Morphology: Domain morphology of the blends is closely related to their props. and depends on factors such as composition, preparation, vulcanisation/cross-linking, and viscosity ratio. The morphology of various blends has been studied extensively by SEM and optical microscopy
[11,12,13,14,15,23,24,27,28,31,32,33]
Miscellaneous: Useful comparisons with extensive data have been reported [1,2,3]. Considerable information on many TPVs has been reported [5,6,7]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: The linear expansion coefficient of PP/EPR blends at -20° increases sharply as the elastomer content increases from approx. 5 wt% [12]
Transition Temperature General: Cross-linking in PP/EPDM blends lowers the crystallisation temp. (T_c. Increasing the amount of elastomer in the uncross-linked blend generally lowers T_c but after cross-linking the reverse trend is observed [21]. Addition of peroxide and co-agent has little effect on the melting point of PP in PP/NR and PP/EPR blends but T_c in the former is increased by addition of both. In PP/EPR blends increasing the co-agent also raises $T_c$significantly but the presence of peroxide can lower T_c significantly. T_m remains unchanged upon increasing viscosity ratio but T_c decreases [16,17]
Deflection Temperature:

No.	Value	Note
1	100–114°C	PP/EPR 58/31; varying MW of EPR, 10% talc [27]
2	100–106°C	PP/EBR 58/31; varying MW of EBR, 10% talc [27]

Vicat Softening Point:

No.	Value	Note
1	134–143°C	PP/EPDM 80/20; not cross-linked [22]
2	140–148°C	PP/EPDM 80/20; cross-linked [22]
3	135°C	PP/SBS 80/20; not cross-linked [22]
4	137°C	PP/SBS 80/20; not cross-linked [22]
5	134°C	PP/SIS 80/20; not cross-linked [22]
6	140°C	PP/SIS 80/20; not cross-linked [22]

Brittleness Temperature:

No.	Value	Note
1	<-60°C	max., PP/EPDM [2]
2	-24°C	compatibilised PP/NBR [2]
3	-47°C	PP/EPDM:compatibilised PP/NBR, 50:50 [2]

Transport Properties:

Transport Properties General: The melt flow rate of PP/EPR and PP/EPDM blends decreases with increasing amounts of elastomer and increases with cross-linking. Cross-linking of PP/SBS and PP/SIS blends results in a decrease in melt flow rate [12,20,22]. The addition of peroxide and co-agent to PP/NR blends has a significant effect on the melt index. At constant level of peroxide the addition of increasing amounts (0–0.1%) of co-agent (TMPTA) causes a slight increase in melt index. Melt index decreases sharply as the amount of co-agent rises to 0.4%. Above 0.4% co-agent, the melt index changes only slightly. At a constant level of co-agent the addition of up to 0.01% peroxide causes a sharp drop in the melt index. Amounts of peroxide between 0.01 and 0.02% cause only a slight decrease in the melt index and above 0.02% peroxide, the melt index increases slightly [16]
Melt Flow Index:

No.	Value	Note
1	100–510 g/10 min	PP/NR 90/10; varying levels of peroxide co-agent [16]
2	140–240 g/10 min	PP/EPDM; increasing EPDM; not cross-linked [20]
3	140–470 g/10 min	PP/EPDM; increasing EPDM; varying degress of cross-linking [20]
4	160 g/10 min	PP/EPDM 80/20; not cross-linked [22]
5	240 g/10 min	PP/EPDM 80/20; not cross-linked [22]
6	150 g/10 min	PP/SBS 80/20; not cross-linked [22]
7	70 g/10 min	PP/SBS 80/20; not cross-linked [22]
8	260 g/10 min	PP/SIS 80/20; not cross-linked [22]
9	130 g/10 min	PP/SIS 80/20; not cross-linked [22]

Polymer Melts: The effect of peroxide /co-agent addition on the melt viscosity of PP/EPR and PP/NR blends has been reported [16,17]. Changes in the rheological props. arising from the addition of glass fibre to PP/EPDM blends have been reported [19]. The melt rheology of PP/SBS blends has been studied with and without dynamic vulcanisation. Melt elasticity increases and melt fracture decreases with increasing SBS content and dynamic vulcanisation enhances these effects [30]

Mechanical Properties:

Mechanical Properties General: Effects of blend ratio and dynamic vulcanisation on mech. props. have been reported [5]. A range of thermoplastic vulcanisates with polypropylene has been reported [1]. In studies on the correlation between blend props. and characteristics of PP and elastomer it has been found that the best compositions are formed when there is a greater degree of crystallinity in PP, when there are higher entanglement densities in the elastomer and when the surface energy of the elastomer is similar to that of PP. The morphology and particle size of the rubber are important factors affecting the mechanical props. of blends, particularly impact strength and flexural modulus. These are improved with fibril formation. The effect of struct. on mechanical props. has been investigated for a number of blends including PP/EPR, PP/EPR/PE and PP/SEBS [24,33]. The props. of PP blends with elastomers in which the surface energies are different can be improved by compatibilisation. For example, PP/NBR blends may be compatibilised by the addition of EPDM or by maleic-modification of PP and the use of amine-terminated nitrile elastomer (NBR). PP/NBR blends may also be compatibilised by melt grafting using 2-isopropenyl-2-oxazoline or glycidyl methacrylate both of which allow chemical reaction between PP and the elastomer. By these means PP/NBR blends can be obtained which are comparable to PP/EPDM blends in their mechanical props.[2,25,26,31,32]. The variation of loss and storage moduli and loss tangent with temp. and composition has been reported for PP/NBR and PP/NR. The effect of compatibilisation and dynamic vulcanisation on the dynamic mechanical props. is also reported [14,29]. Yield strength and flexural modulus both decrease and the elongation at break increases as the elastomer content of a PP/EPDM blend is increased. The effect of cross-linking varies but generally gives rise to lowered yield strength and increases in elongation and flexural modulus. The impact strength and toughness are also improved as the level of elastomer increases. Cross-linking further improves the impact strength, the improvement being particularly effective at elastomer levels of approx. 20% and higher [20,21]. Increasing the extent of cross-linking improves storage modulus and decreases loss tangent values and has more effect in blends with a higher proportion of elastomer. Increasing the amount of elastomer reduces the storage modulus and increases the loss tangent

[10,21]. In PP/SBS blends the tensile strength, tensile modulus and impact strength decrease and the elongation increases as the amount of elastomer increases. Dynamic vulcanisation gives rise to a greater improvement in props. This improvement is relatively small at low levels of SBS but is dramatic at SBS amounts of 20% and more [24]. The effect of viscosity ratio and added peroxide/co-agent on mechanical props. has been reported for PP/NR, PP/NBR and PP/EPR [14,16,17]. PP blended with EPR/PE can have better impact strength than PP blended with EPR alone. [12,33]. EBR has been found to have a greater toughening effect in PP blends than EPR [27]. The effect of the addition of filler and extender oil on the mechanical props. of PP/rubber blends has been reported [2,10,23]. Tear strength 100.5 kN m^{-1} (30% natural rubber, not cross-linked), 115.2 kN m^{-1} (30% natural rubber, dynamically cross-linked), 22.1 kN m^{-1} (70% natural rubber, not cross-linked), 44.4 kN m^{-1} (70% natural rubber, dynamically cross-linked) [15]

Tensile (Young's) Modulus:

No.	Value	Note
1	97–103 MPa	PP/EPDM 66.7/100; decreasing particle size; static vulcanisation [2]
2	58 MPa	PP/EPDM 66.7/100; dynamic vulcanisation [2]
3	60–72 MPa	PP/EPDM 66.7/100; dynamic vulcanisation, decreasing cross-link density [2]
4	22–435 MPa	PP/EPDM 66.7/100; increasing levels of PP; dynamic vulcanisation [2]
5	691–1175 MPa	PP/SEBS; varying composition and MW [24]
6	691–998 MPa	PP/SEBS; 80/20 varying composition and MW [24]
7	843–1170 MPa	PP/SEBS; 90/10 varying composition and MW [24]
8	250 MPa	PP/NBR 70/30; no compatibilisation [31]
9	135 MPa	PP/NBR 50/50; no compatibilisation [31]
10	47 MPa	PP/NBR 30/70; no compatibilisation [31]

Flexural Modulus:

