz	modified [4]
8	0.03–0.04	100 Hz–1 MHz	ISO 250, DIN 0303-4 [3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.492	ASTM D542, DIN 53491, ISO R489 [1,2,3]

Transmission and Spectra: Transmittance 90–92% (ASTM D1003, DIN 5036) [1,2,3]
Volume Properties/Surface Properties: Haze 0.4–2.5% (max., ASTM D1003, DIN 5036) [1,2,3], 1 (max., ISO D1003) [3], 2 (max., impact modified, ISO D1003) [3]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	68–88°C	155–190°F, no load, ASTM D788 [4]
2	71°C	160°F, no load, modified [3]
3	74°C	no load, general purpose, ASTM D788, DIN 525 [5]
4	82°C	no load, general purpose, ASTM D788, DIN 526 [5]
5	90°C	no load, DIN 527 [5]
6	98°C	no load, general purpose, ASTM D788, DIN 528 [5]
7	75–98°C	[3]
8	75–93°C	impact modified [3]

Flammability: Flammability rating HB (UL94) [1,2,3]; BH 3–30 mm min^{-1} (ISO 707) [3], FH 3–35 mm min^{-1} (ISO 707) [3]. Glow wire test 650° (IEC 695-2-1) [2]. Ignition point 350° (moulding powder) [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: The MW of most bulk-polymerised PMMA is too high to allow satisfactory flow props. for it to be used in injection moulding, extrusion, blow moulding and coating applications. Although it is possible to greatly reduce the MW by mechanical scission by rolling on a two-roll mill, moulding/extrusion compounds are usually manufactured by suspension polymerisation. Suspension polymerisation is usually carried out in a comparatively short time (1h max.) as there is no serious exotherm problem. A catalyst (e.g., peroxide) is dissolved in the monomer and the soln. dispersed in approx. two parts water along with various additives. Typical additives include suspending agents (aluminium oxide, talc and magnesium carbonate); protective colloids e.g., PVA and sodium polymethacrylate; buffering agents e.g., sodium hydrogen phosphate, chain transfer agents (to control MW) (lauryl mercaptan, trichloroethylene); lubricants (stearic acid); emulsifier (sodium lauryl sulfate).The size and shape of the beads formed during suspension polymerisation can be difficult to control. The size of the beads (usually between 50 and 1000 μm) is determined by the size and shape of the reactor, the type and rate of agitation and the nature of the additives. Processed by standard injection or compression moulding, extrusion and thermoforming. Regrind can be used at high ratios in most applications but must be dried if used immediately. If a properly designed, vented barrel is used PMMA can generally be injection-moulded or extruded without drying. Good temp., pressure and speed control are necessary for consistent high quality products. Moisture levels should be below 0.3% before extruding and below 0.1% before moulding. Products may require annealing to improve stress crack resistance if they are to come into contact with solvents or are to be load-bearing
Mould Shrinkage (%):

No.	Value	Note
1	0.3–0.8%	[3]
2	0.5–0.8%	impact modified [3]
3	0.2–0.8%	ASTM D955 [1,2,8]
4	0.1–0.4%	[9]

Applications: Has applications in building components (e.g., panels, frames etc.); glazing and display fittings; automotive industry (lights, number plates, spoilers and instrumentation); road lighting, domestic lighting; domestic equipment (e.g., bowls, glasses, furniture etc); bathroom fittings; medical products (e.g. diagnostic test-tubes, optical lenses etc); engineering components (e.g. photocopier parts); fashion items (e.g. shoe heels, costume jewellery)

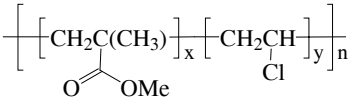
Poly(methyl methacrylate-*co*-vinyl alcohol) P-386

Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate), Poly(vinyl alcohol)
Monomers: Methyl methacrylate, Vinyl alcohol
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_2H_4O)_y]_n$
Fragments: $C_5H_8O_2$ C_2H_4O
Morphology: Graft copolymers exhibit lamellar microphase morphology. [1] Various methods of synth. all produce copolymers with the same struct. [2]
Identification: Poly(methyl methacrylate) branches may be isol. from graft copolymers by oxidative degradation with nitric acid [1,3]

Volumetric & Calorimetric Properties:
Glass Transition Temperature:



No.	Value	Note
1	105–110°C	[1]

Transition Temperature General: T_m increases with increasing methacrylate content [1]. T_g varies with the percentage content of methacrylate [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by free-radical polymerisation using potassium persulfate or ceric ion initiators [2,4]
Applications: Used as alkali-resistant sizing agents for textiles

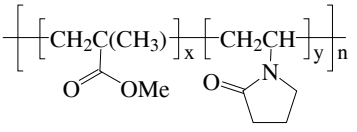
Poly(methyl methacrylate-*co*-vinyl chloride) P-387

Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate), Poly(vinyl chloride)
Monomers: Methyl methacrylate, Vinyl chloride
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_2H_3Cl)_y]_n$
Fragments: $C_5H_8O_2$ C_2H_3Cl

Volumetric & Calorimetric Properties:
Glass Transition Temperature:

No.	Value	Note
1	65–105°C	[13]

Transition Temperature General: T_g varies with the percentage content of methacrylate [1]



Transport Properties:
Polymer Solutions Dilute: Intrinsic viscosity varies with composition. η 0.87–1.02 dl g^{-1} (0–33% MMa) [3]

Mechanical Properties:
Mechanical Properties General: Yield stress and initial modulus of the graft copolymer increase with increase in methacrylate grafting, whereas yield strain and elongation decrease [3]

Polymer Stability:
Decomposition Details: Pyrolysis at 150–200° liberates methyl chloride and causes intramolecular cyclisation yielding terpolymers [2,3]

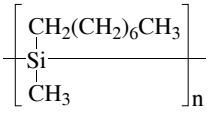
Poly(methyl methacrylate-*co*-*N*-vinylpyrrolidone) P-388

Related Polymers: Polymethacrylates, General, Poly(methyl methacrylate)
Monomers: Methyl methacrylate, *N*-Vinylpyrrolidone
Material class: Thermoplastic
Polymer Type: acrylic copolymers
Molecular Formula: $[(C_5H_8O_2)_x\ (C_6H_9NO)_y]_n$
Fragments: $C_5H_8O_2$ C_6H_9NO
Morphology: Forms hydrogels known as "snake-cage" polymers; linear poly(methyl methacrylate) "snakes" held in a cage of cross-linked *N*-vinylpyrrolidone [1]

Mechanical Properties:
Tensile Strength Break:



No.	Value	Note	Elongation
1	157 MPa	16 kg mm^{-2}, approx., 25% MMA, 74% water content [1]	450%
2	98 MPa	10 kg mm^{-2}, 20% MMA, 76% water content, approx. [1]	400%
3	19.6 MPa	2 kg mm^{-2}, 10% MMA, 85% water content, approx. [1]	200%

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by dissolution of *N*-vinylpyrrolidone in poly(methyl methacrylate) in the presence of cross-linking agent (diethylene glycol dimethacrylate) then polymerising by photoinitiation (24h, 10°). The resultant polymer is then heated at 90–100° for a further 24h [1]
Applications: Applications in medicine (membranes, drug delivery systems)

Poly(methyl-*n*-octylsilane) P-389

Synonyms: *Poly(methyloctylsilylene). PMOS. ME8*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
114528-74-4

Molecular Formula: $(C_9H_{20}Si)_n$
Fragments: $C_9H_{20}Si$
Molecular Weight: 2.9×10^5 [1,2,3,9]
General Information: Hydrophobic [2].
Morphology: Shows a highly elastic character. Conformational studies carried out using uv-vis of films on a hydrophobic surface [2,7].

Surface Properties & Solubility:

Solubility Properties General: See [7].

Transport Properties:

Transport Properties General: Reported to have the viscosity of rubber cement [4].

Optical Properties:

Optical Properties General: Broad absorption band around 308nm, indicating a noncrystalline disordered state including gauche conformations of the Si backbone [2]. Displays an abrupt thermochromic transition (301nm to 330nm, after red shift) [3,9]. The anisotropic polarisability and its isotropic fluid structure allow the possibility of the Kerr effect [4].
Transmission and Spectra: Ir [1,7,9], uv-vis [1,2,3,8,9,10], nmr [1,7,9,11] and fluorescence [5,9] data reported.

Polymer Stability:

Thermal Stability General: Unlike lower analogues, a first-order transition occurs sumultaneously, thermochromism being observed at an onset temperature of -1°C, with an increased ΔH [3].

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by Wurtz-type reductive-coupling polymerisation of dichloromethyl-*n*-octylsilane in THF at room temperature with yields of 54–58% (highest yield achieved to-date) [1,3,7,12]. There are no other reported syntheses in the literature [1].
Applications: Organic semiconductor [4]. Membrane plate module [6]. Pyrolysis to silicon carbides [7].

Polymethyloctylsiloxane fluid P-390

Synonyms: *Polymethylalkylsiloxane fluid. Poly[oxy(methyloctylsilylene)]*
Related Polymers: PDMS fluid
Monomers: Dichloromethyloctylsilane, Cyclic methyloctylsiloxane
Material class: Fluids
Polymer Type: silicones
CAS Number:

CAS Reg. No.
108644-23-1
158865-53-3

Molecular Formula: $[C_9H_{20}OSi]_n$
Fragments: $C_9H_{20}OSi$
Molecular Weight: MW 1500–10000
Miscellaneous: Methylalkylsiloxanes with alkyl chains of more than eight carbon atoms have similar props. to polymethyloctylsiloxane fluid. Commercial methylalkylsiloxanes may contain mixts.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.91 g/cm^3	[1,5]

Glass Transition Temperature:

No.	Value	Note
1	-92°C	large values of *n* [10,11]

Transition Temperature:

No.	Value	Note
1	-50°C	Pour point (-58°F) [1,5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers, higher alcohols. Insol. H_2O, lower alcohols [3,4]
Surface and Interfacial Properties General: Coefficient of friction 0.08. Has much better lubricating props. than does dimethyl silicone fluid [5]
Wettability/Surface Energy and Interfacial Tension: γ_c 30.4 mJ m^{-2} (30.4 dyne cm^{-1}) [1,5]

Transport Properties:

Polymer Melts: Viscosity 1.5 St (38°). Viscosity increases sharply with increasing pressure. Viscosity temp. coefficient 0.75 [5,6,7]

Electrical Properties:

Electrical Properties General: Electrical props. are similar to hydrocarbon fluids
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.4	[2,9]

Dissipation (Power) Factor:

No.	Value	Note
1	1×10^{-5}	[2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.445	[1,5]

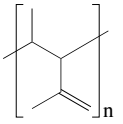
Polymer Stability:

Polymer Stability General: Less stable than dimethyl silicone fluids
Thermal Stability General: Usable between -50–150° [5]
Upper Use Temperature:

No.	Value
1	150°C

Decomposition Details: Oxidised above 150° [5]
Flammability: Fl. p. 315° [5]
Environmental Stress: Stable to H_2O, air, oxygen and other materials. Props. deteriorate due to cross-linking when exposed to radiation [8]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. Very thin films liable to degradation [4,5,7]
Hydrolytic Stability: Stable to H_2O and aq. solns. Very thin films spread on water; liable to hydrolytic degradation [2,7,8]
Biological Stability: Non-biodegradable [2,7]
Recyclability: Can be reused; no large scale recycling

Applications/Commercial Products:



Processing & Manufacturing Routes: For low viscosity fluids methyloctyldichlorosilane is hydrolysed and the hydrolysate equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane. For high viscosity fluids cyclic methyloctylpolysiloxanes are equilibrated together under alkaline catalysis with traces of chain terminator at 150°
Applications: Used as a lubricant, mold release agent and hydraulic fluid

Poly(2-methylpentadiene) P-391

Synonyms: *Poly(1,3-dimethyl-1,3-butadiene). PMPD. Poly(2-methyl-1,3-pentadiene). PDMB. Poly(2-methyl-1,4-pentadiene)*
Monomers: 2-Methyl-1,4-pentadiene, 2-Methyl-1,3-pentadiene
Polymer Type: polyolefins, polydienes
CAS Number:

CAS Reg. No.	Note
105639-53-0	Poly((*E*)-2-methyl-1,3-pentadiene), isotactic
95763-37-4	Poly(2-methyl-1,4-pentadiene), isotactic
25931-14-0	Poly(2-methyl-1,3-pentadiene)
83174-63-4	Poly(2-methyl-1,3-pentadiene), isotactic
26714-20-5	Poly((*E*)-2-methyl-1,3-pentadiene)

Molecular Formula: $(C_6H_{10})_n$
Fragments: C_6H_{10}
Morphology: There are two cryst. forms of (*E*)-2-methyl-1,3-pentadiene (greater than 98% *cis*-content). α-form: orthorhombic a 10.74Å, b 13.04Å, c 7.87Å; space group Pbca; Z=8 (isotactic); β-form a 9.3Å, b 7.73Å, c 7.90Å; space group $P2_12_12_1$; Z=4 [2]. *trans*-1,4-poly(2-methylpentadiene) has a monoclinic cryst. struct: a 4.82Å, b 9.19Å, c 12.89Å; space group $P2_1/c$; β 93.5°; isotactic (25°); a 4.82Å, b 9.08Å, c 12.78Å; space group $P2_1/c$; β 93.6° (-120°) [8]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.85 g/cm^3	1,4-form [4,9]

Thermodynamic Properties General: Variation of C_p with temp. has been reported [4]
Melting Temperature:

No.	Value	Note
1	165°C	*cis*-form; β cryst form [2]
2	175°C	*cis*-form; α cryst form [2]
3	200°C	*trans*-form [2]

Glass Transition Temperature:

No.	Value	Note
1	3.7–4.7°C	varying MW [4]
2	1.1–2.6°C	*cis*/*trans* (60/40), varying MW [9]
3	-13°C	high *cis*-1,4 content [10]

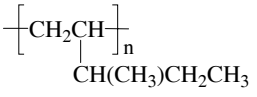
Transport Properties:

Polymer Solutions Dilute: The effects of temp. and MW on rheological props. have been reported. [9] Intrinsic viscosity 0.47 dl g^{-1} (THF, 30°, MW 445 000), 0.71 dl g^{-1} (THF, 30°, MW 763000), 2.18 dl g^{-1} (THF, 30°, MW 3770000); 0.23 dl g^{-1} (2-octanol, 28.9°, MW 445000), 0.3 dl g^{-1} (2-octanol, 28.9°, MW 763000), 0.65 dl g^{-1} (2-octanol, 28.9°, MW 3770000) [4]. Huggins

coefficients 0.77 (MW 445000), 0.88 (MW 763000), 1.02 (MW 3770000) [4]. Theta temp. 28.9° (2-octanol, *cis*/*trans* (64/36)) [11]

Mechanical Properties:
Miscellaneous Moduli:

No.	Value	Note	Type
1	0.42 MPa	[4,9]	Plateau modulus
2	0.3 MPa	calc., 1,4-form [4,9]	Plateau modulus



Optical Properties:
Transmission and Spectra: Ir and C-13 nmr spectral data have been reported [2,4,5,6,7]
Total Internal Reflection: Birefringence dn/dc 0.0989 $cm^3\ g^{-1}$ (633 nm, 30°, cyclohexane) [4]

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerised using vanadium, titanium or nickel-based catalysts; the product has varying isomeric compositions. A *cis*-1,4-polymer has been obtained using the catalyst system AlR_3-$TiCl_4$ and also a ternary catalyst system: $AlEt_2Cl$-$Nd(OCOC_7H_{15})_3$-triisobutyl aluminium. A *trans*-1,4-polymer has been produced using $Ni(AcAc)_2$-MAO. [1,2,7] Anionic polymerisation has also been reported [4]. Optically active polymer can be obtained by asymmetric inclusion polymerisation, e.g. in apocholic acid canals [3]
Applications: Used as intermediates in synth. of polypropylene

66906-10-3	(±)-form
88611-18-1	isotactic, (±)-form
29036-72-4	syndiotactic

Molecular Formula: $(C_6H_{12})_n$
Fragments: C_6H_{12}
Tacticity: Optically active isotactic and atactic forms known
Morphology: Isotactic, (*S*)-form, tetragonal, a 1.395, b 1.335, c 0.68 [9], helix 4_4 (or possibly tetragonal, a 1.92, b 1.92 [15])

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.89 g/cm^3	[9]
2	d 0.88 g/cm^3	[14]
3	d 0.831 g/cm^3	[11]
4	d 0.832 g/cm^3	[11]

Melting Temperature:

No.	Value	Note
1	271–273°C	(*S*)(+)-form [10,13]
2	260–264°C	(*S*)(+)-form [11]
3	271–278°C	(*S*)(+)-form [12]
4	229–237°C	[12]
5	200–205°C	[11]
6	360–362°C	[14]
7	266–268°C	[13]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. 1,2,4-trichlorobenzene, boiling 1,1-ditolylethane, 1,1-diphenylethane [6]. Slightly sol. dibutyl phthalate, dioctyl phthalate (above 264°) [11]. Insol. boiling xylene [12]

Transport Properties:
Polymer Solutions Dilute: [η] 0.20–0.34 dl g^{-1} (30°, CCl_4) [2]. [η] 0.8 dl g^{-1} [13]

Optical Properties:
Transmission and Spectra: Ir [16] and C-13 nmr [3,6,7,17] spectral data have been reported
Total Internal Reflection: $[\alpha]_D^{25}$ +257 ((*S*)(+)-form) [12]. $[\alpha]_D^{24}$ +255 ((*S*)(+)-form) [11]. Other optical rotation values have been reported [10,19]. Temp. coefficients of optical rotation have been reported [5,20]. $[M]_D^{25}$ +154 ((*S*)(+)-form) [21,22]. $[M]_D^{20}$ +163 ((*S*)(+)-form) [13]. $[M]_D$ +180 ((*S*)(+)-form) [8]. Temp. effects on birefringence intensity have been reported [15]

Polymer Stability:
Environmental Stress: Undergoes oxidation by ozonolysis [18]

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerised using Ziegler-Natta catalysts, such as $TiCl_3AlMe_3$-$ZnMe_2$ in toluene at 50° [3]

Poly(4-methyl-1-pentene) P-393

Synonyms: *P4MP*
Related Polymers: Injection moulding Glass filled, Injection moulding Mineral filled, Glass reinforced, Moulded, Extrusion unfilled
Monomers: 4-Methyl-1-pentene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
24979-98-4	isotactic
25068-26-2	
131724-39-5	syndiotactic
101239-82-1	
113834-30-3	
26680-37-5	isotactic*S*-form
33409-74-4	isotactic (±)-form

Molecular Formula: $(C_6H_{12})_n$
Fragments: C_6H_{12}
Additives: Antioxidants
General Information: Refers to commercial product, which is a copolymer with 3–5% of an α-olefin having a linear alkyl chain C_6-C_{16}.
Tacticity: Predominantly isotactic, head-to-tail struct.
Morphology: Form III tetragonal a 19.46, b 19.46Å, c 7.022Å, α 90° β 90° μ 90° 4, helix [63,64]. Isotactic, tetragonal a 18.70Å, c 13.68Å [49]. Tetragonal a = b 18.35Å, c 13.52Å (lower draw); orthrohombic a 17.70Å, b 8.85Å, c 12.33Å (higher draw) [54]. Can crystallise in five forms depending on crystallisation conditions [57]. Other morphological studies have been reported [59]. Syndiotactic tetragonal a 18.03Å [64]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.833 g/cm^3	[44]
2	d^{23} 0.829 g/cm^3	[48]
3	d 0.83 g/cm^3	isotactic [49]
4	d 0.83 g/cm^3	[52]
5	d 0.838 g/cm^3	amorph. [53]
6	d 0.828 g/cm^3	cryst. [53]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00069 K^{-1}	T <-185° [61]	l
2	0.00089 K^{-1}	T >-185° [61]	L

Equation of State: Equation of state information has been reported [17,33]
Thermodynamic Properties General: Thermodynamic props. over the temp. range -266–397° have been studied [2]. Heat of combustion has been reported [25]. Variation of Cp with temp. has been reported [65]. Thermal conductivity increases with increasing temp. [53]
Latent Heat Crystallization: Heat of fusion 5.2-5.8 kJ mol^{-1} (isotactic) [15], 61.96 J g^{-1} (14.8 cal g^{-1}) [16]. ΔH 92 J g^{-1} [43], 102 J g^{-1} [43]. Entropy of fusion 10.3 JK^{-1} mol^{-1} (2.46 cal K^{-1} mol^{-1}). [16] Heat of combustion has been reported [25]. Variation of Cp with temp. has been reported [65] ΔH (melt) 9.93 kJ mol^{-1} [45]. ΔS (melt) 19.5 J K^{-1} mol^{-1} [45]. Heat of polymerisation -95 kJ mol^{-1} [45]. Entropy of polymerisation -131 J mol^{-1} K^{-1} [45]. ΔG_{polym} -56 kJ mol^{-1} [45]. Heat of fusion 10.04–13.8 kJ mol^{-1} (2400–3300 cal mol^{-1}) [52].
Thermal Conductivity:

No.	Value	Note
1	0.11 W/mK	melt [44]
2	0.2 W/mK	cryst. [44]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.56 kJ/kg.C	-194°	P
2	2.57 kJ/kg.C	147° [55]	p

Melting Temperature:

No.	Value	Note
1	245°C	[43]
2	230°C	[44]
3	235°C	[45]
4	238°C	[47]
5	240°C	[52,57]

Glass Transition Temperature:

No.	Value	Note

2	38°C	[46]
3	42°C	[47]
4	34°C	[55]
5	23–27°C	amorph. [75]

Transition Temperature General: T_m of crystalline polymer increases with pressure up to a max. pressure of 3 k bar [3]

Deflection Temperature:

No.	Value	Note
1	80–90°C	0.46 MPa, ASTM D686 [67]
2	48–50°C	1.82 Mpa, ASTM D686 [67]
3	58°C	ASTM D648 [52]

Vicat Softening Point:

No.	Value	Note
1	173–180°C	ASTM D1525 [67]

Transition Temperature:

No.	Value	Note
1	172°C	fusion temp. [55]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 30.98–33.5 $J^{1/2}cm^{-3/2}$ (7.4–8 $cal^{1/2}$ $cm^{-3/2}$) [51]
Solvents/Non-solvents: Sol. isopropylcyclohexane (154°), *tert*-butylcyclohexane (154°), cyclohexylbenzene (212°), butyl stearate (220°), *n*-octyl acetate (210°), decalin (190°), dodecane (197°), mineral oil (248°) [51]. Insol. Me_2CO, MeOH, EtOH, 2-propanol [51]
Surface and Interfacial Properties General: Critical surface tension has been reported. [31]
Wettability/Surface Energy and Interfacial Tension: Wettability data have been reported. [68] Contact angle 95° (glycerol/polymer melt-vapour interface), 96° (glycerol/gold-polymer melt interface) [74]

Transport Properties:

Polymer Solutions Dilute: η 6.5 dl g^{-1} (65°, cyclohexane) [28], 2.8 dl g^{-1} (135°, decalin) [28], 2.5 dl g^{-1} (135°, decalin) [52]. Viscosity determined from flow curves has been reported [37]. η 5.5 dl g^{-1} (150°, decalin) [46]. Viscosity is dependent upon method of synth. [46]
Permeability of Gases: The diffusion coefficient of CO_2 increases with increasing pressure (2–6.3 MPa) whereas those of N_2 and CH_4 do not change with increasing pressure below Tg [18]. The diffusion coefficients of H_2, He, N_2 and Ar have been determined graphically. [24] Gas flux [O_2] 0.61 × 10^{-6} cm^3 cm^{-2} s^{-1} $(cm\ Hg)^{-1}$ [62]
Permeability of Liquids: Permeability coefficients of C_1–C_4 alkanes have been reported [29].
Water Absorption:

No.	Value	Note
1	0.01 %	saturation, ASTM D570 [67]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	32.3 cm^3 mm/(m^2 day atm)	
2	CO_2	92.6 cm^3 mm/(m^2 day atm)	
3	N_2	8.4 cm^3 mm/(m^2 day atm)	
4	H_2	136 cm^3 mm/(m^2 day atm)	
5	He	101 cm^3 mm/(m^2 day atm)	
6	CH_4	10.79 cm^3 mm/(m^2 day atm)	[57]

Mechanical Properties:

Mechanical Properties General: Variation of mechanical loss modulus with temp. has been reported. [48]. Other mechanical props. have been reported [70,71].

Tensile (Young's) Modulus:

No.	Value	Note
1	2230 MPa	[54]
2	800–1200 MPa	[57]
3	1590 MPa	[58]

Tensile Strength Break:

No.	Value	Note	Elongation
1	31 MPa	4500 psi, ASTM D638 [52]	5%
2	17–20 MPa	[57]	10–25%

Flexural Strength at Break:

No.	Value	Note
1	1172 MPa	170 kpsi, ASTM D747 [52]

Compressive Modulus:

No.	Value	Note
1	800–1200 MPa	ASTM D695 [67]

Elastic Modulus:

No.	Value	Note
1	343.2 MPa	3500 kg cm^{-2} [30]
2	2900 MPa	isotactic, room temp. [40]
3	2620 MPa	isotactic, room temp., chain axial direction [40]

Poisson's Ratio:

No.	Value	Note
1	0.33	isotactic [40]
2	0.43	[58]

Tensile Strength Yield:

No.	Value	Note
1	9.81 MPa	100 kg cm^{-2} [30]
2	23–28 MPa	[57]

Miscellaneous Moduli:

No.	Value	Note
1	1544 MPa	224 kpsi secant modulus [52]
2	1654 MPa	240 kpsi tangent modulus ASTM D638 [52]
3	4030 MPa	

Viscoelastic Behaviour: Thermoacoustic parameters have been reported [5,19]. The acoustic impedance at 2MHz and room temp. is similar to that of human skin [7] thereby making it suitable for medical applications.
Hardness: Rockwell R80 (ASTM D785) [52], Shore D80 (ASTM D1706) [52]

Friction Abrasion and Resistance: Wear data have been reported [69]
Izod Notch:

No.	Value	Notch	Note
1	26.68 J/m	Y	0.5 ft lb in $^{-1}$, ASTM D256
2	100–200 J/m	Y	[57]

Electrical Properties:

Electrical Properties General: A continuous spectrum of complex dielectric permittivity and loss tangent has been reported. [11] Dielectric props. have been reported [23]. Power factor is unaffected by ageing at 150° for 1500h or at 200° for 21h [32]. Loss tangent increases with increasing frequency and decreasing temp. [42]. Other electrical props. have been reported [72]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.1		approx. [32]
2	2.1	30–100 Hz, 25° [57]	

Dielectric Strength:

No.	Value	Note
1	63–65 kV.mm^{-1}	ASTM D149 [67]

Magnetic Properties: Magnetic susceptibility and anisotropy have been reported [20]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	8×10^{-5}	100–1000 kHz	min., [32]
2	<0.00045	10000 MHz	max., [32]
3	<0.266		max. [46]

Optical Properties:

Optical Properties General: Study of complex refractive index has been reported. [9,10,11]. A study of far-ir refractive index has been reported [12]. The temp. variation of optical constants of TPX has been reported [13]
Refractive Index:

No.	Value	Note
1	1.46	17° [57]

Transmission and Spectra: C-13 nmr [4,8,27], FT-IR [6], ir [22,34,39,76], Raman [36], esr [41] and H-1 nmr [77] spectral data have been reported. Useful transmittance in the medium and long-wave ir regions [26]
Volume Properties/Surface Properties: Clarity Highly transparent due to limited spherulite growth [52]. Haze 1.2–1.5% [67]

Polymer Stability:

Thermal Stability General: Degrades above 280°
Decomposition Details: Thermal degradation proceeds via intra-molecular hydrogen transfer. Pyrolysis at 700° gives short-chain (C_1-C_4) hydrocarbons, butadiene and isopentane as the main products [14,21]. Oxidative thermal degradation at 130–170° gives Me_2CO and H_2O plus short-chain hydrocarbons [35]. Activation energy of degradation 96.29 kJ mol^{-1} [35]. Pyrolysis at 380–400° yields 1-alkene oligomers formed by free-radical processes, backbiting and β-scission [56]
Flammability: Self-ignition temp. has been reported [38]
Environmental Stress: Degrades readily in the presence of oxygen and light [67]. Other weathering data have been reported [73]
Chemical Stability: Has high stability to inorganic substances, acids and alkalis. Attacked by conc. solns. of chromic acid, chlorine, bromine and fuming nitric acid [67]
Biological Stability: Biodegradation study has been reported [1]
Stability Miscellaneous: Electron beam irradiation significantly decreases elongation at break, T_m and heat of fusion [50]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation performed in liq. monomer at 50–70° using Ziegler-Natta catalysts. Reaction product is a granular powder which is stabilised and extruded into pellet form. Isotactic, head-to-tail polymer is synth. using Ziegler-Natta catalysts containing chromium, zirconium, vanadium or titanium. [57] Also synth. by cationic polymerisation [60] at low temps. (-130–20°) using aluminium halide initiators [57]. Syn-diotactic polymer can by synth. using a complex zirconium dichloride or methylaluminoxane catalyst at 30° [66]
Mould Shrinkage (%):

No.	Value
1	1.2–3.4%

Applications: Medical equipment: syringes, transfusion equipment, pacemaker parts and respiration equipment. Laboratory equipment: spectroscopic cells, laboratory ware, animal cages. Food contact products: microwave oven trays (major use), food packaging. Electrical and electronic applications including release film for printed circuit boards, cables and connectors. Automotive applications, and in wire and cable coating. Uses due to microwave transparency (microwave oven cookware, food packing, service trays). Potential use in contact lenses

Poly(4-methyl-1-pentene), Extrusion, Unfilled

P-394

Related Polymers: Poly(4-methyl-1-pentene)
Monomers: 4-Methyl-1-pentene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
24979-98-4
25068-26-2

Molecular Formula: $(C_6H_{12})_n$
Fragments: C_6H_{12}
General Information: FDA compliant

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.84 g/cm^3	ISO 1183 [1]

Vicat Softening Point:

No.	Value	Note
1	130°C	Mandrel SX, ASTM D1525
2	145°C	Mandrel HX, Mandrel HXO, ASTM D1525
3	160°C	Mandrel HXP, ASTM D1525 [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Extrusion and thermoforming
Applications: Release film for printed circuit boards. Food packaging: microwave trays and covers, food containers, paper coatings. Separators in manuf. of laminates. Automotive component housings. FDA compliance

Trade name	Details	Supplier
Crystalor		Phillips 66

Mandrel	SX, HX grades	Mitsui Sekka
TPX		Mitsui Petrochemicals

Poly(4-methyl-1-pentene) films P-395

Related Polymers: Poly(4-methyl-1-pentene)
Monomers: 4-Methyl-1-pentene
Material class: Thermoplastic, Fibres and Films
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
24979-98-4
25068-26-2

Molecular Formula: $(C_6H_{12})_n$
Fragments: C_6H_{12}
Morphology: Form I isotactic tetragonal a 18.70Å, c 13.68Å 7_2 helix [5]
Miscellaneous: Studies on struct. of isotactic film have been reported [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 0.83 g/cm^3	isotactic [5]
2	d 0.835 g/cm^3	Mandrel X-22, X-88, ISO 1183 [8]
3	d 0.834 g/cm^3	Mandrel X-44, ISO 1183 [8]

Thermal Expansion Coefficient:

No.	Value	Type
1	0.00017 K^{-1}	L

Thermal Conductivity:

No.	Value	Note
1	0.04 W/mK	0.0004 cal (cm s °C)$^{-1}$

Specific Heat Capacity:

No.	Value	Note	Type
1	1.96 kJ/kg.C	0.47 cal (g °C)$^{-1}$	P

Melting Temperature:

No.	Value	Note
1	243°C	isotactic [5]

Vicat Softening Point:

No.	Value	Note
1	145°C	Mandrel X-22, ASTM D1525
2	160°C	Mandrel X-44, ASTM D1525
3	185°C	Mandrel X-88 [8]

Transport Properties:

Permeability of Gases: Permeation and diffusion coefficients of He, Ne, Ar, CH_4, propane, isobutane and neopentane in isotactic films increase with increasing temp. (30–80°) but are independent of film thickness and gas pressure [3]. Permeability constants *in vacuo*; sample thickness 0.01076 cm [4] [N_2] 7.83 × 10^{-10} cm^3 cm cm^{-2} s^{-1} (cm Hg)$^{-1}$, [O_2] 32.3 × 10^{-10}, [CO_2] 92.6 × 10^{-10}, [He] 101 × 10^{-10} [H_2] 136 × 10^{10}. Diffusion constants *in vacuo*, sample thickness 10760 cm^3 [4] [N_2] 5.5 × 10^7 cm^2 s^{-1} [O_2] 10.1 × 10^7 cm^2 s^{-1}. Electron-beam irradiation (1–80 M rad in N_2) has little effect on the permeability coefficient [6]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	360 MPa	18° isotactic [5]	30%
2	37 MPa	150° isotactic [5]	67%

Elastic Modulus:

No.	Value	Note
1	687 MPa	23°, 0.05 mm, TPX-22
2	1079 MPa	23°, 0.05 mm, TPX X-44
3	1472 MPa	23°, 0.05 mm, TPX X-88

Tensile Strength Yield:

No.	Value	Note
1	16.7 MPa	23°, 0.05 mm, TPX-22
2	23.1 MPa	23°, 0.05 mm, TPX X-44
3	28.5 MPa	23°, 0.05 mm, TPX X-88

Mechanical Properties Miscellaneous: Stress-strain behaviour of ultra-drawn isotactic films has been reported [7]
Failure Properties General: Tear resistance 3500 g mm^{-1} (25°, 0.05 mm, TPX X-22); 1000 g mm^{-1} (23°, 0.05 mm, TPX X-44); 500 g mm^{-1} (23°, 0.05 mm, TPX X-88)

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Type
1	10 × 10^{15} Ω.cm	S

Dielectric Permittivity (Constant):

No.	Value
1	2.12

Dielectric Strength:

No.	Value
1	63–65 kV.mm^{-1}

Optical Properties:

Transmission and Spectra: 92–94% transmission
Volume Properties/Surface Properties: Haze 1.5% (23°, TPX X-22); 20% (23° TPX X-88)

Polymer Stability:
Decomposition Details: Oxidative thermal stability and oxidation induction time both increase with increasing degree of orientation of the film [2]

Applications/Commercial Products:

Trade name	Details	Supplier
Mandrel	X-22, X44, X-88	Mitsui Sekka
Opulent		Mitsui Petrochemicals

2	48.04 J/m	Y	0.9 ft lb in^{-1}, room temp. 20% filled [1]
3	50.1 J/m	Y	0.94 ft lb in^{-1}, room temp. 30% filled [1]
4	53.4 J/m	Y	1 ft lb in^{-1}, room temp, 40% filled [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Melt temp. can range from 274° to 316° - optimum 293–313°. Mould temp. is 66°. Low pressures are desirable for optimum props. 2.4–3.4 MPa (350–500 psi). Hold pressure 25–50% less than injection pressure. Back pressure 0–0.7 MPa (0–100 psi). Screw speed 50–100 rpm
Mould Shrinkage (%):

No.	Value	Note
1	0.1–1%	
2	1%	10% filled [1]
3	0.5%	20% filled [1]
4	0.2%	30% and 40% filled [1]

Applications: Automotive and electrical applications. Flame retardant version available at 30% fibre

Poly(4-methyl-1-pentene), Moulded P-399

Related Polymers: Poly(4-methyl-1-pentene)
Monomers: 4-Methyl-1-pentene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
113834-30-3
24979-98-4
25068-26-2

Molecular Formula: $(C_6H_{12})_n$
Fragments: C_6H_{12}
Additives: May be 'white filled' (opaque). Easily coloured
General Information: Includes blow moulded and injection moulded materials

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.833 g/cm^3	RT18, RT18XB, DX820, ASTM D792 [3]
2	d 0.835 g/cm^3	MX002, ASTM D792 [3]
3	d 0.834 g/cm^3	MX004, ASTM D792 [3]
4	d 1.08 g/cm^3	MBZ230; ASTM D792

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.000117 K^{-1}	ASTM D696 [3]	L

Melting Temperature:

No.	Value	Note
1	236°C	injection moulded [2]

Glass Transition Temperature:

No.	Value	Note
1	40–44°C	injection moulded [2]

Deflection Temperature:

No.	Value	Note
1	90°C	0.45 MPa, RT18, RT18XB; ASTM D648 [3]
2	80°C	0.45 MPa, MX002; ASTM D648 [3]
3	85°C	0.45 MPa, MX004; ASTM D648 [3]
4	110°C	0.45 MPa, MBZ230; ASTM D648 [3]

Vicat Softening Point:

No.	Value	Note
1	173°C	9.8N, RT18, RT18XB, DX820; ASTM D1525 [3]
2	145°C	9.8N, MX002; ASTM D1525 [3]
3	160°C	9.8N, MX004; ASTM D1525 [3]
4	175°C	9.8N, MBZ230; ASTM D1525 [3]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	26 g/10 min	TPX RT18, TPX RT18XB, TPX MX004; 260°, ASTM D1238 [3]
2	180 g/10 min	TPX DX820; 260°, ASTM D1238 [3]
3	22 g/10 min	TPX MX002, ASTM D1238 [3]
4	30 g/10 min	TPX MBZ230, ASTM D1238 [3]

Water Absorption:

No.	Value	Note
1	0.01 %	24h, ASTM D570 [3]
2	0.11 %	24h, TPX MBZ230; ASTM D570 [3]

Mechanical Properties:

Tensile Strength Yield:

No.	Value	Elongation	Note
1	2.35 MPa	25%	TPX RT18, RT18XB; ASTM D638 [3]
2	2.3 MPa	20%	TPX DX820; ASTM D638 [3]
3	1.5 MPa	120%	TPX MX002; ASTM D638 [3]
4	2 MPa	85%	TPX MX004; ASTM D638 [3]
5	2.4 MPa	25%	TPX MBZ230; ASTM D638 [3]

Fracture Mechanical Properties: Fatigue fracture behaviour of an injection-moulded sampling is not very sensitive to post-moulding conditioning. Room temp. ageing has little effect on stress-relaxation behaviour [1]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.12	100Hz, ASTM D150	[3]

Dielectric Strength:

No.	Value	Note
1	65 $kV.mm^{-1}$	ASTM D149 [3]
2	63 $kV.mm^{-1}$	TPX MX002; ASTM D149 [3]

Optical Properties:

Volume Properties/Surface Properties: Transparency 91–92% [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Blow moulding, preferred temp. at lip part of the core 280–300°. Injection moulding at 260–330°

Mould Shrinkage (%):

No.	Value	Note
1	1.2–3.4%	
2	1.7–2.1%	TPX RT18 [3]
3	1.7–1.9%	TPX MX004 [3]
4	1.4–1.7%	TPX MBZ230 [3]

Applications: Bottles for medical use. Cultivating vessels. Laboratory ware

Poly(methylphenylsilane) P-401

Synonyms: *Poly(phenylmethylsilane). Poly(methylphenylsilylene)*
Related Polymers: Dichloropoly(methylphenylsilane], Polysilanes
Monomers: Dichloromethylphenylsilane
Material class: Thermoplastic
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
76188-55-1

Molecular Formula: $(C_7H_8Si)_n$
Fragments: C_7H_8Si
Molecular Weight: MW 20000–1000000

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	220°C	[5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, THF. Mod. sol. ethers, aliphatic hydrocarbons. Slightly sol. acetonitrile. Insol. alcohols, H_2O [1,2,3,8]

Electrical Properties:

Electrical Properties General: Volume resistivity for polymer doped with AsF_5 1–10 Ω cm[5]
Complex Permittivity and Electroactive Polymers: Holemobility 2×10^{-4} cm^2 V^{-1} s^{-1} (2×10^5 V cm^{-1}, room temp.) [7,10]

Optical Properties:

Transmission and Spectra: Strong absorption 338–341 nm. Fluorescence 360 nm [4,6,9]

Polymer Stability:

Upper Use Temperature:

No.	Value
1	220°C

Environmental Stress: Decomposed by uv below 350 nm. Cross-linked by uv of 350 nm or above [6,9], radical cations are generated
Chemical Stability: Inert to air and atmospheric moisture. Gases break down SiSi bond with evolution of hydrogen. Oxidised by strong oxidising agents [3]
Hydrolytic Stability: Stable to H_2O and acid solns. Basic solns. decompose SiSi bonds; hydrogen is evolved [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepd. by Wurtz coupling of [1,2,8] dichloromethylphenylsilane in organic solvents at around 110°. The reaction is quenched by addition of water. Other synth. has been reported [11]
Applications: Potentially useful electronic (light-emitting diodes) and non-linear optical props. Can be used in microlithography due to uv sensitivity

Polymethylphenylsiloxane fluid P-402

Synonyms: *Poly((dimethyl)(methylphenyl)siloxane) fluid*
Related Polymers: PDMS fluid, Polyphenylsiloxane fluid
Monomers: Dichlorodimethylsilane, Dichloromethylphenylsilane, Hexamethylcyclotrisiloxane, Cyclic methylphenylsiloxane
Material class: Fluids, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
156048-35-0

Molecular Formula: $[(C_7H_8OSi).(C_2H_6OSi)]_n$
Fragments: C_7H_8OSi C_2H_6OSi
Identification: Silicone fluids containing phenyl groups have higher values of density than dimethylsiloxane

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.05 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0009 K^{-1}	[7]	V

Thermal Conductivity:

No.	Value	Note
1	0.15 W/mK	0.087 Btu ft^{-1} h^{-1} °F^{-1} [3,11]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.4 kJ/kg.C	0.34 Btu lb^{-1} °F^{-1} [3]	P

Transition Temperature General: Low levels of phenyl substitution lower the pour point [1,10]
Transition Temperature:

No.	Value	Note
1	-73°C	Pour point (-100°F) [3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16 J$^{1/2}$ cm$^{-3/2}$ (7.8–7.9 cal$^{1/2}$ cm$^{-3/2}$) [5,9]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, ethers, esters, ketones. Insol. alcohols, H_2O [1,4,5]. (Low MW methylphenyl silicones are sol. alcohols)
Wettability/Surface Energy and Interfacial Tension: γ_c 21 mJ m^{-2} (21 dyne cm^{-1}) [3,7]. γ_c Increases with increase in phenyl substitution

Transport Properties:

Polymer Melts: Viscosity 0.7 St. Viscosity temp. coefficient 0.65 see [poly phenyl siloxane fluid] [3,4,12,13]

Mechanical Properties:

Miscellaneous Moduli:

No.	Value	Note
1	1650 MPa	16700 kg cm^{-2} [4]

Mechanical Properties Miscellaneous: Compressibility decreases with increasing phenyl substitution [4]

Electrical Properties:

Electrical Properties General: Has excellent insulating props.
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9	[3,6,14]

Dielectric Strength:

No.	Value	Note
1	29 kV.mm^{-1}	[3]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0013	[3]

Optical Properties:

Optical Properties General: Refractive index higher than that of dimethyl silicone [8]
Refractive Index:

No.	Value	Note
1	1.428	[3]

Transmission and Spectra: Transparent above 280 nm [5]

Polymer Stability:

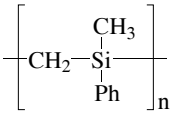
Polymer Stability General: Stable over wide temp. range
Thermal Stability General: Usable between -75–205° in the presence of air. In the absence of air usable up to 300°

Upper Use Temperature:

No.	Value
1	225°C
2	205°C

Decomposition Details: Oxidised above 225° [2]
Flammability: Fl. p. 220° (430°F) [3]
Environmental Stress: Stable to H_2O, air, oxygen and other materials. Not as resistant to radiation as [polyphenylsiloxane fluid] [1]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. Very thin films are liable to degradation [1,5,6]
Hydrolytic Stability: Stable to H_2O and aq. solns. Very thin films spread on water; liable to hydrolytic degradation [1,5,6]
Biological Stability: Non-biodegradable [5,6]
Recyclability: Can be reused; no large scale recycling

Applications/Commercial Products:



Processing & Manufacturing Routes: For low viscosity fluids dichlorodimethylsilane and dichloromethylphenylsilane are hydrolysed and equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane. For high viscosity fluids dimethyl- and methylphenyl-cyclic polysiloxanes are polymerised together under alkaline catalysis with traces of chain terminator at 150 °
Applications: Used as a hydraulic fluid and for lubrication between -75° and 205°. Possess good electrical props.