No.	Value	Note

3	4.9–18.2 MPa	PP/EPDM (66.7/100); dynamic vulcanisation; decreasing cross-link density [2]	
4	17.9–28.8 MPa	PP/EPDM (66.7/100); increasing levels dynamic vulcanisation [2]	470–580%
5	18.3 MPa	PP/NBR (70/30); no compatibilisation [31]	96%
6	9.2 MPa	PP/NBR (50/50); no compatibilisation [31]	43%
7	3.5 MPa	PP/NBR (30/70); no compatibilisation [31]	39%
8	24.3 MPa	PP/EPDM (40/60) ; dynamic vulcanisation [2]	530%
9	21.6 MPa	PP/butyl rubber (40/60); dynamic vulcanisation [2]	380%
10	22.7 MPa	PP/poly-transpentenamer (40/60); dynamic vulcanisation [2]	210%
11	26.4 MPa	PP/natural rubber (40/60); dynamic vulcanisation [2]	390%
12	20.8 MPa	PP/butadiene (40/60); dynamic vulcanisation [2]	258%
13	21.7 MPa	PP/styrene-butadiene rubber (40/60); dynamic vulcanisation [2]	128%
14	13 MPa	PP/chloroprene rubber (40/60); dynamic vulcanisation [2]	141%
15	17 MPa	PP/nitrile rubber (40/60); dynamic vulcanisation [2]	201%
16	8.6 MPa	PP/EPDM; dynamic vulcanisation [2]	415%
17	22.6 MPa	compatibilised PP/NBR; dynamic vulcanisation [2]	485%
18	15.9 MPa	50/50 mix of PP/EPDM and compatibilised PP/NBR; dynamic vulcanisation [2]	510%
19	32.4 MPa	room temp.; 330 kg cm^{-2}, PP/EPR(80/20) [13,17]	510%
20	20.1–30.4 MPa	room temp.; 205–310 kg cm^{-2}, PP/EPR/HDPE (80/10/10) [13]	470–610%

Tensile Strength Yield:

No.	Value	Note
1	23.5 MPa	room temp., 240 kg cm^{-2}, PP/EPR (80/20) [13]
2	28–30.4 MPa	room temp., 285–310 kg cm^{-2}, PP/EPR/HDPE (80/10/10) [13]

3	19.1–20.6 MPa	194–210 kg cm^{-2}, PP/NR (90/10), varying levels of cross-linking [16]
4	17.5–26.7 MPa	PP/SEBS; varying composition and MW [24]
5	17.5–23 MPa	PP/SEBS (80/20) varying MW [24]
6	20.9–26.7 MPa	PP/SEBS (90/10) varying MW [24]

Impact Strength: Falling weight impact strength 1.4–1.6 J (PP/EPR/HDPE (88/6/6)) [11], 12.6–12.9 (PP/EPR/HDPE (76/12/12)) [11]
Hardness: Shore D41–D43 (PP/EPDM (66.7/100); decreasing particle size; static vulcanisation), D42 (PP/EPDM (66.7/100); dynamic vulcanisation), D40–D22 (PP/EPDM (66.7/100); dynamic vulcanisation, decreasing cross-link density), D34–D59 (PP/EPDM (66.7/100), increasing levels of PP, dynamic vulcanisation) [2], D55 (PP/NBR (70/30); no compatibilisation), D45 (PP/NBR (50/50); no compatibilisation), D18 (PP/NBR (30/70); no compatibilisation) [31], D68 (PP/EPDM), D93 (compatibilised PP/NBR), D87 (50/50 mix of PP/EPDM and compatibilised PP/NBR [2]; Shore R61 (PP/EPR (80/20) [17]; Shore A95 (PP/NBR (70/30); no compatibilisation), A93 (PP/NBR (50/50); no compatibilisation), A83 (PP/NBR (30/70); no compatibilisation) [31]. Rockwell 75–76 (PP/EPR (58/31); varying, MW of EPR; 10% talc), 83–84 (PP/EBR (58/31); varying MW of EBR; 10% talc [27]
Failure Properties General: The effect of composition and dynamic cross-linking on the tear strength of PP/natural rubber blends has been studied. Examination of the fracture surfaces suggests that PP brittle fracture is changed to a ductile type on the addition of rubber. Dynamic cross-linking of the elastomer appears to result in restricted flow under tear pressure [15]. The toughening mechanisms of various blends with and without cross-linking have been reported [20,27]
Izod Notch:

2	27.8–38.4 kJ/m^2	Notched	PP/SEBS (80/20); varying MW [24]
3	3.6–13.4 kJ/m^2	Notched	PP/SEBS (90/10); varying MW [24]

Polymer Stability:

Thermal Stability General: The thermal stability of PP is improved by the addition of rubber [29]
Decomposition Details: The main degradation of PP/natural rubber occurs in the range 400–425° [29]
Chemical Stability: PP/rubber blends have good resistance to hot oil [14]. Volume of swell in hot ASTM No.3 oil, 70h, 100°) 62.5 (PP/EPDM) 22 (compatibilised PP/NBR) 32.5 (50/50 mix of PP/EPDM and compatibilised PP/NBR) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by melt mixing, soln. blending or latex mixing, melt mixing being the most usual. Banbury mixers, mixing extruders and twin-screw mixers are suitable. For dynamically vulcanised blends (TPVs), rubber and plastic plus any filler, plasticiser, lubricant, stabiliser, etc. are melt mixed. Curatives and cross-linkers are then added and mixing continued until mixing torque (or energy) passes through a maximum [7]. The thermoplastic vulcanisation of PP and EPDM in supercritical propane has been reported [28]. Sulfur-curing of PP/EPDM blends has been reported [18]. Dynamic vulcanisation produces elastomer particle sizes far smaller than those obtained using static process, i.e. precured, ground and melt-mixed. For example particle sizes of 1–2 μm are obtained by dynamic vulcanisation compared with 5–70 μm and above for static vulcanisation (PP/EPDM blends). Modification by melt grafting has been used to compatibilise PP blends with polymers such as NBR [25,26]. Blends can be processed by injection moulding or extrusion [2]
Applications: Applications in mechanical rubber goods (gaskets, seals, wheels, tubing, bumpers, suction cups, rollers, etc.); in automotive components (shock isolators, fuel line hose cover, body plugs, grommets, etc.); in hosing; in electrical applications (plugs, cable insulation, bushings, etc.); and in footwear and sports goods

Trade name	Details	Supplier
Santoprene	completely vulcanised PP/EPDM	Monsanto Chemical
TPR 1700	partially vulcanised PP/EPDM	Uniroyal

Polypropylene/styrenic blends P-508

Synonyms: *PP/PS blends*
Related Polymers: Polypropylene blends
Material class: Blends
Polymer Type: polypropylene, styrenes
CAS Number:

CAS Reg. No.
9003-07-0
9003-53-6

General Information: Primarily of academic interest, being good for blend morphology study. PP/PS blends have improved high temp. and grease resistance props. PP/HIPS (high impact) and PP/SBS show good mechanical props. and large strain at break. PP/SB/EPDM shows an exceptional balance of props. PP/poly(styrene-*co*-terpene) is useful for production of biaxially oriented, heat sealable film
Morphology: Photomicrographs showing struct. at various compositions and using different blending techniques have been reported [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.8865 g/cm^3	100% PP
2	d 0.9149 g/cm^3	80% PP/20% PS
3	d 0.9304 g/cm^3	70% PP/30% PS
4	d 0.968 g/cm^3	50% PP/50% PS

No.	Value	Note
1	162°C	PP ≤50%
2	163°C	PP <50% [1]

Glass-Transition Temperature:

No.	Value	Note
1	103°C	80% ≤ PP ≤20% [1]

Surface Properties & Solubility:

Solubility Properties General: Equilibrium swelling props. in *n*-hexane have been reported [1,5]

Transport Properties:

Polymer Melts: A plot of melt viscosity versus blending ratio has been reported [2]

Mechanical Properties:

Mechanical Properties General: The effect of compatibilisers on mechanical props. has been reported [3,4]. Elongation falls sharply with increasing polystyrene content

Tensile (Young's) Modulus:

No.	Value	Note
1	686 MPa	7000 kg cm^{-2}, 100% PP
2	1863 MPa	19000 kg cm^{-2}, 100% PS [5]