Molecular Formula: $(C_8H_{10}Si)n$
Fragments: $C_8H_{10}Si$
Molecular Weight: MW 82,500 [2], 200,000 [1]. There is a molecular weight dependence on the preparative method employed [9]. The molecular weight decrease caused by main chain scission and insolubilisation, which is attributable to cross-linking, were observed when the reaction proceeded heterogeneously [9]. The highest MW polymer was synthesised when a pure trans isomer was used as monomer [12].
General Information: Slightly yellow solid. Suitable starting polymer for the preparation of numerous functional substituted poly(silylenemethylenes).
Tacticity: Atactic [2]. Rh- and Pt-catalysed polymerisation products show slightly different tacticities [12].
Morphology: Elastic thermalisation lifetime analysis shows a slow relaxation process, leading to an equilibrium structure with small radii of the cavities [5]. Scanning electron microscopy shows the polymer to have a relatively fine-grained surface [8].
Identification: Elemental analysis: %C calc. 71.57 found 70.98; %H calc. 7.51 found 7.24 [2].

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	125–140°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	22–25°C	[2,6,10] Measured for a series of PMPSMs and tacticities by DSC [12].

Surface Properties & Solubility:

Solvents/Non-solvents: Soluble in $CHCl_3$ and THF. Insoluble in alcohols and aliphatic hydrocarbons [2].

Transport Properties:

Volatile Loss and Diffusion of Polymers: 10% wt. loss temp. 476°C [1,12]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	100–850 MPa	[12]

Tensile Strength Break:

No.	Value	Note	Elongation
1	4–16 MPa	[12]	Show great elongation above 200%: 200%–850%

Optical Properties:

Transmission and Spectra: pmr ($CDCl_3$) = 0.35 ($SiCH_2$), 0.56 ($SiCH_3$), 6.9–7.8 (Ph) [2,12].
cmr ($CDCl_3$) = 1.2 ($SiCH_3$), 5.5 ($SiCH_2$), 127.0–140.5 (Ph) [2,12].
Si-29 ($CDCl_3$) = -4.7 [2].
A theoretical model (ETLA) is tested by means of amorphous poly(methylphenylsilenmethylene). Estimated values of the localisation time constants are 137ps [7].

IR: Characteristic absorption at 1055 cm^{-1} for the Si-C-Si backbone, Si-H at 2115cm^{-1} [10,12].

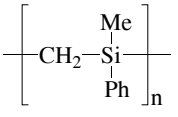
Polymer Stability:

Polymer Stability General: Exhibits very good thermal stability in the absence of oxidising agents [9,12,13,]. Weight percentage of material obtained after heating the polymer to 800°C are tabulated [12]

Thermal Stability General: Weight remains unchanged below about 300°C. Weight loss occurs at 467°C in air, and around 600°C in nitrogen. Showed a two step weight loss in the temperature range 400°C and 700°C in an air atmosphere [10,12]. Other studies claim stable up to 500°C in inert atmosphere; easily oxidised in air above 220°C [15,16]

Decomposition Details: The residue after heating to 800°C was an off-white solid forming a silica-like material. The major products of this pyrolysis were benzene, toluene, xylene and biphenyl [10,12]. A spectroscopic analysis of the pyrolysed products are tabulated [12]

Applications/Commercial Products:



Processing & Manufacturing Routes: Radical polymerisation of 1,3-disilacyclobutanes having one or more aryl groups in the presence of radical generators and 1,3-disilacyclobutanes having no radially reactive groups, then ring-opening and cross-linking of them under heating [1,12]. Bulk polymerisation by Rh, with or without catalysed catalyst polymerisation [4,12]. Pt catalysed [13,15,16,17]

Applications: Thermolysis >800°C produces silicon carbide ceramic fibre [1]. Can be used for copolymer with polystyrene. May have value as resistant elastomer at high temp. in the absence of oxygen. A chemical sensor having a transducer element and a layer of composite material including a polymer matrix and a solid particulate filler disposed in the polymer matrix provides chemical sensors exhibiting improved properties [11].

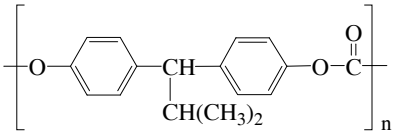
Poly[(methylphenylsilylene)methylene] P-404

Polymer Type: carbosilane polymers
CAS Number:

CAS Reg. No.
98241-68-0

Molecular Formula: $(C_8H_{10}Si)n$
Fragments: $C_8H_{10}Si$
Molecular Weight: 2,000–3,000 [1]
General Information: End capped α-ethyl-ω-bromo-



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by treating Grignard reagents and silanes [1]

Bibliographic References

[1] Jpn. Pat. (Shin-Etsu Chemical Industry), *CA*,124130, 1985, 60 084 330

Poly[1,1-(2-methylpropane) bis(4-phenyl) carbonate] P-405

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(2-methylpropylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-1,1-isobutane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxydiphenyl-1,1-isobutane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
32242-75-4

Molecular Formula: $(C_{17}H_{16}O_3)_n$
Fragments: $C_{17}H_{16}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18 g/cm^3	25° [2]

Melting Temperature:

No.	Value	Note
1	170–180°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	149°C	[2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. CH_2Cl_2, *m*-cresol, EtOAc, cyclohexanone, THF, pyridine, DMF; swollen by C_6H_6, Me_2CO [1]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	76 MPa	775 kg cm^{-2} [2]	147%

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until approaching T_g

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.4	1 kHz	25–100° [2]

Dissipation (Power) Factor:

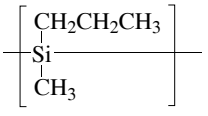
No.	Value	Frequency	Note
1	0.00052	1 kHz	25–100° [2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5702	25° [2]

Transmission and Spectra: Ir spectral data have been reported [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used phosgenation approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [1]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20-30°, in an inert solvent (e.g. CH_2Cl_2). Catalysts are used to achieve high MWs [12]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150-300°) in the absence of O_2 with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,2]

Poly(methylpropylsilane) P-406

Synonyms: *Poly(methylpropylsilylene). Dichloromethylpropylsilane homopolymer*
Monomers: Dichloromethylpropylsilane
Material class: Thermoplastic
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.	Note
88003-13-8	poly(methylpropylsilylene)
88002-81-7	dichloromethylpropylsilane homopolymer

Molecular Formula: $(C_4H_{10}Si)n$
Fragments: $C_4H_{10}Si$
General Information: Conductive polymer which exhibits photoluminescence and thermochromism. Prod. as white solid.
Morphology: At r.t. adopts hexagonal columnar unit cell, with a=11.50, b=9.36, c=3.87Å [1]. Exist in an all-trans planar conformation of the backbone [1,2,3], which changes to a less ordered or isotropic state above 40°C [2,3]. The chains pack with little interpenetration, and the crystals may be considered as bundles of long, closely packed prisms. The restricted interlocking of neighboring chains results, in turn, in a poor register of the chains along the c-axis. Transmission electron microscopy reveals that the crystallised polymer adopts a lamellar microstructure, with parallel lamellae tending to form tight bundles. Crystallises with a nucleation-controlled type of kinetics [1,2]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	48.4–51.8°C	[2,4]

Glass-Transition Temperature:

No.	Value	Note
1	-35°C	[7]

Transition Temperature General: Small endothermic transition at 38–39°C and larger melting transition at 45–50°C [2,7].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. C_6H_6, toluene, THF, chloroform, alkanes [5,7].

Electrical Properties:

Electrical Properties General: Photoconductive behaviour indicates hole transport predominates. Band gap 3.6eV [6]

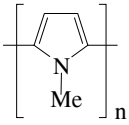
Optical Properties:

Optical Properties General: Thermochromism exhibited with blue shift on increasing the temperature of films, λ_{max} at 325nm (20°C) changes to 304nm (55°C) [3]. Photoluminescence spectrum with λ_{max} at *ca*. 350nm is quenched by electron acceptors such as C_{60} fullerene [8]. Birefringence is evident at 25°C, while at temperatures above 40°C polymer films are isotropic [7].
Transmission and Spectra: pmr [5,7,9,10,11], cmr [5,7,9,10], Si-29 nmr [9,10], ir [11], uv [3,18], Raman [19], photoluminescence [8] and x-ray diffraction [1,7,12,13] spectral data have been reported.

Polymer Stability:

Polymer Stability General: Prolonged exposure to UV light results in photoscission of σ-bonds, which can be reduced with the addition of electron acceptors such as fullerenes [8].
Thermal Stability General: Thermal degradation at 400°C has been studied by pyrolysis mass spectrometry [14].
Decomposition Details: Onset of thermal decomposition at 260°C, complete decomposition at 540°C [15].

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by Wurtz dehalogenation coupling of dichloromethylpropylsilane with sodium in toluene [5,7,10]. The addition of a crown ether [16] or ethyl acetate [17] or the use of THF as solvent [11] to increase the rate of polymerisation has been reported.

Poly[(methylsilylene)(methylene)] P-408

Synonyms: *Poly(1-methyl-1-silylenemethylene). Polycarbomethylsilane. Polysilapropylene. PMSM. OMSM. Oligo[(methylsilylene)(methylene)]*
Related Polymers: Polycarbosilanes
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
62306-27-8

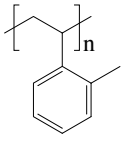
Molecular Formula: $(C_2H_6Si)n$
Fragments: C_2H_6Si
Molecular Weight: For OMSM: M_n 442; M_w/M_n 1.4 (60%); M_n 28,900, M_w/M_n 2.4 (40%) [3]
General Information: Refers to a series of oligo[(methylsilylene)(methylenes)] (OMSM) and poly[(methylsilylene)(methylenes)] (PMSM). An important feature of this polymer is the presence of a large proportion of dihydridosilicon groups [3]
Tacticity: From the methylene pmr spectrum, syndiotactic and isotactic sequences are both involved in PMSM [2,4]
Morphology: Yellow oil [2]
Identification: For -(SiH(CH_3)CH_2)n: Calc: C, 41.34; H, 10.33; Cl, 0; Si, 48.33
For -$(CH_3)_2$HSiCH_2-SiH(CH_3)-$(CH_2)_{23}$-SiH$(CH_3)_2$: Calc: C 41.67; H 10.56; Cl, 0; Found C, 41.6; H, 10.35, Cl, 0.14; Si not given

Surface Properties & Solubility:
Solubility Properties General: Insol. pentane [2]

Optical Properties:
Transmission and Spectra: Ir [2,3], Si-29 nmr and C-13 mas nmr [1,2,3] and gc-ms [2] spectra reported

Polymer Stability:
Decomposition Details: Heating PMSM at 350–450°C (476°C see [4]) in a carefully purged atmosphere (dry argon) gave products identified by gc-ms as: H_2, CH_4, C_2H_6, $MeSiH_3$, Me_2SiH_2, Me_3SiH and Me_4Si. Small amounts of CH_2=CH_2 and SiH_4 also were detected [2,3]
Pyrolysis of PMSM at 1000°C under an argon flow resulted only in poor ceramic yield (5%). This was due to the linear structure of the polymer. The cleavage of Si-CH_2 bonds gave volatile products, which were eliminated since a condenser could not trap them, thermolysis being at atmospheric pressure in an open vessel [2]
Polytitanocarbosilane containing an excess amount of titanium alkoxide was synthesised by the mild reaction of PMSM with titanium(*IV*) tetra-*n*-butoxide at 220°C under nitrogen atmosphere. The obtained precursor polymer was melt-spun at 150°C continuously using melt-spinning equipment with a winding drum. The spun fibre, which contained excess amount of nonreacted titanium alkoxide, was pre-heated to 100°C and subsequently fired up to 1200°C heat-treated in air to obtain continuous lucid fibre [5]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synthesised like other polycarbosilanes by ring-opening polymerisation of disilacyclobutanes using a Pt catalyst (66% yield) [4]. Can also be produced from polydimethylsilane by Kumada rearrangement at 470°C [4]. OMSM was prepared by a Grignard coupling reaction followed by reduction [4]. The chlorinated polycarbosilane was readily converted into the corresponding hydrido or deuterio polymer after refluxing the reaction mixture for 24h in an inert atmosphere (96.5% yield) [2]. Visible light-absorbing platinum(*II*) bis(β-diketonate) complexes for photocatalytic hydrosilylation



cross-linking of OMSM with tetravinylsilane also used [3]
Applications: Coated silicon wafers [4]. Pyrolysis to produce semiconductor-grade SiC layers [3,4]. Strong photocatalytic fibre (TiO_2-covered SiO_2 fibre) [5]. Coliform-sterilisation ability of TiO_2-covered SiO_2 fibre [5]. Powder metallurgical compositions containing organometallic lubricants [6]. Antireflective hard mask compositions [7].

Poly(α-methylstyrene) P-411

Synonyms: *Pα-MS. Poly[(1-methylethenyl)benzene]. Poly(1-methyl-1-phenyl-1,2-ethanediyl)*
Monomers: α-Methylstyrene
Material class: Thermoplastic
Polymer Type: styrenes
CAS Number:

CAS Reg. No.	Note
25014-31-7	
30939-97-0	isotactic
25086-17-3	syndiotactic

Molecular Formula: $(C_9H_{10})_n$
Fragments: C_9H_{10}
General Information: The high MW polymer is a hard clear material. Low MW material is liq.

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.04 g/cm^3	[1]
2	d 1.065 g/cm^3	[2]

Equation of State: Equation of state information has been reported [8]
Thermodynamic Properties General: Δα 0.000398 K^{-1}. ΔC_p 37.58 J K^{-1} mol^{-1} (0.076 cal g^{-1} K^{-1}) [16]
Latent Heat Crystallization: ΔH_f 73.3 kJ mol^{-1} (17.5 kcal mol^{-1}) [3]. $-\Delta H_c$ 5010.9 kJ mol^{-1} (1195.91 kcal mol^{-1}) [3]. $-\Delta H_c$ 4991.4 kJ mol^{-1} (42.3 kJ g^{-1}) [4]. S 134.7 J K^{-1} mol^{-1} (27°) [5]. ΔC_p 26.3 J K^{-1} mol^{-1} [6]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.492 kJ/kg.C	27° [5]	P
2	1.555 kJ/kg.C	37° [7]	P
3	2.757 kJ/kg.C	217° [7]	P

Glass-Transition Temperature:

No.	Value	Note
1	165°C	[2]
2	168°C	[6]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: δ 8.6 [14]. δ_p 38.55–38.97 $J^{1/2}$ $cm^{-3/2}$ (9.20–9.3 $cal^{1/2}$ $cm^{-3/2}$) [9]

Transport Properties:
Polymer Solutions Dilute: Theta temps. 36.5–37.5° (cyclohexane) [11], 31.5–33.5° (cyclohexane) [14], 92.0–96.0° (methylcyclohexane) [14]
Permeability of Gases: [He] 14.5 × 10^{-10}; [CH_4] 0.14 × 10^{-10} cm^2 $(s\ cmHg)^{-1}$ [2]
Permeability of Liquids: Liq. permeability values have been reported [10]

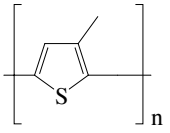
Mechanical Properties:
Elastic Modulus:

No.	Value	Note
1	0.32 MPa	200° [1]

Optical Properties:
Transmission and Spectra: Raman spectral data have been reported [12]

Polymer Stability:
Flammability: Limiting oxygen index 18% [15]
Environmental Stress: Exposure to uv radiation *in vacuo* causes random chain scission, with subsequent depolymerisation of the radicals formed to yield small amounts of the monomer [13]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by low temp. free radical polymerisation (below 0°, due to exceptionally low ceiling temp.)
Applications: Plasticiser in paints, waxes and adhesives. Plasticisers are generally of low MW and are liq.



Trade name	Supplier
Resin 18	Dow

Poly(3-methylthiophene) P-412

Related Polymers: Poly(thiophene)
Monomers: 3-Methylthiophene
Polymer Type: polythiophene
CAS Number:

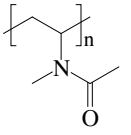
CAS Reg. No.
84928-92-7

Molecular Formula: $(C_5H_4S)_n$
Fragments: C_5H_4S

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	145°C	[1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. THF, nitropropane, toluene, xylene, $CHCl_3$, anisole, nitrobenzene, benzonitrile [1]



Electrical Properties:
Electrical Properties General: Electrical conductivity depends on method of synth. [2,6,7,8,9,14]. Doping increases electrical conductivity [10]
Complex Permittivity and Electroactive Polymers: Conductivity values have been reported. σ 100–120 Ω^{-1} cm^{-1} [2], 750 Ω^{-1} cm^{-1} [11]

Optical Properties:
Transmission and Spectra: Ir [3,4,5], uv [9,12,13], H-1 nmr [9] and x-ray photoelectron [12] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by chemical or electrochemical oxidn. polymerisation of 3-methylthiophene with various catalysts [14], or oxidn. polymerisation of bithiophenes [15]
Applications: Potential applications in liq. crystal films and diodes

Poly(*N*-methyl-*N*-vinylacetamide) P-413

Synonyms: *Poly(N-ethenyl-N-methylacetamide). PMVAc. Poly(N-vinyl-N-methylacetamide)*
Monomers: *N*-Methyl-*N*-vinylacetamide
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
26616-03-5

Molecular Formula: $(C_5H_9NO)_n$
Fragments: C_5H_9NO
Morphology: Exists predominantly in the *trans*-configuration [6]

Volumetric & Calorimetric Properties:
Vicat Softening Point:

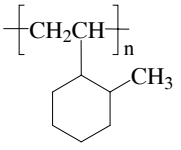
No.	Value	Note
1	202°C	[3]

Surface Properties & Solubility:
Solubility Properties General: Miscible with poly(vinylidene fluoride) provided the wt fraction of PVF is less than 0.7 [11]; with poly(styrene-*co*-acrylonitrile), when the acrylonitrile content is 65% [2]
Surface and Interfacial Properties General: Films have good adhesion to glass and fair adhesion to aluminium [3]
Surface Tension:

No.	Value	Note
1	65.3 mN/m	1% soln. [4]
2	67.1 mN/m	[4]

Transport Properties:
Polymer Solutions Dilute: η 2.08 dl g^{-1} (20°, H_2O), 0.48 dl g^{-1} (20°, Me_2CO) [3], 4.43 dl g^{-1} (30°, H_2O) [8]

Optical Properties:
Transmission and Spectra: Ir spectral data have been reported [9]



Polymer Stability:
Thermal Stability General: Becomes rubbery above 260° and darkens at 290° [3]
Chemical Stability: May be completely hydrolysed by heating with 3*M* hydrochloric acid at 101° for approx. 150h [5]
Biological Stability: The ability of an aq. soln. to transport the pharmaceutical agent Paraoxon through the skin has been reported [8]

Applications/Commercial Products:
Processing & Manufacturing Routes: May be synth. by free-radical polymerisation [7,8] in alkaline soln. under N_2 at 50° for 18h using AIBN initiator [3] or in heptane under N_2 at 95° [4]

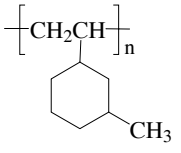
Poly(2-methylvinylcyclohexane) P-414

Synonyms: *Poly(1-ethenyl-2-methylcyclohexane). Poly(1-(2-methylcyclohexyl)-1,2-ethanediyl)*
Monomers: 2-Methyl-1-vinylcyclohexane
Material class: Thermoplastic
Polymer Type: polyolefins
Molecular Formula: $(C_9H_{16})_n$
Fragments: C_9H_{16}



Surface Properties & Solubility:
Solvents/Non-solvents: Slightly sol. boiling tetrahydronaphthalene, boiling decahydronaphthalene. Insol. C_6H_6 [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-Al(^{i}Bu)$_3$ in heptane at 75–85° [1]

Bibliographic References

Poly(3-methylvinylcyclohexane) P-415

Synonyms: *Cyclohexane-1-ethenyl-3-methyl homopolymer. Poly(1-ethenyl-3-methylcyclohexane). Poly(1-(3-methylcyclohexyl)-1,2-ethanediyl)*
Monomers: 3-Methyl-1-vinylcyclohexane
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

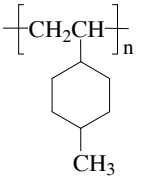
CAS Reg. No.
126895-43-0

Molecular Formula: $(C_9H_{16})_n$
Fragments: C_9H_{16}
General Information: Solid [1]

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	276–355°C	[1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. C_6H_6, tetrahydronaphthalene [1]. Mod. sol. Et_2O [1]. Insol. MeOH [1]



Transport Properties:
Polymer Solutions Dilute: [η] 0.74 dl g^{-1} (C_6H_6, 29.2°) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-Al(^{i}Bu)$_3$ in heptane at 60–85° [1]

Bibliographic References

Poly(4-methylvinylcyclohexane) P-416

Synonyms: *Poly(1-ethenyl-4-methylcyclohexane). Poly(1-(4-methylcyclohexyl)-1,2-ethanediyl)*
Monomers: 4-Methyl-1-vinylcyclohexane
Material class: Thermoplastic
Polymer Type: polyolefins
Molecular Formula: $(C_9H_{16})_n$
Fragments: C_9H_{16}

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	225–250°C	[1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. Et_2O, C_6H_6 [1]. Slightly sol. boiling 1-butanol [1]. Insol. MeOH [1]

Transport Properties:
Polymer Solutions Dilute: [η] 0.45 dl g^{-1} (C_6H_6, 29.2°) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-Al(^{i}Bu)$_3$ in heptane at 75–85° [1]

Bibliographic References

[1] Overberger, C.G. and Mulvaney, J.E., *J. Am. Chem. Soc.,* 1959, **81,** 4697, (synth, melting point, solubility)

Poly(methyl vinyl ketone) P-417

Synonyms: *Poly(acetyl ethylene). Poly(3-buten-2-one). POLY MVK. PMVK*
Monomers: 3-Buten-2-one
Material class: Gums and resins
Polymer Type: polyvinyls

CAS Number:

CAS Reg. No.	Note
78-94-4	3-buten-2-one polymers
25038-87-3	homopolymer
31175-23-2	isotactic
86992-29-2	syndiotactic
50940-42-6	dimer

Molecular Formula: $(C_4H_6O)_n$
Fragments: C_4H_6O
General Information: Isotactic, syndiotactic and atactic forms known [17]
Morphology: Crystal Lattice Constants a 14.56Å, b 14.56Å, c 14.10Å [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.12 g/cm^3	[15]
2	d 1.17 g/cm^3	[2]
3	d 1.216 g/cm^3	[2]

Volumetric Properties General: Molar volume 66.59 cm^3 (25°, calc.) [14]
Melting Temperature:

No.	Value	Note
1	30–40°C	[2]
2	165–170°C	[2]
3	140–160°C	[13]
4	170–195°C	[13]
5	110–125°C	[13]

Glass-Transition Temperature:

No.	Value	Note
1	35°C	[1]

Surface Properties & Solubility:

Solubility Properties General: Solubility parameters have been reported [14]. Molar heat of sorption has been reported [2]
Solvents/Non-solvents: Very sol. $CHCl_3$. Sol. phenylacetylene, thiophenol, nitromethane, 2-methyl-3-butyn-2-ol, pyrrole, trichloroethylene, 1,1,2,2-tetrachloroethane, Me_2CO, EtOH, EtOAc, CH_2Cl_2. Insol. hept-1-yne, *N*-methylacetamide, CCl_4, tetrachloroethane, H_2O, cyclohexane [9,10,13,15]
Wettability/Surface Energy and Interfacial Tension: Dispersive surface energy γ 18–29 mJ m^{-2} (temp. dependent) [1]

Transport Properties:

Polymer Solutions Dilute: Reduced viscosity η_{sp} 0.197 (Me_2CO, 25°), 0.234 (Me_2CO, 25°), 0.242 (Me_2CO, 25°) [13]

Electrical Properties:

Electrical Properties General: Equilibrium dipole moment 0.35 D [11]. Relaxation dipole moment 1.02 D (50 MHz), 1.25 D (1 GHz)
Complex Permittivity and Electroactive Polymers: Complex permittivity calculation for polymer in dioxane soln. has been reported [11]

Dissipation (Power) Factor:

No.	Value	Note
1	0.012–0.03	[16]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5	[15]

Transmission and Spectra: Ir [2,8,13], C-13 nmr [3], H-1 nmr [13] and ion spectral data [4] have been reported

Polymer Stability:

Decomposition Details: Decomposition occurs at 200° (approx.) causing aldol condensations with the elimination of water. The mechanism of decomposition has been reported [8,13]
Environmental Stress: Radiation decomposition leads to free radical dissociation giving CO, CH_4 and acetaldehyde [12]
Chemical Stability: Degraded and coloured by alkali [8,13]. Attacked by acid

Applications/Commercial Products:

Trade name	Supplier
Poly(methyl vinyl ketone)	Aldrich
Poly(methyl vinyl ketone)	Merck

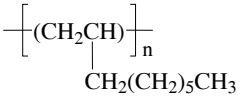
Poly(1-nonadecene) P-418

Synonyms: *Poly(1-heptadecylethylene). Poly(1-heptadecyl-1,2-ethanediyl)*
Monomers: 1-Nonadecene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:



CAS Reg. No.	Note
62132-73-4	atactic

Molecular Formula: $(C_{19}H_{38})_n$
Fragments: $C_{19}H_{38}$

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using $Al(^iBu)_2H$ as catalyst to form a dimer, which is then polymerised using a strong acid catalyst in an inert solvent at 0–50° for up to 5h [1]

Bibliographic References
[1] *U.S. Pat.,* 1976, 3 999 960, (synth)

Poly(1-nonene) P-419

Synonyms: *Poly(1-heptylethylene). Poly(1-heptyl-1,2-ethanediyl)*
Monomers: 1-Nonene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
29254-71-5	atactic
27458-69-1	isotactic

Molecular Formula: $(C_9H_{18})_n$
Fragments: C_9H_{18}
General Information: Gum
Morphology: Monoclinic, a 0.59, b 4.3, c 1.34, β 96° [8]

Volumetric & Calorimetric Properties:
Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00078 K^{-1}	[10]	V

Poly(1-octadecene) P-420

Monomers: 1-Octadecene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25511-67-5	atactic
26746-89-4	isotactic
133578-06-0	syndiotactic

Molecular Formula: $(C_{18}H_{36})_n$
Fragments: $C_{18}H_{36}$
General Information: White fibrous powder [2]
Morphology: Isotactic poly(1-octadecene) has two polymorphic forms. Form I orthorhombic, form II orthorhombic, a 0.75, b 7.04, c 0.67, α 130°36′ [3]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d^{20} 0.92 g/cm^3	[4]
2	d 0.905 g/cm^3	isotactic, form I [3]
3	d 0.91–0.92 g/cm^3	isotactic, form II [3]
4	d^{20} 0.95 g/cm^3	cryst. [5]
5	d^{20} 0.85 g/cm^3	amorph. [5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00076 K^{-1}	$T > T_m$ [6]	V

Melting Temperature:

No.	Value	Note
1	71°C	[9]
2	68–70°C	isotactic [4]
3	71°C	isotactic [7]
4	68°C	[8]
5	58°C	calc [10]

Glass-Transition Temperature:

No.	Value	Note
1	-30°C	[18]
2	41.5°C	atactic [4]
3	39°C	calc. [10]

Transition Temperature:

No.	Value	Note	Type
1	55°C	25 Hz	α
2	-110°C	170 Hz [2]	β
3	43°C	isotactic	first order
4	46°C	isotactic [9]	second order
5	-140°C	[18]	Low temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Mod. sol. hexane [11]

Transport Properties:

Polymer Solutions Dilute: [η] 1.53 dl g^{-1} (tetrahydronaphthalene 135°) [12]. [η] 2.26 dl g^{-1} (toluene, 55°) [7]. η_{spec} 70.4 (toluene, 55°) [7]

Polymer Melts: Dynamic viscosity, dynamic rigidity, apparent viscosity results have been reported at various temps. [12]. Flow activation energy 31.4–35.2 kJ mol^{-1} (7.5–8.4 kcal mol^{-1}) [13]. Zero shear viscosity η_0 2600 (80°) [13]

Mechanical Properties:

Mechanical Properties General: Dynamic tensile storage modulus and loss modulus values have been reported (110 Hz, -160–70°) [19]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.0004 MPa	0.1 Hz, 100° [13]	Shear

Optical Properties:

Refractive Index:

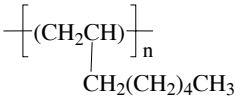
No.	Value	Note
1	1.495	29° [4]

Transmission and Spectra: Ir and Raman spectral data have been reported [14,15,16]

Total Internal Reflection: Stress optical coefficient -10500 (25°) [7]

Polymer Stability:

Stability Miscellaneous: Stability to uv light in presence of stabilisers has been reported [17]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4AlEt_3$ [11]

Poly(1-octene) P-421

Synonyms: *Poly(caprylene). Poly(1-hexylethylene). Poly(1-hexyl-1,2-ethanediyl)*

Monomers: 1-Octene

Material class: Thermoplastic

Polymer Type: polyolefins

CAS Number:

CAS Reg. No.	Note
25068-25-1	atactic
26746-84-9	isotactic
133578-04-8	syndiotactic

Molecular Formula: $(C_8H_{16})_n$

Fragments: C_8H_{16}

General Information: Viscous, tacky, yellow, rubbery gum [3,4]

Morphology: Isotactic, probably monoclinic a 0.56, b 3.8, c 0.76, β 97° helix 4_1 [2]

Volumetric & Calorimetric Properties:

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00023 K^{-1}	[5]	L

Thermodynamic Properties General: ΔH_f 30 J g^{-1} [2]. Other thermophysical props. have been reported [26]. Specific heat capacity values have been reported [7]
Melting Temperature:

No.	Value	Note
1	-38°C	[8,10]
2	5°C	[2]
3	10°C	[9]
4	21°C	calc. [10]

Glass-Transition Temperature:

No.	Value	Note
1	-65°C	[5,10,12]
2	-63°C	[11]
3	-53°C	[28]
4	-45°C	[12,32]
5	-52°C	calc. [11]

Transition Temperature:

No.	Value	Note	Type
1	-42°C		α
2	-160°C	[3]	β
3	-105°C	low temp. discontinuity [5]	γ
4	-70°C		α
5	-170°C	[24]	β

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. boiling MeOH [13]

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	30 g/10 min	ASTM D1238-15, η_{inh} 1 dl g^{-1} (tetrahydronaphthalene, 100° or 145°) [14]

Polymer Solutions Dilute: 50.4° (phenetole) [4]. [η] 2.66 dl g^{-1} (toluene, 25°) [19]. Other values for viscosity and θ values have been reported [1,4,15,16,18,23,25]
Polymer Melts: Melt flow activation energy 35.6 kJ mol^{-1} (8.5 k cal mol^{-1}) [14]; 77.5 kJ mol^{-1} (18.5 k cal mol^{-1}) [20]; 41.9 kJ mol^{-1} (10 k cal mol^{-1}) [16]. Zero shear viscosity 4500 (80°) [21]. Dynamic viscosity, dynamic rigidity, apparent viscosity, and critical shear rates at various temps. have been reported [14,16]

Mechanical Properties:
Mechanical Properties General: Dynamic tensile storage modulus and loss modulus values have been reported [31]
Miscellaneous Moduli:

No.	Value	Note	Type
1	0.003 MPa	0.1 Hz, 100° [21]	Shear modulus

Optical Properties:
Transmission and Spectra: C-13 nmr [17,27,29], H-1 nmr [29], ir [6,22,28,29,30] and Raman [6,22,30] spectral data have been reported
Molar Refraction: $\frac{dn}{dC}$ -0.105 (bromobenzene, 30°) [4]
Total Internal Reflection: Stress optical coefficient C_T -1590 (25°) [19]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $MgCl_2$ supported $TiCl_4$-AlR_3 [29]

Poly(octyl methacrylate) P-423

R = $CH_2(CH_2)_6CH_3$ (octyl)
= $CH(CH_3)(CH_2)_6CH_3$ (1-methylheptyl)
= $CH_2CH(CH_2)_3CH_3$ (2-ethylhexyl)
CH_2CH_3
= $CH_2(CH_2)_4CH(CH_3)_2$ (*iso*-octyl)

Synonyms: *Poly(octyl 2-methyl-2-propenoate)*
Related Polymers: Polymethacrylates General
Monomers: Octyl methacrylate, 1-Methylheptyl methacrylate, 2-Ethylhexyl methacrylate, Isooctyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25087-18-7	*n*-octyl
25719-51-1	2-ethylhexyl

Molecular Formula: $(C_{12}H_{22}O_2)_n$
Fragments: $C_{12}H_{22}O_2$
General Information: There are several isomeric octyl methacrylates. Unless specified otherwise, data refer to the *n*-octyl isomer

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.971 g/cm^3	[1,2]
2	d^{100} 0.927 g/cm^3	[3]
3	d^{20} 0.988 g/cm^3	1-methylheptyl [4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00058–0.00062 K^{-1}	uv polymerised, T > T_g [5]	V

Equation of State: Mark-Houwink constants have been reported [12,14]
Melting Temperature:

No.	Value	Note
1	<-55°C	max. [6]

Glass-Transition Temperature:

No.	Value	Note
1	-20°C	uv polymerisation, dilatometric method [5]
2	-70°C	[6,7]
3	-10°C	2-ethylhexyl [8]

Brittleness Temperature:

No.	Value	Note
1	-15°C	refractometric method [6]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 12.13 J$^{1/2}$ cm$^{-3/2}$ (8.4 cal$^{1/2}$ cm$^{-3/2}$) [9]; 12.05 J$^{1/2}$ cm$^{-3/2}$ (8.3 cal$^{1/2}$ cm$^{-3/2}$) [10]; 13.02 J$^{1/2}$ cm$^{-3/2}$ (9.7 cal$^{1/2}$ cm$^{-3/2}$, 2-ethylhexyl) [11]
Solvents/Non-solvents: Sol. *n*-butanol, 2-butanone [12]
Wettability/Surface Energy and Interfacial Tension: -(dγ/dT) 0.062 mN m^{-1} K^{-1} [13]
Surface Tension:

No.	Value	Note
1	28.8 mN/m	20°, 2-ethylhexyl, MV 64000 [13]
2	20.8 mN/m	150°, 2-ethylhexyl, MV 64000 [13]
3	17.7 mN/m	200°, 2-ethylhexyl, MV 64000 [13]

Transport Properties:

Polymer Solutions Dilute: Molar volumes 127.7 cm^3 mol^{-1} (van der Waals, amorph., 25°) [2]; 204.2 (rubber, amorph., 25°) [2]. Theta temps. 16.8° (*n*-butanol, MW 330000–12500000) [14]; 20° (*n*-butanol); 20° (butanone); 25° (Me_2CO/*n*-heptane, isooctyl) [15]

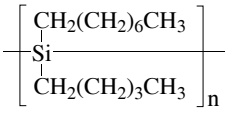
Mechanical Properties:

Mechanical Properties General: Plateau modulus 0.033 dyne cm^{-2} [3]
Viscoelastic Behaviour: Williams-Landel-Ferry constants for temp. superposition and Vogel parameters have been reported [16,17]. Other viscoelastic props. have been reported [19]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.478	20°, 1-methylheptyl [4]



Total Internal Reflection: Intrinsic segmental anisotropy -47 × 10^{-25} cm^3 (C_6H_6) [18]; -12.5 × 10^{-25} cm^3 (CCl_4) [18]

Poly(octylpentylsilylene) P-424

Synonyms: *Dichlorooctylpentylsilane homopolymer. C5-C8*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
171673-30-6

Molecular Formula: $(C_{13}H_{28}Si)n$
Fragments: $C_{13}H_{28}Si$
General Information: Produces a non-brittle film. Shows superior fracture toughness when compared with the symmetric poly(alkylsilanes) [3].
Morphology: Structure is very similar to that of C3–C5 (hexagonal, columnar packing both above and below the order-disorder transition). Exhibits a large degree of order in the hexagonal, columnar mesophase above and below its first-order temperature [1,3].
Miscellaneous: Stronger than C2–C5 but it retains a relatively large degree of flexibility and extensibility. Ordering of the polymer occurs at low temperatures, as DSC and X-ray diffraction show an order-disorder transition [1].

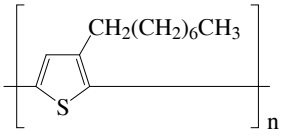
Glass-Transition Temperature:

No.	Value	Note
1	36–37°C	[1]

Mechanical Properties:
Mechanical Properties General: The large degree of order in the hexagonal, columnar mesophase is confined by the relatively high modulus of 2×10^7Pa. Hexagonal packing of the condis phase inhibits liquid-like flow under pressure. The transition merely reduces the elastic modulus by one to two orders of magnitude relative to the glassy state [1].

Tensile (Young's) Modulus:



No.	Value	Note
1	21.4 MPa	at 23°C [1]
2	16 MPa	at 100°C [1]

Optical Properties:
Optical Properties General: The existence of first-order transitions and the observation of UV thermochromic red shifts upon cooling for these polymers which do not crystallise are most likely the result of polarisation interactions between the σ-bonded Si backbone and the alkyl side chains, which is consistent with the predictions of the model of Schweizer for conjugated polymers [2,3].
Transmission and Spectra: Uv [2,3] spectra reported.

Polymer Stability:
Thermal Stability General: The disordering transition occurs at -36°C in the DMA of C5–C8 at 100rad sec^{-1} (16Hz) [1].
The transition enthalpy of 3.9cal g^{-1} (3.5kJ mol^{-1}) for C5-C8 is relatively small, indicating that a greater change in structure occurs at the first order transition [3].