Tensile Strength Break:

No.	Value	Note
1	32.4 MPa	4700 psi, 100% PP
2	34.5 MPa	5000 psi, 100% PS
3	20.7 MPa	3000 psi, 60% PP/40% PS, plunger machine
4	29.6 MPa	4300 psi, 75% PP/25% PS, plunger/static mixer [2]

Hardness: Shore 69 (100% PP); 80 (100% PS, ASTM D2240-68) [2]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	1.4–1.8%	100% PP
2	0.5%	approx., 100% PS, ASTM D955-51 [2]

Polypropylene, Talc filled P-509

Synonyms: *PP, Talc filled. Polypropene, Talc filled*
Related Polymers: Polypropylene, Polypropylene, Filled, Isotactic polypropylene
Monomers: Propylene
Material class: Thermoplastic, Composites
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
Additives: Talc (natural, hydrated magnesium silicate). Lamellar form 40%
General Information: Addn. of talc improves flexural and dimensional props. and gives high stiffness props. at the expense of tensile and impact strengths and thermal stability. Surface is matt and welding is impaired

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.23–1.27 g/cm^3	40% talc filled, homopolymer [1]
2	d 1.23–1.24 g/cm^3	40% talc filled, copolymer [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4.2×10^{-5}–8×10^{-5} K^{-1}	homopolymer, 40% talc filled [1]	V

Thermal Conductivity:

No.	Value	Note
1	0.32 W/mK	0.00076 cal cm^{-1} s^{-1} °C^{-1}, ASTM C177, 40% talc filled [1]

Melting Temperature:

No.	Value	Note
1	156–168°C	homopolymer, 40% talc filled [1]

Deflection Temperature:

No.	Value	Note
1	79–82°C	175–180°F, homopolymer [1]
2	65–74°C	150–165°F, copolymer, 40% talc filled, 1.84 MPa (264 psi), ASTM D648 [1]
3	129–143°C	265–290°F, homopolymer
4	102–121°C	215–250°F, copolymer, 40% talc filled, 0.45 MPa (66 psi), ASTM D648 [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.01–0.03 %	$^1/_8$" thick, 24h, ASTM D570 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3100–3960 MPa	450–575 kpsi, homopolymer, 40% talc filled, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	3100–4310 MPa	450–625 kpsi, 28° (73°F)
2	2756 MPa	400 kpsi, 93° (222°F), homopolymer
3	2345–2755 MPa	340–400 kpsi, 28° (73°F), copolymer, 40% talc filled, ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	30–34 MPa	4300–5000 psi, homopolymer	3–8%
2	24 MPa	3500 psi, copolymer, 40% talc filled ASTM D638 [1]	20%

Flexural Strength at Break:

No.	Value	Note
1	43–63 MPa	7000–9200 psi, homopolymer
2	35 MPa	5100 psi, copolymer, rupture or yield, 40% talc filled, ASTM D790 [1]

Tensile Strength Yield:

No.	Value	Note
1	32 MPa	4600, homopolymer
2	21 MPa	3100 psi, copolymer, 40% talc filled, ASTM D638 [1]

Compressive Strength:

No.	Value	Note
1	52 MPa	7500 psi, rupture or yield, homopolymer, 40% talc filled, ASTM D695 [1]

Hardness: Rockwell R94-R110 (homopolymer); R83 (copolymer, 40% talc filled, ASTM D785) [1]
Izod Notch:

No.	Value	Notch	Note
1	21–32 J/m	N	0.4–0.6 ft lb in^{-1}, $^1/_8$" thick, homopolymer [1]
2	43–214 J/m	N	0.8–4 ft lb in^{-1}, $^1/_8$" thick, copolymer, 40% talc filled, ASTM D256A [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	19.68 kV.mm^{-1}	500 V mil^{-1}, $\frac{1}{8}$" thick, homopolymer, 40% talc filled, ASTM D149 [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processing temp. range (40% talc filled) 175–290° (350–550°F), homopolymer, injection moulding); 175–245° (350–470°F, injection moulding), 220–245° (425–475°F, extrusion grade, copolymer) [1]. Moulding pressure range (40% talc filled) 70–140 MPa (10–20 kpsi), homopolymer); 100–140 MPa (15–20 kpsi, copolymer) [1]

Mould Shrinkage (%):

No.	Value	Note
1	0.8–1.5%	linear (0.008–0.015 in/in, homopolymer)
2	0.9–1.2%	0.009–0.12 in/in, copolymer (40% talc filled, ASTM D955) [1]

Applications: Applications include food containers and various structural parts, appliances, packaging and other household goods. Also used in automotive engine housings and ducts

Polypropylene, Wood-filled P-510

Synonyms: *Polypropene. PP. Poly(1-propene). Poly(methyl ethylene). Propene polymer. Propylene polymer*

Related Polymers: Polypropylene, Isotactic Polypropylene, Atactic Polypropylene, Polypropylene, Filled, Polypropylene, Aluminium filled, Polypropylene, Calcium carbonate filled, Polypropylene, Talc filled, Polypropylene, Glass fibre reinforced, Polypropylene, Mica filled, Polypropylene, Carbon filled, Polypropylene, Glass fibre reinforced

Monomers: Propylene

Material class: Thermoplastic

Molecular Formula: $(C_3H_6)n$

Fragments: C_3H_6

General Information: Extrusion and injection molding grades available.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.966–1.145 g/cm^3	(ASTM D792, 20–60% filled, molding grade) [1]
2	d 0.951–1.142 g/cm^3	(ASTM D792, 20–60% filled, extrusion grade) [1]

Deflection Temperature:

No.	Value	Note
1	71–94°C	ASTM D648, 20–60% filled, extrusion grade [1]
2	61–98°C	ASTM D648, 20–60% filled, molding grade [1]

Vicat Softening Point:

No.	Value	Note
1	153–158°C	ASTM D1525, 20–60% filled, extrusion grade [1]

Transport Properties:

Transport Properties General: Processing characteristics often better than MFI suggests [1].

Melt Flow Index:

No.	Value	Note
1	5 g/10 min	(value less than) ASTM D1238, at 190°C, 20–60% filled, extrusion grade [1]
2	0.5–7.4 g/10 min	(min. value less than) ASTM D1238, at 190°C, 20–60% filled, molding grade [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2730–6010 MPa	ASTM D638, 20–60% filled, extrusion grade [1]
2	2500–6200 MPa	ASTM D638, 20–60% filled, molding grade [1]

Flexural Modulus:

No.	Value	Note
1	2480–4880 MPa	ASTM D790, 20–60% filled, extrusion grade [1]
2	2200–4900 MPa	ASTM D790, 20–60% filled, molding grade [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	21–26.6 MPa	ASTM D638, 40–60% filled, extrusion grade [1]	1.2–6.2%
2	19.7–25.3 MPa	ASTM D638, 20–60% filled, molding grade [1]	1.2–9.2%

Tensile Strength Yield:

No.	Value	Note
1	30.9–32.3 MPa	ASTM D638, 20–40% filled, extrusion grade [1]
2	26.3–27.4 MPa	ASTM D638, 20–40% filled, molding grade [1]

Flexural Strength Yield:

No.	Value	Note
1	41.5–56.4 MPa	ASTM D790, 20–60% filled, extrusion grade [1]
2	39.1–47.6 MPa	ASTM D790, 20–60% filled, molding grade [1]

Izod Notch:

No.	Value	Notch	Note
1	23.3–46.4 J/m	Y	ASTM D256, 20–60% filled, extrusion grade [1]
2	49–196 J/m	N	ASTM D256, 20–60% filled, molding grade [1]
3	22.3–29.5 J/m	Y	ASTM D256, 20–60% filled, extrusion grade [1]
4	40–126 J/m	N	ASTM D256, 20–60% filled, molding grade [1]

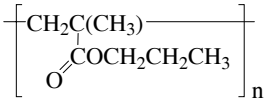
Applications/Commercial Products:

Processing & Manufacturing Routes: Injection molding processing:
Dryer inlet temp. 104°C
Dew point -29°C
Drying time 2–4 hours
Processing temps.: rear <182°C, middle <188°C, front <193°C, nozzle <193°C
Residence time <15 min.
Blowing agents low temp.
Screw type conventional
Extrusion processing:
Dryer inlet temp. 104°C
Dew point -29°C
Drying time 2–4 hours
Temp. settings.: zone 1 <149–171°C, zone 2 <164–188°C, zone 3 <171–193°C, zone 4 <182–193°C, adapter <182–204°C, die <182–204°C
Residence time <15 min.
Blowing agents low temp.
Screen packs <20 mesh
Draw down 0–5%
Screw type conventional

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	0.18–0.87%	ASTM D955, 20–60% filler, molding grade [1]



Applications:

Trade name	Supplier
Tipwood	Tipco Industries Ltd.

Poly(*n*-propyl methacrylate) P-511

Synonyms: *Poly(propyl-2-methyl-2-propenoate). Poly[1-(propoxycarbonyl)-1-methyl ethylene]*
Monomers: *n*-Propyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
25609-74-9

Molecular Formula: $(C_7H_{12}O_2)_n$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.085 g/cm^3	[1,2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00058 K^{-1}	uv polymerisation, above T_g [3]	V
2	0.000315 K^{-1}	uv polymerisation, below T_g [3]	V

Volumetric Properties General: Molar volumes: Van der Waal's, V_w 76.6 cm^3 mol (amorph. polymer, 25°); glassy polymer, V_g 118.7 cm^3 mol (amorph. polymer, 25°)
Melting Temperature:

No.	Value	Note
1	33°C	refractometric method [4]

Glass-Transition Temperature:

No.	Value	Note
1	35–43°C	[2]
2	35°C	Uv polymerisation, dilatometric method [3]

Transition Temperature General: γ-transition, $T_{2\gamma}$ -150° [5]
Vicat Softening Point:

No.	Value	Note
1	55°C	[1]

Brittleness Temperature:

No.	Value	Note
1	35°C	refractometric method [4]

Transition Temperature:

No.	Value	Note	Type
1	-150°C	[5]	γ-transition temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: 36.8 $J^{1/2}$ $cm^{-3/2}$ (8.8 $cal^{1/2}$ $cm^{3/2}$) [6,7]; 36.4–40.2 $J^{1/2}$ $cm^{-3/2}$ (8.7–9.6 $cal^{1/2}$ $cm^{-3/2}$) [8]
Solvents/Non-solvents: Sol. cyclohexane (hot), gasoline (hot), turpentine, castor oil (hot), linseed oil (hot), CCl_4, EtOH, Et_2O, Me_2CO [9]. Insol. formic acid
Surface and Interfacial Properties General: Surface tension, γ 33.3 mN m^{-1} (20°, MV 8500) [10], 24.7 mN m^{-1} (150°, MV 8500) [10], 21.5 mN m^{-1} (200°, MV 8500) [10], -dγ/dT 0.065 mN m^{-1}, $°C^{-1}$ (MV 8500) [10]
Wettability/Surface Energy and Interfacial Tension: Contact angle 65° (advancing, H_2O) [11]

Transport Properties:

Polymer Solutions Dilute: Polymer-liq. interaction parameters [12], 0.82 (hexane), 0.63 (2-butanone), 1.42 (acetonitrile), 0.01 ($CHCl_3$), 0.98 (*n*-propanol), 0.82 (Me_2CO), 0.65 (EtOAc)
Permeability of Liquids: Diffusion coefficient [H_2O] 18.4 × 10^{-8} cm^2 s^{-1} (37°) [11]

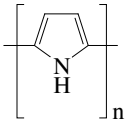
Mechanical Properties:

Hardness: Vickers 7 (5 kg load) [13]

Electrical Properties:

Electrical Properties General: Refractive index μ_n 1.484 (20°) [2,13]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.1	[2]



Polymer Stability:

Decomposition Details: Decomposes at 250° yields monomer [13]

Poly(pyrrole) P-512

Synonyms: *PPY. Pyrrole black. Pyrrole red*
Related Polymers: Poly(*N*-methylpyrrole)
Monomers: Pyrrole
Polymer Type: polypyrrole
CAS Number:

CAS Reg. No.
30604-81-0

Molecular Formula: $(C_4H_3N)_n$
Fragments: C_4H_3N
General Information: Props. of poly(pyrrole) are determined by the method of synth. [1,2,3,4,38]. Electrochemical synth. has been used to form durable films of conducting polymer [39]
Morphology: Cryst. a 0.82, b 0.735, c 0.682, α, β 90° and γ 117° [5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.4 g/cm^3	[7,8,9]

Thermal Conductivity:

No.	Value	Note
1	0.62–1.12 W/mK	7° [10]

Thermal Diffusivity: 0.0028–0.0066 cm^2 s^{-1} [24]; 0.0091–0.0093 cm^2 s^{-1} (11–59°) [10]
Specific Heat Capacity:

No.	Value	Note	Type
1	0.8–1.4 kJ/kg.C	[10]	P

Transition Temperature:

No.	Value	Note	Type
1	60–80°C	[6]	Decomposition temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. C_6H_6, $CHCl_3$, CH_2Cl_2, dioxane, EtOH [6]. Insol. conc. sulfuric acid, 40% NaOH [8], H_2O, pentane [6]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	18–33 MPa	[11,12,13,14]	2–410%

Electrical Properties:

Electrical Properties General: Electrical conductivity [40,41,42,43] depends on the counter-ion [15,16,17,18,19]. Doping increases conductivity [20,21]; conductivity decreases on ageing [9,22]
Surface/Volume Resistance:

No.	Value	Note	Type
1	6.6×10^{15} Ω.cm	[8]	S

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.031–8.035	[7,23]

Complex Permittivity and Electroactive Polymers: Conductivity values σ 51.3 (3h); 35.1 (14 days) [9]; 59.2 Ω^{-1} cm^{-1} [24]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.78–1.766	10 GHz	[7,23]

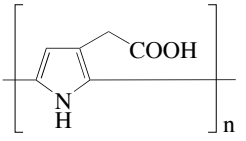
Optical Properties:

Transmission and Spectra: Ir [6,8,25,26], Raman [27], H-1 nmr [6,28], epr [25,29,30], uv [27] and x-ray photoelectron [31] spectral data have been reported

Polymer Stability:

Decomposition Details: Poly(pyrrole) is oxidised in the presence of oxygen. At temps. above 230° this oxidation is a bulk phenomenon leading to decomposition. At temps. below 230° the oxidation is a slow, gradual process [22]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by chemical oxidative polymerisation of pyrrole [29,32,33,34]; or by electrochemical polymerisation of pyrrole [35,36,37,39]
Applications: Lightweight secondary batteries, electromagnetic interference shielding, transistors, and many potential applications as electrode materials, e.g. in enzyme electrodes for studying enzyme-catalysed kinetics

Poly(3-pyrroleacetic acid) P-513

Synonyms: *1H-Pyrrole-3-acetic acid homopolymer*
Monomers: 1*H*-Pyrrole-3-acetic acid
Material class: Thermoplastic
Polymer Type: polypyrrole
CAS Number:

CAS Reg. No.
134215-74-0

Molecular Formula: $(C_6H_5NO_2)n$
Fragments: $C_6H_5NO_2$
General Information: Conductive polymer with sensitivity towards pH [1]. Prod. electrochemically as blue-black film.

Electrical Properties:

Electrical Properties General: Conductivity as high as 37 S cm^{-1} has been reported for film, with a proposed self-doping mechanism [1]

Optical Properties:

Transmission and Spectra: Ftir [2], xps and ms [3] spectral data have been reported.