Poly(3-octylthiophene) P-425

Monomers: 3-Octylthiophene
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
104934-51-2

Molecular Formula: $(C_{12}H_{18}S)_n$
Fragments: $C_{12}H_{18}S$
Morphology: Crystal form, a 21.1, b 4.0, c 7.8 [3]

Volumetric & Calorimetric Properties:
Melting Temperature:

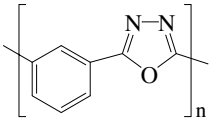
No.	Value	Note
1	150°C	approx. [1]

Transition Temperature General: T_g values have been reported [2]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. THF, decalin, $CHCl_3$ [4]

Transport Properties:
Polymer Solutions Dilute: [η] 1.05 dl g^{-1} (25°, $CHCl_3$) [3]

Electrical Properties:
Complex Permittivity and Electroactive Polymers: Conductivity 200 Ω^{-1} cm^{-1} [1]



Optical Properties:
Transmission and Spectra: Ir [5,7] and uv spectral data [1,6] have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by oxidation polymerisation of bithiophenes, [8] or chemical or electrochemical oxidation polymerisation with various catalysts
Applications: Potential applications as liq. crystal films, diodes and solid electrolytes

Poly(1,3,4-oxadiazole-2,5-diyl-1,3-phenylene) P-426

Synonyms: *Poly(m-phenylene-1,3,4-oxadiazole)*
Related Polymers: Poly(oxadiazoles), Poly(1,3,4-oxadiazole-2,5-diyl-1,4-phenylene)
Monomers: 1,3-Benzenedicarboxylic acid, Hydrazine sulfate
Material class: Thermoplastic
CAS Number:

CAS Reg. No.
26100-80-1

Molecular Formula: $(C_8H_4N_2O)_n$
Fragments: $C_8H_4N_2O$

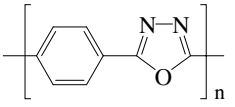
Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	>400°C	min. [1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. conc. H_2SO_4 [6]. Insol. DMF

Transport Properties:
Polymer Solutions Dilute: η_{inh} 0.134–0.172 (0.025–0.2% H_2SO_4) [3], 0.24 (H_2SO_4) [4], 0.73 dl g^{-1} (c, 0.2 g dl^{-1} in H_2SO_4, 30°) [5], 0.6 (H_2SO_4) [1]

Optical Properties:
Transmission and Spectra: Uv spectral data have been reported [1,3]



Polymer Stability:
Thermal Stability General: Rapid weight loss occurs at 400° and 500–560° then slow weight loss up to 700° [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Isophthalic acid is treated with hydrazine sulfate in the presence of a strong dehydrating agent

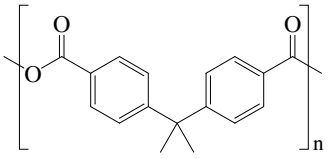
Poly(oxadiazoles) P-428

Related Polymers: Poly(1,3,4-oxadiazole-2,5-diyl-1,3-phenylene), Poly(1,3,4-oxadiazole-2,5-diyl-1,4-phenylene)
General Information: Polymers containing oxadiazole units have excellent thermal and hydrolytic stability and can form fibres, films and membranes [1,4,5]



Polymer Stability:
Thermal Stability General: Aromatic polymers decompose between 450–500°; aliphatic polymers decompose between 400–450°. Fibres have excellent thermal stability [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by dehydration of a polyhydrazide or dihydrazide; reaction of a bistetrazole with a diacid chloride; or heating a polyacylamidazone with acid [1]
Applications: The oxadiazole-containing polymers have potential applications as reverse-osmosis membranes, fibres, films coatings, felts, laminates and moulded objects, gas and liq. filters

Polyoxymethylene P-432

Synonyms: *Polyacetal. Acetal. Polyformaldehyde. POM*
Monomers: Formaldehyde, Trioxane
Material class: Thermoplastic
Polymer Type: acetal, polyalkylene ether
CAS Number:

CAS Reg. No.
9002-81-7

Molecular Formula: $(CH_2O)_n$
Fragments: CH_2O
Molecular Weight: MW 20000–90000; M_w/M_n 2

Additives: Antioxidants, uv stabilisers, pigments, glass fibre, lubricants, PTFE
Morphology: Two cryst. forms. Trigonal a 0.447 nm, b 0.447 nm, c 1.73 nm; orthorhombic a 0.476 nm, b 0.766 nm, c 0.356 nm [6]
Miscellaneous: Crystalline polymers with approx. 60–80% crystallinity. End groups are usually modified to prevent unzipping. The main chain may also be modified to improve stability by the inclusion of copolymers e.g. ethylene oxide. Many commercial grades are co- and terpolymers

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	amorph., trig. [6]
2	d 1.49 g/cm^3	cryst. [6]
3	d 1.533 g/cm^3	cryst., orthorhombic [6]
4	d 1.39–1.43 g/cm^3	ASTM D742 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
0	9.2×10^{-5} K^{-1}	[2]	l
1	8.1×10^{-5} K^{-1}	[1]	l

Thermal Conductivity:

No.	Value	Note
1	0.224 W/mK	[1]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.47 kJ/kg.C	[1,2]	p

Melting Temperature:

No.	Value	Note
1	166°C	[2]
2	175°C	[3]
3	177°C	[5]
4	186–189°C	[7]

Glass-Transition Temperature:

No.	Value	Note
1	-13°C	[3]
2	-82°C	[6]

Transition Temperature General: -73° [3]
Deflection Temperature:

No.	Value	Note
1	170°C	0.45 MPa ASTM D684 [1]
2	121–124°C	1.8 MPa, ASTM D684 [1]

Vicat Softening Point:

No.	Value	Note
1	185°C	ASTM D569

Surface Properties & Solubility:

Solvents/Non-solvents: No solvents at room temp. but liquids with a similar solubility parameter will cause swelling. Sol phenol, aniline, benzyl alcohol (above 110°)

Transport Properties:

Transport Properties General: Low gas and vapour permeability. Little efffect on props. from humidity

Melt Flow Index:

No.	Value	Note
1	9 g/10 min	general purpose [3]
2	2.5 g/10 min	[2]
3	6 g/10 min	[5]

Polymer Melts: Viscosity , MW relationships have been reported in a variety of solvents [8,9]. Huggins coefficient 0.31–0.41 [9,10]

Water Absorption:

No.	Value	Note
1	0.25 %	after 24h immersion [1]
2	0.16 %	50% relative humidity [3]
3	0.2 %	equilibrium, 50% relative humidity

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	14.6–19.7 cm^3 mm/(m^2 day atm)	23°, 50% relative humidity, Delrin [5]
2	O_2	4.7–6.7 cm^3 mm/(m^2 day atm)	23°, 50% relative humidity, Delrin [5]

Mechanical Properties:

Mechanical Properties General: Acetals have excellent fatigue resistance and resistance to creep. They also have a low coefficient of friction and excellent abrasion resistance

Tensile (Young's) Modulus:

No.	Value	Note
1	3500–5900 MPa	ASTM D638 [1,2,4,5]

Flexural Modulus:

No.	Value	Note
1	2390–3020 MPa	ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	62–70 MPa	ASTM D638 [1,2]	25–65% elongation, break; 15–31% elongation, yield

Flexural Strength at Break:

No.	Value	Note
1	88–100 MPa	ASTM D790 [1,2]

Poisson's Ratio:

No.	Value	Note
1	0.35	[2]

Flexural Strength Yield:

No.	Value	Note
1	98.5 MPa	[5]

Compressive Strength:

No.	Value	Note
1	112.31 MPa	ASTM D695; Delrin 500P [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2190 MPa	[2]	shear modulus

Mechanical Properties Miscellaneous: Shear strength 54.84 MPa (ASTM D732) [2]. Stress-strain relationships have been reported

Hardness: Rockwell M78-M94 [1,2] Rockwell R120 (Delrin 500P) [5]

Fracture Mechanical Properties: Has better fatigue resistance than Nylon 66

Friction Abrasion and Resistance: Coefficient of friction (static) μ_{stat} 0.1–0.3 (dry, steel) [1,3]. Abrasion resistance Taber CS-17 14–20 mg (1000 cycles)$^{-1}$ (ASTM D1044). [1] Coefficient of friction 0.3 (self) [4]

Izod Notch:

No.	Value	Notch	Note
1	62–72 J/m	Y	ASTM D256 [2]
2	70–120 J/m	Y	ASTM D256 [1]

Electrical Properties:

Electrical Properties General: Typical electrical props. for thermoplastics used in non-critical applications. Not suitable for application at high frequencies (1GHz) or applications involving high electric stress above 70°

Surface/Volume Resistance:

No.	Value	Note	Type
2	10×10^{15} Ω.cm	0.2% water, ASTM D257 [3]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3–7	100Hz–1MHz	ASTM D150 [1,3]

Dielectric Strength:

No.	Value	Note
1	19.7 kV.mm^{-1}	short time [3]

Arc Resistance:

No.	Value	Note
1	129s	ASTM D495 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004–0.007	100Hz–1MHz	[2,8]

Optical Properties:
Optical Properties General: Opaque

Polymer Stability:
Thermal Stability General: Generally good resistance to thermal and oxidative degradation
Upper Use Temperature:

No.	Value	Note
1	90°C	[1]
2	82°C	air [3]
3	65°C	water [3]

Decomposition Details: Thermal decomposition leads to the production of formaldehyde gas; this can lead to the chain unzipping if unchecked. Modified end groups are used to prevent this
Flammability: Flammability rating HB (UL94) [5]
Environmental Stress: Prolonged exposure to uv light will induce chalking and gradual embrittlement. Additives be can used to improve this
Chemical Stability: Good resistance to common chemicals but contact with strong oxidising agents is not recommended. Good resistance to aromatics, alcohols, oils, grease, chlorinated hydrocarbons; fair resistance to ketones and detergents
Hydrolytic Stability: Has good resistance to hot water. Poor resistance to mineral acids

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerised using ionic initiation. Anionic initiators are thought to be used to produce commercial polymers. Carried out in an inert hydrocarbon solvent. Processed by injection moulding, extrusion and rotational moulding. Further fabrication can be carried out using conventional metal-working techniques
Applications: Consumer goods (kettles). Plumbing (fittings and valves). Automotive components (fuel caps or pump housings). Gears, bearings and air flow valves, filter housings

Poly(oxysiliconphthalocyanin) P-433

Synonyms: *Phthalocyaninatopoly(siloxane). Poly(phthalocyaninato silicone oxo)*
Related Polymers: Polysiloxanes
Monomers: Dichlorosilicon phthalocyanine, Dihydroxysilicon phthalocyanine
Material class: Polymer liquid crystals
Polymer Type: silicones
CAS Number:

CAS Reg. No.
39114-20-0

Molecular Formula: $[C_{68}H_{88}N_8O_9Si]_n$
Fragments: $C_{68}H_{88}N_8O_9Si$
Molecular Weight: MW 40000–100000
General Information: Is dark purple, highly crystalline and axially-linked. Is of interest owing to its electrical props. [6]
Morphology: Hexagonal packing of cylinders, inter rod distance 2.57 nm repeat distance of monomers along chain 0.333 nm [1]. Crystallises naturally into an orthorhombic struct. a 13.80Å, b 27.59Å, C 6.66Å, space group Ibam. A tetrahedral struct. is produced during oxidation of the polymer and this is retained after reduction [6,10,11]. Doping with halogen and $NO^{\oplus}\ X^{\ominus}$ (where X is $BF_4^{\ominus}$, $PF_6^{\ominus}$ or $SbF_6^{\ominus}$) gives a tetrahedral struct. a 13.97Å, c 6.60Å; space group P4/mcc; Si:I or Br 1:1.12. Doping is heterogeneous [11,12,13]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.432 g/cm^3	[6]
2	d 1.802 g/cm^3	iodine-doped [11]

Transition Temperature General: Decomposes before melting [8]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. conc. mineral acids, chlorinated hydrocarbons, aromatic hydrocarbons, ethers [2,4,5,6,7]. Insol. H_2O, alcohols
Surface and Interfacial Properties General: Forms stable film on air-water interface readily transferred onto hydrophobic surface to form Langmuir-Blodgett film with liq. crystalline props. [1,7]
Wettability/Surface Energy and Interfacial Tension: Collapse pressure of film on water 23 mN m^{-1} (65°); 39 mN m^{-1} (6°) [1,5]

Transport Properties:
Transport Properties General: Readily transferred from film on water air interface onto hydrophobic solid surface to form Langmuir-Blodgett film [1,5]

Electrical Properties:
Electrical Properties General: Resistance falls sharply on doping with iodine to 100 Ω cm [3,8].
Complex Permittivity and Electroactive Polymers: Electrochemical doping produces a wide range of conductive polymers with tuneable electrical, magnetic and optical props. Although oxidative doping is usual, reductive doping has also been reported [10,11]. The effects of doping on conductivity have been reported [11,12]. Doping with electron-acceptors such as 2-chloroaniline, results in a decrease in conductivity [9]
Magnetic Properties: Iodine-doped polymer exhibits Curie-tailing at low temps. [11]

Optical Properties:
Optical Properties General: Optical reflectance data for the doped polymer have been reported [11]
Transmission and Spectra: Absorption max. 545 nm (polymer). Absorption max. 680 nm (monomer) [5]. Ir, Raman, esr, C-13 nmr and uv spectral data have been reported [6,11,13]
Total Internal Reflection: Chromophore dipole transition moment is perpendicular to polymer backbone [5]. Dichroic ratio of Langmuir-Blodgett film increases from 2.7–5.8 on annealing at 140° for 30 mins. (Dichroic ratio absorption of light polarised perpendicular to direction of dipping/light polarised parallel to dipping) [5,7]

Polymer Stability:

Polymer Stability General: The bulk of phthalocyanine ring protects the siloxane backbone from some reagents [6,8]
Upper Use Temperature:

No.	Value	Note
1	280°C	[7]

Decomposition Details: Onset of decomposition (without melting) occurs at 550° [8]
Environmental Stress: Not degraded by oxygen or moisture [3,7]. Reduced in electrolytic cell at -1.5 V, oxidised at 0.25 V
Chemical Stability: Stable in conc. acids. Sol. conc. acids and most organic solvents [5,6]
Hydrolytic Stability: Insol. in water; not degraded by water or moisture [2,3]
Recyclability: Not recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: The dichloro silicon phthalocyanine monomer (or the dihydroxy silicon phthalocyanine monomer obtained from it by hydrolysis or ion exchange) is condensed in organic solvent at around 200° in the presence of metal catalyst [2,4,8]. Catalyst necessary in order for polymerisation to occur at temps. low enough to avoid degradation of alkoxy substituted phthalocyanines [2]. Fibres may be spun from solns. in strong acid [11]. Doping is carried out by stirring powdered polymer with halogen in dry, deoxygenated C_6H_6 for 48h. Iodine doping can also be performed in conc. sulfuric acid soln. [13]
Applications: Main commercial interest is in the optical props. of Langmuir-Blodgett films formed from this material. These films are stable and of particularly high optical quality

Poly(1-pentadecene) P-434

Synonyms: *Poly(1-tridecylethylene). Poly(1-tridecyl-1,2-ethanediyl)*
Monomers: 1-Pentadecene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
59284-11-6	Isotactic

Molecular Formula: $(C_{15}H_{30})_n$
Fragments: $C_{15}H_{30}$
Morphology: Three forms known [2]

Volumetric & Calorimetric Properties:

Melting Temperature:

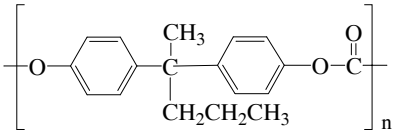
No.	Value	Note
1	54°C	[1]
2	60°C	[3]
3	59°C	[2]

Transition Temperature:

No.	Value	Note
1	13°C	Isotactic first order transitions [2]
2	20°C	

Optical Properties:

Transmission and Spectra: Ir and Raman spectral data have been reported [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3$-$AlEt_2Cl$ [1]

Poly[2,2-pentane bis(4-phenyl)carbonate] P-435

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(1-methylbutylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-2,2-pentane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxydiphenyl-2,2-pentane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
32243-05-3

Molecular Formula: $(C_{18}H_{18}O_3)_n$
Fragments: $C_{18}H_{18}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.13 g/cm^3	25° [1]

Melting Temperature:

No.	Value	Note
1	200–220°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	137°C	[1,2]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.2 %	25°, 65% relative humidity [3]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	97.17 cm^3 mm/(m^2 day atm)	1.11 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25 atm, 1 atm [2]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	65.2 MPa	665 kg cm^{-2} [1]	66%

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until approaching T_g

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.3	1 kHz	25–100° [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00042	1 kHz	25–100° [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5745	25° [1]

Transmission and Spectra: Ir spectral data have been reported [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used phosgenation approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [3]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. CH_2Cl_2). Catalysts are used to achieve high MWs [1,3]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150-300°) in the absence of O_2, with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,3]

Surface Properties & Solubility:

Solubility Properties General: Solubility props. and polymer solvent interaction parameter values have been reported [46,47]
Cohesive Energy Density Solubility Parameters: Cohesive energy density parameters have been reported [48]
Internal Pressure Heat Solution and Miscellaneous: Heats of mixing at infinite dilution in various solvents have been reported at 25° [11]
Solvents/Non-solvents: Sol. boiling heptane, toluene, C_6H_6 [12], Et_2O, EtOAc. Insol. MeOH [8,10]. Other solubility data have been reported [52]
Wettability/Surface Energy and Interfacial Tension: Surface free energy [53] and critical surface tension have been reported [48]

Transport Properties:

Polymer Solutions Dilute: θ 56° (isotactic, phenetole), 48.5° (amorph., phenetole) [49]; θ 31–32° (isoamyl acetate) [50]; θ 62.4° (2-pentanol) [12]; θ 32.5° (isobutyl acetate), 64° (phenetole), 85° (anisole), 121° (diphenylmethane), 149° (diphenyl ether) [51]. [η] 1.695 dl g^{-1} (30°, toluene, isotactic) [50]; [η] 3.48 dl g^{-1} (30°, toulene, isotactic) [51]; [η] 0.215 dl g^{-1} (21°, heptane) [3]; [η] 1.68 dl g^{-1} (25°, C_6H_6) [54]; [η] 2–3 dl g^{-1} (100°, tetrahydronaphthalene) [8]; [η] 3.29 dl g^{-1} (55°, toluene) [37]; [η] 4.7 dl g^{-1} (135°, tetrahydronaphthalene) [34]. Other viscosity values have been reported [10,55,56,57,58]

Mechanical Properties:

Mechanical Properties General: Mech. props. [5,59,60], flexibility [57] and rigidity [61] have been reported. Tensile, dynamic tensile and loss moduli have been reported [44,62]. Variation of dynamic modulus with temp. has been reported in graphical form [41]
Tensile Strength Break:

No.	Value	Note
1	58 MPa	-60° [63]

Impact Strength: Impact strength values have been reported [59]
Viscoelastic Behaviour: Acoustic [44] and thermoacoustic props. [65] have been reported
Hardness: Hardness has been reported [52]

Electrical Properties:

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.015–0.07	40–600 Hz	-180–-30° [41]

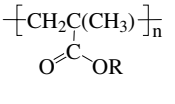
Optical Properties:

Optical Properties General: Refractive index has been reported [57]
Transmission and Spectra: H-1 nmr [45], C-13 nmr [1,66,67], esr [68], ir [32,34,69] and Raman [38,70,71] spectral data have been reported
Total Internal Reflection: Birefringence has been reported [5]. Stress optical coefficient 325–378 [37]

Polymer Stability:

Decomposition Details: The isotactic form decomposes at 115° to give CO_2, AcOH and propanoic acid as the major products [34,73]. Other decomposition details have been reported [72]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_3AlEt_2Cl$ [32,38]. Moulding behaviour has been studied

Poly(pentyl methacrylate) P-437

R = C_5H_{11} (pentyl)
= $CH_2CH_2CH(CH_3)_2$ (*iso*-pentyl)
= $CH_2C(CH_3)_3$ (*neo*-pentyl)
= $CH(CH_3)CH_2CH_2CH_3$ (1-methylbutyl)
= $CH(CH_3)CH(CH_3)$ (1,2-dimethylpropyl)

Synonyms: *Poly(amyl methacrylate). Poly(pentyl 2-methyl-2-propenoate)*
Related Polymers: Polymethacrylates General
Monomers: *n*-Pentyl methacrylate, Isopentyl methacrylate, Neopentyl methacrylate, 1-Methylbutyl methacrylate, 1,2-Dimethylpropyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
34903-87-2	neopentyl

Molecular Formula: $(C_9H_{16}O_2)_n$
Fragments: $C_9H_{16}O_2$
General Information: There are several isomeric pentyl methacrylates. Where no isomer is specified, the data refer to the *n*-pentyl isomer

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.032 g/cm^3	
2	d 1.03 g/cm^3	1-methylbutyl [1]
3	d^{25} 0.993 g/cm^3	neopentyl [2]
4	d 1.032 g/cm^3	isopentyl [2]

Glass-Transition Temperature:

No.	Value	Note
1	15°C	[3]
2	26–39°C	neopentyl [4]

Vicat Softening Point:

No.	Value	Note
1	115°C	neopentyl
2	46°C	isopentyl
3	63°C	1-methylbutyl [1]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 5.9 $J^{1/2}$ $cm^{-3/2}$ (8.4 $cal^{1/2}$ $cm^{-3/2}$) (neopentyl) [4]
Wettability/Surface Energy and Interfacial Tension: Polymer liq. interaction parameters 0.62 (hexane), 0.79 (2-butanone), 1.41 (acetonitrile), 0.11 ($CHCl_3$), 1.19 (*n*-propanol), 1.13 (Me_2CO), 0.79 (EtOAc) [5]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.98 dl g^{-1} (C_6H_6, neopentyl, MW 1930000), 0.32 dl g^{-1} (C_6H_6, neopentyl, MW 150000) [4]. Molar volumes 97 cm^3 mol^{-1} (van der Waals, amorph., 25°, isopentyl and neopentyl), 151.4 cm^3 mol^{-1} (glassy, amorph., 25°, isopentyl), 157.3 cm^3 mol^{-1} (glassy, amorph., 25°, neopentyl) [2]

Mechanical Properties:

Hardness: Vickers (5 kg load) 17 (neopentyl), 4 (isopentyl), 12 (1-methylbutyl) [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.481	20°
2	1.461	20°, neopentyl
3	1.48	20°, isopentyl
4	1.477	20°, 1-methylbutyl [1]

Polymer Stability:

Decomposition Details: Decomposition at 250° yields monomer for each isomer with a small amount of olefin by side-chain cracking for some isomers (e.g., 1,2-dimethylpropyl) [1]

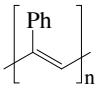
Poly(3-phenoxypropylene oxide) P-438

Synonyms: *Poly[oxy(phenoxymethyl)-1,2-ethanediyl]. Poly(phenylglycidyl ether). Poly[(phenoxymethyl)oxirane]. Poly(1,2-epoxy-3-phenoxypropane)*
Monomers: (Phenoxymethyl)oxirane
Material class: Thermoplastic
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
100629-24-1	
25265-27-4	homopolymer
26895-29-4	homopolymer, isotactic



Molecular Formula: $(C_9H_{10}O_2)_n$
Fragments: $C_9H_{10}O_2$

Molecular Weight: > M_n 3500–5700; M_w/M_n 1.42–2.07
General Information: Highly crystalline polymer

Poly(phenylacetylene) P-439

Synonyms: *Poly(ethynylbenzene)*
Related Polymers: Poly(acetylenes)
Monomers: Phenylethyne
Material class: Thermoplastic
Polymer Type: polyacetylene
CAS Number:

CAS Reg. No.	Note
25038-69-1	
120851-94-7	(*Z*)-form
27306-15-6	(*E*)-form
26970-23-0	

Molecular Formula: $(C_8H_6)_n$
Fragments: C_8H_6
General Information: Poly(phenylacetylene) is air stable and insulating when undoped, becoming semiconducting when doped with both donors or acceptors. [14] Formation of high MW materials has been studied [15]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	225°C	[1]
2	200–210°C	[2]

Vicat Softening Point:

No.	Value	Note
1	214–227°C	[3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic and halogenated hydrocarbons, cyclic ethers [7], Me_2CO, C_6H_6 [8]

Transport Properties:

Polymer Solutions Dilute: [η] 0.16 dl g^{-1} (toluene, 30°) [12]

Optical Properties:

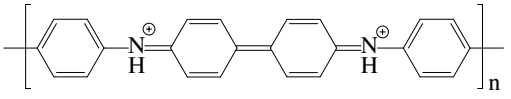
Refractive Index:

No.	Value	Note
1	1.7–1.72	1064 nm [13]
2	1.67–1.71	354 nm [13]

Transmission and Spectra: Uv [3], ir [4], H-1 nmr [5] and C-13 nmr [9] spectral data have been reported

Polymer Stability:

Thermal Stability General: In soln. *cis*-transoid struct. isomerises above 80° to produce a *trans*-cisoidal struct. At temps. >120° *cis-trans* isomerisation is accompanied by cyclisation and scission



Decomposition Details: Decomposes above 325° with hydrogen migration accompanied by crosslinking reactions; at 420° thermal decomposition leads to C_6H_6 [11]
Environmental Stress: No changes observed when stored at -20° in the dark for 6 months. MW decreases by half on standing at room temp. in light for 6 months [3,10]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by addition polymerisation with Ziegler-Natta catalysts, transition-metal complexes and free radical initiators. Can also be prod. by an Aldol-type polycondensation from phenylacetaldehyde [14] and by an anionic polymerisation mechanism [16]
Applications: Potential applications as selective gas permeable membranes, photoconductors and in non-linear optics

Poly(*N*-phenylaniline) P-440

Synonyms: *Poly(diphenylamine). N-phenylbenzenamine homopolymer. Diphenylamine homopolymer. PDPA*
Monomers: Diphenylamine
Polymer Type: polyaniline
CAS Number:

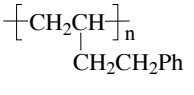
CAS Reg. No.
25656-57-9

Molecular Formula: $(C_{12}H_9N)n$
Fragments: $C_{12}H_9N$
Molecular Weight: 57,458 [3]
General Information: Polymerisation proceeds via 4,4′ coupling as opposed to the head-tail polymerisation observed in polyaniline and derivatives.
Morphology: Yellow-green-blue [7]. The morphology of the films change from fibrillar to granular with a change in monomer concentration of 0.05–0.4*M*. TEM revealed that PDPA nanofibrils have a uniform and well-aligned array structure [5]
Miscellaneous: Two kinds of electrochemically synthesised film have been characterised by *ex situ* resonance Raman, FT-IR and UV-vis-NIR Reflectance spectroscopies. The *ex situ* spectra of the films showed differences that were rationalised assuming the predominance of the diphenosemiquinone aminoimine structure in one film, while in the other the diphenoquinone diimine segments were predominant [8].

Surface Properties & Solubility:
Solubility Properties General: Shows *ca.* 8% wt/wt (0.3*M*) or higher solubility in doped and undoped states in organic media [7].

Electrical Properties:
Electrical Properties General: Electrical conductivity 0.02S cm^{-1} to $1x10^{-8}$S cm^{-1}[1,7]. Films of PDPA-BF_4^- anion show an increase in conductivity [9]. Conducting blends of PDPA doped with H_2SO_4 or *p*-toluenesulfonic acid (*p*-TSA) and PVDF showed an increase in conductivity from about 10^{-9} to 10^{-5}S cm^{-1}, with a percolation threshold of 5% of PDPA-H_2SO_4/*p*-TSA [13]

Optical Properties:
Transmission and Spectra: Ir [2,3,5,6,7,8], pes [2], uv-vis [2,3,5,7,8], uv-vis for copolymerisation of aniline with diphenylamine-4-sulfonic acid [4] and nmr [7] spectra reported.



Polymer Stability:
Decomposition Details: The polymer decomposes in three steps corresponding to an initial loss of H_2O molecules, volatilisation of ClO_4 along with low molecular weight fragments and complete decomposition and degradation of the polymer matrix. The decreasing trend in the % weight loss of the second step is observed with increasing monomer concentration due to presence of a non-ionic insulating phase [5,8]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synthesised electrochemically under galvanostatic conditions in non-aqueous MeCN media at different monomer concentrations [5]. 4-Aminobiphenyl and diphenylamine were electropolymerised in acidic and organic media to produce poly(4-aminobiphenyl) and poly(diphenylamine) [6]. Synthesised by chemical oxidative method using salt of dodecyl benzene sulfonic acid, in conc. HCl and diphenylamine in HCl followed by pre-cooling and addition of freshly prepared ammonium persulfate [3]
Applications: A corrosion inhibitor for Fe [3]. Fuel cells containing conductive polymer electrode catalysts [10]. Application of a single electrode, modified with PDPA and dodecyl sulfate, for the simultaneous amperometric determination of electro-inactive anions and cations in ion chromatography [11]. Sensitive and selective method and device for the detection of trace amounts of a substance [12]

Poly(4-phenyl-1-butene) P-441

Synonyms: *Poly(1-(2-phenylethyl)-1,2-ethanediyl)*
Monomers: 4-Phenyl-1-butene

Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
30137-21-4	
28827-17-0	isotactic

Molecular Formula: $(C_{10}H_{12})_n$
Fragments: $C_{10}H_{12}$
Additives: Tetra-substituted phenols as stabilisers
General Information: Slightly rubbery solid [6]
Morphology: Monoclinic, a 1.04, b 1.80, c 0.661, helix 3_1 [9]; c 0.655, helix 3_1 [10]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.042 g/cm^3	[7]
2	d 1.045 g/cm^3	isotactic [9]
3	d 0.962 g/cm^3	atactic [9]
4	d 1.04 g/cm^3	[13]

Latent Heat Crystallization: Heat of fusion has been reported [9]. ΔH_f 4.36 kJ mol^{-1}, 4.6 kJ mol^{-1} [12]
Melting Temperature:

No.	Value	Note
1	159°C	[4]
2	158–160°C	[6]
3	162–168°C	[7]
4	158°C	[9]

Glass-Transition Temperature:

No.	Value	Note
1	10°C	[7,9]
2	40°C	[11]

Transition Temperature:

No.	Value	Note	Type
1	130–160°C	[1]	Softening temp.
2	77–85°C	[3]	Softening temp.
3	40°C	[4]	Softening temp.
4	168°C	[6]	Polymer melt temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. heptane [3,7], warm C_6H_6 [3]. Insol. Me_2CO [3], isopropanol [7], EtOH [9]

Transport Properties:

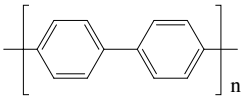
Polymer Solutions Dilute: [η] 1.19 dl g^{-1} [4]; η_{inh} 3.65 dl g^{-1} (decahydronaphthalene, 130°) [6]; [η] 0.63 dl g^{-1} (tetrahydronaphthalene, 80°) [9]; [η] 1.6–2.9 dl g^{-1} (tetrahydronaphthalene, 135°) [13]. Other viscosity values have been reported [1]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [3]

Polymer Stability:

Environmental Stress: A study into the effects of oxidation by atomic oxygen has been reported. Bulk props. are unaffected as only the polymer surface is affected [8]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-$AlEt_3$ in heptane at 55° [1,3,4,5,6,7,9,13]

Poly(*p*-phenylene) P-442

Synonyms: *Poly(paraphenylene). PPP. p-Polyphenyl*
Monomers: Biphenyl
CAS Number:

CAS Reg. No.	Note
26008-28-6	homopolymer

Molecular Formula: $(C_{12}H_8)_n$
Fragments: $C_{12}H_8$

Electrical Properties:

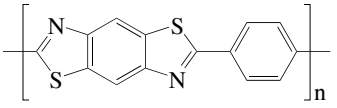
Electrical Properties General: Conductivity 3.3 × 10^{-13} S cm^{-1} (non-doped); 2.2 × 10^{-10} S cm^{-1} (iodine atmosphere) [1]

Optical Properties:

Transmission and Spectra: Ir and uv spectral data have been reported [1,2,4,5]

Polymer Stability:

Polymer Stability General: Possesses excellent oxidative and thermal stability [3,4]
Thermal Stability General: Thermal stability is dependent upon thermal treatment during the aromatisation process [3]
Decomposition Details: Decomposes at 600–800° forming oligomers, but with no evidence of C_6H_6 or biphenyl being produced [3]
Chemical Stability: Has excellent oxidative stability in air, withstanding temps. up to 350° [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: Main methods of preparation are the Kovacic synthesis [6] and the Yamamoto synthesis [7,10]. May also be polymerised electrochemically [4,9]
Applications: Has applications in electroactive materials, including use in batteries, cathodes, LEDs. Applications due to heat resistance include electrical insulators, fabrics for heat-resistance, and rocket nozzles

Poly(*p*-phenylenebenzobisthiazole) P-443

Synonyms: *Poly(benzo[1,2-d:4,5-d']bisthiazole-2,6-diyl-1,4-phenylene). PBZT. PBT*
Monomers: 1,4-Benzenedicarboxylic acid, 2,5-Diamino-1,4-benzenedithiol
Material class: Thermoplastic
Polymer Type: polybenzothiazole
CAS Number:

CAS Reg. No.
69794-31-6

Molecular Formula: $(C_{14}H_6N_2S_2)_n$
Fragments: $C_{14}H_6N_2S_2$
General Information: High-strength crystalline rigid-rod polymer with good thermal stability. Prod. as yellow or brown powder.
Morphology: Monoclinic unit cell, a=11.60Å, b=3.59Å, c=12.51Å [1,2]. Heat treatment increases crystallinity [2]. Concentrated solutions of polymer in acids such as sulfuric acid [3] or polyphosphoric acid [4] used for producing fibres are liquid crystalline, with crystal solvates formed in conc. aq. solns [5].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.5 g/cm^3	fibre [6]

Thermal Expansion Coefficient:

No.	Value	Note
1	2.9×10^{-6} K^{-1}	axial chain value (20-445°C) [7]

Transition Temperature General: No glass-transition temperature or melting point recorded up to decomposition temperature (*ca.* 700°C in nitrogen) [8,9]

Surface Properties & Solubility:

Solubility Properties General: Polymer sol. only in strong acids but will dissolve in aprotic solvents such as nitromethane in the presence of Lewis acids such as BCl_3, $AlCl_3$ and $GaCl_3$ [8,9]
Solvents/Non-solvents: Sol. sulfuric acid, polyphosphoric acid, methanesulfonic acid, chlorosulfonic acid, trifluoroacetic acid [9,10]. Insol. most organic solvents, H_2O

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	168000–269000 MPa	fibre [11,13]
2	132000–238000 MPa	film [12]

Tensile Strength Break:

No.	Value	Note	Elongation
1	1000–2900 MPa	fibre [11,13]	0.5–1.7% [13]
2	1230 MPa	film [12]	2.5%

Elastic Modulus:

No.	Value	Note
1	372000 MPa	[7]

Electrical Properties:

Electrical Properties General: After electrochemical oxidation in THF with tetrabutylammonium tetrafluoroborate, doped polymer had conductivity of 20 S cm^{-1} [14]. Polymer is reported to exhibit both hole [15] and electron [16] transport properties. Electroluminescence has been exhibited in LED devices [15,17,18], with a blue shift observed (λ_{max} 570nm to 496nm) on increasing bias voltage [18]

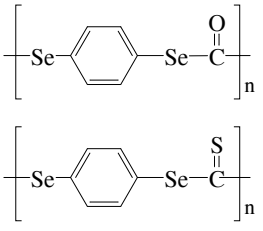
Optical Properties:

Optical Properties General: UV absorption (λ_{max} 437nm) and photoluminescence (λ_{max} 587nm) bands for polymer film have been recorded [17,18]. Optical nonlinear third order susceptibilities as high as 10^{-11} to 10^{-10} esu have been reported [10].
Transmission and Spectra: Pmr [9], ir [8,19,20,21], uv [8,9,15,17,18], photoluminescence [15,17,18] and x-ray diffraction [1,2,7] and neutron diffraction [24] data have been reported.

Polymer Stability:

Thermal Stability General: Rapid thermal degradation occurs above 600°C in air and at *ca.* 700°C in nitrogen [10]. After 200h in air there is no weight loss at 316°C, only 10% at 343°C and 30% at 370°C [10]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. mainly by reaction of 2,5-diamino-1,4-benzenedithiol dihydrochloride with terephthalic acid in polyphosphoric acid [22]. The diphosphate instead of the dihydrochloride has been used [23], and modified dithiol compounds with terephthaloyl dichloride as monomers have been reported [19,20]. Fibres are obtained from liquid crystalline solutions of polymer in acid by extrusion and coagulation in water.
Applications: Potential applications for high-strength fibres, in electronics and for fuel cell membranes.

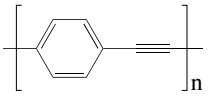
Poly(phenylenediselenocarbonate) P-444



Synonyms: *Polyphenylenediselenothiocarbonate*
Monomers: 1,4-Dibromobenzene
Molecular Formula: $(C_7H_4OSe_2)_n$; $(C_7H_4SSe_2)_n$
Fragments: $C_7H_4OSe_2$ $C_7H_4SSe_2$
Additives: Doping agents include $AlCl_3$, $FeCl_3$, SbF_5 and I_2

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. all common solvents, conc. H_2SO_4, 1*M* NaOH [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: 1,4-Dibromobenzene is dissolved in DMF and refluxed at 120° with Na_2Se_2 for several days. The resultant phenyldiselenide polymer is suspended in THF and excess sodium borohydride is added followed by thiophosgene or phosgene [1]
Applications: Potential limited use as semiconductor when doped with iodine

Poly(1,4-phenylene ethynylene) P-445

Synonyms: *Poly(1,4-phenylene-1,2-ethynediyl). Poly(p-phenyleneethynylene). Poly(p-phenylene xylidine)*
Monomers: 1,4-Diethynylbenzene, 1,4-Diiodobenzene, 1-Ethynyl-4-iodobenzene
Material class: Thermoplastic
CAS Number:

CAS Reg. No.	Note
26520-99-0	poly(1,4-phenylene-1,2-ethynediyl)
90216-60-7	

Molecular Formula: $(C_8H_4)n$
Fragments: C_8H_4
General Information: Parent polymer of group of conductive polymers. Polymer is prod. as stable yellow-brown solid with very limited solubility in organic solvents. Improved solubility obtained by substitution in benzene ring
Morphology: Rigid-rod structure with p2gg two-dimensional symmetry, a=7.74, b=4.98 Å [1]

Surface Properties & Solubility:
Solubility Properties General: Virtually insol. most organic solvents, incl. THF, benzene, toluene, CH_2Cl_2, [2,3]

Electrical Properties:
Electrical Properties General: Properties of insulator when undoped [4]. Increase in conductivity on doping with iodine or $FeCl_3$ [3,5]

Polymer Stability:
Polymer Stability General: Stable up to 360° with no melting point [3]
Thermal Stability General: Degradation occurs at *ca.* 380° in N_2[4]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Pd-catalysed coupling of 1,4-dihalobenzene and 1,4-diethynylbenzene [3,4], from 4-iodophenylacetylene with $CuSO_4$ [6], by Pd-catalysed reaction of 1,4-diiodobenzene with acetylene [2], or by electrolysis of α,α,α,α′,α′,α′-hexachloroxylene in propylene carbonate [5]

Poly(*m*-phenylene isophthalamide) P-446

Synonyms: *Nylon MPD-I. Nylon HT. Poly(imino-1,3-phenyleneiminocarbonyl-1,3-phenylenecarbonyl). Poly(m-phenylenediamine-co-isophthalic acid)*
Related Polymers: Aramids, Nylon polyester copolymer, Glass fibre filled
Monomers: 1,3-Benzenediamine, 1,3-Benzenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: aromatic polyamides
CAS Number:

CAS Reg. No.
24938-60-1

Molecular Formula: $(C_{14}H_{10}N_2O_2)_n$
Fragments: $C_{14}H_{10}N_2O_2$
Additives: Common uv stabilisers are not effective
Morphology: Orthogonal, a 6.7, b 4.71, c 11, 1 monomer per unit cell (ρ 1.14 g cm^{-3}); triclinic, a 5.27, b 5.25, c 11.3, 1 monomer per unit cell (space group C1-1, ρ 1.147 g cm^{-3})

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d < 1.33 g/cm^3	max., amorph.
2	d > 1.36	min., cryst. [1]
3	d 1.14 g/cm^3	cryst., orthogonal
4	d 1.147 g/cm^3	cryst., triclinic

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4.5×10^{-5} K^{-1}	T > T_g [1]	L

Thermodynamic Properties General: Heat of combustion 28.7 kJ g^{-1}

Specific Heat Capacity:

No.	Value	Note	Type
1	1.42 kJ/kg.C	solid, 25° [1]	P
2	1.214 kJ/kg.C	[5]	V

Melting Temperature:

No.	Value	Note
1	387–427°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	272°C	[1]

Transport Properties:

Polymer Solutions Dilute: η_{inh} 1.86 dl g^{-1} (sulfuric acid, 30°, 0.5 g fibre (100 ml)$^{-1}$

Mechanical Properties:

Mechanical Properties General: Tensile modulus 10.4 N tex^{-1} (20°), 7.9 N tex^{-1} (300°) [3]

Mechanical Properties Miscellaneous: Tenacity 0.49 N tex^{-1} (28% elongation, 20°); 0.27 N tex^{-1} (22% elongation, 250°); 0.11 N tex^{-1} (23% elongation, 330°); 0 N tex^{-1} (440°) [3]

Polymer Stability:

Polymer Stability General: Has excellent chemical, radiation and hydrolytic stability

Thermal Stability General: Prolonged exposure to air at 300° reduces tenacity remarkably [3]. Nomex paper has useful life 1400h at 250°, 40h at 300°. Retains 80% strength at 177° for several thousand hours [5]

Upper Use Temperature:

No.	Value
1	180–200°C

Flammability: Burns with difficulty forming black insulating char. Limiting oxygen index 26% (top of sample). Surface chlorine treatment increases limiting oxygen index to 36% [2,4]. Limiting oxygen index 28.5% [1]

Environmental Stress: Uv light discolours surface layer which then protects material from further degradation

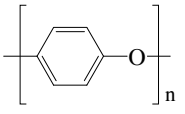
Chemical Stability: More resistant than Nylon 6,6 to acids, less resistant than polyester. Stable to phosphoric acid, formic acid, Me_2CO, formaldehyde, gasoline, dimethylacetamide, fluorocarbons and trichloroethylene. Degraded by conc. mineral acids and NaOH at ambient temp. [5]

Hydrolytic Stability: Good base and hydrolytic stability compared with polyesters. Withstands washing cycles at 95°. Resistant to steam, but undergoes hydrol. on exposure to SO_2

Stability Miscellaneous: Fadometer test, 50% strength loss (25h, AATCC method, 16 A-1960)

Applications/Commercial Products:

Processing & Manufacturing Routes: Low temp. soln. polymerisation or interfacial polymerisation using diamine and diacid chloride. Fibres prod. by soln. spinning



Applications: High performance fibres used in radiator hoses and steam hoses

Poly(phenylene oxide) P-447

Synonyms: *PPO. Poly(oxyphenylene)*

Monomers: Phenol

Material class: Thermoplastic

Polymer Type: polyphenylene oxide

CAS Number:

CAS Reg. No.
25667-40-7
9041-80-9

Molecular Formula: $(C_6H_4O)_n$

Fragments: C_6H_4O

General Information: Linear crystalline polymer of good thermal stability but limited flow props. The name also refers confusingly to Poly(2,6-dimethyl-1,4-phenylene oxide), of greater commercial use

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.32 g/cm^3	amorph. [1]
2	d 1.43 g/cm^3	cryst. [1]

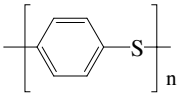
Tensile Strength Yield:

No.	Value	Elongation	Note
1	56.2 MPa	6.5%	562 M dyne cm^{-2} [4]

Optical Properties:
Transmission and Spectra: Ir, C-13 nmr and x-ray spectral data have been reported [5,6,7]

Polymer Stability:
Decomposition Details: Ether linkages decompose without rearrangement though cyclisation to benzofuran systems is observed (25–600°) [8]. Decomposes to give H_2 and methane between 350 and 620° [5]



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by oxidative coupling with a homogeneous oxidation catalyst or via halogen displacement (Ullmann coupling)

Poly(phenylene sulfide) P-448

Synonyms: *PPS. Poly(thiophenylene)*
Related Polymers: Poly(phenylene oxide)
Monomers: 1,4-Dichlorobenzene, 4-Bromobenzenethiol
Material class: Thermoplastic
Polymer Type: polyphenylene sulfide
CAS Number:

CAS Reg. No.
25212-74-2
9016-75-5

Molecular Formula: $(C_6H_4S)_n$
Fragments: C_6H_4S
Additives: Glass fibre, mineral fillers, carbon fibre, lubricants (PTFE, silicones)
General Information: Linear polymers with approx. 60–65% crystallinity. One of the most important properties is the material's tendency to change when heated in air. The change is indicative of an increase in molecular weight due to chain extension or cross-linking. This process is often referred to as curing. Filled grades have better impact strength, stiffness and strength

Hardness: Rockwell R124 (ASTM D785) [14]

Friction Abrasion and Resistance: Coefficient of friction 0.24 (dynamic)

Izod Notch:

No.	Value	Notch	Note
1	16.2 J/m	N	23°, ASTM D256 [6]
2	20 J/m	N	ASTM D256 [14]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	1 kHz	20° [3]

Dielectric Strength:

No.	Value	Note
1	150 kV.mm^{-1}	3.2 mm, ASTM D149 [14]

Arc Resistance:

No.	Value
1	120s

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0005	10 kHz	ASTM D150 [14]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [11]

Polymer Stability:

Thermal Stability General: Stable after continuous use at 240°. Non-burning [14]
Upper Use Temperature:

No.	Value
1	200°C

Decomposition Details: Between 350–450° decomposition produces hydrogen sulfide, dimers and trimers via radicals [11]. Above 450° evolution of hydrogen becomes predominant producing radicals which undergo cross-linking. Char yield 66–72% (N_2, 800°) [6], 42–47% (air, 800°)
Flammability: Limiting oxygen index 48–50% (ASTM D2863) [6]. Non-burning. Non drip. Flammability V0 (UL 94). Smoke evolution D_m 124.88 [6]
Environmental Stress: Polymer shows considerable resistance to degradation from electron beam radiation [13]
Chemical Stability: Resistant to weak acids, strong alkalis and organic solvents. Attacked slowly by strong oxidising acids. Not resistant to halogens or halogenated organics at higher temps. [14]. Rarely used unfilled
Stability Miscellaneous: Toxicity: Ti (time to incapacitation) 9.59–10.84 min. Td (time to death) 10.57–12.4 min. [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by reaction of 1,4-dichlorobenzene with sodium sulfide (Phillips Process), or self condensation of a metal salt of a 4-halothiophenol. May be compression moulded, extruded or injection moulded
Mould Shrinkage (%):

No.	Value	Note
1	1%	[14]

Applications: Chemical and high temp. resistant coating and moulding material for electrical connectors, bearing material with low friction. Electrical conducting polymer when doped

Poly(phenylene sulfide), 40% Glass fibre filled P-449

Monomers: 1,4-Dichlorobenzene
Material class: Composites
Polymer Type: polyphenylene sulfide
CAS Number:

CAS Reg. No.
9016-75-5
25212-74-2

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.6 g/cm^3	ASTM D1505 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.2×10^{-5} K^{-1}	[1]	L

Deflection Temperature:

No.	Value	Note
1	243°C	ASTM D648 [1]
2	>260°C	min., ASTM D648, annealed [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.05 %	max., 24h

Mechanical Properties:

Mechanical Properties General: Possesses good dimensional stability, with low creep and good fatigue resistance

Flexural Modulus:

No.	Value	Note
1	11700 MPa	ASTM D790 [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	135 MPa	1.3%	ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	200 MPa	ASTM D790 [1]

Compressive Strength:

No.	Value	Note
1	145 MPa	ASTM D695 [1]

Hardness: Rockwell R123 (ASTM D785) [1]

Izod Area:

No.	Value	Notch	Note
1	0.075 kJ/m^2	Notched	75 N m^{-1}, ASTM D256 [1]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	46×10^{15} Ω.cm	ASTM D257 [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.9	1 kHz	ASTM D150 [1]
2	3.8	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	177 $kV.mm^{-1}$	32 mm, ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	34s	ASTM D495 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001	1 kHz	ASTM D150 [1]
2	0.0013	1 MHz	ASTM D150 [1]

Polymer Stability:

Upper Use Temperature:

No.	Value
1	170–200°C

Flammability: Flammability rating V0, 5 V (UL 94)

Environmental Stress: Resistant to radiation

Chemical Stability: Has good resistance up to 200°; resistant to organic solvents, weak acids and strong alkalis

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	0.2–0.6%	[1]

Poly(*p*-phenylene terephthalamide) P-450

Synonyms: *Poly(p-phenylene diamine-co-terephthalic acid). Nylon PPD-T. Poly(imino-1,4-phenyleneiminocarbonyl-1,4-phenylenecarbonyl)*

Related Polymers: Aramids, Nylon polyester copolymer, Glass fibre filled

Monomers: 1,4-Benzenediamine, 1,4-Benzenedicarboxylic acid

Material class: Thermoplastic, Polymer liquid crystals

Polymer Type: aromatic polyamides

CAS Number:

CAS Reg. No.
24938-64-5

Molecular Formula: $(C_{14}H_{10}N_2O_2)_n$
Fragments: $C_{14}H_{10}N_2O_2$
Additives: 1% Phosphorous to reduce flammability
General Information: Exists in soln. as rigid rodlike liq. cryst. structs. When spun from soln. to fibre random coil structs. do not form, but rigid chains pack in quasi parallel bundles and shearing forces orient bundles to give a product with high modulus and tenacity, due to highly orientated fully extended chains which crystallise easily
Morphology: Monoclinic, a 7.728, b 5.184, c 12.81, γ 90°, 2 monomers per unit cell

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.48 g/cm^3	cryst.
2	d 1.542 g/cm^3	cryst.

Melting Temperature:

No.	Value	Note
1	497–600°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	307–347°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. sulfuric acid

Transport Properties:

Polymer Solutions Dilute: Inherent viscosity 4.8 dl g^{-1} (sulfuric acid, 30°, MW 60000, 0.5 g fibre (100 ml)$^{-1}$)

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	60000–160000 MPa	[5]

Flexural Modulus:

No.	Value	Note
1	100000 MPa	ASTM D1044 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	2900–3320 MPa	[5]	1.5–3.6%
2	2100 MPa	aged 500h, 180° [5]	
3	1200 MPa	aged 500h, 200° [5]	

Compressive Strength:

No.	Value
1	250 MPa

Complex Moduli: Specific modulus 16000–23000 N tex^{-1}
Mechanical Properties Miscellaneous: Tenacity 20500 N tex^{-1} (23°, fibre) [5]; 8800 N tex^{-1} (300°, fibre) [1]
Failure Properties General: Has excellent wear resistance
Friction Abrasion and Resistance: Abrasion resistance 250 cycles (perforation, Martindale test, P180 sandpaper) [6]

Electrical Properties:

Electrical Properties General: Has very high resistivity. Electrical props. are retained at high temps.
Complex Permittivity and Electroactive Polymers: Breakdown voltage -76 V mm^{-1} (180°) [7]

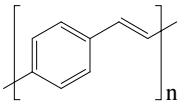
Polymer Stability:

Thermal Stability General: Short term property retention at 300°. Heat ageing results in loss of elongation and tenacity, but ultimate failure due to loss of tenacity [7]. High level of strength up to 250°
Upper Use Temperature:

No.	Value
1	250°C

Decomposition Details: Decomposition temp. 460° (onset of wt loss); 530° (50% wt loss) [9,10]. Decomposes releasing mainly CO_2; CO, N_2O and HCN are also released [5]
Flammability: Fibres burn with difficulty and do not melt producing a thick insulating char layer. Limiting oxygen index 28.5–29% (top of sample); 24.5% (top); 16.5% (bottom) [2,3]. Values can be increased to 40–42% by cross-linking with incorporation of 1% phosphorous
Environmental Stress: Susceptible to uv radiation but stable to γ-irradiation and x-rays
Chemical Stability: Stable to long term exposure to phosphoric acid, Me_2CO, formaldehyde, gasoline, fluorocarbons
Hydrolytic Stability: Withstands steam and boiling water. Resistant to hot alkali, but degraded by hot dil. mineral acids and conc. acids at ambient temp.
Biological Stability: Has good biological stability

Applications/Commercial Products:



Processing & Manufacturing Routes: Diamine and acid chloride are mixed in *N*-methylpyrrolidone containing dissolved lithium chloride or calcium chloride. Optimum polymer concentration is approx. 6–7% for optimum MW. Commercially H_2O is used to wash and slurry the polymer. The polymer is redissolved in H_2SO_4 to give a soln. for spinning into fibres. Wet spinning gives the highest MW and tensile props. Dry yarn is hot drawn, draw ratio depending on spin speed affecting tenacity and elongation of the fibre. The polymer forms an anisotropic soln. which assists molecular alignment, so hot drawing is less important to attain high strength fibres

Poly(*p*-phenylene vinylene) P-451

Synonyms: *Poly(p-xylylidene). Poly(1,4-phenylene-1,2-ethene-diyl). PPV*
Related Polymers: Poly(*p*-2,5-dimethoxyphenylene vinylene)
Monomers: 1,4-Benzenedicarboxaldehyde, 4-Bromostyrene
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
26009-24-5	
33379-71-4	(*E*)-form

Molecular Formula: $(C_8H_6)_n$
Fragments: C_8H_6
General Information: Conducting polymer. Yellow powder in appearance [2,3,4]
Morphology: Monoclinic; a 0.790, b 0.605, c 0.658, α 123° [1] bond lengths and angles of polymer repeat unit have been calculated [5,6,7]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.283 g/cm^3	[1]

Thermodynamic Properties General: ΔC_p 0.14 kJ kg^{-1} K^{-1} [11]. ΔH_f 2.36 kJ mol^{-1} (23.1 J g^{-1}) [11]
Melting Temperature:

No.	Value	Note
1	>340°C	min. [8,9,10]

Glass-Transition Temperature:

No.	Value	Note
1	8°C	[11]

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. all common solvents [11]

Transport Properties:

Polymer Solutions Dilute: η 1.5 (0.012*M* Na_2SO_4, 25°) [12]

Mechanical Properties:

Mechanical Properties General: Mech. props. are anisotropic and highly dependent upon the degree of molecular orientation. Chemical doping reduces the tensile modulus and tensile strength [13]

Tensile (Young's) Modulus:

No.	Value	Note
1	2300–37000 MPa	[13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	48.2–271 MPa	[13]	2.1–38%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	45.2–152 MPa	1.4–3.3 %	[13]

Electrical Properties:

Electrical Properties General: Electrical props. depend upon method of synth. [14,15,16]. Chemical doping increases conductivity [17,18,19,20,21,22,23]
Complex Permittivity and Electroactive Polymers: The redox behaviour has been studied [43]

Optical Properties:

Refractive Index:

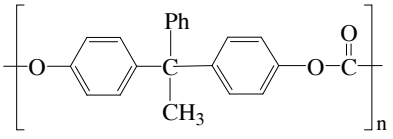
No.	Value	Note
1	1.95–2.28	700–2500 nm [35]

Transmission and Spectra: Ir [2,24,25,26,27,28,29,30], Raman [31,32,33,34], uv [36], C-13 nmr [38] and mass [37] spectral data have been reported

Polymer Stability:

Decomposition Details: Major decomposition in nitrogen occurs above 400°; 45% weight loss occurs at 900° [39]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. in a variety of ways including Wittig reaction of terephthaldehyde [2,8]; base elimination of xylylene bisdialkyl sulfonium salts [40]; Heck reaction of 4-bromostyrene; [9] electrochemical polymerisation of tetrabromo-*p*-xylene [41] and by a precursor route [44]. Easily processed and fabricated
Applications: Many potential applications in optical and electronic areas for use in light emitting diodes, electroluminescent devices

Poly[1,1-(1-phenylethane) bis(4-phenyl) carbonate] P-452

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(1-phenylethylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenylphenylmethylmethane-co-carbonic dichloride). Bisphenol ACP polycarbonate*
Monomers: Bisphenol ACP, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
26985-42-2

Molecular Formula: $(C_{21}H_{16}O_3)_n$
Fragments: $C_{21}H_{16}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.21 g/cm^3	25° [4]
2	d 1.084 g/cm^3	[2]
3	d 1.207 g/cm^3	30° [5]

Melting Temperature:

No.	Value	Note
1	210–230°C	[4]

Glass-Transition Temperature:

No.	Value	Note
1	176°C	[4]
2	179°C	[5,6]
3	183°C	[2]
4	174°C	[1]

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends with tetramethylpolycarbonate [1]; and immiscible blends with bisphenol A polycarbonate, polymethyl methacrylate, and polystyrene [1]
Cohesive Energy Density Solubility Parameters: Flory-Huggins polymer-solvent interaction parameters have been reported: 0.55 (CH_2Cl_2, 250°) [2]; 0.32 ($CHCl_3$, 250°) [2]; 1.4 (decane, 250°) [2]; 0.09 (cyclohexanol, 250°) [2]
Solvents/Non-solvents: Sol. CH_2Cl_2, *m*-cresol, cyclohexanone, THF, C_6H_6, pyridine, DMF; swollen by EtOAc, Me_2CO [3]

Transport Properties:

Permeability of Gases: The permeability of CO_2 decreases with increasing pressure (2-20 atm) [5]
Water Absorption:

No.	Value	Note
1	0.2 %	25°, 65% relative humidity [3]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	622 cm^3 mm/(m^2 day atm)	7.11 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [5]
2	CH_4	27.49 cm^3 mm/(m^2 day atm)	3.14 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 2 atm, calc. [5]
3	O_2	133 cm^3 mm/(m^2 day atm)	1.52 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25°, 1 atm [6]
4	N_2	23.72 cm^3 mm/(m^2 day atm)	2.71 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 2 atm, calc. [5]
5	He	910 cm^3 mm/(m^2 day atm)	1.04 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [5]
6	H_2	910 cm^3 mm/(m^2 day atm)	1.05 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [5]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	80.8 MPa	824 kg cm^{-2} [4]	55%

Complex Moduli: The variation of tan δ with temp. (-150–240°) has been reported [5,7]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until approaching T_g
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.3	1 kHz	25–100° [4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0005	1 kHz	25–100° [4]

Optical Properties:

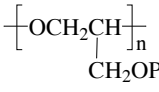
Refractive Index:

No.	Value	Note
1	1.613	25° [4]
2	1.616	calc. [1]

Transmission and Spectra: Ir spectral data have been reported [8]
Molar Refraction: dn/dc 0.1288 (c →0, 25°, C_6H_6) [9]

Polymer Stability:

Thermal Stability General: Stable under N_2 atmosphere up to 400° [2]
Decomposition Details: Decomposition temp. 427° (N_2) [5]. Thermo-oxidation is slow below 280° with weight loss onset at 300° [8]. Weight loss on heating in air 7.04% (350°, 30 min.) [5]. High temp. oxidation proceeds through scission of carbonate bridges, removal of phenyl substituents at the central carbon atom and formation of aldehyde, ketone and quinenoid carbonyl groups [8]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes, phosgenation and transesterification. The most widely used approach is interfacial polycondensation in a suitable solvent, but soln. polymerisation is also carried out in the presence of pyridine [3]. A slight excess of phosgene is introduced into a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (*e.g.* CH_2Cl_2). Catalysts (quaternary ammonium and phosphonium salts) are used to achieve high MWs [3,4,10]. With transesterification, the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2 with the elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [3,4]

Poly(phenylglycidyl ether) P-453

Synonyms: *Poly[(phenoxymethyl)oxirane]. Poly(3-phenoxypropylene oxide). Poly(1,2-epoxy-3-phenoxypropane). PGE*
Monomers: (Phenoxymethyl)oxirane
Polymer Type: epoxy, polyalkylene ether
CAS Number:

CAS Reg. No.	Note
25265-27-4	
26895-29-4	isotactic

Molecular Formula: $(C_9H_{10}O_2)_n$
Fragments: $C_9H_{10}O_2$
General Information: Hard, tough, opaque solid [4]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	203°C	[2,4]
2	195°C	isotactic [4]
3	72–120°C	[3]
4	186–189°C	isotactic [5]

Glass-Transition Temperature:

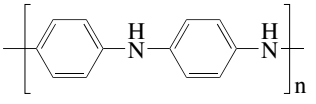
No.	Value	Note
1	9°C	C_6H_6 extracted polymer, xylene recrystallised polymer

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot cyclohexanone, hot *o*-dichlorobenzene, hot DMF, hot phenylglycidyl ether [5]. Slightly sol. C_6H_6 [2], chloronaphthalene [2]. Insol. Et_2O [2]

Transport Properties:

Polymer Solutions Dilute: η_{inh} 2.2 dl g^{-1} (0.1% in chloronaphthalene, 135°) [2]. η 2 dl g^{-1} (0.1% in chloronaphthalene, 135°, crude polymer) [4]. η 1.9 dl g^{-1} (0.1% in chloronaphthalene, 135°, extracted with C_6H_6) [4]. η 1.6 dl g^{-1} (0.1% in chloronaphthalene, 135°, xylene recrystallised polymer) [4]. [η] 0.467 dl g^{-1} (*o*-dichlorobenzene, 121°) [5]



Optical Properties:

Optical Properties General: Electron micrographs have been reported [6]
Transmission and Spectra: Ir [5], x-ray [5,6], H-1 nmr [7] and mass spectral data [3] have been reported

Poly(*N*-phenyl-*p*-phenylenediamine) P-454

Synonyms: *1,4-Benzenediamine, N-phenyl-, homopolymer. Poly(4-aminodiphenylamine). PPPD*
Monomers: 4-Aminodiphenylamine
Polymer Type: polyaniline
CAS Number:

CAS Reg. No.
89230-95-5

Molecular Formula: $(C_{12}H_{12}N_2)n$
Fragments: $C_{12}H_{12}N_2$
Additives: PANi

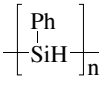
General Information: Methods of preparation result in head-tail polymerisation. The base polymers show some dissimilarities in the thermal decomposition behaviour, solubility, and intrinsic oxidation state [5].
Morphology: Structure is similar to polyaniline [5]
Identification: Chloride derivative: $C_{7.0}H_{5.9}NCl_{0.58}$ [2,5]

Surface Properties & Solubility:
Solubility Properties General: The monomer does not dissolve in the aqueous acid [5]

Electrical Properties:
Electrical Properties General: σ=1.8x10^{-2} to 2×10^{-4} S cm^{-1} [1,2,3,5]

Optical Properties:
Transmission and Spectra: Ir [1,5]; uv-vis [1,5] and xps [5] spectra reported.

Polymer Stability:
Polymer Stability General: Polymer stability depends upon synthesis [5]
Thermal Stability General: The polymer shows weight loss behaviour entirely different from the monomer. Retains a significantly higher proportion of weight for temperatures higher than 500°C. This difference in degradation behaviour is not as evident in the TG scans of polyaniline base obtained by the different methods. The onset of the major weight loss step of the DPAI base polymer is approx. 100°C higher than those of the polyaniline bases and the weight retained at 700°C is also slightly higher. In the case of PPDI base polymer, the weight loss is slow and gradual with no distinct steps, and the weight retained at 700°C [5]



Applications/Commercial Products:
Processing & Manufacturing Routes: The aniline dimer, *N*-(4-aminophenyl)aniline, has been polymerised cleanly under mild conditions to obtain an emeraldine base form of polyaniline using [MeB(3-(Mes)Pz)$_3$]CuCl as the catalyst and H_2O_2 as the oxidant, while the subsequent acidification of the emeraldine base gives the conducting emeraldine salt form of polyaniline [1]
The polymer has been synthesised from PrPPD using ammonium persulfate in dilute acids or by Cu(ClO$_4$)$_2$.6H$_2$O in MeCN [2,4,8]
Electrically conducting thin films of aniline derivatives have been deposited by the Langmuir-Blodgett (LB) technique and vacuum evaporation [3]

Applications/Commercial Products:
Applications: Secondary batteries, which maintain a high charging and discharging efficiency [6,7]. Photopolymerisation of aniline derivatives by photoinduced electron transfer for application to image formation [9]. Used in the manufacture of electric cable [10]

Poly(phenylsilane) P-455

Synonyms: *Poly(phenylsilylene). Phenylpolysilane. PPSi*
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
95584-36-4

Molecular Formula: (C$_6$H$_6$Si)n
Fragments: C$_6$H$_6$Si
Molecular Weight: 1,900–14,000 depending upon metallocene catalyst used. Ti-based catalysts gave samples with a lower average degree of polymerisation compared with Zr analogues [1,2,3,5,11,12]
General Information: Polysilanes (RSR′) have significant potential as preceramics and in the fabrication of optical devices.
Tacticity: Atactic (a-PPSi), isotactic (i-PPSi) and syndiotactic stereoarrangements are known for PPSi. Mostly found as atactic microstructure with a small syndiotactic bias. Syndioselective probability (1-Pm) of 0.55 during propagation of the pseudochiral chain. The d.p. was found to be dependent on the metal and the degree of Cp-ring substitution of the metallocene precatalyst [1,3,5]
Morphology: Off-white gum/crystal [1,3]. Amorphous structure, where the arrangement of Ph rings is comparable to the statistical disorder of benzene molecules in the liquid state [10]. An atactic structure has been suggested for the polymer morphology based on the large number of ^{29}Si environments indicated to be present [5,12]

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: See [11]

Surface Properties & Solubility:
Solubility Properties General: Si-H moiety on which a Ph group is substituted may be responsible for the good solubility in basic aqueous solutions [6]

Optical Properties:
Transmission and Spectra: Ir [2,8], uv-vis [9], nmr [1,2,5,8,9,12] and ms [8] spectra reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Phenylsilane can be converted catalytically to polyphenylsilane using substituted achiral group IV metallocene dichloride precatalysts (CpR)$_2$MCl$_2$, where M=Ti, Zr and CpR=C$_5$H$_4$C(Me)$_2$CHMe$_2$ or Cp(CpR)MCl$_2$ where M=Ti, Zr and Cp=C$_5$H$_5$ in combination with 2 equiv. of *n*-BuLi [1,5,9].
Synth. by Wurtz-type coupling of prochiral organochlorosilanes [1].
Presence of B(C$_6$F$_5$)$_3$ in reactions catalysed by the Cp$_2$ZrCl$_2$/BuLi gives (PhSiH)n. [2,3]
Ni-catalysed polymerisation of PhSiH$_3$ [2]
PPSi can be developed in basic aqueous solution when exposed to 254 nm light. [6]

Applications/Commercial Products:
Applications: Co-catalyst for Si-Si bond formation reactions [2]. Polysilane and epoxy resin used as primer coat with good adhesion [4]. Battery electrodes, solar battery and electromagnetic shields [6]

Trade name
Phenylpolysilane 10

Polyphenylsiloxane fluid P-456

Synonyms: *Polymethylphenylsiloxane fluid. Poly[oxy(methylphenylsilylene)]*
Related Polymers: More general information, Dimethyl substituted
Monomers: Dichloromethylphenylsilane, Cyclic methylphenylsiloxane
Material class: Fluids
Polymer Type: silicones
CAS Number:

CAS Reg. No.
9005-12-3
31230-04-3

Molecular Formula: $[C_7H_8COSi]_n$
Fragments: C_7H_8OSi
Molecular Weight: MW 1000–30000
General Information: Silicone fluids containing phenyl groups have higher values of density than dimethylsiloxane

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00055 K^{-1}	[7]	V

Thermal Conductivity:

No.	Value	Note
1	0.13 W/mK	(0.00032 cal.S^{-1}.cm^{-1}.°C^{-1}) [13,14]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.4 kJ/kg.C	(0.34 Btu.16^{-1}°F^{-1}) [3]	P

Transition Temperature General: High level of phenyl substitution raises pour point above that for dimethyl silicone [9]
Transition Temperature:

No.	Value	Note
1	-30°C	Pour point [1]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18.4 J$^{1/2}$cm$^{-3/2}$ (9 cal$^{1/2}$cm$^{-3/2}$) [5,10]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, esters, ethers, ketones. Insol. alcohols, H_2O [1,5,11]
Surface and Interfacial Properties General: Better lubricating props. than dimethyl silicone fluid [6]
Wettability/Surface Energy and Interfacial Tension: τ_c 25 mJm^{-2} (25 dyne.cm^{-1}). τ_c increases with increasing phenyl substitution [3,7]

Transport Properties:

Polymer Melts: Viscosity has been reported [1,2,3,11,15,16]. Viscosity temp. coefficient 0.85. The viscosity of methyl phenyl silicone oils drops more rapidly with temp. than that of methyl silicone oils, but at room. temp. methyl phenyl silicones have higher viscosity than methyl silicones of the same MW

Mechanical Properties:

Mechanical Properties General: Much less compressible than [PDMS fluid]
Elastic Modulus:

No.	Value	Note
1	2000 MPa	Bulk modulus (approx.) (200000 kg.cm^{-2}, (approx.)) [11,12]

Electrical Properties:

Electrical Properties General: Excellent insulating props. but inferior to those of dimethyl silicone fluids
Dielectric Permittivity (Constant):

No.	Value	Note
1	3	[4,17]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	[4]

Optical Properties:

Optical Properties General: Refractive index higher than that of dimethyl silicone [8]
Refractive Index:

No.	Value	Note
1	1.525	[3,8]

Transmission and Spectra: Transparent above 280 nm [5]

Polymer Stability:

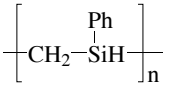
Polymer Stability General: The homopolymer is particularly stable at high temps.
Thermal Stability General: Usable between -40° and 250° in the presence of air. Usable up to 300° in the absence of air [3]
Upper Use Temperature:

No.	Value
1	250°C
2	275°C

Decomposition Details: Oxidised above 275° [2]
Flammability: Fl. p. 315° (600°F) [3]
Environmental Stress: Stable to H_2O, air, oxygen, metals and other materials. Highly resistant to radiation [1]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. V. thin films liable to degradation [1,4,5]
Hydrolytic Stability: Stable to H_2O and aq. solns. V. thin films spread on water; liable to hydrolytic degradation [1,4,5]

Biological Stability: Non-biodegradable [4,5]
Recyclability: Can be reused; no large scale recycling

Applications/Commercial Products:



Processing & Manufacturing Routes: For low viscosity fluids dichloromethylphenylsilane is hydrolysed and equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane. For high viscosity fluids cyclic methylphenylpolysiloxanes are equilibrated under alkaline catalysis with traces of chain terminator at 150°
Applications: Used as plastics additive and for high temp. heat transfer. Used in high temp. greases and in solder baths

Trade name	Supplier
SF 1265	General Electric Silicones

Poly[(phenylsilylene)methylene] P-457

Synonyms: *PPSM*
Related Polymers: Polycarbosilanes
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
321667-67-8

Molecular Formula: $(C_7H_8Si)n$
Fragments: C_7H_8Si
Molecular Weight: MW 11,200; M_w/M_n 2.5. All asymmetrically substituted polymers were obtained in high molecular weight form [2]
General Information: Polymerisation was conducted in toluene since the monomer is a solid which sublimes very easily during heating. Even at a higher temperature and for longer reaction times, the resultant polymer was still obtained in a relatively low molecular weight compared to other PSM's. The difficulty of this polymerisation could originate from the strongly electronegative nature of the chloro and phenyl groups. PPSM is a monosilicon analogue of polystyrene [2]
Morphology: Polymer found to be atactic [2]
Identification: Found: C, 65.23%; H, 13.05%; calc: C, 65.6%; H, 12.50% [2]

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

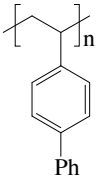
No.	Value	Note
1	-37.6°C	[2]

Optical Properties:

Transmission and Spectra: Pmr, cmr, Si-29 nmr spectra reported [2]

Polymer Stability:

Thermal Stability General: The phenyl attached directly to the polymer backbone imparts increased thermal stability, relative to alkyl and hydrogen substituents. In addition, the polymer begins to lose weight at a lower temperature than PMPSM resulting in a higher char yield [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Improved synthesis routes to the DSCB monomers were developed which proceed through Grignard ring closure reactions on alkoxy-substituted chlorocarbosilanes [2]
Applications: Insulating film for semiconductor device [1]

Polyphenylsulfone, Unreinforced P-459

Synonyms: *PPSF. Poly[oxy(1,1′-biphenyl)-4,4′-diyloxy-1,4-phenylenesulfonyl-1,4-phenylene]*
Monomers: 4,4′-Dichlorodiphenyl sulfone, 4,4′-Biphenyldiol
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25608-64-4	Radel R

Molecular Formula: $(C_{24}H_{16}O_4S)_n$
Fragments: $C_{24}H_{16}O_4S$
General Information: Polyphenylsulfone is a transparent, tough, rigid, amorph. thermoplastic. It offers outstanding thermal stability, superb resistance to hydrol. in hot water and steam environments and excellent inherent burning resistance. The impact performance of polyphenylsulfone is very high when compared with the other sulfone resins. It continues to exhibit useful mech. props. at temps. up to 180° under prolonged or repeated thermal exposure. Light amber colour

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.29 g/cm^3	ASTM D792 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.6×10^{-5} K^{-1}	ASTM D696 [2]	L

Thermal Conductivity:

No.	Value	Note
1	0.35 W/mK	ASTM C177 [1]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.17 kJ/kg.C	23° [1]	P

Melting Temperature:

No.	Value	Note
1	360–390°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	220°C	[1]

Transition Temperature General: T_g of PPSF is 30° higher than that of PSU
Deflection Temperature:

No.	Value	Note
1	207°C	1.8 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	approx. [1]	Second order (β)

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 22 J$^{1/2}$ cm$^{-3/2}$ (min.) [3]
Solvents/Non-solvents: Sol. polar solvents such as *N*-methylpyrrolidinone, dimethylacetamide, pyridine and aniline [1]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	18 g/10 min	0.3 MPa, 400°, ASTM D1238 [2]

Water Absorption:

No.	Value	Note
1	0.37 %	24h
2	1.1 %	equilibrium, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Tough and rigid. Has exceptional resistance to creep. Very high notched impact strength and has the ability to retain a high degree of ductility after prolonged heat exposure. Impact and toughness props. are improved over those of PES and PSU [1,4,5]
Tensile (Young's) Modulus:

No.	Value	Note
1	2350 MPa	ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	2410 MPa	ASTM D790 [2]

Tensile Strength Break:

No.	Note	Elongation
1	ASTM D638 [1]	90%

Compressive Modulus:

No.	Value	Note
1	1730 MPa	ASTM D695 [1]

Poisson's Ratio:

No.	Value	Note
1	0.42	0.5% strain [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	70 MPa	7.2%	ASTM D638 [2]

Flexural Strength Yield:

No.	Value	Note
1	91 MPa	ASTM D790 [2]

Compressive Strength:

No.	Value	Note
1	99 MPa	ASTM D695 [1]

Impact Strength: Tensile impact strength 400 kJ m^{-2} (ASTM D1822) [2]
Hardness: Rockwell M86 (ASTM D785) [1]
Failure Properties General: Shear strength (yield) 62 MPa (ASTM D732) [1]
Friction Abrasion and Resistance: Abrasion resistance 20 mg (1000 cycles)$^{-1}$ (ASTM D1040, Taber CS-17 test) [1]
Izod Notch:

No.	Value	Notch	Break	Note
1	693 J/m	Y		ASTM D256 [2]
2		N	Y	ISO 180/IC [2]

Electrical Properties:

Electrical Properties General: Offers excellent insulating and other electrical props. The dielectric constants and dissipation factors are low even in the GHz (microwave) frequency range. This performance is retained over a wide temp. range
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.44	60 Hz	ASTM D150 [1]
2	3.45	1 kHz	ASTM D150
3	3.45	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	14.6 kV.mm^{-1}	3.2 mm thick, ASTM D149 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0006	60 Hz	ASTM D150 [1]
2	0.0076	1 MHz	ASTM D150 [1]

Optical Properties:

Optical Properties General: Exhibits optical transparency
Refractive Index:

No.	Value	Note
1	1.67	ASTM D1505 [1]

Transmission and Spectra: Light transmittance 70% [1]
Volume Properties/Surface Properties: Haze 7% (max., 3.1 mm thick, ASTM D1004) [1]

Polymer Stability:

Polymer Stability General: Withstands exposure to elevated temps. in air and water for prolonged periods
Thermal Stability General: Excellent thermal stability and resistance to thermal oxidation
Upper Use Temperature:

No.	Value	Note
1	180°C	UL 746 [1]

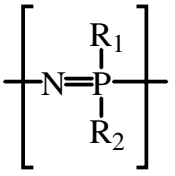
Flammability: Flammability rating V0 (0.8 mm thick, UL94) [1]. Limiting oxygen index 38% (ASTM D286) [1]. Smoke density 30 (6.2 mm, ASTM E662) [1]. Exhibits excellent resistance to burning. Has outstanding flame retardancy and very low smoke release characteristics [1]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light. Absorbance in the uv region occurs with attendant discoloration and losses in mech. props. due to polymer degradation [1]. Good resistance to many forms of ionising radiation [1,6,7,8]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resists aliphatic hydrocarbons and most alcohols. Crazed, swollen or dissolved by chlorinated hydrocarbons, esters and ketones [1]
Hydrolytic Stability: Superb resistance to hydrol. by hot water and steam [1]
Stability Miscellaneous: Good dimensional stability [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polyphenylsulfone is obtained via the nucleophilic substitution polycondensation route. This synth. is based on reaction of essentially equimolar quantities of 4,4′-dichlorodiphenylsulfone with the biphenol in a dipolar aprotic solvent in the presence of alkali base. Diphenyl sulfone, sulfolane, and *N*-methyl-2-pyrrolidinone are examples of suitable solvents. Potassium carbonate is used as base. High injection pressure is usually required for injection moulding. Melt temps. are in the range of 360–400° and mould temp. range is 120–190°. Prior to melt processing the resin must be dried for 2.5h at 150° to avoid structural and appearance defects in the fabricated parts due to bubbling and foaming of the trapped moisture. It is easily processed by other thermoplastic fabrication techniques including extrusion, thermoforming, and blow moulding. Extrusion into film, sheet, tubing or profile can be accomplished on conventional extrusion equipment. Stock temps. during extrusion are in the range of 315–375°. Once formed can be annealed to reduce moulded-in stress [1,2,3]
Mould Shrinkage (%):

No.	Value	Note
1	0.7%	ASTM D955 [2]

Applications: Typical applications include aircraft cabinet interior components, sterilisable medical devices, electrical/electronic components, chemical process equipment and automotive parts. It complies with U.S. Pharmacopeia Class VI requirements for use in medical device components



Trade name	Details	Supplier

Polyphosphazenes P-460

$R_1 = R_2$ = alkoxy groups (OR), where R = F, etc.