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by electropolymerisation of 3-pyrroleacetic acid in a suitable solvent such as MeCN [2,3] or propylene carbonate [4] with a supporting electrolyte such as lithium perchlorate [2,4] or tetrabutylammonium tetrafluoroborate [3].
Applications:

Poly(resorcinol isophthalate) P-514

Synonyms: *Poly(metaphenylene isophthalate). Poly(oxy-m-phenyleneoxyisophthaloyl). Poly(oxy-1,3-phenyleneoxycarbonyl-1,3-phenylenecarbonyl)*
Monomers: 1,3-Benzenediol, 1,3-Benzenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
26618-61-1	from isophthalic acid
28211-79-2	from isophthaloyl chloride
26637-46-7	repeating unit

Molecular Formula: $(C_{14}H_8O_4)_n$
Fragments: $C_{14}H_8O_4$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.34 g/cm^3	[3]

Melting Temperature:

No.	Value	Note

5	230–245°C	[11]

Glass-Transition Temperature:

No.	Value	Note
1	155°C	[2]
2	132°C	405K [3]
3	124.4°C	397.6K, calc. [7]
4	130°C	[9]

Transition Temperature:

No.	Value	Note	Type
1	312°C	[4]	Polymer melt temp.
2	245°C	[12]	Polymer melt temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot *m*-cresol, hot *o*-chlorophenol, hot DMF, hot DMSO, hot 1,1,2,2-tetrachloroethane, hot *N*-methyl-2-pyrrolidone [6]. Insol. H_2O [5], Me_2CO [5], $CHCl_3$, formic acid [6], chlorobenzene [6]. Solubility in other solvents has been reported [11]
Wettability/Surface Energy and Interfacial Tension: Surface free energy, γ_s 41.7 mJ m^{-2}, γ_d 37.4 mJ m^{-2}, γ_p 4.3 mJ m^{-2}; γ_p/γ_s 0.1 [6]

Transport Properties:

Polymer Solutions Dilute: $[\eta]$ 0.31 dl g^{-1} [1]; $[\eta]_{inh}$ 0.29 dl g^{-1} (*m*-cresol, 25°) [2]; $[\eta]_{inh}$ 1.32 dl g^{-1} (phenol/tetrachloroethane, (60:40), 25°) [3]; $[\eta]_{inh}$ 0.25 dl g^{-1} (phenol/tetrachloroethane, (60:40), 30°) [4]; $[\eta]_{inh}$ 0.14 dl g^{-1} (1-methyl-2-pyrrolidinone, 30°) [5]; $[\eta]$ 0.19 dl g^{-1} (phenol/tetrachloroethane, (60:40), 30°) [6]; $[\eta]_{inh}$ 1.38 dl g^{-1} (phenol/tetrachloroethane, (60:40), 30°) [12]

Mechanical Properties:

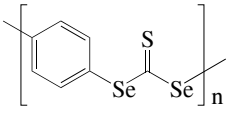
Mechanical Properties General: Dynamic elastic modulus has been reported [3]

Optical Properties:

Optical Properties General: Exhibits optical anisotropy [6] in the melting state
Transmission and Spectra: Ir [1], nmr [3] and mass spectral [5] data have been reported

Polymer Stability:

Thermal Stability General: Heat resistance has been reported [8]
Decomposition Details: Decomposition temp. 540° [2], 490° [5]. Thermal degradation details have been reported [3,6]. 10% Weight loss occurs at 474° [6]. Activation energy for thermal degradation 190 kJ mol^{-1} (45 kcal mol^{-1}) [10]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by the interfacial polymerisation of isophthaloyl chloride with 1,3-benzenediol in $CHCl_3/H_2O$ at 20° [1,2,4,5,12]

Poly(selenocarbonothioylseleno-1,4-phenylene) P-515

Synonyms: *Poly(p-phenylenediselenothiocarbonate). PPSSe$_2$*
CAS Number:

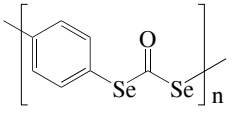
CAS Reg. No.	Note
182067-75-0	Poly(selenocarbonothioylseleno-1,4-phenylene)

Molecular Formula: $(C_7H_4SSe_2)n$
Morphology: Dopant agent produces a high regularity in the polymer structure, with a corresponding increase in conductivity [2].

Identification: Elemental analysis: %C calc. 30.2 found 31.2; %H calc. 1.4 found 2.0; %Se calc. 56.8 found 55 [1].

Surface Properties & Solubility:
Solubility Properties General: $PPSSe_2$ has low solubility

Electrical Properties:
Electrical Properties General: When the polymer was doped with $FeCl_3$, $AlCl_3$ and SbF_5, the conductivity value was not increased satisfactorily as tabulated [1]. The iodine-doped compound exhibits semiconducting properties. The small conductivity of poly(*p*-thioselenocarbonate) after doping with iodine has been attributed to the localisation of a positive charge on the sulfur [1]. Tends to form dimers through polar bonds that cause the decrease in conductivity [1].



Optical Properties:
Transmission and Spectra: IR: C-Se 490 cm^{-1}; *p*-arom. 805 cm^{-1}; C-S 1030 cm^{-1} [1].

Applications/Commercial Products:
Processing & Manufacturing Routes:
Applications: Iodine doped polymers exhibit semiconducting properties [1,2].

Poly(selenocarbonylseleno-1,4-phenylene) P-516

Synonyms: *Poly(p-phenylenediselenocarbonate). $PPSe_2$*
CAS Number:

CAS Reg. No.	Note
182067-71-6	Poly(selenocarbonylseleno-1,4-phenylene)

Molecular Formula: $(C_7H_4OSe_2)n$
General Information: Bright red powder in 75% yield.
Morphology: Morphology studied using scanning electron microscopy. The $PPSe_2$ chains are observed with a globular and laminar phase with great disorder. When the compound contains selenocarbonate, the structure is more laminar, with a high degree of disorder and bigger spacing between the sheets. The morphology of this structure is in agreement with low measured conductivities [1]. For poly-*p*-phenyleneselenide (PPSe), the dopant agent produces a high regularity in the polymer structure, with a corresponding increase in conductivity [2].
Identification: Elemental analysis: %C calc. 30.7 found 27.9; %H calc. 1.7 found 1.6; %Se calc. 67.5 found 68.8 [1].

Surface Properties & Solubility:
Solubility Properties General: $PPSe_2$ has low solubility.

Electrical Properties:
Electrical Properties General: Doping with iodine was carried out according to the Gutierrez method. When the products were doped with $FeCl_3$, $AlCl_3$ and SbF_5, the conductivity values were not increased satisfactorily as tabulated [1].

Optical Properties:
Transmission and Spectra: Ir : C-Se 490 cm^{-1}; *p*-arom. 800 cm^{-1} [1]

Applications/Commercial Products:
Processing & Manufacturing Routes:
Applications: Iodine doped polymers exhibit semiconducting properties [1,2].

Poly(silane) P-517

Synonyms: *Poly(silylene). PSA. PS. Psi. TP*
Related Polymers: Polycarbosilanes
Polymer Type: polysilanes
CAS Number:

CAS Reg. No.
32028-95-8

Molecular Formula: $(H_2Si)n$
Fragments: H_2Si
General Information: Si analogue of polyethylene. Predictions of theoretical studies was an unusually high torsional mobility for the PS chains, owing to the relatively long Si-Si bonds and, consequently, low barriers for rotation [6]
Morphology: Initially reported as an air-sensitive orange solid. *Ab initio* crystal orbital calculations reveal that the *trans*-conformer is the ground state of polysilane (and not gauche-polysilane as originally thought). The gauche-polysilane (GP) is 0.15 kcal mol^{-1} per unit above the *trans*-polysilane (TP). TP has a smaller band gap, lower ionisation potential and greater electron delocalisation than GP. The effective mass of the hole at the valence band edge is ultimately greater in GP than in TP [6,7,13]
Miscellaneous: Conformationally more flexible than polysilaethylene [8]

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	140°C	predicted [8]

Optical Properties:
Transmission and Spectra: Ir [10,11,12], uv [10], nmr [11], epr [11] and pes [9] spectra reported.
Total Internal Reflection: In the early stages of Si deposition at a substrate temperature of 200°C, SiH_2 is the major surface species although $(SiH_2)n$ chains and SiH_3 also exist. At room temperature, SiH_3 and $(SiH_2)n$ chains are the dominant surface products. At -95°C, polymerisation reactions among adsorbates proceed on the surface to form polysilanes consisting of $(SiH_2)n$ chains terminated with SiH_3 [2].