Related Polymers: Fluoroalkoxyphosphazene
Material class: Synthetic Elastomers
Polymer Type: polyphosphazenes

Volumetric & Calorimetric Properties:

Transition Temperature General: Low T_g (typically below -40°) causes polymers to have elastomeric props. at room temp. [1]

Mechanical Properties:

Mechanical Properties General: Good elastomeric props. [1]

Polymer Stability:

Thermal Stability General: Good low temp. props. [1]
Flammability: Non-flammable [1]
Environmental Stress: Resistant to oxidation [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. varies widely with precise chemical composition of polymer. See specific polyphosphazenes for more detailed information [1]

Polyphthalamide P-461

Synonyms: *PPA*
Related Polymers: Aramids
Material class: Thermoplastic
Polymer Type: aromatic polyamides
Molecular Formula: $C_8H_6N_2O_2$
Fragments: $C_8H_6N_2O_2$
General Information: Copolyamide of isophthalic acid and terephthalic acid. It possibly contains some phthalic acid and is polymerised with aliphatic and substituted diamines
Miscellaneous: Water absorption is 30% that of Nylon 6,6. Chemical resistance on par with Nylon 6,6

No.	Value	Frequency	Note
1	0.005	60 Hz	33% glass fibre, ASTM D150
2	0.017	1 MHz	33% glass fibre, ASTM D150

Polymer Stability:

Polymer Stability General: The polymer is stable in air up to 115° and up to 349° in nitrogen
Thermal Stability General: Thermogravimetric analysis in air at a heating rate of 10° min^{-1} shows that Amodel PPA are stable to 349°. Rapid thermal degradation occurs above 340°
Upper Use Temperature:

No.	Value	Note
1	185°C	5000h, 33% glass fibre reinforced, ASTM D3045
2	35°C	unfilled
3	115°C	tensile impact
4	165°C	20000h, 33% glass fibre reinforced, ASTM D3045

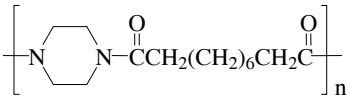
Flammability: Glow wire test: Polyphthalamide (PPA) passes 30 second contact test at 960°. Flammability rating HB (0.8 mm, 40 mm min^{-1}, 33% glass fibre, UL94); V0 (1.6 mm, 50% glass fibre, UL94)

Environmental Stress: Weight loss after 30 days immersion at 23°; 0.8% in 10% NH_4OH, 2.1% in 10% aq. NaCl, 4.8% in 50% $ZnCl_2$, 1.8% in 36% H_2SO_4, 1.6% in 10% NaOH, 1.4% in 5% NaOCl soln.. In Arc Model x-w weatherometer test (alternate wet/dry cycles), PPA losses 50% tensile strength after 6000h; Uv modified grades lost $<5\%$ after 6000h
Chemical Stability: Commercial grades contain Uv stabiliser. Chemically resistant to aliphatic and aromatic hydrocarbons, oils, greases, chlorinated hydrocarbons, ketones, alkalis. Acceptable resistance to MeOH and strong acids and to ethylene glycol soln. Attacked by phenols. Dissolves in H_2SO_4
Hydrolytic Stability: Resistant to steam at 132°. Measured on tensile bars in 30 min. cycles from room temp. to 132°, about 30% loss of strength after 50 cycles. When tensile bars subject to exposure of water containing 30 ppm chlorine at 82°, effect measured as weight change. 3% loss of weight occurs after 90 days. 3.4% weight loss after 30 days in deionised water at 93°

Applications/Commercial Products:

Processing & Manufacturing Routes: Minimum mould temp. of 135–150° is required. PPA is hydroscopic so must be pre-dried
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.8%	33% glass fibre, ASTM D955
2	1.3–1.8%	impact modified, ASTM D955
3	1.1–1.5%	unfilled, ASTM D955



Applications: Used in automobile under the bonnet applications; fuel component systems. Also used in electronic and electrical systems for connectors, switch components and housings

Glass-Transition Temperature:

No.	Value	Note
1	146°C	[3]
2	142°C	[4]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve shows a viscoelastic region up to the yield point, followed by a stress drop and then a short necking region (at approx. constant stress) until the stress increases to the break point. [5] Tensile strength decreases with temp., but the polymer is still relatively strong to approx. 35-40% of original value at 180° [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	2650 MPa	27000 kg cm^{-2}, amorph. [5]
2	2750 MPa	28000 kg cm^{-2}, cryst. [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	97.6 MPa	995 kg cm^{-2}	19%
2	94 MPa	9.6 kg mm^{-2} [5]	34%
3	100 MPa	10.2 kg mm^{-2}, cryst. [5]	36%

Tensile Strength Yield:

No.	Value	Note
1	90.2 MPa	9.2 kg mm^{-2} [5]

Complex Moduli: Variation of power dissipation factor (tan δ) with temp. has been reported

Electrical Properties:

Electrical Properties General: Dielectric constant and power dissipation factor increase with increasing temp. [1]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.3	1 kHz	25° [1]
2	3.6	1 kHz	100° [1]

Dissipation (Power) Factor:

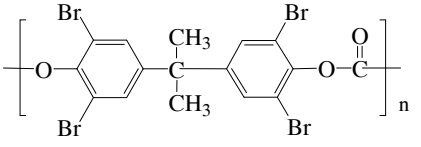
No.	Value	Frequency	Note
1	0.00115	1 kHz	25° [1]
2	0.0016	1 kHz	100° [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.59	25° [1]

Transmission and Spectra: Ir spectral data [6] and absorbance [7] have been reported



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by two routes; phosgenation or ester interchange. Phosgenation is accomplished by interfacial polycondensation (most widely used) involving base-catalysed reaction of phosgene with an aromatic dihydroxy compound in CH_2Cl_2, with a catalyst to give high MW products [1,6,7], or by soln. polymerisation in pyridine [6] Ester exchange involves melt (150-300°) polymerisation of the aromatic dihydroxy compound with excess diphenyl carbonate in the absence of air. Reaction rate may be increased by use of alkaline catalysts or a medium-high vacuum in the final stages [1,6]

Monomers: Tetrabromobisphenol A, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
28774-93-8
50641-20-8

Molecular Formula: $(C_{16}H_{10}Br_4O_3)_n$
Fragments: $C_{16}H_{10}Br_4O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.91 g/cm^3	[5]
2	d 1.25 g/cm^3	20°, amorph. [6]
3	d 1.27 g/cm^3	cryst. [6]
4	d 1.953 g/cm^3	[3,7]

Volumetric Properties General: Volume expansion coefficient 0.000329 cm^3 (g °C)$^{-1}$ (melt) [3]; 63.6×10^{-6} cm^3 (g °C)$^{-1}$ (glass) [3]

Melting Temperature:

No.	Value	Note
1	240–260°C	[5]
2	238–256°C	amorph. [6]
3	263–267°C	cryst. [6]

Glass-Transition Temperature:

No.	Value	Note
1	263°C	[3,7]
2	248°C	[1]

Deflection Temperature:

No.	Value	Note
1	243°C	1.8 MPa, 264 psi, ASTM D1708-59T [10]

Surface Properties & Solubility:

Solubility Properties General: Forms immiscible blends with Bisphenol A polycarbonate; tetramethylpolycarbonate, polymethyl methacrylate and polystyrene [1]
Cohesive Energy Density Solubility Parameters: Solubility parameter 21 $J^{1/2}$ $cm^{-3/2}$ (calc.) [2]; 20.7 $J^{1/2}$ $cm^{-3/2}$ (10.1 $cal^{1/2}$ $cm^{-3/2}$) (calc.) [3]
Solvents/Non-solvents: Sol. (room temp.) 1-methyl-2-pyrrolidinone, methyl phenyl ketone, cyclohexanone, bis(2-methoxyethyl)ether, triethyleneglycol dimethyl ether, tetraethyleneglycol dimethyl ether, CH_2Cl_2 [4]; insol. hydrocarbons, alcohols, diethylene glycol, triethylene glycol, 2-ethoxyethanol, H_2O. [4] A lower critical soln. temp. is found for bis(2-ethoxyethyl) ether at 25° for polymer concns. of less than 10% wt [4]

Transport Properties:

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	0.208 cm^3 mm/(m^2 day atm)	3.17 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [3,7]
2	CH_4	0.0062 cm^3 mm/(m^2 day atm)	9.45 × 10^{-15} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [3,7]
3	O_2	0.0669 cm^3 mm/(m^2 day atm)	1.02 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 1-2 atm [3,7,8]
4	N_2	0.0089 cm^3 mm/(m^2 day atm)	1.37 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 1-2 atm [3,7,8]
5	He	0.867 cm^3 mm/(m^2 day atm)	1.32 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [3,7]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve shows a viscoelastic region up to the yield point followed by an increase in stress to the break point; little or no neck formation is observed. The tensile strength (yield) is high compared to that of Bisphenol A polycarbonate [9]

Tensile (Young's) Modulus:

No.	Value	Note
1	3140 MPa	32000 kg cm^{-2}, amorph. [9]
2	3240 MPa	33000 kg cm^{-2}, cryst. [9]
3	3200 MPa	470 kpsi, ASTM D1708-59T [10]

Tensile Strength Break:

No.	Value	Note	Elongation
1	109 MPa	1112 kg cm^{-2} [5]	8%
2	107 MPa	10.9 kg mm^{-2}, amorph. [9]	10%
3	110 MPa	11.2 kg mm^{-2}, cryst. [9]	8%
4	108 MPa	15.7 kpsi, ASTM D1708-59T [10]	7%

Tensile Strength Yield:

No.	Value	Note
1	98.1 MPa	10 kg mm^{-2} [9]
2	109 MPa	15.8 kpsi, ASTM D1708-59T [10]

Electrical Properties:

Electrical Properties General: Dielectric constant varies only with temp. at T_g. Dissipation factor increases with increasing temp. [5]
Dielectric Permittivity (Constant):

No.	Value	Frequency
1	2.7	1 kHz, 25–100° [5]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	1 kHz	25° [5]
2	0.0038	1 kHz	100° [5]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.6147	25° [6]
2	1.615	calc. [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by two routes; phosgenation or ester interchange. Phosgenation is accomplished by interfacial polycondensation (most widely used) involving base-catalysed reaction of phosgene with an aromatic dihydroxy compound in CH_2Cl_2, with a catalyst to give high MW products [5,11], or by soln. polymerisation in pyridine [11] Ester exchange involves melt (150-300°) polymerisation of the aromatic dihydroxy compound with excess diphenyl carbonate in the absence of air. Reaction rate may be increased by use of alkaline catalysts or a medium-high vacuum in the final stages [5,11]
Applications: Flame retardant applications

Trade name	Supplier
Lexan DL 616	General Electric Plastics

2	CH_4	0.011 cm^3 mm/(m^2 day atm)	1.68 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [2,6]
3	O_2	0.11 cm^3 mm/(m^2 day atm)	1.71 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, [2,6,11]
4	N_2	0.0177 cm^3 mm/(m^2 day atm)	2.7 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35° [2,6,11]
5	He	1.35 cm^3 mm/(m^2 day atm)	2.6 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [2,6]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve shows a viscoelastic region up to the yield point, followed by an increase in stress to the break point; little or no neck formation is observed. Tensile strength (yield) is relatively high compared to Bisphenol A polycarbonate [12]

Tensile (Young's) Modulus:

No.	Value	Note
1	3140 MPa	32000 kg cm^{-2}, amorph. [12]
2	3240 MPa	33000 kg cm^{-2}, cryst. [12]
3	2800 MPa	410 kpsi, ASTM D1708-59T [9]

Tensile Strength Break:

No.	Value	Note	Elongation
1	113.2 MPa	1154 kg cm^{-2} [4]	10%
2	113 MPa	11.5 kg mm^{-2}, amorph. [12]	12%
3	115 MPa	11.7 kg mm^{-2}, cryst. [12]	10%
4	77.9 MPa	11.3 kpsi, ASTM D1708-59T [9]	27%

Tensile Strength Yield:

No.	Value	Note
1	103 MPa	10.5 kg mm^{-2} [12]
2	92.4 MPa	13.4 kpsi, ASTM D1708-59T [9]

Complex Moduli: The variation of power dissipation factor with temp. (-150–240°) has been reported [13]
Impact Strength: The impact strength is greatly reduced compared to Bisphenol A polycarbonate. Dart impact strength 24.3–29.7 mJ (0.4 mm thick) [14]

Electrical Properties:

Electrical Properties General: Dielectric constant varies with temp. only at T_g; power dissipation factor increases with increasing temp.

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	1 kHz	25–100° [4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001	1 kHz	25° [4]
2	0.0037	1 kHz	100° [4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.6056	25° [4]
2	1.606	calc. [1]

Transmission and Spectra: Ir spectral data have been reported [3]

Polymer Stability:

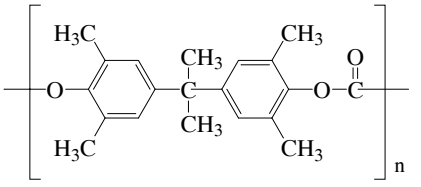
Thermal Stability General: Possesses a high degree of thermal stability

Decomposition Details: Principal degradation mechanism involves chain scission; HCl, CO_2, CO and CH_4 are evolved. Residual polymer is insol. even at early stages of degradation. [15] Activation energy for rate of CO_2 evolution 141 kJ mol^{-1} (33.6 k cal mol^{-1}, vacuum, 360–420°) [15]

Chemical Stability: Resistant to MeOH [4]

Hydrolytic Stability: Very resistant to basic hydrolysis; withstands 20% NaOH at room temp. [4]; hydrolysis rate at 100° in 10% NaOH is 3% that of Bisphenol A polycarbonate [16]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by two routes; phosgenation or ester interchange. Phosgenation is accomplished by interfacial polycondensation (most widely used) involving base-catalysed reaction of phosgene with an aromatic dihydroxy compound in CH_2Cl_2, with a catalyst to give high MW products [3,4], or by soln. polymerisation in pyridine [3] Ester exchange involves melt (150-300°) polymerisation of the aromatic dihydroxy compound with excess diphenyl carbonate in the absence of air. Reaction rate may be increased by use of alkaline catalysts or a medium-high vacuum in the final stages [3,4]

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends in all proportions with Bisphenol A polycarbonate [1,2,3,4], from room temp. -280°; solvent induced phase separation may also occur [3]. Also miscible in all proportions with polystyrene [1,4,5,6,7,8], phase separation occurs on heating (lower critical soln. temp. behaviour) [1,6,7,9,10]. Cloud points 241–255° (30 wt. % polystyrene) [6]; 249–254° (30 wt. % polystyrene) [7]; 237–244° (50 wt. % polystyrene) [6]; 242–246° (50 wt. % polystyrene) [7]; 250° (57% polystyrene) [10]; 257° (68% polystyrene/32% TMPC) [10]; 250–256° (70 wt. % polystyrene) [7]; 265–295° (70 wt. % polystyrene) [6]. Forms miscible blends at room temp. with styrene-acrylonitrile copolymers (18 wt. % acrylonitrile) [11]; styrene-maleic anhydride (10 wt. % maleic anhydride) [9]; styrene-methyl methacrylate (20–30 wt. % methy lmethacrylate) [11]. Above these compositions immiscible blends are observed. Compatibility with copolymers of a given monomer ratio may be influenced by blend composition, preparation method and temp. [9,11]. Miscible with linear aliphatic polyesters having 5–10 aliphatic carbons per ester group in the repeat struct. With poly(butylene adipate) and poly(1,4-cyclohexane dimethylene succinate), partial miscibility is found; blends with poly(ethylene adipate) and poly(2,2-dimethyl-1,3-propylene succinate), are completely phase separated [12]. Tetramethylpolycarbonate forms immiscible blends with poly methyl methacrylate [1]

Cohesive Energy Density Solubility Parameters: Solubility parameter 18.5 $J^{1/2}\,cm^{-3/2}$ (calc.) [13]; 19.2 $J^{1/2}\,cm^{-3/2}$ (9.39 $cal^{1/2}\,cm^{-3/2}$, calc.) [14]; 21.4 $J^{1/2}\,cm^{-3/2}$ (10.46 $cal^{1/2}\,cm^{-3/2}$, calc.) [15,16]. Cohesive energy density 352 J m^{-3} (calc.) [17]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink constants have been reported [21,33]

Permeability of Gases: The permeability of CO_2 decreases with pressure up to 300 psi (20 atm) [19,34,35,36] after which plasticisation occurs and permeability increases; the permeability-pressure curve shows hysteresis [35]. Conditioning at 550 psi (37 atm) for 7 days leads to an increase in permeability [35]. Temp. dependence [14,24,26] and gas selectivity [14,18,19,23,34] have been reported

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	1610 cm^3 mm/(m^2 day atm)	1.84 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 1 atm [36]
2	CO_2	1426 cm^3 mm/(m^2 day atm)	1.63 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 5 atm [36]
3	CO_2	1225 cm^3 mm/(m^2 day atm)	1.4 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [34,36]
4	CO_2	1138 cm^3 mm/(m^2 day atm)	1.3 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [14,18,34,36]
5	O_2	367 cm^3 mm/(m^2 day atm)	4.2 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [14,18,23,34]
6	O_2	262 cm^3 mm/(m^2 day atm)	3 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25°, 1-2 atm [24]
7	N_2	46.7 cm^3 mm/(m^2 day atm)	5.34 × 10^{-14} cm^2 (s Pa)$^{-1}$, 25°, 1-2 atm [24]
8	N_2	71.8 cm^3 mm/(m^2 day atm)	8.2 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 1-2 atm [14,18,34]

16	CH_4	59 cm^3 mm/(m^2 day atm)	6.8 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 10 atm, calc. [34]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2400 MPa	DIN 53457 [8,21]
2	2180 MPa	[17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	62 MPa	DIN 53457 [21]	50%
2	62 MPa	DIN 53457 [8]	40%

Tensile Strength Yield:

No.	Value	Note
1	80 MPa	DIN 53457 [21]
2	93.8 MPa	[17]

Complex Moduli: The variation of tan δ with temp. [39] (-150–160°) and of G′ and G″ with temp. [31] (-50–200°) and master curve for the complex shear modulus, G*, with frequency [30] has been reported
Impact Strength: Dart impact test. Impact energy 33–115 J m^{-1} (0.635–1.323 mm thick) [40]
Failure Properties General: Brittle at room temp. [13,40]. Critical crazing strain 1.59–1.95% (air, 23°, 20h) [17]
Izod Notch:

No.	Value	Notch	Note
1	3 J/m	Y	[8]
2	4 J/m	Y	DIN 53453 [21]

Electrical Properties:

Electrical Properties General: Dissipation power factor, tan δ, has been reported [4]
Complex Permittivity and Electroactive Polymers: Variation of ϵ″ with frequency [2,5,22] and temp. [4,22] has been reported

Optical Properties:

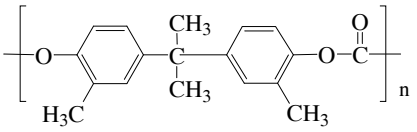
Refractive Index:

No.	Value	Note
1	1.546	20° [1,8,21]

Transmission and Spectra: Ir [21] and uv [41] spectral data have been reported

Polymer Stability:

Environmental Stress: Photolysed by light (254–365 nm). In a vacuum, photo-scission occurs, followed by decarboxylation and recombination to form cyclodienone-type compounds [41]. In the presence of oxygen, carbonate bond scission is followed by radical induced oxidation to form thermally stable hydroperoxides and secondary oxidation products [41]. These are further photo-oxidised to phenolic and quinone-methide groups. Only the extent of degradation varies with wavelength; at short wavelengths (254 nm) photo-oxidation occurs only on the surface (5–10 nm), at longer wavelengths (300–365 nm) photo-oxidation occurs deeper in the sample [41]. More stable than Bisphenol A polycarbonate [41]
Chemical Stability: Thermal oxidation is a two stage process. At temps. of 100-450°, thermo-oxidative pyrolysis occurs, with a predominance of endothermic scission reactions (leading to hydroperoxide formation) [41,42]. At higher temps., exothermic oxidation occurs [42]. Rate of decomposition temp. 444° (pyrolysis, heating rate 10° min^{-1}) [42]; 612° (oxidation, heating rate 10° min^{-1}) [42]. In N_2 or He only one thermal decomposition step is observed [42]
Hydrolytic Stability: Tetramethylpolycarbonate is highly resistant to hydrolysis [8,9], including boiling aq. NaOH [8]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by interfacial polycondensation. A large excess of phosgene is introduced into a suspension or soln. of tetramethyl Bisphenol A in aq. NaOH, 20–30° in CH_2Cl_2 at high pH and with high concentrations of tertiary amine catalyst [8,21]

Poly[2,2-propane bis[4-[2-methylphenyl]] carbonate] P-468

Synonyms: *Poly[oxycarbonyloxy(2-methyl-1,4-phenylene)(1-methylethylidene)(3-methyl-1,4-phenylene)]. Poly(4,4′-dihydroxy-3,3′-dimethyldiphenyl-2,2-propane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxy-3,3′-dimethyldiphenyl-2,2-propane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
26500-24-3

Molecular Formula: $(C_{18}H_{18}O_3)_n$
Fragments: $C_{18}H_{18}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.22 g/cm^3	25° [3]
2	d 1.22 g/cm^3	20°, amorph. [4]
3	d 1.16 g/cm^3	[6]

Equation of State: Mark-Houwink parameters have been reported [1]
Melting Temperature:

No.	Value	Note
1	150–170°C	[3]
2	156–172°C	amorph. [4]

Glass-Transition Temperature:

No.	Value	Note
1	98°C	[5]
2	124°C	[6]
3	128°C	[7]
4	100°C	[8]
5	125°C	[1]

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends with Bisphenol A polycarbonate and tetramethylpolycarbonate; it forms immiscible blends with polymethyl methacrylate and polystyrene
Solvents/Non-solvents: Sol. MeCl, *m*-cresol, EtOAc, cyclohexanone, THF, C_6H_6, pyridine, DMF; swollen by Me_2CO [2]

Transport Properties:

Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.015 cm^3 mm/(m^2 day atm)	2.3 × 10^{-4} cm^2 (s Pa)$^{-1}$, 25° [5]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve shows a viscoelastic region up to the yield point, followed by a stress drop and then necking behaviour (at approx. constant stress) until the stress increases to the break point [10]

Tensile (Young's) Modulus:

No.	Value	Note
1	1180 MPa	12000 kg cm^{-2}, amorph. [10]

Tensile Strength Break:

No.	Value	Note	Elongation
1	56 MPa	5.7 kg mm^{-2} [10]	116%

Tensile Strength Yield:

No.	Value	Note
1	38.2 MPa	3.9 kg mm^{-2} [10]

Complex Moduli: The variation of power dissipation (tan δ) with temp. (-150–240°) has been reported [11]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor increase slightly with increasing temp. [3]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.5	1 kHz	25° [3]
2	2.6	1 kHz	100° [3]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	1 kHz	25° [3]
2	0.004	1 kHz	100° [3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5783	25° [3]
2	1.577	20° [7]
3	1.578	calc. [1]

Transmission and Spectra: Ir spectral data have been reported [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by two routes; phosgenation or ester interchange. Phosgenation is accomplished by interfacial polycondensation (most widely used) involving base-catalysed reaction of phosgene with an aromatic dihydroxy compound in CH_2Cl_2, with a catalyst to give high MW products [2,3], or by soln. polymerisation in pyridine [2] Ester exchange involves melt (150-300°) polymerisation of the aromatic dihydroxy compound with excess diphenyl carbonate in the absence of air. Reaction rate may be increased by use of alkaline catalysts or a medium-high vacuum in the final stages [2,3]

Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(dimethylsiloxane) P-469

Synonyms: *Polycarbonate-block-poly(dimethylsiloxane). Polycarbonate-poly(dimethylsiloxane) block copolymer. Polycarbonate silicone copolymer. Silicone polycarbonate copolymer*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Poly(dimethylsiloxane)
Monomers: Bisphenol A, Carbonic dichloride, Dichlorodimethylsilane
Material class: Semithermoplastic, Copolymers, Synthetic Elastomers
Polymer Type: bisphenol A polycarbonate, dimethylsilicones
CAS Number:

CAS Reg. No.
64365-15-7

Molecular Formula: $[(C_{16}H_{14}O_3)_x.C_{15}H_{14}O.(C_2H_6OSi)_y]_n$
Fragments: $C_{16}H_{14}O_3$ $C_{15}H_{14}O$ C_2H_6OSi
General Information: The block copolymers are random alternating multi-block copolymers with polydisperse blocks. [8,9] They exhibit props. ranging from flexible elastomers to rigid engineering thermoplastics depending on composition [7,9]
Morphology: Block copolymers form separate microphases consisting of polycarbonate-rich domains in a polydimethylsiloxane-rich matrix. [7,8,10,11,12,13,14,15] Morphology is affected by the casting solvent (when present). [10,15,16] For example, casting from hexane-rich solvents causes aggregation of the polycarbonate blocks. [10] For polycarbonate content of 50% or less at about -73°, nearly all the polycarbonate is in rigid domains in a polydimethylsiloxane mobile matrix. [8] The rigid fraction decreases with increasing temp., especially as its T_g is approached. [8] At shorter polydimethylsiloxane block lengths (<20) increased mixing of the components is favoured [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.147 g/cm^3	25% PDMS, 17.8 polycarbonate units [13]
2	d 1.104 g/cm^3	34% PDMS, 11 polycarbonate units [13]
3	d 1.097 g/cm^3	50% PDMS, 6 polycarbonate units [13]
4	d 1.052 g/cm^3	60% PDMS, 4.4 polycarbonate units [13]
5	d 1.04 g/cm^3	64% PDMS, 3.8 polycarbonate units [13]
6	d 1.05–1.09 g/cm^3	65% PDMS, total M_n 27800–96300 [16]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9.56×10^{-5} K^{-1}	20°, 43% PDMS, MW 170000	L
2	0.000168 K^{-1}	20°, 50% PDMS, total MW 120000	L
3	0.000204 K^{-1}	20°, 55% PDMS, total MW 220000	L
4	0.000219 K^{-1}	20°, 65% PDMS, total MW 84000	L

Volumetric Properties General: Density varies with degree of polymerisation of the polydimethylsiloxane component. [13,16] The linear thermal expansion coefficients of the block copolymers lie between those of the homopolymers and increase with increasing polydimethylsiloxane content [10]
Melting Temperature:

No.	Value	Note

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 $J^{1/2}$ $cm^{-3/2}$ (7.5 $cal^{1/2}$ $cm^{-3/2}$, silicone), δ 20.5 $J^{1/2}$ $cm^{-3/2}$ (10 $cal^{1/2}$ $cm^{-3/2}$, polycarbonate) [7]

Solvents/Non-solvents: Sol. hexane/CH_2Cl_2, [10] CH_2Cl_2, [17] $CHCl_3$, THF, [18,19,20] chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. aliphatic hydrocarbons, alcohols, H_2O [2,5], MeOH [6,9,19]. Swollen by methylcyclohexane, isopropyl ether, decalin, silicone fluid, butanol, [21] heptane, hexane, cyclohexane [10,16]

Surface and Interfacial Properties General: Very high resistance to water. [4] Block copolymers show a distinct preference for polydimethylsiloxane at the surface over a wide range of compositions, [18,19,22] which is illustrated by the spreading of films on water. [23] Annealing of the polymer films at 180° for 24h *in vacuo* drives more polydimethylsiloxane into the surface area [18,19,22,24]

Wettability/Surface Energy and Interfacial Tension: Films containing 25–83% polydimethylsiloxane (M_n 6350) and polycarbonate (M_n 35000) spread on water at 24°. [23] The area occupied by the films at 2 dyne cm^{-1} is roughly proportional to the siloxane content; block lengths of polydimethylsiloxane (above 20 units) and polycarbonate seem unimportant [23]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	1.1 g/10 min	300°, total MW 10000 [12]

Permeability of Gases: Less gas permeable than (silicone rubber (heat vulcanised)) but relative permeability is similar. [1] Gas permeability depends upon temp., degree of polymerisation and amount of polydimethylsiloxane [13]

Permeability and Diffusion General: Diffusivity of propane depends upon the polydimethylsiloxane content and its degree of polymerisation. For a given degree of polymerisation, diffusivity generally increases with polydimethylsiloxane content [13]

Gas Permeability:

No.	Gas	Value	Note
1	Propane	96299 cm^3 mm/(m^2 day atm)	1.1 × 10^{-10} cm^2 (s Pa)$^{-1}$, 64% PDMS, degree of polymerisation 20, 50° [13]
2	Propane	122562 cm^3 mm/(m^2 day atm)	1.4 × 10^{-10} cm^2 (s Pa)$^{-1}$, 60% PDMS, degree of polymerisation 40, 50° [13]
3	Propane	201353 cm^3 mm/(m^2 day atm)	2.3 × 10^{-10} cm^2 (s Pa)$^{-1}$, 64% PDMS, degree of polymerisation 100, 50° [13]

Mechanical Properties:

Mechanical Properties General: Mech. props. depend on the end cap ratio. [9] Tensile strength increases and maximum elongation decreases as the percentage of polycarbonate increases [2,3,6,9,10]. Elastomer has high mech. strength. The variation of shear modulus with temp. (-100–270°) for polydimethylsiloxane content 25–75% and degrees of polymerisation of 20 and 40 has been reported [21]

Tensile Strength Break:

No.	Value	Note	Elongation
1	24 MPa	3500 psi, 50% silicone by weight [2,3,6]	270%
2	22.5–25.7 MPa	3270–3730 psi, 46% PDMS, end cap ratio 1.2, ASTM D412 [9]	360–370%
3	15.6–18.1 MPa	2270–2630 psi, 46% PDMS, end cap ratio 2, ASTM D412 [9]	320–380%
4	20–22.8 MPa	2900–3300 psi, 52% PDMS, end cap ratio 1.2, ASTM D412 [9]	510–570%
5	1.37 MPa	197 psi, no break, 51% PDMS, end cap ratio 4, ASTM D412 [9]	>950%
6	12–13.7 MPa	1740–1980 psi, 57% PDMS, end cap ratio 1.2, ASTM D412 [9]	690–890%
7	1.3–2.6 MPa	190–370 psi, no break, 57% PDMS, end cap ratio 2, ASTM D412 [9]	>950%
8	26.9 MPa	43% PDMS, total MW 170000 [10]	716%
9	13.3 MPa	50% PDMS, total MW 120000 [10]	729%
10	45 MPa	6500 psi, 15% PDMS [6]	110%
11	32 MPa	4600 psi, 44% PDMS [6]	110%
12	14.4 MPa	55% PDMS, total MW 229000 [10]	454%
13	18 MPa	2700 psi, 60% PDMS [6]	480%
14	12.5 MPa	65% PDMS, total MW 840000 [10]	1690%
15	43 MPa	6300 psi, 15% PDMS [6]	90%
16	28 MPa	4000 psi, 44% PDMS [6]	110%
17	16 MPa	2400 psi, 60% PDMS [6]	270%

Elastic Modulus:

No.	Value	Note
1	1900–1950 MPa	1.9–1.95 × 10^{10} dyne cm^{-2}, 25% PDMS, -196° [21]
2	2100 MPa	2.1 × 10^{10} dyne cm^{-2}, 50% PDMS, -196° [21]
3	2030 MPa	2.03 × 10^{10} dyne cm^{-2}, 65% PDMS, -196° [21]
4	1950 MPa	1.95 × 10^{10} dyne cm^{-2}, 60% PDMS, -196° [21]
5	1700 MPa	1.7 × 10^{10} dyne cm^{-2}, 75% PDMS, -196° [21]

Complex Moduli: The variation of loss tangent and loss modulus with temp. (-150–130°, 110 Hz) for block copolymers with 43–65% polydimethylsiloxane and degrees of polymerisation of 10 or 20 has been reported. [10,15] Props. are affected by the solvent from which the films are cast [10,15]

Viscoelastic Behaviour: Stress-strain curves have been reported. [10,16] As the polydimethylsiloxane content increases (45–65%) there is a transition to elastomeric behaviour. [6,9,10] The stress-strain curve for polydimethylsiloxane content of 43% shows a viscoelastic region up to the yield point followed by a slight stress drop and an increase in stress to the break point at 716% elongation. [10] At lower levels of polydimethylsiloxane the yield stress is more pronounced, and necking occurs. [6] At higher polydimethylsiloxane content no yield point is observed, and the stress increases to very large elongations (500–1500%). [10,16] Sonic modulus (room temp., 10 kHz) decreases with polydimethylsiloxane content and with decreasing end cap ratio. [9] Stress relaxation curves for block copolymers show relaxation modulus decreases with time and with increasing temp.; stress relaxation behaviour depends on the casting solvent [10]

Electrical Properties:

Electrical Properties General: Has good insulating props. [1] The variation of dielectric constant and dissipation factor with temp. (-160–160°, 50 Hz–100 kHz) has been reported [16,17]

Optical Properties:

Refractive Index:

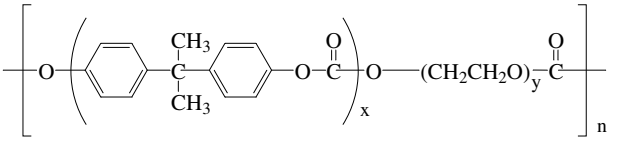
No.	Value	Note
1	1.43–1.48	65% PDMS [16]

Transmission and Spectra: Transparent in the visible region [1]
Total Internal Reflection: Birefringence-strain curves for polydimethylsiloxane content 65% and degree of polymerisation 20–100 have been reported [16]
Volume Properties/Surface Properties: Clarity transparent (block copolymer films) [7,21]

Polymer Stability:

Thermal Stability General: Block copolymers have good thermal stability with decomposition occurring above 300°. [25]
Decomposition Details: Decomposes above 300° [5]. Decomposition is a two-step process. [25] In air, the first (lower temp.) reaction is thermooxidative and the second reaction is depolymerisation. In N_2, the second reaction has a lower activation energy than in air. [25] The appearance of the char (750°) is dark in N_2 but in air contains relatively large amounts of greyish oxides of silicon. The mechanism of decomposition is complicated as indicated by the higher levels of silicon in the char from copolymers with higher polycarbonate content. For polymers with polydimethylsiloxane degree of polymerisation 20, 2.5% weight loss in N_2 occurs at 407–521° (21.9% PDMS), 390–472° (47.8% PDMS), 415–537° (62.8% PDMS); in air at 384–514° (21.9% PDMS), 340–446° (47.8% PDMS), 364–462° (62.8% PDMS). Activation energy of decomposition in N_2 41–208 kJ mol^{-1} (117–164 kJ mol^{-1} in air) depending on polydimethylsiloxane content [25]
Flammability: No self-supporting combustion. [5] Limiting oxygen index as a function of polydimethylsiloxane content shows a max. of 38–40% (15–30% polydimethylsiloxane). Limiting oxygen index 30–40% (6–81% PDMS, degree of polymerisation 2–40, ASTM D2863-70), 50% (18% PDMS, degree of polymerisation 5, ASTM D2863-70). Limiting oxygen index is independent of siloxane block length [26]
Environmental Stress: High resistance to electric discharge [1]
Chemical Stability: Resistant to aliphatic hydrocarbons and alcohols; dissolved by chlorinated and aromatic hydrocarbons [5]
Hydrolytic Stability: Very resistant to hydrol. [4]
Recyclability: Not recyclable

Applications/Commercial Products:



Processing & Manufacturing Routes: Formed by reaction of hydroxy-terminated oligomers (made by phosgenation of Bisphenol A) with 'chlorine-terminated' poly(dimethylsiloxane) in the presence of tertiary amines. Reaction of dimethylamino-terminated poly(dimethylsiloxane) with the elimination of dimethylamine and thermal cleavage is also used. Block copolymers are synth in soln. in two stages; a polydisperse α,ω-dichlorosiloxane oligomer is treated with bisphenol A in pyridine/CH_2Cl_2 to give an end-capped oligomer. [6,8] Depending on the relative amounts of oligomer and bisphenol A, chain extension of the siloxane block may occur. [8] Secondly, the end-capped siloxane oligomer is treated with phosgene and bisphenol A to form the (polydisperse) polycarbonate block *in situ*. [6,8] The block copolymer is isol. by precipitation with MeOH or after solvent evaporation. [6] This procedure gives a range of block copolymers with polydimethylsiloxane degree of polymerisation 2–100 and polycarbonate 3–70. [6,8] The polycarbonate block size depends on the ratio of α,ω-dichlorosiloxane to bisphenol A in the end-capping reaction. [9] Block copolymers may also be synth. by interfacial polymerisation using a carboxylic acid terminated polydimethylsiloxane oligomer; this gives a SiC linkage [20]
Applications: Coatings for aluminium or concrete to prevent ice formation, in laminates and fillers, selective membranes, impact modifiers

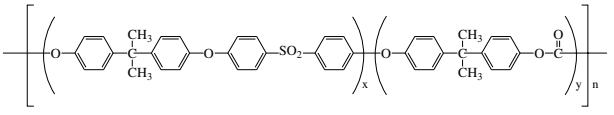
Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(ethylene oxide) P-470

Synonyms: *Polycarbonate-block-poly(ethylene oxide). Block copolymer of 4,4′-(1-methylethylidene)bis[phenol] with α-hydro-ω-hydroxypoly(oxy-1,2-ethanediyl) and carbonic acid*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polyethylene oxide
Monomers: Bisphenol A, Carbonic dichloride, Ethylene oxide
Material class: Synthetic Elastomers, Copolymers

Polymer Type: polyethylene oxide, bisphenol A polycarbonate
CAS Number:

CAS Reg. No.
108795-16-0



Molecular Formula: $[(C_{16}H_{14}O_3).(C_2H_4O).CO]_n$
Fragments: $C_{16}H_{14}O_3$ C_2H_4O CO

Applications/Commercial Products:

Processing & Manufacturing Routes: Microporous membranes (5% poly(ethylene oxide) 4000). Haemodialysis membranes (20–40% PEG 6000 or 20,000). Used in the separation of polar and non-polar gases, ultrafiltration, microfiltration, electrophoresis, desalination of sea-water

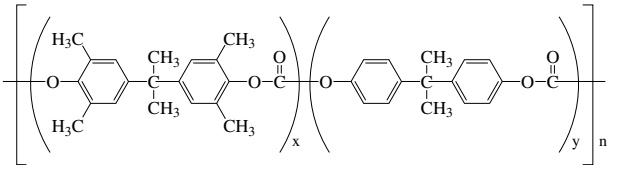
Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly[4,4′-isopropylidenediphenoxydi(4-phenylene)-sulfone] P-471

Synonyms: *Polycarbonate-block-polysulfone. Polycarbonate-polysulfone block copolymer*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate]
Material class: Thermoplastic, Copolymers
Polymer Type: polycarbonates (miscellaneous), polysulfone
Molecular Formula: $((C_{27}H_{22}O_4S).(C_{16}H_{14}O_3)_y)_n$
Fragments: $C_{27}H_{22}O_4S$ $C_{16}H_{14}O_3$



Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(methylmethacrylate) P-472

Synonyms: *Polycarbonate-block-poly(methylmethacrylate). Polycarbonate-poly(methylmethacrylate) block copolymer. Block copolymer of 4,4′-(1-methylethylidene)bis[phenol] with carbonic acid and methyl 2-methyl-2-propenoate. Poly(4,4′-[1,4-phenylenebis(1-methylethylidene)]bisphenol-co-carbonic acid)-block-poly(1-methoxycarbonyl)-1-methylethylene)*
Related Polymers: Poly(methylmethacrylate), Poly[2,2-propanebis(4-phenyl)carbonate]
Monomers: Bisphenol A, Carbonic dichloride, Methyl methacrylate
Material class: Thermoplastic, Copolymers
Polymer Type: acrylic, bisphenol A polycarbonate
CAS Number:

CAS Reg. No.	Note
122873-25-0	source based: carbonic dichloride
125321-92-8	source: carbonic acid

Molecular Formula: $[(C_5H_8O_2).C_3H_4O_2S.(C_{16}H_{14}O_3)]_n$
Fragments: $C_5H_8O_2$ $C_{16}H_{14}O_3$

Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly[2,2-propanebis[4-(2,6-dimethylphenyl)]carbonate] P-473

Synonyms: *Polycarbonate-block-poly(tetramethyl Bisphenol A carbonate)*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Poly[2,2-propanebis[4-(2,6-dimethylphenyl)]carbonate]
Monomers: Bisphenol A, Carbonic dichloride, Tetramethyl Bisphenol A
Material class: Thermoplastic, Copolymers
Polymer Type: polycarbonates (miscellaneous), bisphenol A polycarbonate
CAS Number:

CAS Reg. No.	Note
132410-03-8	source: carbonic acid

Molecular Formula: $[(C_{20}H_{22}O_3).(C_{16}H_{14}O_3)]_n$
Fragments: $C_{20}H_{22}O_3$ $C_{16}H_{13}O_3$

Poly[2,2-propane[4-(2,6-dimethyl)phenyl]carbonate]/Polystyrene (High impact) blend P-474

Related Polymers: Polystyrene (High Impact), Poly[2,2-propane[4-(2,6-dimethylphenyl)carbonate]
Monomers: Tetrabromobisphenol A, Styrene
Material class: Blends
Polymer Type: polycarbonates (miscellaneous), polystyrene
General Information: Tetramethylpolycarbonate is miscible in all proportions with polystyrene. [1,2,3,4,5,6]. However, phase separation occurs on heating (lower critical soln. temp. behaviour) [1,4,5,7,8]. The polymers are not miscible on a segmental level, but on a higher structural level [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 1.055 g/cm^3	20% tetramethylpolycarbonate, polystyrene MW 10000–30000 [7]

17	165–172°C	87.5% tetramethylpolycarbonate MW 40000, 12.5% polystyrene MW 250000 [3]
18	161°C	90% tetramethylpolycarbonate MW 52600, 10% polystyrene MW 289000 [4]
19	176°C	90% tetramethylpolycarbonate MW 67000, 10% polystyrene MW 200000 [2]

Vicat Softening Point:

No.	Value	Note
1	110°C	25% tetramethylpolycarbonate, 75% high-impact polystyrene B [6]
2	139°C	50% tetramethylpolycarbonate, 50% high-impact polystyrene B [6]
3	167°C	75% tetramethylpolycarbonate, 25% high-impact polystyrene B [6]

Surface Properties & Solubility:

Solubility Properties General: Interaction energy between tetramethylpolycarbonate [5] and polystyrene -0.75–-0.71 J cm_3 (-0.18–-0.17 cal cm^3) (30–80% tetramethylpolycarbonate) [5]. Interaction parameter 0.029 (tetramethylpolycarbonate (MW 67000), 50% polystyrene (MW 200000) [7]. This value is less negative for higher tetramethylpolycarbonate levels [7]
Solvents/Non-solvents: Sol. THF [2], CH_2Cl_2 [3,4,7], C_6H_6 [4]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1700 MPa	25% tetramethylpolycarbonate, 75% high-impact polystyrene [6]
2	2100 MPa	50% tetramethylpolycarbonate, 50% high-impact polystyrene [6]
3	2300 MPa	75% tetramethylpolycarbonate, 25% high-impact polystyrene [6]

Izod Notch:

No.	Value	Notch	Note
1	14 J/m	Y	25% tetramethylpolycarbonate, 75% high-impact polystyrene [6]
2	12 J/m	Y	50% tetramethylpolycarbonate, 50% high-impact polystyrene [6]
3	8 J/m	Y	75% tetramethylpolycarbonate, 25% high-impact polystyrene [6]

Electrical Properties:

Complex Permittivity and Electroactive Polymers: The variation of η'' with frequency (0.01Hz–100 kHZ) for several temps. (140–165°) for 25, 50 and 75% tetramethylpolycarbonate blends has been reported [3]

Optical Properties:

Volume Properties/Surface Properties: The appearance of the films can depend on the solvent from which they were cast [7]; films from CH_2Cl_2 are transparent [7]

Polymer Stability:

Thermal Stability General: The blends show phase separation on heating for 5 mins at 235–295°, depending on composition [4,5,8]. The process is reversible [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by casting from soln. [3,4,5,7]. A soln. containing 5% polymer in THF is cast onto a glass plate mounted on a heated block at 50–60° for 5 min [5]. Alternatively, CH_2Cl_2 may be used and the film left to dry at room temp. [3,4,7]. The films are then dried in a vacuum oven at 60–190° for 1–7 days [3,4,5,7]. Casting from toluene leads to crystallisation of the tetramethylpolycarbonate [7]
Applications: Suggested use as microwaveable dishes and car headlamp reflectors

Trade name	Supplier

Poly(propene-*alt*-carbon monoxide-*alt*-ethene) P-475

Synonyms: *1-Propene-carbon monoxide-ethene alternating copolymer. Aliphatic polyketones. Poly(propylene-alt-carbon monoxide-alt-ethylene)*
Related Polymers: Polypropylene, Polyethylene
Monomers: Propylene, Ethylene, Carbon monoxide
Material class: Thermoplastic, Copolymers
Polymer Type: polyethylene, polypropylenepolyketones
CAS Number:

CAS Reg. No.
121520-83-0

Molecular Formula: $[(C_3H_6).(C_2H_4).(CO)]_n$, $(C_6H_{10}O)_n$
Fragments: C_3H_6 C_2H_4 CO $C_6H_{10}O$
Additives: Stabilisers (to improve thermal stability for melt processabilty and stability to uv). Glass fibre; flame retardants
General Information: A high-melting polymer with good impact props., good dimensional heat stability and good barrier props.
Morphology: α-form: orthorhombic a 0.701, b 0.507, c 0.759 [1] a 0.691, b 0.512, c 0.76 [4]. β form: orthorhombic, a 0.796, b 0.478, c 0.759 [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26 g/cm^3	3% propylene [1]
2	d 1.24 g/cm^3	[1]
3	d 1.48 g/cm^3	30% glass fibre [1]
4	d 1.4–1.6 g/cm^3	flame retardant grades [1]

Melting Temperature:

No.	Value	Note
1	220°C	6% propylene [1,2]
2	170°C	17% propylene [1]

Glass-Transition Temperature:

No.	Value	Note
1	15°C	[1]
2	17°C	7% propylene [2]

Transition Temperature General: A sub-T_g γ-transition has been reported [1]. T_m increases with increasing CO content [1]. T_g decreases with increasing levels of sorbed water [3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. *m*-cresol, *o*-chlorophenol, trifluoroacetic acid (decomposes); Insol. common organic solvents

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	6 g/10 min	240°, 2.16 kg, ISO 1133 [1]
2	5 g/10 min	240°, 2.16 kg, ISO 1133, 30% glass fibre [1]

Polymer Solutions Dilute: 1.8 dl g^{-1} (*m*-cresol, 30°, 6% propylene), 1.52 dl g^{-1} (*m*-cresol, 90°, 6% propylene), 2.3 dl g^{-1} (phenol/trichlorobenzene, 30°, 6% propylene), 1.75 dl g^{-1} (phenol/trichlorobenzene, 100°, 6% propylene) [1]. Huggins constants for polymer containing 6% propylene have been reported [1]
Permeability of Gases: Diffusivity He 8.46×10^{-6} cm^2 s^{-1} (25°, amorph.), O_2 9.58×10^{-8} cm^2 s^{-1} (25°, amorph.), CO_2 $3.76 \times {}^{-8}$ cm^2 s^{-1} (25°, amorph.) [2,3]. Permeability He 2.35×10^{-7} cm^2 (atm min.)$^{-1}$, (25°, crystallinity 42%) [2,3], O_2 $5.03–6.43 \times 10^{-9}$ cm^2 (atm min)$^{-1}$ (25°, crystallinity 42%) [2,3], CO_2 $4.41–5.75 \times 10^{-8}$ cm^2 (atm min)$^{-1}$ (25°, crystallinity 42%) [2,3], N_2 1.23×10^{-9} cm^2 (atm min)$^{-1}$ (25°, crystallinity 42%) [2,3], CH_4 2.022×10^{-9} cm^2 (atm min)$^{-1}$, (25°, crystallinity 42%) [2,3], ethane 6.11×10^{-10} cm^2 (atm min)$^{-1}$, (25°, crystallinity 42%) [2,3]
Water Absorption:

No.	Value	Note
1	0.5 %	23°, 50% relative humidity ASTM D570 [1]
2	0.3 %	23°, 50% relative humidity, 30% glass fibre ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: The effect of shear controlled orientation in injection moulding (SCORIM) on the mechanical props. has been reported. Young's modulus and tensile strength both increase as a result of SCORIM processing [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1400 MPa	1400 N mm^{-2}, ISO/R 527 [1]
2	7300 MPa	7300 N mm^{-2}, 30% glass fibre, ISO/R 527 [1]
3	2500–6000 MPa	2500–6000 N mm^{-2}, flame retardant grades, ISO/R 527 [1]

Flexural Modulus:

No.	Value	Note
1	1400 MPa	1400 N mm^{-2}, ISO/R 527 [1]
2	7000 MPa	7000 N mm^{-2}, 30% glass fibre, ISO/R 527 [1]
3	2500 MPa	2500 N mm^{-2}, flame retardant grades, ISO/R 527 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	55 MPa	55 N mm^{-2}, ISO/R 527 [1]	350%
2	120 MPa	120 N mm^{-2}, 30% glass fibre, ISO/R 527 [1]	3%
3	55–90 MPa	55–90 N mm^{-2}, flame retardant grades, ISO/R 527 [1]	2.5–9%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	60 MPa	25%	60 N mm^{-2}, ISO/R 527 [1]

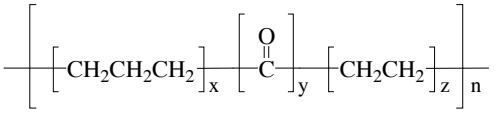
Miscellaneous Moduli:

No.	Value	Note	Type
1	1300 MPa	1300 N mm^{-2}, 1h, 0.5% elongation, ISO 899 [1]	creep modulus
2	900 MPa	900 N mm^{-2}, 1000h, 0.5% elongation, ISO 899 [1]	creep modulus

Hardness: Rockwell R105 (ASTM D785) [1]
Friction Abrasion and Resistance: Coefficient of dynamic friction 0.19 (against steel, ASTM D1894); 0.28 (against brass, ASTM D1894); 0.17 (against aluminium, ASTM D1894); 0.31 (against self, ASTM D1894). Taber abrasion resistance 12 mg (1000 cycles)$^{-1}$ (1 kg load, CS-17 wheel, ASTM D1044) [1]
Izod Notch:

No.	Value	Notch	Note
1	1500 J/m	Y	ISO 180/1A [1]
2	8000 J/m	Y	30% glass fibre ISO 180/1A [1]

Polymer Stability:
Decomposition Details: Thermodecomposition is a complex process [1]
Chemical Stability: Has good chemical resistance. Slight swelling can be caused by solvents which are capable of hydrogen-bonding or which have a chemical composition similar to that of the polymer. Aq. solns. of weak acids and bases have little effect; is attacked by strong acids and bases particularly at elevated temps. and with prolonged exposure [1]



Applications/Commercial Products:
Processing & Manufacturing Routes: Perfectly alternating terpolymers are obtained by using transition metal (e.g., palladium) catalysts [1]. Suitable for injection moulding, blow moulding, extrusion and rotational moulding
Applications: Applications due to good barrier props. in food packaging

Trade name	Supplier
Carilon	Shell Chemicals

Poly(propene-*co*-carbon monoxide-*co*-ethene) P-476

Synonyms: *1-Propene-carbon monoxide-ethene copolymer. Aliphatic polyketone. Poly(propylene-co-carbon monoxide-co-ethylene)*
Related Polymers: Polypropylene, Polyethylene, Poly(propene-*alt*-carbon monoxide-*alt*-ethene)
Monomers: Propylene, Carbon monoxide, Ethylene
Material class: Thermoplastic, Copolymers
Polymer Type: polyethylene, polypropylenepolyketones
CAS Number:

CAS Reg. No.
88995-51-1

Molecular Formula: $[(C_3H_6)_x(CO)_y(C_2H_4)_z]_n$
Fragments: C_3H_6 CO C_2H_4
General Information: A white highly crystalline solid with good impact props. Is dimensionally heat stable

Volumetric & Calorimetric Properties:
Transition Temperature General: T_m increases with increasing CO content [1]

Mechanical Properties:
Mechanical Properties General: Mechanical props. are dependent on the amount of CO [1]

Polymer Stability:
Environmental Stress: Non-alternating copolymers are photodegradable; at room temp. uv irradiation causes chain cleavage following a Norrish-II type process [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Can be synth. by free-radical polymerisation or by using γ-irradiation [1]

Poly(1-propenyl ether functional siloxane) P-477

Related Polymers: PDMS [polymethyldimethylsiloxane fluid]
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones
Molecular Formula: $[(C_2H_6OSi).(C_{11}H_{22}O_3Si)]_n$
Fragments: C_2H_6OSi $C_{11}H_{22}O_3Si$
Molecular Weight: MW 2000–3000
General Information: Poly functional siloxanes can be made from siloxane monomers and oligomers in order to prod. precisely determined products but use of polymethylhydrogen-*co*-dimethyl siloxane is likely to be commercially more important. Electron beam-induced cationic polymerisation takes place rapidly and at low radiation doses [1]
Miscellaneous: Incorporation of vinyl groups into the side chain allow ready polymerisation by UV or electron beam in presence of photoinitiator

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymethyldimethylsiloxane fluid [1,2] is reacted with 1-allyloxy-4-(propyloxy)butane (PAB) in the presence of a noble metal catalyst for 1h at 65°. The product can be readily polymerised in the presence of an onium salt photoinitiator by UV radiation or an electron beam
Applications: Potentially useful in high speed coatings. Polyfunctional siloxane very rapidly polymerises with photoinitiator and UV or electron beam

Poly(propyl acrylate) P-478

Synonyms: *Poly[1-(propoxycarbonyl)ethylene]. Poly(propyl 2-propenoate)*
Monomers: Propyl acrylate
Material class: Natural elastomers
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
24979-82-6

Molecular Formula: $(C_6H_{10}O_2)_n$
Fragments: $C_6H_{10}O_2$
Molecular Weight: The MW can range from 1000–5000000
Additives: Soap-urea, activated thiol, soap-sulfur, lead thiourea, thiourea, diamine, carbon black, etc.

General Information: A soft, tacky polymer with low T_g, good thermal stability, low resistance to oils and non-polar solvents; it is only used commercially as copolymer. It forms copolymers with a variety of monomers (e.g. polyolefins, vinyl acetate, vinyl chloride) to give a wide range of products

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d_4^{25} 1.1 g/cm^3

Volumetric Properties General: Molar volume 103 cm^3 mol^{-1}
Melting Temperature:

No.	Value	Note
1	-37°C	
2	-25°C	emulsion or aq. soln. polymer, DSC 20° min^{-1}, mid point

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18.52 J$^{1/2}$ cm$^{-3/2}$. Molar cohesive energy 35.3 kJ mol^{-1}
Plasticisers: Thiokol TP-759, Plastolein 9720, Admex 760
Solvents/Non-solvents: Sol. C_6H_6, toluene, xylene, CH_2Cl_2, $CHCl_3$, dichloroethane, chlorobenzene, dioxane, 2-butanone, diisopropyl ketone, cyclohexanone, butyl acetate, isobutyl propionate, cyclohexyl acetate, cyclohexanol (hot), isobutanol (hot). Insol. aliphatic hydrocarbons, hydrogenated naphthalenes, Et_2O

Transport Properties:

Polymer Solutions Concentrated : Temporary contact between polymer chains results in the formation of gels which cannot be processed satisfactorily
Permeability of Gases: Has low permeability to gases and liqs.

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	1.72–2.76 MPa	250–400 psi, pure gum, ASTM D412	450–750%
2	6.89–17.24 MPa	1000–2500 psi, black, ASTM D412	150–450%

Viscoelastic Behaviour: Has reasonable rebound when cold; very good when hot. Has a fair to good resistance to tear
Hardness: Durometer A40-A90
Friction Abrasion and Resistance: Has good abrasion resistance

Polymer Stability:

Polymer Stability General: Retains original props. under normal use conditions
Thermal Stability General: Stable to heat up to 250°. Decomposes slowly unless subjected to extreme heat conditions. Excellent resistance to heat ageing
Decomposition Details: Decomposition between 300–500° gives mainly propylene, propanol and CO_2
Flammability: Readily flammable
Environmental Stress: Unaffected by normal uv degradation, as the primary uv absorption occurs below solar spectrum of 290 nm. Uv stabilisers improve stability. Excellent resistance to oxidation
Chemical Stability: Undergoes cross-linking and degradation when heated in the presence of a free-radical initiator
Hydrolytic Stability: Stable to both acid and alkaline hydrol.

Applications/Commercial Products:

Processing & Manufacturing Routes: Commercially it is predominantly prepared by free radical emulsion polymerisation and soln. polymerisation. It is processed by injection moulding, blow moulding, extrusion and thermoforming. Stearic acid, TE-80 and Vanfore AP2 are added as processing aids
Applications: Exclusively used for applications in adhesives and coatings. It is used in paints, coatings and lacquers in the paper industry. It is also used in radiation curable systems, adhesives and sealing compounds

Polypropylene P-479

Synonyms: *Polypropene. PP. Poly(1-propene). Poly(methyl ethylene). Propene polymer. Propylene polymer*
Related Polymers: Polypropylene, isotactic, Polypropylene, atactic, Polypropylene, syndiotactic, Polypropylene Film, Polypropylene Fibres, Polypropylene powder/fibre filled, Polypropylene Blends, Polypropylene copolymers, Polypropylene (chlorinated), Polypropylene oxides
Monomers: Propylene
Material class: Thermoplastic
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.	Note
9003-07-0	
25085-53-4	isotactic

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Molecular Weight: MW 25000–500000, MW 80000–500000 (commercial). M_w/M_n 2.1–8.0
Additives: Stabilisers: hindered phenol, Irganox 1010, Ethyl A0330, Topanol CA, Goodditte 3114, phosphites. Uv stabilisers: hindered piperidines, uv absorbents. Clarifier: Millad. Surface improver: PTS-CEL. Sarmalen
Tacticity: Commercial polypropylene is a complex mixt. of varying amounts of isotactic, stereoblock and atactic forms, each with a given MW distribution. In general, references tend to be to this product unless tacticity is specifically stated. Isotactic polypropylene is the major product from Ziegler-Natta and more recent order-specific catalysts. Syndiotactic polypropylene results from regular, alternating monomer insertion. Non-crystalline, atactic polypropylene exhibits random location of the pendant methyl groups. Stereoblock is defined as comprising segments of isotactic and atactic polypropylene. Commercial polypropylene is mainly isotactic. Tradenames given refer to commercial materials [1,2]
Identification: Thermoplastic [3]. Cl, N, S, P normally absent. Burns with bluish, non-smoky flame with flaring molten drops. Little or no residue, waxy, slightly acrid odour on extinction. On pyrolysis becomes transparent, melts at about 170° and decomposes at about 350° with evolution of low MW hydrocarbons. The isotactic index [4] is the fraction insoluble in boiling heptane though on a commercial basis, solubility in xylene or decalin is used to determine a measure of stereoregularity [5]. Because of the lack of chemical reactivity, physical tests are normally preferred. Polypropylene floats in water like polyethylene polyethylene (PE) and poly(4-methyl-1-pentene polymethylpentene) (PMP); floats in isophorone (distinct from PE) and sinks in 80/20 v/v. alcohol/water (distinct from PMP) [3]. Spot test: HgO in H_2SO_4 gives a yellow colour [45]

Miscellaneous: Polypropylene is prod. in a wide variety of MW, MW distributions and crystallinities in addition to modification by fillers, additives, co-polymerisation and blending. Hence hundreds of grades are commercially available [1,2]. Polypropylene use has increased at a higher rate than all other thermoplastics. Growth rate is such that it tends to be limited only by overall economic growth. Polymerisation propagation rate constant K_p 2000000 × exp (-32000/RT) (50–150°, radical telomerisation) [68,69]. Activation Energy of Propagation E_p 23.4 kJ mol^{-1}. (gas phase) [70]. It has been said that polypropylene is not a top grade plastic, but it has an attractive price to performance ratio, especially with respect to blends [50] see polypropylene blends

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.903 g/cm^3	ASTM 792A-2 [1]
2	d 0.9–0.91 g/cm^3	homopolymer
3	d 0.89–0.905 g/cm^3	copolymer
4	d 0.88–0.905 g/cm^3	impact modified [6,7]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8.1×10^{-5}–0.0001 K^{-1}	ASTM D696	L
2	6.8×10^{-5}–9.5×10^{-5} K^{-1}	copolymer and impact modified copolymer [6]	L
3	6.5×10^{-5} K^{-1}	-30°-0°	L
4	0.000105 K^{-1}	0°-30°	L
5	0.000145 K^{-1}	30°-60°, ASTM D696 [7]	L

Equation of State: Tait and Spencer-Gilmore equation of state information has been reported [84,85,86,87,88].
Thermodynamic Properties General: Effects of isotacticity and crystallisation temp. on crystalline struct. and thermodynamic props. have been reported [54]. C_p values have been reported [82,91]. A detailed investigation of work on T_m, T_g, C_p, enthalpy, entropy and Gibbs function has been reported [82,83]
Latent Heat Crystallization: $\Delta H_{cryst.}$ 87–92 J g^{-1} [20]. ΔH_{fusion} 209 J g^{-1} (100% crystalline, 92–95% isotactic, MW range 22000–947000). $\Delta H_{cryst.}$ 97 J g^{-1} (approx.) (>95% isotactic, MW range 22000–947000), 40 J g^{-1} (approx., <50% isotactic, MW range 22000–947000) [46]. Values vary with T_m, tacticity and MW range [47]. Other $\Delta H_{cryst.}$ values have been reported [49]. Heat of polymerisation and entropy of polymerisation values have been reported [71]. ΔH 86.5 kJ mol^{-1}. ΔS° 167 J K^{-1} mol^{-1} (25°, monomer gas phase, polymer gas phase); ΔH 104 kJ mol^{-1}. ΔS° 205 J K^{-1} mol^{-1}, 25°, monomer gas phase, polymer crystalline/partly crystalline); ΔH 84 kJ mol^{-1}. ΔS° 113 J K^{-1} mol^{-1} (25°, monomer liquid phase, polymer condensed amorph. phase); ΔH 69 kJ mol^{-1} (-78°, monomer soln. phase butane, polymer condensed amorph. phase) [71]
Thermal Conductivity:

No.	Value	Note
1	0.117 W/mK	0.00028 cal (cm s °C)$^{-1}$, ASTM C177 [6]
2	0.25 W/mK	[14]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.926 kJ/kg.C	[7,12]	P

Melting Temperature:

No.	Value	Note
1	168–175°C	crystalline, hompolymer and copolymer
2	160–168°C	crystalline, impact modified copolymer [6]

Glass-Transition Temperature:

No.	Value	Note
1	-20°C	amorph. [6,13]

Transition Temperature General: T_g varies with increasing M_n to an assymptotic value [13]. T_g dependant on tacticity and thermal history of the sample [7]. T_g is more MW dependent than T_m, hence effectiveness of low MW plasticisers [72]
Deflection Temperature:

No.	Value	Note
1	50–60°C	1.84 MPa, (264 psi), ASTM D648, homopolymer
2	96–120°C	225–250°F, 0.45 MPa, (66 psi), ASTM D648, hompolymer [6,7]
3	55–60°C	130–140°F, 1.84 MPa, (264 psi), ASTM D648, copolymer
4	85–105°C	185–220°F, 0.45 MPa, (66 psi), ASTM D648, copolymer [6]
5	45–55°C	115–135°F, 1.84 MPa, (264 psi), ASTM D648, impact modified
6	75–90°C	167–192°F, 0.45 MPa, (66 psi), ASTM D648, impact modified [6]

Vicat Softening Point:

No.	Value	Note
1	138–155°C	ASTM D1525 [7]

Brittleness Temperature:

No.	Value	Note
1	25°C	ASTM D746 [7]

Surface Properties & Solubility:

Solubility Properties General: Solubility varies greatly with tacticity
Cohesive Energy Density Solubility Parameters: δ 19.2 $J^{1/2}$ $cm^{-3/2}$ (calc.) [8,10]; δ 18.8 $J^{1/2}$ $cm^{-3/2}$ (25°) [9,10]
Internal Pressure Heat Solution and Miscellaneous: ΔH_s 31 J g^{-1} (18000 g mol^{-1}, C_6H_6, 25°) [55,56]; 6.4 J g^{-1} (18000 g mol^{-1}, CCl_4, 25° [55,57]; 3.9 J g^{-1}) (18000 g mol^{-1}, cyclohexane, 25°) [55,56]. Other heats of soln. values have been reported [58]
Plasticisers: Plasticisers used include esters of nonanoic acid (10–15%, by weight), which lower brittleness temp. and improve elongation at break [2,97], petrolatum which improves low temp. performance [2,98]; DOS (15% by weight) plus a cross-linking agent (5% by weight) which gives good low temp. props. without sacrificing room temp. strength, and bis(hexyl)azelate and bis(2-ethylhexyl)adipate which are used in food applications
Solvents/Non-solvents: Sol. hydrocarbons (above 80°), halogenated hydrocarbons (above 80°), higher aliphatic esters and ketones, diamyl ether [11]. Insol. all common organic solvents (room temp.), polar organic solvents, inorganic solvents [11]

Transport Properties:

Transport Properties General: Transport props. vary with composition (grade)

Melt Flow Index:

No.	Value	Note
1	0.25–0.35 g/10 min	ASTM D1238L, pipes and sheets
2	1.5–2 g/10 min	ASTM D1238L, films
3	5–7 g/10 min	ASTM D1238L, injection moulding
4	7–10 g/10 min	ASTM D1238L, cast and tubular film[7]
5	0.3 g/10 min	MW 650000
6	1.2 g/10 min	MW 410000
7	5.3 g/10 min	MW 300000
8	13 g/10 min	MW 145000 [16]
9	0.25–70 g/10 min	range available according to grade [1]

Polymer Solutions Concentrated : K_0 values have been reported [53]
Polymer Melts: Polymer melts vary widely according to grade. Complex dynamic viscosity values have been reported [35,36]. η^* 470–4720 Pa s depending on M_n and low frequency storage modulus
Permeability of Gases: Permeability decreases with decreasing density and increasing crystallinity
Water Absorption:

No.	Value	Note
1	0.03 %	$\frac{1}{8}$" thick, 24h, ASTM D570 [6,7]

Gas Permeability:

No.	Gas	Value	Note
1	He	0.018 cm^3 mm/ (m^2 day atm)	2.8 × 10^{-14} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]
2	H_2	2.03 cm^3 mm/ (m^2 day atm)	3.1 × 10^{-12} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]
3	N_2	0.021 cm^3 mm/ (m^2 day atm)	3.3 × 10^{-14} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]
4	O_2	0.111 cm^3 mm/ (m^2 day atm)	1.7 × 10^{-13} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]
5	CO_2	0.45 cm^3 mm/ (m^2 day atm)	6.9 × 10^{-13} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]
6	H_2	3.34 cm^3 mm/ (m^2 day atm)	5.1 × 10^{-12} cm^2 (s Pa)$^{-1}$, 20°, 50% cryst. [51]

Mechanical Properties:

Mechanical Properties General: Modifications to mech. props. have been reported [32,92,93]

Tensile (Young's) Modulus:

No.	Value	Note
1	1140–1550 MPa	165–225 kpsi, ASTM D638, homopolymer
2	895–1240 MPa	130–180 kpsi, ASTM D638, copolymer [6]
3	345–1035 MPa	50–150 kpsi, ASTM D638, impact modified
4	1032–1720 MPa	ASTM D638 [7]

Flexural Modulus:

No.	Value	Note
1	1172 MPa	ASTM D790 [7]
2	1172–1724 MPa	170–250 kpsi, 28° (73°F)
3	345 MPa	50 kpsi, 93°, (200°F)
4	241 MPa	35 kpsi, 121°, (250°F)
5	896–1379 MPa	130–200 kpsi, 28°, (73°F), ASTM D790, homopolymer [6]
6	276 MPa	40 kpsi, 93° (200°F)
7	207 MPa	30 kpsi, 121°, (250°F), ASTM D790, copolymer [6]
8	414–1103 MPa	60–160 kpsi, 28°

Tensile Strength Break:

No.	Value	Note	Elongation
1	31–41 MPa	4500–6000 psi, ASTM D638, homopolymer [6]	100–600%
2	28–38 MPa	4000–5500 psi, ASTM D638, copolymer [6]	200–500%
3	24–34 MPa	3500–5000 psi, ASTM D638, impact modified copolymer [6]	200–700%

Flexural Strength at Break:

No.	Value	Note
1	41–55 MPa	Flexural strength at break or yield, 6000–8000 psi, ASTM D790, homopolymer [6]
2	34–48 MPa	5000–7000 psi, ASTM D790, copolymer
3	28–41 MPa	4000–6000 psi, ASTM D790, impact modified copolymer [6]

Compressive Modulus:

No.	Value	Note
1	1034–2068 MPa	150–300 kpsi, ASTM D695 [6]

Elastic Modulus:

No.	Value	Note
1	1170–1720 MPa	170–250 kpsi, ASTM D790, general purpose
2	690–1380 MPa	100–290 kpsi, ASTM D790, high impact
3	1310–4200 MPa	190–600 kpsi, ASTM D790, flame retardant [22]

Poisson's Ratio:

No.	Value	Note
1	0.4	
2	-0.22	1.6% strain - a microporous auxetic PP has been reported [17]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	29.3–38.6 MPa	11–15%	ASTM D638, mainly isotactic [7]

2	31–37 MPa		4500–5400 psi, ASTM D638, homopolymer [6]
3	22–30 MPa		3200–4300 psi, ASTM D638
4	11–28 MPa		1600–4000 psi, ASTM D638, impact modified copolymer [6]

Compressive Strength:

No.	Value	Note
1	38–55 MPa	5500–8000 psi, ASTM D695, homopolymer
2	24–55 MPa	3500–8000 psi, ASTM D695
3	24–41 MPa	3500–6000 psi, ASTM D695, impact modified copolymer [6]

Miscellaneous Moduli:

No.	Value	Note	Type
1	552 MPa	shear, d 0.91 g cm^{-3}	Creep modulus
2	526 MPa	shear, d 0.907 g cm^{-3}, injection	Creep modulus
3	1510 MPa	d 0.91 g cm^{-3}, tensile	E_c
4	1590 MPa	d 0.907 g cm^{-3}, tensile, injection moulding	E_c

Impact Strength: Notched impact strength improves with converted 60% β-form and by surface chlorination, see
Viscoelastic Behaviour: Viscoelastic behaviour has been reported [23,24,25,96]
Hardness: Shore D70–D80 (ASTM D1706, mainly isotactic); Rockwell R80–R102 (ASTM D785, commercial homopolymers); Rockwell R65–R96 (ASTM D785A); Shore D70–D73 (ASTM D2240, general commercial copolymers). Rockwell R50–R60 (ASTM D785A); Shore D45–D55 (ASTM D2240, impact modified copolymers). Rockwell C55–C60 (ASTM D785B); Rockwell R95 (ASTM D785A); Rockwell R80 (ASTM D785A, extrusion grade medium impact copolymer); Rockwell R60 (ASTM D785A, extrusion grade high-impact copolymer); Rockwell C60–C65 (ASTM D785B); Rockwell R99–R100 (ASTM D785A, general purpose, injection moulding homopolymer); Rockwell R98–R100 (ASTM D785A, thin complex part injection moulding homopolymer) [1,6,7]
Fracture Mechanical Properties: Fracture is brittle below about 30° for the homopolymer. Plasticising effect of ethylene additions suppresses yield stress and ductile/brittle transition temp. Fracture toughness, K_c 5.5–7.5 Mn $m^{-3/2}$ [34]. Can be altered by fillers [32,33] see polypropylene, filled and polypropylene polyethylene copolymer
Friction Abrasion and Resistance: Wear 0.03 mm^3 m^{-1} (max.) (5.5 N load, simulated marine slurries), 1.1 mm^3 m^{-1} (5.5 N load, 120 μm silicon carbide paper, dry, shows ductile flow at surface. The grade used is not stated) [18]. Particle erosion 17.72 mm^3 cm^{-2} (250 g of 120 grade silicon carbide at 0.123 g s^{-1}). Cavitation erosion 11–20 mm^3 cm^{-2} (5h). Abrasive wear 9.14 mm^3 cm^{-2} (sample, Shore D76) [19]
Izod Notch:

No.	Value	Notch	Note
1	20–320 J/m	Y	0.4–6 ft lb in^{-1},isotactic, ASTM D256 [1,6,7]
2	5–40 J/m	Y	0.1–0.7 ft lb in^{-1}, isotactic, ASTM D256 [1,6,7]
3	80–130 J/m	Y	23°, extrusion grade [1,6,7]
4	530 J/m	Y	34°, medium impact [1,6,7]
5	640 J/m	Y	23°, high impact [1,6,7]
6	35–65 J/m	Y	23°, general purpose [1,6,7]
7	20–35 J/m	Y	23°, injection moulded [1,6,7]
8	130–530 J/m	Y	23°, general purpose, medium-high impact [1,6,7]
9	70 J/m	Y	23°, injection moulded [1,6,7]

Electrical Properties:

Electrical Properties General: Excellent electrical props., especially low electrical losses. May be modified by filler content where applicable [23]. Electrical conductivity [6] is proportional to exp. (inverse temp.). Plots have different slopes above and below the softening temp. (390K). Observed high activation energy at T >390K implies intrinsic conductivity, low activation energy at T <90K implies impurity conductivity. Conductivity increases with sample thickness. Variations with temp. have been reported [21]. Other electrical props. have been reported, see polypropylene films
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.2–2.3	1 kHz	ASTM D150 [7]
2	2.2–2.6	10 kHz–1 GHz	ASTM D1531

Dielectric Strength:

No.	Value	Note
1	24 $kV.mm^{-1}$	610 V mil^{-1}, ASTM D149 [6,7]
2	17 $kV.mm^{-1}$	120° [6,7]
3	20 $kV.mm^{-1}$	500 V mil^{-1}, ASTM D149, impact modified copolymer [6]

Arc Resistance:

No.	Value	Note
1	136–185s	ASTM D495 [7]

Static Electrification: If the concentration of light positive ions is greater than 500000 cm^{-3} (20°, 40% relative humidity) the surface charge density tends to zero [78]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0003	60 Hz	ASTM D510 [7]
2	0.001	100 MHz	ASTM D510 [7]
3	0.0005–0.0018	1 MHz	[7]
4	0.0002–0.0003	1 MHz	ASTM D150 [22]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.49	25°

Transmission and Spectra: Solid state nmr of atactic and isotactic polymer have been reported [80,81] (see also isotactic polypropylene and atactic polypropylene). FT-ir spectral data have been reported [90]. Other ir spectral data have been reported [91,95]
Molar Refraction: Concentration dependence of refractive index has been reported [61,62,63,64,65,66,67]
Volume Properties/Surface Properties: Translucent-opaque (ASTM D791) [22], yellow index 3–15% (ASTM D1925), gloss 48–51% (ASTM D523), luminosity 70 (min.) (ASTM D1635) [7]

Polymer Stability:

Polymer Stability General: Polymer stability is generally good

Upper Use Temperature:

No.	Value	Note
1	85°C	approx.
2	120°C	approx. [23]

Decomposition Details: Pyrolysis occurs at 469° and combustion occurs at 550°. Thermal decomposition reaction is predominantly 'back-biting' to the fifth or ninth carbon of the chain end
Flammability: Flammability has been reported [44,50,51,52,53,57]. Lowest flame spread rate 0.04–0.06 cm s^{-1} [54]. Flammability can be reduced by various additives phosphorus or halogen compds [56,58], antimony compounds [53,54,58], ammonium polyphosphate [59,60] and various inorganic fillers [61,62,63]. Limiting oxygen index 18.6% (ASTM D2863) [37]; 17.0% (ASTM D2863) [38]
Environmental Stress: Readily stress crazes [23]. Does not stress crack (ASTM D1693) [7]. Subject to uv degradation, with deterioration of tensile props., with maximum photochemical sensitivity at 370 nm [23,26]. Outdoor lifetime 0.2 y (50% loss of tensile and impact props.)
Chemical Stability: Attacked by oxidising agents [2,41,42,43]; photo-oxidative degradation leads to embrittlement. Antioxidants are always added to commercial grades. Decomposed by sulfuric acid above 100° [2] generating CO_2
Hydrolytic Stability: Excellent hydrolytic stability [2]
Recyclability: Recycled polypropylene can be blended with virgin material to give a 'monopolymer blend' [99]. Because PP undergoes rapid thermomechanical degradation, re-stabilising is necessary [99]

Applications/Commercial Products:

Processing & Manufacturing Routes: Early batch manufacture using $TiCl_3$ catalysts activated by $Al(C_2H_5)_2Cl$ in a hydrocarbon medium was replaced by continuous processes following basically the same reaction route. Older plants still use advanced $TiCl_3$ catalysts in the Solvay process, giving less catalyst residue and an atactic fraction low enough not to need separation. Counter-current washing of the polymer slurry with fresh monomer ensures high purity in the Sumitomo process. $MgCl_2$ - supported, high yield catalysts, introduced by Montedison and Mitsui Petrochemicals, give sufficiently low catalyst residue not to need removal but atactic fraction separation is still required. Current (simplified) plants based on these superactive supported catalysts have lower environmental impact due to reduced waste/recovery requirements and lower energy consumption. Metallocene catalyst processes are being commercialised by some producers. Recent developments have enabled polypropylene similar to commercial Ziegler-Natta materials to be prod. but with narrow MW distributions (M_w/M_n 2). High yield of isotactic fraction is obtained or, with an appropriate variation of catalyst, syndiotactic [1,28,29,30,31]. Injection moulding process temp. is traditionally 260–290° [6] but with current high flow rate polymers can be as low as 200°. Blow moulding is finding application with newer grades. Extrusion blow moulding uses lower melt temp. (205–215°); injection blow moulding is at higher temp. Stretch blow moulding causes biaxial orientation increasing stiffness, low temp. impact strength and clarity. In extrusion a temp. range of 205–260° is possible using low melt flow rate, high MW grades. Modifications, including graft co-polymerisation, are often used. Thermoforming is not a traditional way of processing polypropylene but newer grades and refined equipment have overcome the narrow temp. range required and the tendency to sag
Mould Shrinkage (%):

No.	Value	Note
1	1–2.5%	0.01–0.025 in/in linear, ASTM D955, homopolymer [6]
2	2–2.5%	0.02–0.025 in/in linear, ASTM D955, copolymer [6]
3	1–2.5%	0.01–0.025 in/in linear, ASTM D955, impact modified copolymer [6]

Applications: Because of the range of struct./property variations available, polypropylene grades are available to suit most polymer processing technologies. Injection moulded components are used as automotive parts (fascias, bumpers, batteries, etc.) appliances, consumer products (closures, integrally hinged boxes, child-proof caps, toys, cups, dishes, outdoor furniture), rigid packaging, medical products (syringes, pans, trays, utensils). Blow moulded products include bottles (high clarity) and automotive parts. Extrusion and thermoforming forms some pipes and profiles but mostly sheets which are then thermoformed for food containers, trays (esp. for microwavability). Fibres see polypropylene fibres used in carpeting, non-woven fabrics. Films see polypropylene films used in packaging

Polypropylene, Aluminium filled P-480

Synonyms: *PP, aluminium filled*
Related Polymers: Polypropylene, Isotactic Polypropylene, Polypropylene, Filled
Monomers: Propylene
Material class: Composites
Polymer Type: polypropylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9003-07-0	
25085-53-4	isotactic

Additives: Aluminium (as powder, fibre or flake)
General Information: Although deleterious to mech. props. under some circumstances aluminium may be used to obtain a lightweight, electrically and thermally conductive composite
Morphology: Crystallinity calculated from DSC thermograms agrees with the estimate from x-ray studies. Crystallinity decreases with increasing Al powder content up to a content of 1.7%. Crystallinity then shows a small increase up to filler content of 3.3% [4]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Thermal conductivity of polypropylene filled with aluminium fibre can be adequately predicted by Nielsen's theoretical development. An increase relative to the unfilled polymer of about 2 times at 12 vol.% Al and 8 times for 30 vol.% has been reported [1,2]. The gradual increase in thermal conductivity of PP filled with aluminium powder gives good agreement with several two-phase literature models. A non-linear increase in Vicat softening point with filler volume level occurs [4]

Transport Properties:

Polymer Melts: Melt viscosity of aluminium powder filled isotactic polymer shows power law dependence on shear stress at temps. 180–220°. Melt viscosity increases with aluminium content to a maximum at approx. 9% aluminium, decreasing with increasing aluminium content beyond this level to less than that of unfilled polymer at 26% aluminium. Die swell ratio and first normal stress difference decrease with increasing aluminium content to a minimum also at approx. 9% aluminium [4]

Mechanical Properties:

Mechanical Properties General: Tensile props. are dependent on crystallinity, decreasing with increasing aluminium powder content [4]. Tensile modulus shows a drastic decrease at 1.63% aluminium and only a slight further decrease at greater aluminium levels. Tensile strength decreases steadily as aluminium content increases, while elongation at break decreases sharply at 0.33% aluminium and then more gradually. Flexural modulus increases steadily with increasing aluminium content. Flexural strength increases up to 1% aluminium then decreases slightly up to 3% aluminium and increases again up to 7% aluminium, relative to unfilled isotactic polymer [3]. These trends are less marked if aluminium fibres are used, especially with polymer modified to give some polymer-filler adhesion [1]
Impact Strength: There is an initial increase in Izod impact strength with increasing aluminium powder content up to 5% aluminium but then a decrease with further increasing aluminium content [3]

Electrical Properties:

Electrical Properties General: Spherical (or irregular) shaped filler particles need to be present at >38 vol.% to obtain a conductive composite - defeating cost and density advantages. If aluminium fibres are used, resistivity as low as 200 Ω cm at 7.7 vol.% aluminium is possible. The greater the aspect ratio of the fibres (or flakes) the lower the filler content at which resistivity falls sharply [1]. The conductivity of polypropylene-aluminium composites prepared by mech. mixing or by polymerisation filling follows the percolation theory. Coefficients of conductivity anisotropy range from $0.1–10^{-12}$ depending on the volume fraction of filler [5]

Polymer Stability:

Thermal Stability General: Increasing aluminium filler content raises the activation energy of the composite and hence increases thermal stability [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Roll milling at approx. 160–200° [1,3]
Applications: EMI shielding, static electricity dissipation, thermal conductivity - especially where low density and/or reduced cost are important

Polypropylene blends P-481

Synonyms: *Polypropene blends. PP blends. Polypropylene alloys. PAB's*
Related Polymers: Polypropylene, Polypropylene copolymers, Blends with polyethylene, Blends with propylene-ethylene copolymer, EPDM blends, Vulcanised, Blends with nylon, Blends with rubber, Blends with polycarbonate, Blends with styrenes, Blends with polyester, Isotactic polypropylene, Polypropylene films
Material class: Thermoplastic, Blends
Polymer Type: polypropylene
Additives: Compatibilisers: a copolymer or graft or by reactive blending
General Information: Blended polymers are rapidly increasing their market share. Polypropylene is blended with other polymers to improve toughness, impact strength, mech. props., chemical resistance, flame retardance, processability (very important), etc. Most commercially important are blends with polyethylene, propylene-ethylene random copolymer, ethylene-propylene elastomers (EPM, EPDM) and nylons. A recently expanding area is thermoplastic elastomer blends such as polypropylene with natural rubber, butyl rubber, butadiene rubber, modified butadiene rubbers, etc. Also significant but of lesser commercial importance as yet are blends with polycarbonate, styrenics and thermoplastic polyesters
Morphology: Almost all blends are immiscible and normally comprise a dispersion of one component within a matrix of the other. Blend props. are controlled by morphology, composition, compounding method and processing methods. With some compositions, the distinction between a blend and a copolymer becomes vague. Micromorphology depends on one of three situations; simultaneous crystallisation of both components (when T_c ranges overlap), crystallisation of one component in the presence of the liq. phase of the other or crystallisation of one component in the presence of a solid phase of the second (heterogeneous nucleation)
Miscellaneous: By the very nature of blends, large variation in props. occurs as a result of proportions of components, and the exact nature of components, method of mixing, as well as all the usual causes of variation. It follows that where props. are given, ranges may be very wide and not necessarily exhaustive. Blends of PP, rheology of such blends, melt mixing and applications have been reported [1]. Eastern Bloc work on polymer blends has developed rather differently from western countries

Polypropylene blends with polyethylene P-482

Synonyms: *PP-PE blends. Polypropene-polyethene blends. Polyethylene blends with polypropylene*
Related Polymers: Polypropylene blends, Propylene-ethylene copolymers, Polyethylene
Monomers: Propylene, Ethylene
Material class: Thermoplastic, Blends
Polymer Type: polyethylene, polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
9002-88-4

Additives: Compatibilisers may be added, usually a co-polymer such as EPR or EPDM, or a peroxide (for reactive blending)
General Information: Addition of PE to PP improves the low temp. impact props. and also the drawability of PP fibres. Most

common are PP blends with LDPE, LLDPE and HDPE. Less common are blends with ULDPE ($\rho = 890$ kg m^{-3}) and ultrahigh MW PE. Blend performance and props. are greatly affected by MW and MW distribution, component ratio, nucleating agents, compatibilisation and thermal or radiative history

Morphology: The blends are immiscible. Compatibilisation may be achieved by addition of a copolymer, reactive blending (using peroxides) or post blending treatment by chemical cross-linking, electron beam radiation or γ-radiation. Reactive compatibilisation or radiation lead to lower blend crystallinity. Micromorphology is controlled by composition, nucleating agents, compatibilisers, and thermal or radiative treatment. As little as 10% HDPE in PP gives a large reduction in the PP spherulite size. Finer spherulite size and better mech. props. are obtained if crystallisation is carried out at temps. less than or equal to 127° (T_c for PE). Blends have the most ordered struct. at 40–70% PP. PP-PE copolymers are more ordered than blends and are most ordered at about 95.5% PP. At up to approx. 50% PE, struct. is spherulitic within a PP matrix. At higher PE levels interpenetrating networks are observed [18,19]. There is no evidence of adhesion between the matrix and the dispersed phase at any composition. Morphology (and fracture props.) are greatly modified by the addition of small amounts of EPR [18,19]. Morphological props. of UHMWPE/LMWPP gel films which are fibrilous without apparent separate domains have been reported [17]. Considerable work has been done to relate mech. props. and rheological props. to morphology [19,31,32,33,34,35,36,37]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.91–0.96 g/cm^3	PP/HDPE [8,16]
2	d 0.89–0.91 g/cm^3	approx. follows simple additive rule PP/ULDPE [24]

Latent Heat Crystallization: ΔH_f (PP) 85–102 J g^{-1} (max. at 30–40% ULDPE); ΔH_f (ULDPE) 51–54 J g^{-1} (monotonic increase with PP content); ΔH_f (total) 52–94 J.g^{-1} (slight devation-negative near pure components, positive for mid-range compositions from simple additive rule [24]

Melting Temperature:

No.	Value	Note
1	156–160°C	PP
2	130–136°C	HDPE, as PP content increases [8]
3	152.5°C	PP
4	105.5°C	LDPE, initial melting point, all compositions [20]