Applications/Commercial Products:
Processing & Manufacturing Routes: A polysilane -(SiHn)x- where n is 1 or 2 and x is 10, 20, or more is manufactured by treating SiH_mX_{4-m}, where m is 1–3 and X is a halogen, with Li in a liquid that is inert to the reagents and a nonsolvent for the polysilane [1]. Reacting Si surfaces in contact with a SiH_4 glow discharge - in the early stages of Si deposition at a substrate temperature of 200°, SiH_2 is the major surface species [2,4]
Applications: Polysilane-yttria hybrid thin films [3]. Active layers of electroluminescent devices [4]

Polysiloxanes P-518

Synonyms: *Polyorganosiloxanes. Silicones*
Related Polymers: Polydimethylsiloxane, Cyclic siloxane, Resins (methyl silicon resin), Polycarbonate silicone copolymer, Silicone polyetherimide copolymer, Silicone phenol formaldehyde copolymer, Silicone epoxy copolymer
General Information: Commercial development of silicone products began in 1937 at the Corning Glass Works (later Dow Corning) and in 1938 at General Electric. Early research was devoted to producing methyl and phenyl silicone resins as possible electrical insulators, but methyl silicone fluids were the first siloxanes to be made commercially. Methyl silicone fluids were valued for high temp. stability and the low temperature-dependence of viscosity. Before the end of the second world war silicone rubber became available for use at temps. exceeding that of other elastomers and silicone resins for use as insulating materials at high temps. became available. Silicone polymers are more expensive than most other polymers. Commercial importance has always been based upon their capacity to function under extreme conditions. By using copolymers of methyl and phenyl siloxanes the low and high temp. performance of silicone fluids and rubbers can be improved compared to dimethyl silicones. Substitution of fluorine or nitrile containing groups allows drastic improvement of solvent resistance. The incorporation of small amounts of vinyl groups into silicone rubber allows for easier vulcanisation by organic peroxide and better elastic props. at high temps. These discoveries resulted in a wide range of silicone products becoming available for many high and low temp. applications particularly where a wide range of temps. would be encountered during use. Room temp. vulcanising (RTV) silicone rubbers became commercially available in the 60's. Whereas heat vulcanising silicone rubber gum is a high MW very high viscosity material which requires crosslinking at elevated temps. with organic peroxide, RTV silicone rubber gum is a relatively low MW fluid with reactive silanol end groups. These end groups can be crosslinked at room temp. by a reactive cross-linker to produce the cured rubber. There is currently considerable interest in the props. and applications of polysiloxane liq. crysts. Such liq. crysts. are likely to have a significant impact in the field of electrooptics and liq. cryst. displays. Polymers of siloxanes and other materials have been developed in a wide variety of forms, resulting in fluids and resins with special props. for particular applications. Fluid copolymers of polysiloxanes and polyethers are commercially important for surfactant props.; other copolymers have found uses as specialist fluids. A very large number of cocondensation products of silicones with organic resins have been described. Copolymers with polyesters are commercially the most important, being harder, more adhesive and more solvent resistant than silicone resins as well as cheaper and more compatible with pigments and dyes. If the siloxane comprises at least 50% of the copolymer then the heat resistance, water repellency and weather resistance typical of silicone resins are largely retained. Silicone production reached half a million metric tonnes a year in the late 80's and continues to rise [1,2,3,4,5,6]

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. H_2O, alcohols [2,3]
Surface and Interfacial Properties General: Generally low surface adhesion [3]

Electrical Properties:

Electrical Properties General: Excellent insulating and dielectric props. [3]

Polymer Stability:

Polymer Stability General: Stable material with wide range of uses. Although silicones are non-toxic their stability and non-biodegradability has caused concern about environmental accumulation [1]
Thermal Stability General: Usable from -100–300° (temp. range varies with particular silicone product)
Flammability: Low flammability [1]
Environmental Stress: Resistant to oxidative degradation, H_2O, weatherning, ozone and corona. Unaffected by uv radiation [3]. Liq. silicones may form very thin films capable of being broken down by oixdative degradation
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam. Fluids in very thin films undergo hydrolytic degradation [1,3]
Biological Stability: Non-biodegradable [2]
Recyclability: Can often be recycled by depolymerisation using steam or acid catalysis [3]. This does not occur on a large scale

Applications/Commercial Products:

Processing & Manufacturing Routes: The development of new methods of curing and vulcanising silicones has increased their versatility and usefulness. Modified silicone resins can be cross-linked at room temp. by methyl triacetoxy silane to produce flexible elastomers similar to RTV silicone rubbers. The liq. silicone rubber system; in which low viscosity vinyl containing silicone gums are rapidly cured by hydrosilation at no more than 100°; allows easier and more economical moulding and extrusion of high quality silicone elastomers
Applications: Because of the low toxicity, bio-stability and water repellency of silicone polymers, silicone fluids have found a role in cosmetics. Silicone rubbers have been widely used in cosmetic surgery particularly for breast implants, but there are currently grave doubts about the long term safety of such procedures. Silicone rubbers generally have low adhesion to most materials. "Non-sticking" characteristics have become particularly important in the manufacture of moulds for the plastics industry. The resistance of silicones to weathering, sunlight and high humidity has proved particularly important in the use of silicone resins as paints or varnishes and as resin films to protect masonry. Low surface tension and high water repellency of silicone fluids makes them useful in polishes, and because of their high compressibility silicone fluids are used for vibration damping. Thermal stability and high thermal conductivity makes them valuable as heat-transfer media. The most important single application of silicones is in the electrical and electronics industry, where high electrical resistance, good dielectric props., and low flammability have made them invaluable. Silicone fluids are used as dielectric media in transformers; silicone resins are used as silicone glass laminates in spacers and wedges in electrical units and as moulding resins for connectors, terminal boards and enclosures. Heat cured silicone rubber is widely used in the manufacture of coatings for wires and cables, providing high reliability over a wide range of temps.; while RTV silicone rubbers are used as protective encapsulants for fragile circuitry. 50% of silicones are sold as fluids or derivatives, 40% as elastomers and 10% as resins or derivatives. Over 1000 products are available commercially

Poly[silylene(methylene)] P-519

Synonyms: *Poly(silaethylene). PSM. PSE. SP4000*
Related Polymers: Polycarbosilanes, Poly[(methylphenylsilylene)-methylene], Poly[(dimethylsilylene)(methylene)]
Polymer Type: carbosilane polymers
CAS Number:

CAS Reg. No.
74056-94-3

Molecular Formula: $(CH_4Si)n$
Fragments: CH_4Si
Molecular Weight: MW 33,000; M_n 12,300 [1,3,4]
General Information: PSM with its 1:1 Si:C ratio is an attractive candidate for a SiC precursor to silicon carbide ceramics [1,5]. Obtained as a viscous liquid at room temperature upon isolation from hydrocarbon solvents. On cooling to just below room temperature, however, it forms a translucent white solid [3].
Tacticity: The preference for the *trans*-state, which is well known in PE, is weakened in PSM [4].
Morphology: Reported to be a linear polycarbosilane with a regularly alternating Si-C backbone structure [1,2,6,10]; Simulation C-Si bond, 0.189 nm [4]
Identification: Calc: C, 27.27; H, 9.09; Found: C, 27.21; H, 9.09 [13]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Exhibits a melting transition which is *ca*. 100°C lower than that of PE [3]
Glass-Transition Temperature:

No.	Value	Note
1	-140–-135°C	Unusually low value for *T*g suggests that the uncrystallised portion of PSM remains mobile down to extremely low temperatures [3]

Surface Properties & Solubility:

Solubility Properties General: Soluble in hydrocarbon solvents [3]

Mechanical Properties:

Mechanical Properties General: The modulus of elasticity and the nanohardness of the SiC films were measured with the aid of a nanoindenter at various depths, which did not exceed 25% of the film thickness. The average nanohardness at indentation depths of approx. 10% of the film thickness was measured up to 13.4GPa [7]

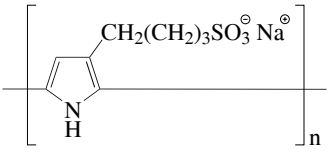
Optical Properties:

Optical Properties General: Specific peaks in the nmr spectra arise either from -SiH-(Me)- branch sites or the CH_3 and SiH_3 end groups [1].
Transmission and Spectra: Ir [3,13], pmr, cmr and Si-29 nmr spectra reported [1,3,13].