Transition Temperature General: For polypropylene blends with virtually all types of PE, two distinct melting, crystallisation (or other transition) temps. are observed. Slight changes may occur with composition (sometimes observed to be test method dependent [20]) but are so small as to not contradict the immiscibility of the components. T_m 161° (PP) increases to max. of 161.8° at 50% ULDPE then decreases to 161.4°; actual values depend on grade of ULDPE; similarly T_m (ULDPE) increases with ULDPE content to value depending on grade. T_c (PP) 112° increases to max. 119° then decreases (according to ULDPE grade); T_c (ULDPE) decreases with increasing ULDPE content to 59° [24]

Vicat Softening Point:

No.	Value	Note
1	60–150°C	PP-ULDPE, significant negative deviation from simple additive rule [24]

Surface Properties & Solubility:

Plasticisers: EPM [7,11,12,15]

Transport Properties:

Polymer Melts: Zero shear viscosity η_o 9.05 poise (180°, 25% HPPE/75% PP), 6.02 poise (200°, 25% HDPE/75% PP); 2.88 poise (180°, 50% HDPE, 50% PP); 2.12 poise (200°, 50% HDPE, 50% PP); 2.27 poise (180°, 75% HDPE, 25% PP); 1.77 poise (200°, 75% HDPE, 25% PP) [9,16]. Zero shear viscosity decreases with increasing temp. and increase in HDPE composition. Complex viscosity η^* 2.1–3.2 Pa s (PP/ULDPE) [24]. Values vary with composition. Other viscosity measurements have been reported [25]

Permeability of Gases: Water vapour transmission 0.128 g d^{-1} m^{-2} (60% PP, 40% PE, ASTM E96-66B); 0.054 g d^{-1} m^{-2} (33% PP, 60% PE, ASTM E96-66B); 0.63–0.8 g d^{-1} m^{-2} (10% PP, 90% PE, ASTM E96-66B) [16]

Mechanical Properties:

Mechanical Properties General: The nature and proportions of the components are not sufficient to determine the mech. props. Depending on the time, temp. and rate of mixing the 'same blend' can show different behaviour. The mixing procedure should be optimised [21,22,23]. Mech. props. can be greatly altered by the incorporation of a compatibilising agent. The extent of such effects is dependent on the chemical struct. and/or on the molecular mass of the added copolymer as well as on the blend composition [11,12,15]

Tensile (Young's) Modulus:

No.	Value	Note
1	735 MPa	max. at 80% PP [18]
2	686 MPa	7000 kg cm^{-2}, PP
3	1078 MPa	11000 kg cm^{-2}, HDPE
4	1034 MPa	150000 psi [30]
5	1379–1724 MPa	200000–250000 psi, injection moulded
6	620–724 MPa	90000–105000 psi, compression moulded
7	482–620 MPa	70000–90000 psi, max. at 25–50% PP, pressed and quenched [21]
8	90–896 MPa	13000–130000 psi [29]
9	240–1250 MPa	0.24–1.25 GPa [25]
10	2000–15000 MPa	draw ratio 20
11	15000–50000 MPa	min. at 70% PP, draw ratio 40
12	22000–50000 MPa	draw ratio 60
13	30000–100000 MPa	approx., linear, draw ratio 100 [17,30]

Flexural Modulus:

No.	Value	Note
1	130–840 MPa	linear [20]
2	245–1240 MPa	23°
3	1210–3310 MPa	-40° [20]
4	100–1500 MPa	[19]

Tensile Strength Break:

No.	Value	Note
1	22–35 MPa	max. at 75–90% PP
2	15.9–30 MPa	50% PP [8,16,18,28]

3	21 MPa	approx., max., PP/LLDPE [15,20,25]
4	300 MPa	draw ratio 10
5	500 MPa	PP
6	600 MPa	max. at 70% PP
7	400 MPa	PE, draw ratio 20
8	600–900 MPa	PP
9	1300–1500 MPa	PE, draw ratio 40
10	700 MPa	PP
11	1600 MPa	PE, draw ratio 60
12	1000 MPa	PP
13	2200 MPa	PE, draw ratio 100
14	3000 MPa	approx., draw ratio 300 [17,30]

Elastic Modulus:

No.	Value	Note
1	1000 MPa	approx., all compositions [12]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	21–34 MPa		[8,18,28]
2	<25 MPa	20%	max., 50:50 PP/LDPE [31]

Miscellaneous Moduli:

No.	Value	Note	Type
1	827 MPa	PP	Secant modulus
2	896 MPa	max. at 90% PP	Secant modulus
3	669 MPa	PE [16]	Secant modulus
4	110–450 MPa	5% elongation [20,21]	5% modulus
5	50–220 MPa	linear [20]	Shear modulus

Impact Strength: Tensile impact strength 67 kJ m^{-2} (32 ft lb in^{-1}, 100% PP), 21 kJ m^{-2} (10 ft lb in^{-1}, 45% PP/55% LDPE), 189 kJ m^{-2} (90 ft lb in^{-1}, 100% LDPE) [15]
Fracture Mechanical Properties: Extent of stress whitening for impact test specimens, including those modified with, has been reported [11]
Izod Notch:

No.	Value	Notch	Note
1	53.4 J/m	Y	1 ft lb in^{-1}, 100% PP [26]
2	107 J/m	N	2 ft lb in^{-1}, 50% PP [26]
3	587 J/m	N	11 ft lb in^{-1}, 25% PP [26]
4	1070 J/m	N	20 ft lb in^{-1}, 100% HDPE [26]
5	60–87 J/m	Y	room temp., 90% PP/10% ULDPE [24]
6	21 J/m	Y	0°, 5–10% ULDPE [24]
7	16 J/m	Y	-20°, 5–10% ULDPE [24]
8	13–16 J/m	Y	-30°, 5–10% ULDPE [24]

Izod Area:

No.	Value	Notch	Note
1	4 kJ/m^2	Unnotched	100% PP [1]
2	2 kJ/m^2	Unnotched	75% PP/25% HDPE [1]
3	1.3 kJ/m^2	Unnotched	50% PP/50% HDPE [1]
4	2.2 kJ/m^2	Unnotched	25% PP/75% HDPE[1]
5	8.4 kJ/m^2	Unnotched	100% HDPE [1]
6	9 kJ/m^2	Unnotched	50% PP/50% LLDPE [29]
7	53 kJ/m^2	Notched	room temp., 95% PP/5% ULDPE [24]

Charpy:

No.	Value	Notch	Note
1	3.5	N	100% PP [20]
2	76	N	100% LDPE [20]

Optical Properties:

Transmission and Spectra: Ir absorption band ratios 720–731 cm^{-1} (PE). 973–998 cm^{-1} (PP) may be used to determine blend composition [23]
Total Internal Reflection: Birefringence 0.040–0.042 (25% PE); 0.043–0.048 (40% PE) (20° <T <170°, sharp fall in value at approx. 170°, UHMWPE/LMWPP Gel film) [17]

Polymer Stability:

Recyclability: Much of the interest in these blends has been generated by the fact that PP, HDPE, LDPE constitute a major proportion of plastic waste which is therefore a potential source [21]

Polypropylene/butadiene rubber blend P-483

Synonyms: *Polypropylene/polybutadiene blend. PP/BR blend. Polypropylene/cis-polybutadiene blend*
Related Polymers: Polypropylene/rubber blends
Monomers: Propylene, 1,3-Butadiene
Material class: Thermoplastic, Synthetic Elastomers
Polymer Type: polypropylene, polybutadiene
CAS Number:

CAS Reg. No.
9003-07-0
9003-17-2

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	20.8 MPa	60:40 BR:PP [1]	258%

Viscoelastic Behaviour: Tension set 27% [1]

Poly(propylene-*co*-butylene) P-484

$$\left[(CH_2CH(CH_3))_x-(CH_2CH(CH_2CH_3))_y\right]_n$$

Synonyms: *Poly(1-butene-co-1-propene). Poly(1-propene-co-1-butene). Butene, polymer with 1-propene*
Related Polymers: Polypropylene copolymers, Polypropylene-ethylene-butylene terpolymer
Monomers: 1-Butene, Propylene
Material class: Thermoplastic, Copolymers
Polymer Type: polypropylene, polyolefins
CAS Number:

CAS Reg. No.	Note
29160-13-2	1-butene, polymer with 1-propene
116257-98-8	block, isotactic
9019-30-1	butene, polymer with 1-propene
108645-83-6	1-butene, block polymer with 1-propene
133006-20-9	syndiotactic
63058-37-7	isotactic

Molecular Formula: $[(C_4H_8)(C_3H_6)]_n$
Fragments: C_4H_8 C_3H_6
General Information: Copolymers of propylene and butylene have low brittle points yet are comparable in strength and melting point to propylene homopolymers [1,2,3]
Morphology: It has been suggested that propylene/butylene copolymers are not completely random even when the monomers are mixed and processed using highly stereospecific $TiCl_3$ catalysts. For propylene between 13 and 76 mol%, two distinct crystalline phases form, one PP rich and one PB rich, suggesting poly[(propylene-*co*-butene-*block*-(butene-*co*-propylene)] as a general structural description

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.895 g/cm^3	approx., 48% wt. butene [9]

Volumetric Properties General: The apparent enthalpy of fusion, overall density and melting temp. all show a "eutectic type" variation with composition showing a minimum at about 48 wt.% butene [9]. Although melting temp. values differ, this trend has also been reported for homogenous samples prod. using metallocene catalysts [4]
Latent Heat Crystallization: Overall apparent enthalpy of fusion ΔH_f 9.84 kJ mol^{-1} (24 cal g^{-1}) (single crystals 100% PP); 4.92 kJ mol^{-1} (12 cal g^{-1}) (single crystals 100% PB); 2.05 kJ mol^{-1} (5 cal g^{-1}) (single crystals 52 wt.% propene/48 wt.% butene random copolymer) [9]
Melting Temperature:

No.	Value	Note
1	133°C	propylene/butylene 85:15 [8]
2	155°C	approx., 100% PP, melt crystallised
3	120°C	approx., 100% PB, melt crystallised
4	100°C	PP
5	65°C	50% propene/50% butene, melt crystallised random copolymer [9]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	3 g/10 min	85 wt.% propylene/15 wt.% butylene, T_m 133° [8]

Mechanical Properties:

Mechanical Properties General: Stiffness is greater than that of for comparable T_m and melt flow index [8]
Flexural Modulus:

No.	Value	Note
1	690 MPa	Secant, 85 wt.% propene/15 wt.% butene [8]

Optical Properties:

Transmission and Spectra: C-13 nmr has been used to determine comonomer sequences in the molecular struct. [7]

Polymer Stability:

Chemical Stability: 1.3% Hexane extractable material (50°); 7% xylene soluble - meets FDA requirements for food packaging materials [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Ziegler-Natta catalyst processes tend to give a heterogeneous copolymer [4]. Addition of alkoxysilane donors [5] or Lewis bases [6] during $MgCl_2$-supported Ziegler-Natta polymerisation can be used to modify the copolymer. Metallocene catalysts prod. homogenous copolymers over the whole composition range with more efficient uptake of the 1-butene [4]
Applications: Applications include food packaging

Polypropylene, Calcium carbonate filled P-486

Synonyms: *PP, Calcium carbonate filled. Polypropene, Calcium carbonate filled*
Related Polymers: Polypropylene, Polypropylene, Filled, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic, Composites
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Additives: Calcium carbonate (chalk, limestone, marble, dolomite, precipitated calcium carbonate, CCP) with or without coating
General Information: Addn. of chalk similar in effect to that of talc, but increases stiffness less and decreases impact strength less. Advantages (c.f. talc-filled): easy dispersal, high melt index, better UV stability, better surface finish, suitable for food use, lower abrasion

Volumetric & Calorimetric Properties:

Density:

[1] Guide to Plastics, *Property and Specification Charts,* McGraw-Hill, 1987

Polypropylene chlorinated P-488

Synonyms: *CPP. Poly(1-propene) chlorinated*
Related Polymers: Polypropylene
Monomers: Propylene
Material class: Synthetic Elastomers
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.	Note
9003-07-0	polypropylene

Molecular Formula: $[(C_3H_5Cl).(C_3H_6)]_n$
Fragments: C_3H_5Cl C_3H_6
General Information: Chlorination up to about 50 wt.% is possible. Chlorination is reported to occur at a mixture of primary, secondary and tertiary carbons [1,4,19,22]. Industrial material has a heterogeneous struct. due to the presence of isotactic polypropylene [4]. White, odourless, non-flammable powder
Tacticity: Isotactic material has a tendency to chlorinate at the 2° carbon of the backbone ($CHClCHCH_3$) [1], and atactic at the 3° carbon (CH_2CClCH_3)
Morphology: On chlorination, the crystallinity of isotactic polypropylene decreases rapidly with increasing chloride content [1,2,6,7]. X-ray diffraction shows pronounced transformation from α to β PP when the chlorine content is between 10 and 17% [2]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Density of isotactic polypropylene increases with increasing chlorine content [2]
Melting Temperature:

No.	Value	Note
1	132–197°C	25.1 wt% Cl
2	162–204°C	28 wt% Cl
3	132–236°C	35 wt% Cl
4	184–234°C	42.5 wt% Cl
5	204–252°C	53.5 wt% Cl [3]

Glass-Transition Temperature:

No.	Value	Note
1	160°C	[5]

Transition Temperature General: T_g increases sharply with increasing chlorine content [3,4]. Brittleness temp. varies with degree of chlorination; atactic polymer is brittle at room temp. if Cl content >25 wt.% [3]. There is no sharp melting point because of chlorination at all three types of carbon [3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Increasing polarity with increasing chlorination leads to increasing CED [3]
Wettability/Surface Energy and Interfacial Tension: Plasma surface chlorinated isotactic polymer has high surface tension; lower

values are obtained when other processes are used [8]
Adhesion General: Mechanism of adhesion promotion has been reported
Surface Tension:

No.	Value	Note
1	35.5 mN/m	$CHCl_3$ [8]

Transport Properties:

Transport Properties General: Intrinsic viscosity of chlorinated atactic polymer depends on the degree of chlorination and the synth. conditions [10]
Water Content: Chlorination of fibres by sodium hypochlorite increases water content (and affinity for cationic dyes) [9]

Mechanical Properties:

Mechanical Properties General: Tackiness of atactic polymer decreases with chlorine content and material is brittle above 25 wt% chlorine [3]. Strength of isotactic polymer decreases with increasing chlorine content [2]
Tensile Strength Break:

No.	Value	Note
1	20–27 MPa	at 20–30% Cl, low crystallinity, isotactic [2]

Impact Strength: Surface chlorination of isotactic polymer (e.g. by photochlorination with chlorine gas) increases impact strength by the formation of polyene chains [11]

Electrical Properties:

Electrical Properties General: Photochlorination of isotactic polymer in chlorine gas, followed by extensive dehydrochlorination can give conductive polyene chains [11]

Optical Properties:

Transmission and Spectra: Ir and C-13 nmr spectral data have been reported [3,4,19,22]
Volume Properties/Surface Properties: Chlorinated isotactic polymer with more than 4% chlorine gives transparent films [2]

Polymer Stability:

Polymer Stability General: Chlorination improves surface protection against photodegradation and weathering [11]
Thermal Stability General: Stability of chlorinated polymer is less than atactic polymer at above 30% chlorine; greater below 30% [15]
Decomposition Details: There are three steps to decomposition; 1. dehydrochlorination, 2. degradation of residual polypropylene segments, 3. further decomposition of the unsaturated chains from step 1 [11,15]
Flammability: Non-flammable (51% Cl) [12], high flame resistance and self extinguishing props. (Cl >30%) [2]. Limiting oxygen index 40–50% (48–60% Cl); 50–64% (64–72% Cl, which exceeds the oxygen index of PVC and fluoropolymers) [13,14]

Applications/Commercial Products:

Processing & Manufacturing Routes: Normally chlorinated with chlorine in suspension in aq. or organic solvents (e.g. CCl_4) in the presence of free radical initiators [8], e.g. with gaseous chlorine containing >0.1 vol% O or O_3 in the presence of water and $[Me_2C(CN)Ni]_2$ giving stable polymers with 5–75% Cl, at 50–60° [18]. Evolved HCl is catalytic and increased presence of isotactic polymer increases the reaction rate [19] but leads to the industrial product being heterogenous [4]. Thermal chlorination, its mechanism and the effect of parameters have been reported [3,20]. The rate of soln. photochlorination decreases with increasing degree of chlorination [4]. Metal salts accelerate chlorination of isotactic polymer but not atactic form [21]. Other production methods are surface photochlorination with Cl_2 gas [11], with $CHCl_3$ or CCl_4 plasma [8], or with sodium hypochlorite [9]
Applications: Atactic polymer used in surfactants, bonding of non-woven fabric, sizing of polypropylene yarn, fire-retardant adhesives, lubricating oil additives, antifouling coatings, primers, printing inks. Also used as a secondary plasticiser for PVC. Isotactic polymer is used as degradation and weathering protection, pre-dying treatment for fibres, film print promoter, coatings, laminates and rubber

Polypropylene copolymers P-489

Synonyms: *Polypropene copolymers. PP copolymers*
Related Polymers: More general information on polypropylene, Isotactic polypropylene, Polypropylene copolymers with ethylene, Ethylene-propylene elastomers (EPM, EPDM, EPR), Polypropylene copolymers with butylene, Polypropylene Blends, Fillers and reinforcers - filled polypropylene, Polypropylene Films
Material class: Thermoplastic, Copolymers
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.	Note
9010-79-1	propene-ethene copolymer
106565-43-9	
25895-47-0	
62849-76-7	

Additives: Stabilisers; fillers and reinforcers
General Information: Polypropylene copolymer (or copolymer polypropylene) frequently refers to propylene-ethylene (up to 10%) random copolymer. A wide range of co- and ter- (and even higher) polymers (alternating, random, block and graft) are of major importance. Depending on the manufacturing method and the resulting morphology, the difference between copolymers and blends may not be clearly defined

Applications/Commercial Products:

Trade name	Details	Supplier
Acctuf 3045	PP copolymer	Amoco Chemical Company
Astryn	PP copolymer	Himont
Fortilene	PP copolymer	Solvay Polymers
Fusabond MZ	PP copolymer	DuPont
Petrothene PP	PP copolymer	Quantum Chemical
Petrothene PP	PP copolymer	USI
Procond	PP copolymer electrically conductive	United Composites
Rexene	PP copolymer	Rexene Products
SD-376	PP copolymer	Himont

Polypropylene - EPDM blends, Vulcanised P-490

Synonyms: *PP-EPDM thermoplastic vulcanisate*
Related Polymers: Polypropylene blends, Other blends with rubbers, Non-vulcanised blends with ethylene-propylene copolymers, EPDM
Material class: Thermoplastic, Synthetic Elastomers, Copolymers, Blends
Polymer Type: polyethylene, polypropylenepolyolefins
Additives: Compatibilisers may be present, otherwise, except for colourants additives tend to be detrimental
General Information: If polypropylene - EPDM mixtures are dynamically vulcanised during blending, the harder polypropylene phase is continuous while the rubbery EPDM phase is a uniform, fine, highly vulcanised dispersion. Props. improve as the EPDM particle size decreases
Identification: Distinct from unvulcanised/part-vulcanised thermoplastic elastomers, thermoplastic vulcanisates have less than 3% extractable rubber in cyclohexane at room temp.
Miscellaneous: Comparison of polypropylene/EPDM (vulcanised) blends with Polypropylene/ethylene-propylene copolymer blends has been reported [10]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.88–1.04 g/cm^3	[4]

Vicat Softening Point:

No.	Value	Note
1	97–143°C	commercial grades, ASTM D1525

Brittleness Temperature:

No.	Value	Note
1	-63–-34°C	commercial grades, ASTM D746

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: As δ for each phase is similar, mixing is good, giving smaller rubber particles and hence good mech. props. [3,9]
Solvents/Non-solvents: Thermoplastic vulcanised blends are swollen by a range of organic solvents, cyclohexane, DMF, propanol etc. and hot oil [8]

Transport Properties:

Polymer Melts: Rheology is highly non-Newtonian - viscosity varies greatly with shear rate. Log viscosity vs. log shear rate is linear over 3 orders of magnitude for each variable (viscosity high at low shear, low at high shear). Viscosity much less sensitive to temp. [3]
Permeability of Gases: Relative air permeability 4.44 (0.76 mm thick, 35°, ASTM D1434) [2]
Water Absorption:

No.	Value	Note
1	>0.8 %	min., 24h

Mechanical Properties:

Mechanical Properties General: Props. vary widely depending on the specific formulation. Commercial grades have increased variation because of the use of fillers (esp. carbon black) and extender oil. The diene (cross-linking agent) in the EPDM phase affects props. [2]. Fatigue performance is superior to natural rubber, EPDM, neoprene [3]. Tensile props. are anisotropic - a standard injection moulded plaque exhibits a strong direction and a weak direction

Tensile (Young's) Modulus:

No.	Value	Note
1	56–435 MPa	no additives [2,7]
2	7.3–235 MPa	ASTM D412, commercial grades [3]

Flexural Modulus:

No.	Value	Note
1	18.5–347 MPa	ASTM D790, commercial grades [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	9.1–28.8 MPa	no additives [2,7]	165–580%
2	4.5–31 MPa	[4]	150–600%
3	4.4–27.6 MPa	ASTM D412, commercial grades [3]	330–600%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	11.4 MPa	50%	commercial grade at Shore D50 [3]

Miscellaneous Moduli:

No.	Value	Note	Type
1	3.9–13.6 MPa	no additives [2,7]	100% modulus
2	2–10 MPa	ASTM D412, commercial grades [3]	

Mechanical Properties Miscellaneous: Tension set 7–46% (no additives) [2,7]; 8–61% (ASTM D412, commercial grades, 100% strain) [3]; 16% (60–40 EPDM:PP) [8]. Stress at 5% compression 0.14–3.7 MPa (ASTM D695, commercial grades) [3]. Stress at 10% compression 0.27– >6.89 MPa (ASTM D695, commercial grades) [3]. Compression set 16–33% (23°, 22h, 25% deflection, ASTM D395B); 17–58% (100°, 22h, 25% deflection, ASTM

D395B, commercial grades) [3]. Bashore Resilience 38–51% (first rebound, ASTM D2632, commercial grades) [3]
Hardness: Shore A55-D50 (commercial grades) [3]; A45-D50 [5,7]
Failure Properties General: Tear strength 108–514 pli (23°, ASTM D624); 42–364 pli (100°, Die C, ASTM D624, commercial grades) [3]
Friction Abrasion and Resistance: Pico abrasion 82.9–544.1 (abrasion index, ASTM D2228), NBS abrasion 25–408 (abrasion index, ASTM D1630, commercial grades) [3]

Electrical Properties:

Electrical Properties General: Dielectric strength values have been reported [3]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$10–20 \times 10^{15}$ Ω.cm	23° and 100°	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.7–3.1	60 Hz	ASTM D15081 [3]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0021–0.0088	0.21–0.88%, 23° [3]
2	0.0015–0.0044	0.15–0.44%, 100° [3]

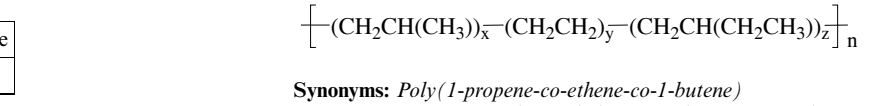
Polymer Stability:

Thermal Stability General: Heat stable up to 260° [3]
Upper Use Temperature:

No.	Value	Note
1	135°C	[3]

Flammability: Fl. p. 340° (min.). Limiting oxygen index 19% (max., general purpose grades); 23–28% (flame retardant grades) [3]
Environmental Stress: Good resistance to ionising radiation and fungi. Resistance to oxygen, ozone and atmospheric pollutants is less than for styrenic, olefinic blend and MPR thermoplastic elastomers [3]
Chemical Stability: Resistant to aq. media including conc. acids and alkalis, and polar solvents; as polarity decreases so does resistance - poor resistance to halocarbons [3]. Resistance to hydrocarbons only fair but better than Polypropylene/ethylene-propylene copolymer blends. Resistance to saturated hydrocarbons better than to aromatics [3]
Hydrolytic Stability: Resistant to aq. media including conc. acids and alkalis [3]
Recyclability: Recyclable [5]. Mech. props. decrease with each recycling [3]

Applications/Commercial Products:



Processing & Manufacturing Routes: Dynamically vulcanised during mixing. Components are mixed under conditions of intensive shear with cross-linking of the EPDM taking place during mixing (dynamic vulcanisation [6]) by the additon of a (non-peroxide) curing agent. Processing as normal for thermoplastics [4,5]
Applications: Better oil resistance, lower compression set and softer than non-vulcanised material. Applications in automotive industry (hose coverings, duct covers, gaskets, seals, convoluted boots, vibration dampers, ignition components, window seals, etc.); architecture and construction (expansion joints, roofing, flooring, weather seals); electrical and electronic industries (primary insulators, jacketing, combined primary insulation and jacketing, connectors, computers, telecommunications, office equipment), hose, tubing, sheet, medical and food-contact applications (FDA approved grades), mechanical rubber goods, impact modifiers for PP, PE (but not for more polar polymers)

Polypropylene-ethylene-butylene terpolymer P-491

Synonyms: *Poly(1-propene-co-ethene-co-1-butene)*
Related Polymers: Propylene-ethylene copolymers, Propylene-butylene copolymers
Monomers: Propylene, Ethylene, 1-Butene
Material class: Copolymers
Polymer Type: polyethylene, polypropylenepolyolefins
CAS Number:

CAS Reg. No.
25895-47-0
119008-27-4
133006-22-1

Molecular Formula: $[(C_4H_8).(C_2H_4).(C_3H_6)]_n$
Fragments: C_4H_8 C_2H_4 C_3H_6
General Information: Poly(propylene-ethylene-butylene) terpolymer is significant over a very wide range of monomer ratios. At certain compositions the terpolymers are elastomers without detectable crystallinity, demonstrating a random sequence distribution and thus being promising as rubbers [1]. Introduction of 1-butene into EPR decreases T_g and improves mech. props. Crystallinity and elasticity are determined by the distribution of monomer units [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.86 g/cm^3	approx. [1]

Melting Temperature:

No.	Value	Note
1	120–145°C	depending on composition; propylene 14–95 mol%, ethylene 3–75 mol%, 1-butene 2–23 mol% [1,3,4]

Surface Properties & Solubility:

Solvents/Non-solvents: Dependent on composition, polymer is insol. heptane [2]

Transport Properties:

Permeability of Gases: Gas permeability increases as ethylene content (density and crystallinity) decreases [1]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	262.7–1543.2 cm^3 mm/(m^2 day atm)	4–23.5 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [1]
2	N_2	65.7–394 cm^3 mm/(m^2 day atm)	1–6 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [1]

Mechanical Properties:

Mechanical Properties General: Complex modulus, loss modulus and loss tangent as function of temp. have been reported [1]
Tensile Strength Break:

No.	Value	Note	Elongation
1	12.4 MPa	126 kg cm^{-2}, carbon filled, vulcanised [1]	492%

Miscellaneous Moduli:

No.	Value	Note	Type
1	8.7 MPa	89 kg cm^{-2}, carbon filled, vulcanised [1]	300% modulus

Viscoelastic Behaviour: Permanent deformation 16% (carbon filled, vulcanised) [1]
Hardness: Shore A66 (carbon filled, vulcanised) [1]

Optical Properties:

Transmission and Spectra: C-13 nmr spectral data have been reported [1]

Applications/Commercial Products:

Trade name	Supplier
Polypro	Chisso Corporation
Vestoplast	Hüls AG
Vestoplast	Shell Chemicals

Polypropylene/ethylene-propylene copolymer blends P-492

Synonyms: *Polypropylene/EPR blend. Polypropylene/EPDM blends, Unvulcanised. PP/EPR TPO. PP/EPDM TPO*
Related Polymers: Polypropylene blends, Ethylene-propylene copolymers, Vulcanised blends, Polyethylene
Monomers: Propylene, Ethylene
Material class: Thermoplastic, Synthetic Elastomers, Blends
Polymer Type: polyethylene, polypropylene
Additives: Additives, which include fillers, reinforcing agents, lubricants, plasticisers, heat stabilisers, antioxidants, uv absorbers, colourants, flame retardants, flow modifiers, and processing aids are mostly present in the rubbery phase at room temp. Some migration to the polypropylene phase may occur at processing temp.
General Information: Blends of polypropylene with ethylene-propylene random copolymer or unvulcanised EPDM are treated as essentially similar. Continuity of both phases is present, resulting in a soft product
Miscellaneous: Comparison of polypropylene/ethylene-propylene copolymer blends with Polypropylene-EPDM blends, vulcanised, has been reported [10]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.89–1.03 g/cm^3	[3]
2	d 1.95 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.4 × 10^{-5}–0.000117 K^{-1}	3 × 10^{-5}–6.5 × 10^{-5}°F^{-1}	L

Melting Temperature:

No.	Value	Note
1	202°C	95 PP: 5 EPM
2	207°C	90 PP: 10 EPM
3	215°C	80 PP: 20 EPM [9]

Brittleness Temperature:

No.	Value	Note
1	-80–-10°C	[3]

Surface Properties & Solubility:

Plasticisers: Paraffinic-type processing oils including Sunpar 150, Sunpar 2280 and Tufflo 6056 [7]. Plasticisers must have high fl. p. due to high processing temps.

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.4–11.4 g/10 min	230°

Polymer Melts: Melt viscosity 220–365 Pa s [3]

Mechanical Properties:

Mechanical Properties General: Props. can be affected if this type of blend is formulated using EPDM, the specific diene, even if uncured. High ethylene content provides strength for the rubber component as some crystallinity is present. Equal ethylene/propylene contents gives a softer material with good impact props.

Tensile (Young's) Modulus:

No.	Value	Note
1	72 MPa	no additives [4]

Flexural Modulus:

No.	Value	Note
1	17.2–1558 MPa	2.5–226 kpsi, commercial grades [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.37–28.8 MPa	53–4177 psi, commercial grades [3]	50–1000%

Miscellaneous Moduli:

No.	Value	Note	Type
1	2.2 MPa	320 psi, TPR 5470 [3]	100%
2	9 MPa	TPR 5490 [3]	100%
3	117 MPa	17000 psi, -51°	Gehman
4	55 MPa	8000 psi, -43°	Gehman
5	24 MPa	3500 psi, -34°	Gehman
6	13.8 MPa	2000 psi, -26°	Gehman
7	6.9 MPa	1000 psi, -18°, commercial grades [3]	Gehman

Mechanical Properties Miscellaneous: Compression set 32–49% (22°, 22h, commercial grades) [3]
Hardness: Shore A66-D72 (commercial grades) [3]
Failure Properties General: Tear strength 80–900 pli (die C, commercial grades) [3]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.37	1 MHz	ASTM D150, filled [3]

Dielectric Strength:

No.	Value	Note
1	21.26–26 kV.mm^{-1}	540–660 V mil^{-1}, general
2	21.26 kV.mm^{-1}	540 V mil^{-1}, 0.08" thick, filled, ASTM D149 [3]

Arc Resistance:

No.	Value	Note
1	114s	filled (TPR 5595), ASTM D495 [3]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	105°C	general purpose formulations [3]
2	125°C	with stabilisers and antioxidants [3]
3	140°C	approx., depending on blend and/or components [3]

Environmental Stress: Weather resistance is good but non-fast grades may undergo a colour change. Stable to ozone [3]
Chemical Stability: Unaffected by H_2O and aq. reagents; acids and bases have little effect. Swollen and softened by hydrocarbon solvents especially hot solvents [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed on normal thermoplastic processing equipment-injection moulding, extrusion, vacuum forming, injection blow moulding, extrusion blow moulding etc. Melt viscosity may be relatively high; newer grades are available to overcome this. Machine parameter tables for processing have been reported [3]
Mould Shrinkage (%):

No.	Value	Note
1	0.6–1.7%	6.0–17 mil in^{-1} [3]

Polypropylene fibres P-493

Synonyms: *Polypropene fibres. PP fibres*
Related Polymers: Polypropylene, Polypropylene copolymers, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic

Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Molecular Weight: MW 20000–1000000. M_w/M_n 2–15
General Information: Circular cross section fibres are waxy. Fibres with non-circular cross section have texture and lustre. After melt drawing, fibres are cold drawn to give orientation. Dyeable fibres are copolymers containing a basic nitrogen atom

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic and chlorinated hydrocarbons. Slightly sol. boiling hydrocarbons

Transport Properties:

Water Content: Effect of chlorination on water content,
Water Absorption:

No.	Value	Note
1	0.01 %	21°, 65% relative humidity [1,2,4]

Mechanical Properties:

Mechanical Properties General: Tensile props. are functions of MW, morphology, production and test conditions [1,2,5]

Tensile (Young's) Modulus:

No.	Value	Note
1	240–322 MPa	[1,4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	160–440 MPa	[1,4]	20–200%

Viscoelastic Behaviour: Viscoelastic behaviour has been reported [3]

Polymer Stability:

Thermal Stability General: Thermal degradation temp. (290°) is lower than that of polyamides and polyesters [1,2]
Flammability: Use of flammability retardants often reduces light and temp. stability
Environmental Stress: Subject to uv degradation, stabilisers are usually radical scavengers
Chemical Stability: Highly sensitive to oxygen; highly substituted phenols are used as stabilisers. Resistant to most organic solvents at room temp., some swelling occurs in chlorinated hydrocarbons. Degraded by strong oxidising agents at high temp.
Hydrolytic Stability: Hydrophobic; resistant to acids and bases

Applications/Commercial Products:

Processing & Manufacturing Routes: Melt spinning is the commonest method of manufacture and involves extrusion, quenching, and take up, followed by drawing (to as much as 6 times original length), stress relieving heat treatment and texturising. The normal melt spin temp. is 240–310°. Also prod. by slit film (film-to-fibre) technology for fibres above 0.7 tex (6.6 den). Non wovens prod. by melt blown, spun bond and spurted fibre methods [1,2,3]
Applications: Used in carpet facing, carpet backing, upholstery, drapery, rope, geotextiles, non-wovens, filtration media, cordage, outdoor furniture webbing, bags and synthetic turf

Polypropylene, Filled P-494

Synonyms: *PP, Filled. Polypropene, Filled*
Related Polymers: Polypropylene, Talc filled, Calcium carbonate filled, Glass fibre filled, glass fibre reinforced, Mica filled, Carbon filled, Aluminium powder filled, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic, Composites
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Additives: Extenders (for cost reduction), e.g. calcium carbonate, talc. Reinforcement e.g. talc, mica, fibres. Conductivity e.g. carbon, aluminium. Fillers include glass fibres, glass spheres, asbestos, wood flour, Wollastonite, zinc oxide, polyamide fibres, polyester fibres, metallic powders, mica, talc and calcium carbonate
General Information: Solid fillers are added to reduce cost by increasing bulk or to modify mechanical, thermal or electrical props. The effect of a filler depends on its particle size, shape, physical props. and chemical composition. Fibres or powders are commonly used. The effects of $\leq$40% treated calcium carbonate and glass bead fillers on the props. of homopolymer and (ethylene) copolymer have been found to be increased density (linearly with the filler content), while T_m, tensile strength, elongation at break and enthalpies of fusion and crystallinity decrease. Hardness increased with glass bead filler and decreased with calcium carbonate filler content
Miscellaneous: The effects of various fillers on struct. and props. of polypropylene (including some blends and copolymers) have been reported [1]

Polypropylene films P-495

Synonyms: *PP films. Polypropene films. OPP*
Related Polymers: Polypropylene, Polypropylene blends, Polypropylene copolymers, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.	Note
9003-07-0	
25085-53-4	isotactic

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
General Information: Polypropylene films may be unoriented (cast) for sparkling optics and clarity, oriented for improved strength, durability and thermal props. or biaxially oriented for maximum strength and durability
Morphology: Morphological props. vary a little with MW distribution, and more so with draw temp. In general as distribution broadens, birefringence may increase, and amorph. orientation may increase ($T > 165°$), long period spacing decreases slightly; as draw temp. increases, crystalline fraction, crystalline orientation and especially long period spacing increase but birefringence and amorph. orientation decrease [3]

Transport Properties:

Permeability of Gases: Water vapour transmission rate 11.2–14.6 $\times$ 10^{-6} cm^3 cm^{-2} s^{-1} (0.5–0.65 nmol cm^{-2} s^{-1}, non-oriented, ASTM E96, 37°, 90% relative humidity); 6.72–8.96 $\times$ 10^{-6} cm^3 cm^{-2} s^{-1} (0.3–0.4 nmol cm^{-2} s^{-1}, oriented, ASTM E96, 37°, 97% relative humidity) [8,9]

Mechanical Properties:

Mechanical Properties General: Mech. props. vary with temp., draw ratio, melt flow and MW distribution. In general, as MW distribution broadens tensile strength increases, elongation decreases, tensile strength modulus increases and shrinkage decreases. As draw temp. increases tensile strength increases then decreases; elongation increases and tensile strength modulus decreases [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	2500–4900 MPa	gauge 12–75 μm [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	50–275 MPa	biaxially oriented, ASTM D882 [9]	35–500%
2	172.3–206.8 MPa	oriented, ASTM D882 [8,9]	60–100%
3	20.7–62 MPa	non-oriented, ASTM D882 [8,9]	400–800%

Elastic Modulus:

No.	Value	Note
1	758–965 MPa	non-oriented
2	2206–2620 MPa	oriented [8,9]

Impact Strength: Impact strength 19–58 kJ m^{-1} (biaxially oriented) [7]. Impact strength 9.8–29.4 N cm (non-oriented); 49–147 N cm (oriented) [8,9]
Mechanical Properties Miscellaneous: Stiffness 4.9–10.8 N m^{-1} [4]
Fracture Mechanical Properties: Tear strength 15.7–129 N mm^{-1} (non-oriented); 1.57–2.35 N mm^{-1} (oriented) [8,9]; 1.2–3.9 N mm^{-1} (biaxially oriented) [7] (ASTM D1922)

Electrical Properties:

Electrical Properties General: Films exhibit good electrical and insulating props. Factors affecting props. include morphology, orientation, crystallinity, tacticity and MW. Dissipation factor increases with increasing irradiation dose; reversed by impregnation with monoisopropyl biphenyl
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2–2.5	60 Hz–1 kHz	24° [1]

Dielectric Strength:

No.	Value	Note
1	315 $kV.mm^{-1}$	8000 V mil^{-1}, 24°, 60 Hz [1]
2	118 $kV.mm^{-1}$	3000 V mil^{-1}, 12–75 μm gauge [4]

Strong Field Phenomena General: Breakdown voltage (25.4 μm thick film) 8 kV (60 Hz) [1]; 16 kV (DC) [2]; 12 kV (60 Hz, monoisopropyl biphenyl impregnated) [3]; 16 kV (DC, monoisopropyl biphenyl impregnated) [3]
Static Electrification: Voltage-current characteristics, frequency dependence of conductance, capacitance and dielectric loss have been reported [3]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	1×10^{-5}	10 kHz	approx.
2	0.002	50 Hz	

Optical Properties:

Optical Properties General: Crystallinity and the presence of spherulites give low transparency. Transparency is raised by quenching, addition of nucleating agents or destroying the spherulites by stretching. Quenching is preferred for food use due to lower contamination [8]. Transparent films are obtained from chlorinated polypropylene having 4% chlorine content
Refractive Index:

No.	Value	Note
1	1.5	[4]

Transmission and Spectra: Turbidity 5 cm^{-1} (chill roll 60–80°); 0.35 cm^{-1} (quenched flowing water); 0.14 cm^{-1} (quenched, roll annealed) [6]
Total Internal Reflection: Birefringence 1090 (chill roll, 60–80°); 1750 (quenched in flowing water); 3290 (quenched, roll annealed) [6]
Volume Properties/Surface Properties: Haze 1–2% (12–75 μm gauge) [4]; 1.5–25% (biaxially oriented) [7]

Polymer Stability:

Thermal Stability General: Relatively high melting point allows sterilisation of PP film wrapped foods [8]
Upper Use Temperature:

No.	Value	Note
1	140°C	extruded
2	143°C	biaxially oriented [7]

Flammability: Processing conditions and environmental temp. influence burning characteristics and smoke generation. As extrusion temp. (or number of extrusions) is increased, Limiting Oxygen Index increases; linear burn rate decreases, mass burn rate increases; thin layers (flame retarded) offer greater resistance to burning [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by tenter-frame or double-bubble processes for oriented film, or by a blown process with water bath quench for unoriented film [6]. Heat seal range for unoriented film is 140–200° (oriented films require co-polymer, terpolymer or alloy layer for heat sealing) [4,7]
Applications: In the absence of other information commercial materials are assumed to be unoriented. Used in packaging of snack foods, baking items, cigarettes, sweets, overwraps, bottle labels, etc. Other uses include pressure-sensitive tape, sheet protectors, stationery products and labels. Electrical usage includes insulation for capacitors and power cables, especially in aerospace industries

Polypropylene, Glass fibre reinforced P-496

Synonyms: *PP, Glass fibre reinforced. Polypropene, Glass fibre reinforced. GRPP*
Related Polymers: Polypropylene, Polypropylene, Filled, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic, Composites
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Additives: Glass fibres, short or long. Coupling agents
General Information: Gives high tensile strength over wide temp. range, high stiffness and improved creep behaviour. Use of coupling agents gives improved mechanical values, increased fatigue strength, good long-term props. and higher bend-creep modulus. Disadvantages of glass fibre reinforcement are reduced impact strength, matt surface and abrasion

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.04–1.13 g/cm^3	20–30% glass fibre reinforced homopolymer
2	d 1.22–1.23 g/cm^3	40% glass fibre reinforced homopolymer

3	d 0.98–1.04 g/cm^3	10–20% glass fibre reinforced copolymer
4	d 1.11–1.21 g/cm^3	30–40% glass fibre reinforced copolymer, ASTM D792

Thermal Expansion Coefficient:

No.	Value	Type
1	2.7×10^{-5}–3.2×10^{-5} K^{-1}	V

Thermal Conductivity:

No.	Value	Note
1	0.35–0.37 W/mK	0.00084–0.00088 cal cm^{-1} s^{-1} C^{-1}, ASTM C177, 40% glass fibre reinforced homopolymer

Melting Temperature:

No.	Value	Note
1	168°C	homopolymer
2	160–168°C	copolymer [1]

Deflection Temperature:

No.	Value	Note
1	132–138°C	270–280°F, 20–30% glass fibre reinforced homopolymer
2	149–166°C	300–330°F, 40% glass fibre reinforced homopolymer
3	127–138°C	260–280°F, 10–20% glass fibre reinforced copolymer
4	138°C	280°F, 1.84 MPa (264 psi), 30–40% glass fibre reinforced copolymer [1]
5	143–146°C	290–295°F, 20–30% glass fibre reinforced homopolymer
6	166°C	330°F, 40% glass fibre reinforced homopolymer
7	152°C	305°F, 10–20% glass fibre reinforced copolymer
8	154°C	310°F, 0.45 MPa (66 psi), 40% glass fibre reinforced copolymer, ASTM D648 [1]
9	121°C	250°F, 20–30% long glass fibre reinforced homopolymer
10	152°C	305°F, 20–30% long glass fibre reinforced homopolymer, ASTM D648 [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.05 %	20–30% glass reinforced homopolymer
2	0.05–0.06 %	40% glass reinforced homopolymer
3	0.01 %	1/8" thick, glass reinforced copolymer, 24h, ASTM D570
4	0.09–0.1 %	1/8" thick, 40% glass reinforced homopolymer, saturation, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Considerable variation in mech. props. occurs due to length, length variation and distribution uniformity of the fibres; degree of coupling and processing history [3]. Mech. props are improved by the addition of a β nucleating agent (e.g. adipic acid) [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	4825–5515 MPa	700–800 kpsi, 20–30% glass fibre reinforced homopolymer
2	7580–10340 MPa	1100–1500 kpsi, 40% glass fibre reinforced homopolymer, ASTM D638 [1]
3	5170–6200 MPa	750–900 kpsi, 20–30% long glass fibre reinforced homopolymer [1]
4	3120 MPa	20°, short glass fibre reinforced
5	5090–5620 MPa	-43°
6	3000–3510 MPa	20°, long glass fibre reinforced, depending on processing [2]
7	16200 MPa	twill weave, long fibre reinforced sheet [4]

Flexural Modulus:

No.	Value	Note
1	3450–4140 MPa	500–600 kpsi, 28° (73°F), 20–30% glass fibre reinforced homopolymer
2	3550–6890 MPa	950–1000 kpsi, 28° (73°F), 40% glass fibre reinforced homopolymer
3	2450–3520 MPa	355–510 kpsi, 28° (73°F), 10–20% glass fibre reinforced copolymer
4	4895–6620 MPa	710–960 kpsi, 28° (73°F), 30–40% glass fibre reinforced copolymer
5	3790–4825 MPa	550–700 kpsi, 28° (73°F), 20–30% long glass fibre reinforced homopolymer [1]
6	6270 MPa	40% short glass fibre
7	4620 MPa	40% long glass fibre mat [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	45–48 MPa	6500–7000 psi, 20–30% glass fibre reinforced homopolymer	2.5–3.0%
2	58–103 MPa	8400–15000 psi, 40% glass fibre reinforced homopolymer	1.5–4.0%
3	48–55 MPa	7000–8000 psi, 10–20% glass fibre reinforced copolymer	3.0–3.4%
4	59–62 MPa	8500–9000, 30–40% glass fibre reinforced copolymer, - ASTM D638[1]	2.2–2.6%
5	52–55 MPa	7500–8000 psi, 20–30% long glass fibre reinforced, homopolymer [1]	2.1–2.2%
6	65.6 MPa	20° short fibre	
7	45.6 MPa	55°	

8	45.4 MPa	20°	
9	24.8 MPa	55°, long fibre reducing with increasing processing [3]	
10	270 MPa	twill weave long fibre reinforced sheet	
11	275 MPa	non crimp fabric long fibre reinforced sheet [4]	

Flexural Strength at Break:

No.	Value	Note
1	48–59 MPa	7000–8500 psi, 20–30% glass fibre reinforced homopolymer
2	70–150 MPa	10500–22000 psi, 40% glass fibre reinforced - homopolymer
3	57–66 MPa	8200–9600 psi, 10–20% glass fibre reinforced copolymer
4	73–76 MPa	10600–11000 psi, rupture or yield, 30–40% glass fibre reinforced copolymer, ASTM D790 [1]
5	69–72 MPa	10000–10500 psi, 20–30% long glass fibre reinforced, homopolymer [1]
6	125.5 MPa	40% short glass fibre [6]
7	142.7 MPa	40% long glass fibre mat [6]

Compressive Strength:

No.	Value	Note
1	45–48 MPa	6500–7000 psi, 20–30% glass fibre reinforced homopolymer
2	61–68 MPa	8900–9800 psi, 40% glass fibre reinforced homopolymer
3	38–39 MPa	5500–5600 psi, 10–20% glass reinforced copolymer
4	37–39 MPa	5400–5700 psi, 30–40% glass fibre reinforced copolymer, ASTM D695 [1]

Impact Strength: 187–203 J m^{-1} (3.5–3.8 ft lb in^{-1}, 1/8" thick, 20–30% long glass fibre reinforced homopolymer) [1]; 7 J m^{-1} (25°), 6 J m^{-1} (-30°, 40% short glass fibre, injection moulded), 63 J m^{-1} (25°), 76 J m^{-1} (-30°, 40% long glass fibre mat, sheet) [6]; 1110 J m^{-1} (twill weave long fibre reinforced sheet) [4]. Rheometrics instrumented rates have been reported [6]
Hardness: Rockwell R100-R115 (20–30% glass fibre reinforced homopolymer); R102-R111 (40% glass fibre reinforced homopolymer); R100-R103 (10–20% glass fibre reinforced copolymer); R104-R105, Shore D45-D55 (30–40% glass fibre reinforced copolymer, ASTM D785 (Rockwell), ASTM D2440 (Shore)) [1]
Izod Notch:

No.	Value	Notch	Note
1	53–64 J/m	N	1.0–1.2 ft lb in^{-1}, 20–30% glass fibre reinforced homopolymer [1]
2	75–107 J/m	N	1.4–2 ft lb in^{-1}, 40% glass fibre reinforced homopolymer [1]
3	51–53 J/m	N	0.95–1 ft lb in^{-1}, 10–20% glass fibre reinforced copolymer [1]
4	48–51 J/m	N	0.9–0.95 ft lb in^{-1}, 1/8" thick, 30–40% glass fibre reinforced copolymer, ASTM D256A [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	19.68–20.07 kV.mm^{-1}	500–510 V mil^{-1}, 1/8" thick, 40% glass fibre reinforced homopolymer, ASTM D149 [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processing temp. ranges (injection moulding) typically 180–225° (360–440°F, 20–30% glass fibre reinforced homopolymer); 230–290° (450–550°F, 40% glass fibre reinforced homopolymer; 175–245° (350–470°F, glass fibre reinforced copolymer)[1]. Moulding pressure range 70–170 MPa (10000–25000 psi, 40% glass fibre filled homopolymer) [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.5%	0.004–0.005 in/in, 20–30% glass fibre reinforced homopolymer
2	0.3–0.4%	0.003–0.004 in/in, 20–30% long glass fibre reinforced homopolymer
3	0.3–0.5%	0.003–0.005 in/in, 40% glass fibre reinforced homopolymer
4	0.3–1%	0.003–0.01 in/in, 10–20% glass fibre reinforced copolymer
5	0.1–1%	0.001–0.01 in/in, 30–40% glass fibre reinforced copolymer, ASTM D955

Flexural Strength at Break:

No.	Value	Note
1	48 MPa	7000 psi, rupture or yield, 40% mica filled impact modified homopolymer, ASTM D790 [1]

Hardness: Rockwell R97 (40% mica filled, ASTM D785) [2]. Shore D82 (40% mica filled, ASTM D2240)
Izod Notch:

No.	Value	Notch	Note
1	3.7 J/m	N	0.7 ft lb in^{-1}, $\frac{1}{8}$" thick, 40% mica filled impact modified homopolymer, ASTM D256A [1]
2	261 J/m	N	4.9 ft lb in^{-1}, 40% mica filled, ASTM D256 [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processing temp. range (injection moulding) 175–245° (350–470°F, 40% mica filled impact modified homopolymer) [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.7–0.8%	0.007–0.008 in/in, linear, 40% mica filled impact modified homopolymer [1]

Applications: Used in automotive engine ducts and housings

Polypropylene/natural rubber blends P-498

Synonyms: *PP/NR blends. Polypropylene/polyisoprene blends. PP/IR blends. Polypropene/cis-1,4-polyisoprene rubber blends*
Related Polymers: Polypropylene/rubber blends
Material class: Thermoplastic, Natural elastomers, Blends
Polymer Type: polypropylene

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.99–1.04 g/cm^3	[1]

Brittleness Temperature:

No.	Value	Note
1	-50–-35°C	ASTM D746 [1]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	5–26.4 MPa	ASTM D412 [1,3]	300–620%

Miscellaneous Moduli:

No.	Value	Note	Type
1	2.1–10.5 MPa	ASTM D412 [1]	Rubber modulus

Viscoelastic Behaviour: Tension set 10–50% (ASTM D412) [1,3]. Compression set 24–45% (23°); 30–63% (100°, ASTM D395B) [1]
Hardness: Shore A60-D50 (ASTM D2240) [1,2]
Failure Properties General: Tear strength 22–98 kN m^{-1} (ASTM D624)

Polymer Stability:
Thermal Stability General: Good retention of tensile props. in hot air (100° for 1 month) [1]
Chemical Stability: Ozone resistance 10 (40°, 110 ppm O_3, ASTM D518) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Dynamically vulcanised during mixing
Applications: Low cost

Trade name	Supplier
Vyram	Advanced Elastomer Systems

Polypropylene/nitrile rubber blends P-499

Synonyms: *Polypropylene/NBR blends*
Related Polymers: Polypropylene/rubber blends
Material class: Thermoplastic, Synthetic Elastomers, Blends
Polymer Type: polypropylene
Additives: Compatibiliser required
General Information: The blend is a compatibilised nitrile rubber fine dispersion in a polypropylene matrix

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1–1.1 g/cm^3	[2]

Brittleness Temperature:

No.	Value	Note
1	-40–-33°C	ASTM D746 [3]

Mechanical Properties:
Mechanical Properties General: Since PP and NBR are grossly incompatible, mech. props. are largely dependent on compatibilisation. A given formulation may enhance one property and not another hence the wide ranges shown [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	105–456 MPa	tensile tester, cross head speed 2.5 cm min^{-1}, up to 30% elongation [1]
2	36–118 MPa	5220–17100 psi, ASTM D412 [3]

Flexural Modulus:

No.	Value	Note
1	58–163 MPa	8460–23590 psi, ASTM D790 [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	8.2–26.7 MPa	tensile tester, 25 cm min^{-1} [1,4]	66–580%
2	9–171 MPa	true stress of break [1]	

Compressive Modulus:

No.	Value	Note
1	0.35–1.23 MPa	51–178 psi, ASTM D695, 5% compression
2	1.1–3.27 MPa	159–576 psi, ASTM D695, 10% compression

Miscellaneous Moduli:

No.	Value	Note
1	9.9–14.2 MPa	stress at 100% strain, tensile tester, 25 cm min^{-1} [1]
2	5.4 MPa	785 psi [3]

Viscoelastic Behaviour: Tension set 15–70% (ASTM D412-66) [1,3,4]. Compression set 17–19% (25% deflection, 22h, 23°, ASTM D395B); 33–48% (25% deflection, 22h, 100°, ASTM D395B) [3]
Hardness: Shore A70-D50 (ASTM D2240) [2,3]
Failure Properties General: Tear strength 250–425 pli (23°, ASTM D624, Die C); 110–230 pli (100°, ASTM D624, Die C) [3]

Polymer Stability:
Thermal Stability General: Service temp. range of -40–125° [3]
Upper Use Temperature:

No.	Value	Note
1	125°C	[3]

Chemical Stability: Excellent resistance to acids, alkalis and hot oils. Excellent resistance to hydrocarbons (less than C_{20}) at room temp. Unstable to diesel above 70° [3]
Hydrolytic Stability: Excellent resistance to aq. solns.

Applications/Commercial Products:
Processing & Manufacturing Routes: Dynamically vulcanised during mixing
Applications: Applications due to oil resistance

Trade name	Supplier
Geolast	Advanced Elastomer Systems

Polypropylene/Nylon blends P-500

Synonyms: *Polypropylene/polyamide blends. PP/PA blends*
Related Polymers: Polypropylene blends
CAS Number:

CAS Reg. No.
9003-07-0
25038-54-4
32131-17-2
63428-83-1

Additives: Compatibilisers are used such as maleated PP, maleated SBS, maleated SEBS or commercial formulations
General Information: Cited advantages of PP/PA blends are low moisture absorption, improved processability, good impact resistance and flexural modulus [8]
Morphology: Uncompatibilised blends are coarse mixtures with particles up to 50 μm which are readily deformable into fibrils. Compatibilisation reduces the particle size to about 1 μm [8,16]. Even in well dispersed, compatibilised blends, processing leads to flow segregation, coarsening of morphology and fibrillation. Changes in morphology with composition and compatibilisation correlate with variations in mech., rheological and other props. have been reported [9,10,11,12,13,17,18]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.03 g/cm^3	PP 40%, PA-6 60% [3]

Latent Heat Crystallization: ΔH_{fusion} 55 kJ kg^{-1} (13.2 cal g^{-1}, from PP), 14 kJ kg^{-1} (3.3 cal g^{-1} from PA) (80% PP/90% PA-6); 20 kJ kg^{-1} (4.7 cal g^{-1}, from PP), 52 kJ kg^{-1} (12.5 cal g^{-1} from PA) (30% PP/70% PA-6) [1]
Melting Temperature:

No.	Value	Note
1	165.3°C	PP
2	220.6°C	PA-6, PP 40%/PA-6 60%, Orgallay R 6000 [2,3]

Deflection Temperature:

No.	Value	Note
1	66°C	75 PP/25 PA-6
2	64°C	25 PP/75 PA-6

Transition Temperature:

No.	Value	Note	Type
1	112.5°C	PP	T_c
2	185°C	PA-6, PP 40%/PA-6 60%, Orgalloy R 6000 [2]	T_c

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	18 g/10 min	75 PP/25 PA-6
2	32 g/10 min	25 PP/75 PA-6 [10]

Polymer Melts: Melt flow props. depend on sample drying. There is a lack of agreement between steady state, dynamic and extensional viscosity data and between first normal stress difference and storage modulus. Elastic responses are larger than for single phase systems. Lowest viscosity occurs at 75% PP: 25% PA. Viscosity may increase as a result of compatibilisation mechanism [8,14]. In capillary flow η is insensitive to temp. between 225° and 250° giving poor agreement with η′ and η*; η_e (elongation viscosity) measured is one order of magnitude less than calculated by the Cogswell relation. Therefore capillary flow is not suitable for characterisation [8]
Water Absorption:

No.	Value	Note
1	3.1–3.8 %	uncompatibilised [12]

Mechanical Properties:

Mechanical Properties General: Data on modified fibre have been reported [15]. Other values of tensile modulus have been reported. [12] Other values of storage modulus have been reported [1,4,6,7]. Loss tangent (tan δ) peaks have been reported [4,6]

Tensile (Young's) Modulus:

No.	Value	Note
1	1150 MPa	75 PP/25 PA-6
2	1500 MPa	25 PP/75 PA-6 [10]

Tensile Strength Break:

No.	Value	Note
1	44 MPa	25% PP/75% PA 1010 [9]

Flexural Strength at Break:

No.	Value	Note
1	33 MPa	75% PP/25% PA-6 [10]
2	58 MPa	25% PP/75% PA-6 [10]

Tensile Strength Yield:

No.	Value	Note
1	27 MPa	75 PP/25 PA-6 [10]
2	42 MPa	25 PP/75 PA-6 [10]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1500–3500 MPa	0°, 40% PP, 60% PA-6, Orgalloy R6000	Storage modulus
2	40–100 MPa	[1,5,6,7]	Loss modulus

Hardness: Rockwell R84 (75% PP/25% PA-6); R95 (50% PP/50% PA-6); R104 (25% PP/75% PA-6) [10]
Fracture Mechanical Properties: Brittle fracture has been reported. [7,9] Charpy critical strain energy release rate, G_c 5800 J m^{-2} (transverse to machining direction); 10 kJ m^{-2} (PP 40%/PA-6 60%, Orgalloy R6000, specimen thickness 2mm along machining direction) [7]

Izod Notch:

No.	Value	Notch	Note
1	14 J/m	N	75% PP/25% PA-6 [10]
2	37 J/m	N	25% PP/75% PA-6 [10]

Izod Area:

No.	Value	Notch	Note
1	2.8 kJ/m^2	Notched	ASTM D256-54T [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Production is typically by modification of the PP (normally by maleation in the presence of peroxide though other acids or anhydrides, (e.g. fumaric, acrylic and methacrylic), may be used followed by mixing with the PA [8]. A commercial compatibiliser is based on ethylene-acrylic ester-maleic anhydride-glycidyl methacrylate [8]. Because of the adverse effects of compatibilisation on crystallinity it must be optimised then closely controlled
Applications: Applications include structs. which require both rigid and flexible parts, e.g. automotive engine air intakes, compressed air lines

Poly(propylene oxide) P-501

Synonyms: *Polymethyloxirane. Polyoxypropylene. Polypropylene glycol. Poly[oxy(methane-1,2-ethanediyl)]. α-Hydro-ω-hydroxy-poly[oxy(methane-1,2-ethanediyl)]. Propylene glycol polyol. Poly(1,2-epoxypropane). PPO. Polypropylene oxide polyols. PO polyols*
Related Polymers: Polypropylene, Oxetane polymers, Propylene oxide elastomers, Poloxamers
Monomers: Propylene oxide
Material class: Oligomers
Polymer Type: polyol, polypropylene oxide
CAS Number:

CAS Reg. No.	Note
25322-69-4	generic
25791-96-2	

Molecular Formula: $(C_3H_6O)_n$
Fragments: C_3H_6O
Molecular Weight: MW normally less than 7000, dependent on termination conditions, prepared via acid or base catalysis. Catalysts are reported that are capable of giving MW up to 1000000
Additives: Stabilisers, usually based on hindered phenols or aromatic amines are added. Antioxidants e.g. butylated hydroxytoluene (BHT)
General Information: Poly(propylene oxide) of MW less than 700 is soluble in water. Solubility decreases with increasing MW, giving rise to a cloud point
Tacticity: The common forms are atactic and isotactic. Syndiotactic is also possible as are optically active forms
Morphology: Conformational analysis shows a gauche oxygen effect [6,7]
Miscellaneous: End groups vary significantly according to the initiator/terminator and may give rise to diols, triols, and other polyols. Some catalysts, notably acidic, give "abnormal" head to head or tail to tail structs. in proportions up to about 45%. Information on blends has been reported [24]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.157 g/cm^3	cryst.
2	d 1.002 g/cm^3	amorph.
3	d^{25} 1.005–1.02 g/cm^3	depending on functionality [14,21]

Latent Heat Crystallization: ΔH_f 8.4 kJ mol^{-1} (at T_m). ΔS_f 23.8 J mol^{-1} K^{-1} (at T_m) [14]
Thermal Conductivity:

No.	Value	Note
1	0.16 W/mK	MW 3000 [11]
2	0.15 W/mK	MW 5000 [11]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.95 kJ/kg.C	25°	P
2	2.3 kJ/kg.C	150°, [11]	P

Melting Temperature:

No.	Value	Note
1	78°C	M_n 500000, isotactic sequence 55
2	82°C	multiple melting transition
3	70–75°C	[14]

Glass-Transition Temperature:

No.	Value
1	-83°C

Transition Temperature General: T_g is independent of stereoregularity [14] and varies little with MW [11]. T_g for networks has been reported [28]
Transition Temperature:

No.	Value	Note	Type
1	-55°C	[14]	β dispersion
2	-150°C	[14]	γ dispersion

Surface Properties & Solubility:

Solubility Properties General: Soln. behaviour in H_2O has been reported [26,27]
Cohesive Energy Density Solubility Parameters: δ_d 15.3–17.3; δ_p 4.2–5.2; δ_h 6.9–7.9; δ 17.3–19.7 [15]
Solvents/Non-solvents: Sol. H_2O (polyols with MW <700), most organic solvents; insol. non-polar solvents (high hydroxyl content) [11]

Transport Properties:

Polymer Solutions Dilute: PPO undergoes conformational change at 30°. Below wt. fractions of 0.6 soln. behaviour is dominated by hydrophobic hydration [26,27]
Polymer Solutions Concentrated : Viscosity - temp. relationships at temps near to T_g for pure PPO 4000 and for polymer electrolytes based on PPO 4000 have been reported [23]
Polymer Melts: Poly (propylene oxide) polyols are liquid for 200 < MW <6000. Viscosity depends on functionality (inversely proportional to equivalent weight) and the initiator. Values may range from 600 mPa s (flexible foam use) to 10000–100000 mPa s (rigid foam use) to 1000000 mPa s (high functionality, sucrose initiated) [11,14]. Addition of dibenzylidene sorbitol (DBS) at amounts 1–2% by weight give highly connected rigid gel networks formed by strong interaction of DBS with all PPO repeat units [23]
Gas Permeability:

No.	Gas	Value	Note
1	H_2	0.0014 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 425
2	H_2	0.0036 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 725
3	H_2	0.009 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 1025
4	H_2	0.014 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 2000
5	H_2	0.022 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 3000
6	CO	0.0003 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 425
7	CO	0.003 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 725
8	CO	0.0014 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 1025
9	CO	0.004 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 2000
10	CO	0.0062 cm^3 mm/(m^2 day atm)	molar mass between crosslinks 3000 [28]

Electrical Properties:

Electrical Properties General: Used as a constituent of polymer electrolytes [8,9,10]

Optical Properties:

Optical Properties General: Refractive index data have been reported [21]
Transmission and Spectra: Spectral data have been reported [22]
Molar Refraction: Specific refractivity 0.26879 cm^{-3} g^{-1} (MW 1000, T_g -83° (approx.)) [21]

Polymer Stability:

Thermal Stability General: Oxidative degradation is rapid at elevated temps. [11]
Decomposition Details: Oxidation products include acetaldehyde, Me_2CO, MeOH, H_2O, formic acid and AcOH. Two mechanisms have been proposed based on hydroperoxide formation at the secondary alkoxy radical [3,5]and/or the tertiary alkoxy radical [3,4]. Unsaturated hydrocarbons are not present - in contrast to purely thermal decomposition. Alkali metal salts strongly retard the formation of volatile products [29]
Flammability: Fl. p. is greater than 93° [11]
Environmental Stress: Poly(propylene oxides) and their precursors are not quantitatively eliminated by sewage treatment works [30]

Applications/Commercial Products:

Processing & Manufacturing Routes: Normal commercial production is by base catalysed anionic polymerisation. [11,16,17,18] e.g. Propylene oxide may be polymerised at 85° for 40h in the presence of tetrabutylammonium benzoate in dry acetonitrile [18] Other methods of synth. have been investigated [11,21]. Partially stereoregular polypropylene oxide may be prod. using the Pruitt-Baggett catalyst. [20]
Applications: Used as a soft polyether unit in polyurethane elastomers and foams; in polymer electrolytes; as surfactants (lubricants, dispersants, antistatic agents, foam control agents, in printing inks, as solubilisers); in hydraulic fluids, coolant compositions; in medical applications (protective bandages, drug delivery systems, organ preservation, dental compositions, fat substitute)

Poly(propylene oxide-*co*-allyl glycidyl ether) P-502

Synonyms: *GPO. PO-AGE copolymer. Allyl glycidyl ether-propylene oxide synthetic rubber. Poly[methyloxirane-co-(2-propenyloxymethyl)oxirane]*
Related Polymers: Propylene oxide elastomers
Monomers: Propylene oxide, Allyl glycidyl ether
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.
25104-27-2

Molecular Formula: $[(C_3H_6O).(C_6H_{10}O_2)]_n$
Fragments: C_3H_6O $C_6H_{10}O_2$
Additives: Curing/vulcanising systems: sulfur cure or sulfur-donor cure, not peroxide types which attack the backbone
General Information: GPO is the ASTM designation. Crystallinity is low, the pendant allyl group contributing to an amorph. state. Molar composition of PO ranges from about 65 to 90%. The copolymer is used in the vulcanised form

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.01 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	-62°C	[1]

Brittleness Temperature:

No.	Value	Note
1	-90°C	uncompounded [2]
2	-61–-58°C	vulcanised, commercial [1,2]
3	-56°C	94% PO, 6% AGE [3]

Surface Properties & Solubility:

Plasticisers: Plasticisers are required only in highly filled compounds or for softening or viscosity. Aromatic oils (e.g. Sundex 790 (Sun Oil)) and esters (e.g. DOP) may be used [2], also ethers (e.g. di(butoxyethoxyethyl) formal), polyesters (e.g. Paraplex G50), ether-esters (e.g. di(butoxyethoxyethyl)adipate) [1]
Solvents/Non-solvents: Unvulcanised polymers sol. aromatic hydrocarbons, aliphatic hydrocarbons [2]

Transport Properties:

Polymer Melts: η 21–26 (oscillating disc rheometry) [1]
Permeability and Diffusion General: Gas permeability is low [1]
Water Absorption:

No.	Value	Note
1	13 %	70h, 20°, vulcanised [2]
2	4 %	70h, 23°, vulcanised [1]
3	10 %	70h, 100°, vulcanised [1]

Mechanical Properties:

Mechanical Properties General: Mech. props. measured after vulcanisation (170°). Tensile strength and hardness are increased by reinforcing fillers. Plots of loading vs. parameter vs. filler have been reported. [2] Low temp. flexibility is excellent (to -65°) as is flex life [1] (slightly better than natural rubber)
Tensile Strength Break:

No.	Value	Note	Elongation
1	10.2 MPa		365%
2	10.6 MPa	air aged 70h, 125° [1]	80%
3	13.3 MPa		370%
4	10.9 MPa	air aged 70h, 150° [2]	210%
5	13.7 MPa	1980 psi, 94% PO, 6% AGE [3]	
6	19.2 MPa	2790 psi, MeOH purified [3]	

Miscellaneous Moduli:

No.	Value	Note	Type
1	3.4 MPa	[1]	100% Modulus
2	3.8 MPa	[2]	100% Modulus
3	6.2 MPa	air aged 70h, 125°	100% Modulus
4	4.6 MPa	air aged 70h, 150° [2]	100% Modulus

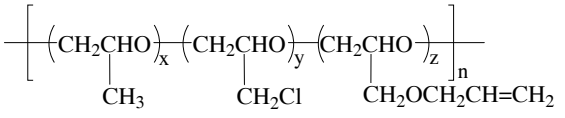
Viscoelastic Behaviour: Compression set 39% (70h, 100°); 66% (70h, 150°) [1]; 66% (70h, 125°); 67% (70h, 150°) [2]; 52% (94% PO, 6% AGE) [3]
Mechanical Properties Miscellaneous: Resilience 42% [1]; 65% (Lupke, 94% PO, 6% AGE) [3]
Hardness: Shore A68–A70 [1,2,3]; 76 (air aged, 70h, 125°) [1]; 73 (air aged, 70h, 150°) [2]; 90 (MeOH purified, 94% PO, 6% AGE) [3]

Failure Properties General: Tear strength 51 kN m^{-1} [1]; 42.7 kN m^{-1} (244 lb in^{-1}, 94% PO, 6% AGE) [3]
Friction Abrasion and Resistance: Wear resistance is poor [1]

Polymer Stability:

Polymer Stability General: Compounding with polycarbonate improves impact and chemical resistance. Copolymerising with styrene increases weather resistance
Thermal Stability General: Resistant to high temp. ageing [1]; further improved by addition of 2-mercaptobenzimidazole [2]
Environmental Stress: Resistance is moderate to poor. Volume change after 70h exposure 48% (ASTM fuel A, 23°); 134% (ASTM fuel B, 23°); 175% (ASTM fuel C, 23°); 11% (ASTM oil no. 1, 125°); 16% (ASTM oil no. 1, 150°); 92% (ASTM oil no. 3, 125°); 102% (ASTM oil no. 3, 150°) [1]
Chemical Stability: Ozone resistance 168h (min., 100 ppm, 49°) [1], further improved by addition of nickel dibutyldithiocarbamate [2] (see natural rubber. Chain backbone is sensitive to peroxides.

Applications/Commercial Products:



Processing & Manufacturing Routes: Normally, soln. polymerisation in aromatic or aliphatic hydrocarbon solvents (e.g. heptane) is carried out in a continuous process. Solvent, catalyst and monomers are fed to a controlled temp., back mixed reactor. Composition uniformity is maintained by adjusting catalyst feed rate to give a constant monomer concentration. Reactivity ratio for PO:AGE is 1. MW control is by organic acid anhydride and organic acid chloride addition [1,2]. Slurry systems have been reported [4,5]. GPO tends to crumble and does not bond well. Best results are obtained by starting mixing of the elastomer only in a cool mill/mixer. Ultimately 60–80° is recommended. Fillers are added incrementally followed by other dry ingredients (not vulcanising agent). Plasticisers follow and finally vulcanising agent (sulfur containing, not peroxide - which should only be added in very small amounts if breakdown is required) [1,2]
Applications: The cured rubber is used as engine mounts and suspension bushings. Applications due to vibration damping comparable to that of natural rubber, but where superior temp. resistance is required. Compounding with polycarbonate yields an impact and chemical resistant product. Copolymer with styrene has applications due to good weather resistance

Poly(propylene oxide-*co*-allyl glycidyl ether-*co*-epichlorohydrin) P-503

Synonyms: *Poly(epichlorohydrin-co-propylene oxide-co-allyl glycidyl ether). GPCO. ECH-PO-AGE terpolymer. Allyl glycidyl ether-epichlorohydrin-propylene oxide synthetic rubber*
Related Polymers: Propylene oxide elastomers
Monomers: Propylene oxide, Allyl glycidyl ether, Epichlorohydrin
Material class: Synthetic Elastomers
Polymer Type: polyalkylene ether, chlorinated polyether

CAS Number:

CAS Reg. No.
25213-15-4

Molecular Formula: $[(C_3H_6O).(C_3H_5ClO).(C_6H_{10}O_2)_2]_n$
Fragments: C_3H_6O C_3H_5ClO $C_6H_{10}O_2$
Additives: Curing/vulcanising systems (sulfur or peroxides) designed for use with conventional rubber. However, any system suitable for polyethers may be used
General Information: GPCO is the ASTM designation. Crystallinity is low and the struct. is generally amorph. Molar composition of PO ranges from about 65 to 90%

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.12 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	-48°C	[1]

Brittleness Temperature:

No.	Value	Note
1	-46°C	ASTM 2137 [1]

Surface Properties & Solubility:

Solvents/Non-solvents: Uncured polymer sol. aromatic solvents, ketones [1]

Transport Properties:

Polymer Melts: η 60–80 (100°, Mooney viscosity) [1]
Permeability and Diffusion General: Gas permeability is low [1]

Mechanical Properties:

Mechanical Properties General: Mech. props. are reported for the vulcanised elastomer (170°). Low temp. flexibility is excellent but deteriorates with increasing epichlorohydrin content
Tensile Strength Break:

No.	Value	Note	Elongation
1	11.4 MPa	[1]	210%
2	11.8 MPa	air aged, 70h, 125° [1]	80%

Miscellaneous Moduli:

No.	Value	Note	Type
1	5.6 MPa		100% Modulus
2	0 MPa	air aged, 70h, 125° [1]	100% Modulus

Viscoelastic Behaviour: Compression set 39% (70h, 100°); 100% (70h, 150°)
Hardness: Shore A77; A90 (air aged, 70h, 125°) [1]
Failure Properties General: Tear strength 46 kN m^{-1} [1]

Polymer Stability:

Thermal Stability General: Exhibits heat resistance similar to epichlorohydrin-ethylene oxide copolymer
Environmental Stress: Fuel resistance is similar to polychloroprene and increases with increasing epichlorohydrin content. Volume change after 70h exposure 12% (ASTM fuel A, 23°); 65% (ASTM fuel B, 23°); 106% (ASTM fuel C, 23°); 0% (ASTM oil no. 1,

125°); 2% (ASTM oil no. 1, 150°); 40% (ASTM oil no. 3, 125°); 56% (ASTM oil no. 3, 150°) [1]. Ozone resistance 168h (min., 100 ppm, 49°) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufacture and processing similar to polypropylene-*co*-allyl glycidyl ether. Reactivity ratio 1.5:1.5:1 hence background monomer ratio control is essential for product uniformity [1]
Applications: Applications in automotive industry as dust covers, fuel hose covers, suspension/transmission boots, antivibration mounts, cable covers. Also has high/low temp. high flex applications

Poly(propylene oxide-*co*-ethylene oxide) P-504

Synonyms: *PO-EO polyols. PO-EO copolymers. Propylene oxide-ethylene oxide copolymers. Methyloxirane-oxirane copolymer*
Related Polymers: Polypropylene oxide
Monomers: Propylene oxide, Ethylene oxide
Material class: Copolymers, Oligomers
Polymer Type: polyalkylene ether, polyethylene oxide
CAS Number:

CAS Reg. No.
9003-11-6

Molecular Formula: $[(C_2H_4O).(C_3H_6O)]_n$
Fragments: C_2H_4O C_3H_6O
Miscellaneous: Usually in the form of a low MW polyol

Polypropylene/polycarbonate blends P-505

Synonyms: *PP/PC blends*
Related Polymers: Polypropylene blends
Material class: Thermoplastic, Blends
Polymer Type: polypropylene, polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
9003-07-0
24936-68-3

Additives: Compatibilisers especially SEBS, styrene-acrylonitrile grafted EPDM, maleated polypropylene and polybutyleneter-ephthalate
General Information: Addition of about 5 wt % polypropylene to polycarbonate or about 10 wt % polycarbonate to polypropylene results in improved processability, impact strength and modulus, while reducing notch sensitivity and mould shrinkage [1]
Morphology: Because of general immiscibility, morphology determines blend performance. Polycarbonate additions to polypropylene enhance crystallinity and slightly increase T_c. Compatibilisation increases the effect. Dispersion is dependent on the viscosity ratio. Processing effects are great, e.g. between the surface and centre of an extruded strand [2,3]. Most deformation and disintegration takes place during the first two minutes of mixing. Composition, viscosity ratio and torque ratio affect size, while viscosity ratio and elasticity ratio affect the shape of the dispersed phase. Some coalescence coarsening has been observed for 23% PC in PP. Shear rate and matrix shear stress have relatively little effect on the dispersed phase. The effect of composition is particularly great near the region of dual phase continuity. The die has a greater effect on the morphology than other aspects of twin-screw extrusion [2,3,4,5,6]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.2 g/cm^3	100% PC
2	d 1.06 g/cm^3	100% PP [7]

Latent Heat Crystallization: ΔH_{fusion} 75 J g^{-1} (PP 92%, PC 8%); 67 J g^{-1} (PP 75%, PC 25%); 39 J g^{-1} (PP 50%, PC 50%) [8]
Melting Temperature:

No.	Value	Note
1	158.5–159°C	[8]

Deflection Temperature:

No.	Value	Note
1	67–140°C	100% PC, 1.82 MPa, negative deviation [8]

Transition Temperature:

No.	Value	Note	Type
1	106–107.5°C	[8]	crystallisation temp.

Transport Properties:

Polymer Melts: Extrudate swell has a max. of 90% (20–25% PP/75–80% PC) [7]. Shear stress to shear rate relations are intermediate between those of the components

Mechanical Properties:

Mechanical Properties General: Small additions (less than 10%) of PC to PP increase hardness, modulus and impact strength but reduce notch sensitivity. Small additions (less than 5%) of PP to PC increase impact strength and modulus but reduce notch sensitivity [10]
Flexural Modulus:

No.	Value	Note
1	1170 MPa	100% PP [8]
2	1300 MPa	75% PP/25% PC [8]
3	900 MPa	60% PP/50% PC [8]
4	1700 MPa	100% PC [8]

Tensile Strength Break:

No.	Value	Note	Elongation
1	12–22 MPa	60% PC [8]	20–10%
2	44 MPa	100% PC [8]	

Tensile Strength Yield:

No.	Value	Note
1	29 MPa	100% PP [8]
2	46 MPa	100% PC [8]
3	12 MPa	50% PP/50% PC [8]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.6		90% PP/10% PC
2	2.72		60% PP/40% PC [10]
3	2.8		50% PP/50% PC
4	3.1		40% PP/60% PC
5	3.22	1–100 kHz	30–150°, 10% PP/90% PC

Dissipation (Power) Factor:

No.	Value	Note
1	0.0002–0.0005	60% PP/40% PC [10]
2	0.0005–0.0007	50% PP/50% PC [10]
3	0.0006–0.0007	50–150°, 40% PP/60% PC [10]

Polymer Stability:

Chemical Stability: PP containing 5–95% PC has excellent chemical resistance [9]

Polypropylene/polyester blends P-506

Synonyms: *PP/PEST*
Related Polymers: Polypropylene blends
Material class: Blends
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0

Additives: Compatibilisers, especially maleated polypropylene
General Information: PP/PEST blends are generally formulated within the dispersed phase region. PP/liq. cryst. polyester blends are a new development based on the orientation (uni- or bi-axial) of the polyester crysts. dispersed in the PP matrix

Volumetric & Calorimetric Properties:

Latent Heat Crystallization: ΔH_f 75.4–83.7 kJ kg^{-1} (18–20 cal g^{-1} PP/LCP, LCP $\leq$20%) [2]
Transition Temperature General: T_g tends to that for PET and is little affected by blending

Transport Properties:

Polymer Melts: Viscosity 4000–40000 Poise (400–4000 Pa s, shear rate 300-10 s^{-1}, 100% polypropylene); 1500–4000 Poise (150–400 Pa s, shear rate 300-10 s^{-1}, 80% polyproylene) [2]

Mechanical Properties:

Mechanical Properties General: Data refer primarily to fibres/filaments

Tensile (Young's) Modulus:

No.	Value	Note
1	10300 MPa	1500 kpsi, 30% PP/70% PET
2	8300 MPa	1200 kpsi, 50% PP/50% PET [1]
3	1000–5000 MPa	80% PP/20% LCP
4	1000–4000 MPa	100% PP [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	40–300 MPa	80% PP/20% sebacic acid, hydroxybenzoic acid, dihydroxybiphenyl	350–550%
2	50–400 MPa	100% PP [2]	400–700%

Mechanical Properties Miscellaneous: Plots of dynamic mech. props. for the PP/PET blends have been reported [1]. Tenacity 0.51 N tex^{-1} (32% elongation) (30% PP/70% PET). 0.5 N tex^{-1} (22% elongation) (50% PP/50% PET)

Polypropylene/rubber blends P-507

Synonyms: *Thermoplastic vulcanisates. PP/rubber blends. Thermoplastic elastomers*
Related Polymers: Polypropylene blends, Blends with EPDM (dynamically vulcanised), Blends with butadiene rubbers (polybutadiene), Blends with nitrile rubbers (NBR), Blends with butyl rubber, Blends with natural rubber, Blends with EPDM (unvulcanised) or EPR, Elastomers based on poly(propylene oxide), Propylene-ethylene elastomers
Material class: Thermoplastic, Synthetic Elastomers, Blends
Polymer Type: polypropylene
Additives: Except for colourants, use of additives within these blends is not recommended
General Information: Combination of a fine dispersion of a highly vulcanised rubber-like component within a thermoplastic matrix gives products comparable to thermoset rubbers but which, being thermoplastic, are re-processable. Blending polypropylene with other polymers improves some of its props. particularly its impact strength at low temps. Blends with rubbers are of particular interest as they can combine the processing and mechanical props. of polypropylene and the flexibility of rubbers. Polypropylene (PP)/rubber blends include: PP/ethylene-propylene-rubber (EPR); PP/ethylene-butene rubber (EBR); PP/EPR/polyethylene; PP/ethylene-propylene-diene (EPDM); PP/poly(*cis*-butadiene) (PCB); PP/natural rubber (NR); PP/nitrile rubber (NBR); PP/styrene-butadiene-styrene (SBS) triblock copolymer; PP/styrene-isoprene-styrene (SIS) triblock copolymer; PP/styrene-block-ethene-*co*-1-butene-block-styrene (SEBS). The most frequently encountered blends are PP/EPDM and PP/EPR; when these contain lower amounts of elastomer (5–20%) low temp. impact strength and toughness are improved with some maintenance of rigidity. Blends containing higher amounts of elastomer become semi-elastomeric and eventually fully elastomeric. PP may be blended with incompatible rubbers in the presence of compatibilisers or

emulsifiers. The potential performance of PP/rubber blends has been further improved by the development of dynamic vulcanisation process