Polymer Stability:

Thermal Stability General: Thermal analysis in nitrogen gave a remarkably high ceramic yield (calc. 90.9; found 87). Weight loss started at approx. 100°C, and there was almost no weight loss after 600°C [13]. Soft-hard binary polymer blends consisting of amorphous polysilylenemethylenes and crystalline poly(diphenylsilylenemethylene) have been studied [6]

Decomposition Details: The observed evolution of D_2 from the deuterio-deriv. of PSE, as the primary gaseous product at 250–400°C, where crosslinking of the polymer occurs, suggests that loss of H_2 from the Si is a key step in the crosslinking process. A reaction pathway is postulated for the crosslinking and pyrolysis of PSE in which both 1,1-H_2 elimination and intramol. H-transfer reactions lead to highly reactive silylene intermediates; these insert into Si-H bonds of neighbouring polymer chains forming Si-Si bonds which rapidly rearrange to Si-C bonds at these temps. to form Si-C interchain cross-links. The cross-links prevent extensive fragmentation of the polycarbosilane network as the temp. is increased further to the range (420°C) where homolytic bond cleavage occurs at an appreciable rate, leading to free radicals. These free radical processes are presumably the main mechanisms at higher temps. (>475°C) where extensive rearrangement of the Si/C network structure is evidenced by solid-state NMR spectroscopy. Further heating of the polymer to 1000°C leads to the formation of SiC in high yield (approx. 85%) [1,10]



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by the ring-opening polymerisation of 1,3-disilacyclobutane [2,10]. SiC films have been successfully deposited on various substrates by oligomer thermal CVD from a novel, halogen-free, oligomer precursor family of polysilylenemethylenes [7]
Applications: Composite materials containing fine particles [8]. Method for forming carbide material on substrates [9]. Porous ceramics [12]

Poly[sodium 4-(3-pyrrolyl)butanesulfonate] P-520

Synonyms: *1H-Pyrrole-3-butanesulfonic acid monosodium salt homopolymer. PPyBS*
Material class: Thermoplastic
Polymer Type: polypyrrole
CAS Number:

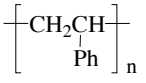
CAS Reg. No.
111984-81-7

Molecular Formula: $(C_8H_{10}NNaO_3S)n$
Fragments: $C_8H_{10}NNaO_3S$
General Information: Water-soluble conductive polypyrrole. Prod. as blue-black film [1,2].
Morphology: Amorphous films prod. electrochemically [1,2].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. H_2O, MeOH [1,2]. Insol. MeCN [1].

Electrical Properties:
Electrical Properties General: Conductive form of polymer is self-doped with zwitterion formation and protonation of pyrrole rings [1]. Maximum conductivity of 0.5 S cm^{-1} recorded [2]

Optical Properties:
Optical Properties General: UV absorption band with λ_{max} *ca.* 400nm for film reported [1,2,3]. In aqueous solution there are bands with λ_{max} *ca.* 390 and 580nm [6].
Transmission and Spectra: Pmr [2], ir [4,6] and uv [1,2,3,6] spectral data have been reported..



Polymer Stability:
Thermal Stability General: Weight loss in major decomposition stage at *ca.* 340°C on heating in nitrogen [4]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. either by electrochemical polymerisation of sodium 4-(3-pyrrolyl)butanesulfonate in MeCN [1,2,5] or $NaNO_3$ soln. [3], or chemically by oxidation of the monomer with $FeCl_3$ in water [6]. The protonated polyacid polymer has also been produced [6].
Applications:

Polystyrene P-521

Synonyms: *Poly(1-phenylethylene). Poly(vinyl benzene). Poly(-phenyl ethene). Poly(phenyl ethylene). Poly(1-vinyl benzene). Poly(ethenyl benzene). PS*
Related Polymers: High-impact polystyrene, Polystyrene, Foamed, Polystyrene latex
Monomers: Styrene
Material class: Thermoplastic
Polymer Type: polystyrene
CAS Number:

CAS Reg. No.	Note
9003-53-6	atactic
25086-18-4	isotactic
28325-75-9	syndiotactic

Molecular Formula: $(C_8H_8)_n$
Fragments: C_8H_8
Molecular Weight: Typically n = 1000 styrene units. A wide range of MW is possible depending on the polymerisation conditions. General purpose polystyrene has MW 100000–300000
Additives: Various additives may be used depending on product application e.g. uv screening agents, antioxidants, flame retardants, anti-static agents. The physical props. of polystyrene may be modified by glass reinforcement. Polystyrene may be filled with glass fibres or glass beads/spheres

General Information: Atactic polystyrene is a crystal clear thermoplastic material, hard, rigid and free of odour and taste [4]. Isotactic polystyrene is an opaque material. General purpose polystyrene is available in the following commercial grades: easy flow and medium flow are used in injection moulding; high heat is used in extrusion applications. Speciality grades include fast cycle resins, food contact grade resins (low residual) and low MW resins [2]
Tacticity: Commercially prod. polystyrene is atactic [8,9] and non-stereospecific. It is an amorph. material. Isotactic polystyrene is prod. on a small scale and is not important commercially. The amorph. isotactic form has similar props. to the atactic material. A partially crystalline isotactic form may also be prepd. This has a degree of crystallinity in the range 45–60%. The crystallisation rate of the isotactic form is very slow. The low crystallinity and rate of crystallisation are the main obstacles to commercial application of isotactic polystyrene as a general purpose plastic. The syndiotactic form has also been prepared on a small scale and may become commercially important in the future. It is a highly crystalline material with a high rate of crystallisation. Many physical props. of isotactic and syndiotactic forms differ significantly from the props. of the amorph. material
Identification: Isotactic and syndiotactic (crystalline) polystyrene may be distinguished from atactic, amorph. polystyrene by their lack of solubility in ketones and their higher melting temps. Tacticity and steric composition can be identified from ir spectra, H-1 nmr and C-13 nmr spectra or X-ray diffraction patterns. Polystyrene softens and burns fairly readily with an extremely sooty flame. The characteristic odour of styrene noticeable on extinction

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.05 g/cm^3	standard, atactic, ASTM D792 [3]
2	d 1.08 g/cm^3	isotactic, crystalline [8]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0002085 K^{-1}	T < Tg [20]	V
2	0.000565 K^{-1}	T > Tg [20]	V
3	6.95×10^{-5} K^{-1}	T < Tg [20]	L
4	0.0001883 K^{-1}	T > Tg [20]	L

Volumetric Properties General: The density of polystyrene depends on the temp. This temp. dependence has been calculated [21]. Density also depends on the tacticity and crystallinity. It is higher for isotactic crystalline polystyrene than for the common atactic form. [8]. Glass fibre reinforcement of polystyrene also increases its density [3]. The density of a polystyrene product may also be affected by processing conditions. Foamed polystyrene products have a much lower density than that of General purpose polystyrene. The volumetric coefficient of thermal expansion has also been fitted to an equation for the temp. range 100–322° [21]. For an oriented thermoformed polystyrene part, the coefficients of expansion parallel and perpendicular to the draw direction are expected to be different [22]. The coefficient of thermal expansion may also be affected by crystallinity (this may be significant for isotactic and syndiotactic forms), cross-linking and the use of fillers. The latter two factors usually reduce the thermal expansion coefficient [23]
Equation of State: Equation of state information has been reported [26,27,28,29]
Thermodynamic Properties General: Thermal conductivity increases with temp. until the T_g is reached; it then decreases slightly. At higher temps. it again increases slightly [2]. The large

discrepancies for polystyrene samples at any given temp. and the varying temp. dependence have been attributed to polymer characteristics such as MW or MW distribution [33]. Thermal conductivity has also been found to depend on sample thickness; however, heat pretreatment of the polystyrene sample is found to reduce this effect and increase the thermal conductivity [33]. DSC based methods for measuring thermal conductivity are most suitable for small sized samples and may be used for polymer melts [32,34]. Heat capacity data for amorph. atactic and isotactic polystyrene have been reviewed [35]. The heat capacity of amorph. polystyrene is found to be a smooth function of temp. from -273–37°. The heat capacity of molten polystyrene is a linear function of temp. from T_g to 327°. The heat capacity of polystyrene from -203° to temps. just below T_g is practically independent of crystallinity and tacticity. The change in heat capacity at T_g does not fit the rule of constant change in heat capacity and this is similar to deviations observed for other polymers containing phenyl structural units [35]

Latent Heat Crystallization: ΔH 19.4 kJ mol^{-1}, ΔS 133.7 J mol^{-1} K^{-1} (25°, amorph.) [35]; ΔH 30.2 kJ mol^{-1}, ΔS 166 J mol^{-1} K^{-1} (100°, amorph.) [35]; ΔH_f 10 kJ mol^{-1} (isotactic) [38]; ΔS_f 17.6 J K^{-1} (isotactic) [8]; ΔH_f 5.53 kJ mol^{-1} (53.2 J g^{-1}) (syndiotactic) [39]

Thermal Conductivity:

No.	Value	Note

3	243°C	isotactic [38]

Glass-Transition Temperature:

No.	Value	Note
1	100°C	100°
2	85–110°C	[5]

Transition Temperature General: General purpose polystyrene is an amorph. material and its glass-transition temp. is its most important thermal property. The glass-transition temp. of polystyrene depends on M_n and this is shown in Fig. 2.1 [24]. The greatest change in T_g is for low values of M_n and there is little change when M_n >85000. The T_g is decreased by the presence of diluents and hence materials such as mineral oil or paraffin oil may be added to lower the T_g and the processing temp. of polystyrene polymers. Diluents can be reactants, solvents or by-products forming during the polymer synth. (e.g. styrene monomer, ethylbenzene) or additives, e.g. stabilisers, flame-retardants and antioxidants. Different diluents lower the T_g by various amounts. Ethylbenzene is more effective on a weight basis at lowering the T_g than paraffin oil [2]. Cross-linking may either increase or decrease T_g depending on whether compositional changes occur [2,23]. The T_g of isotactic polystyrene is in the same range as that for the common, atactic form [5,37]. Amorph. polymers such as common, atactic polystyrene do not have a melting transition temp. However, a sharp melting transition may be observed for crystalline, isotactic samples and also for syndiotactic polystyrene [9]

Deflection Temperature:

No.	Value	Note
1	103°C	1.84 MPa, ASTM D648, injection moulded samples, MW 300000, M_n 130000 [2]

2	27°C	atactic [6]	β relaxation

Surface Properties & Solubility:

Solubility Properties General: Polystyrene is compatible with poly(tetramethyl bisphenol polycarbonate), poly(vinyl methyl ether), poly(2-vinylnaphthalene), poly(3-bromo-2,6-dimethyl-1,4-phenylene oxide-*co*-2,6-dimethyl 1,4-phenylene oxide), poly(2-chlorostyrene), poly(2-chlorostyrene-*co*-4-chlorostyrene), poly(2,6-diethyl-1,4-phenylene oxide), poly(2,6-dimethyl-1,4-phenylene oxide), poly(2,6-dimethyl-1,4-phenylene oxide) (carboxylated) [5], poly(2,6-dipropyl-1,4-phenylene oxide), poly(2-ethyl-6-propyl-1,4-phenylene oxide), poly(6-ethyl-2-methyl-1,4-phenylene oxide), poly(2-methyl-6-propyl-1,4-phenylene oxide), poly(4-bromostyrene-*co*- styrene), poly(butadiene-*co*-styrene), poly(*n*-butyl methacrylate-*co*-styrene), poly(3-bromo-2,6-dimethyl-1,4-phenylene oxide), poly(*n*-butyl methacrylate), poly(*cis*-1,4-isoprene), poly(methyl methacrylate), poly(methyl methacrylate-*co*-styrene), poly(α-methyl styrene), poly(butadiene)

Cohesive Energy Density Solubility Parameters: δ 18.6 [59]. Polystyrene is generally sol. in solvents for which the difference between solubility parameters of the polymer and the solvent is less than 1.8 $MPa^{1/2}$

Internal Pressure Heat Solution and Miscellaneous: Internal spreading pressure Π_e 16 mN m^{-1} (polystyrene-water interface, 25°) [61]. There is some variation in the values of contact angles because polymers are not ideal surfaces. Contact angle hysteresis may occur if the surface is not smooth and homogeneous. The measured contact angles may not be equilibrium contact angles [62]. θ 84–95° (H_2O) [60,61,65], θ 10–15° (α-bromonaphthalene) [61,65], θ 35° (methyl iodide) [65], θ 74° (formamide) [65], θ 80° (glycerol) [65]. Effective molar energy of adhesion 1314.6 J mol^{-1} [66]

Plasticisers: Plasticisers, such as mineral oil, phthalate and adipate esters, are only used for specialist applications as they are detrimental to mech. props. [1,4]

Solvents/Non-solvents: Isotactic and syndiotactic: Insol. ketones, esters, alkanes [8]. Atactic: Sol. butyl acetate, CCl_4, ethylbenzene, toluene, EtOAc, tributyl phosphate, C_6H_6, 2-butanone, $CHCl_3$, styrene, THF, chlorobenzene, methyl isobutyl ketone, DMF, CH_2Cl_2, cyclohexanone, tetrahydrodimethylfuran, diethyl phthalate, dioxane, CS_2, dioxolane, butyrolactone, 1,2-dichlorobenzene, 1-nitropropane, cyclopentanone, 1,2-dibromoethane, pyridine, glycol formal, dimethyl phthalate, PCl_3, cyclohexane/Me_2CO, decahydronaphthalene/diethyl oxalate, phenol/Me_2CO, tetralin [4]; slightly sol. methylcyclohexane, Me_2CO, nitroethane; spar. sol. cyclohexane. Insol. pentane, Et_2O, heptane, 1,2,3,4-tetrafluorobenzene, tricresyl phosphate, dibutyl phthalate, isoamyl alcohol, 4-methyl-2-pentanol glycol ethers, AcOH, 2-ethyl-1-butanol, 2-butanol, 1-butanol, MeCN, 1-propanol, ethylene chlorohydrin, nitromethane, EtOH, 1,2-propylene carbonate, propiolactone, MeOH, ethylene carbonate, H_2O [2,5], trichloroethyl phosphate [5]

Surface and Interfacial Properties General: Surface tension depends on the solvent (or solvent pair) used for the experimental measurements [65]. The spreading pressure Π_e needs to be included in the calculations for accurate results [61]. The experimental error is found to be largest for the γs^p calculations [65]

Wettability/Surface Energy and Interfacial Tension: Polarity 0.168 [5]. - (dt/dT) 0.072 mN $(mK)^{-1}$ (MV 44000). [5] Interfacial tension between polystyrene and other polymers [5] polystyrene-poly(chlorophene) 0.7 mN m^{-1} (20°), 0.5 mN m^{-1} (150°), 0.4 mN m^{-1} (200°) (dt_{12}/dT) 0.0014 mN $(mK)^{-1}$; polystyrene-poly(methyl acrylate) 3.2 mN m^{-1} (150°); polystyrene-poly(ethyl acrylate) 1.4 mN m^{-1} (150°); polystyrene-poly(*n*-butyl acrylate) 1.4 mN m^{-1} (150°); polystyrene-poly(2-ethyl hexyl acrylate) 2.5 mN m^{-1} (150°); polystyrene-poly(vinyl acetate) 4.2 mN m^{-1} (20°), 3.7 mN m^{-1} (150°), 3.4 mN m^{-1} (200°) (-dt_{12}/dT) 0.0044 mN $(mK)^{-1}$; polystyrene-poly(methyl methacrylate) 3.2 mN m^{-1} (20°), 1.5 mN m^{-1} (150°), 0.8 mN m^{-1} (200°) (-dt_{12}/dT), 0.013 mN $(mK)^{-1}$ [5]; polystyrene-linear polyethylene 8.3 mN m^{-1} (20°), 5.7 mN m^{-1} (150°), 4.7 mN m^{-1} (200°) (-dt_{12}/dT) 0.02 mN $(mK)^{-1}$ [5]; polystyrene-branched polyethylene 5.6 mN m^{-1} (20°), 5 mN m^{-1} (150°), 4.8 mN m^{-1} (200°) (-dt_{12}/dT) 0.0046 mN $(mK)^{-1}$ [5]. Polystyrene-water interfacial tension 25.6 mN m^{-1} [60] (calculated from contact angle measurements at 25°). The surface energy (solid surface tension) may be calculated from contact angle measurements [61,65]. For polystyrene t_s 41 mN m^{-1} [61] (calculated from the contact angle with H_2O). For a range of different solns. the average value of γ_s is 42 mN m^{-1} [65]. Different values of γ_s may be obtained when other calculation methods are used [65]. Other values of γ_s 40.7 mN m^{-1} (polymer melt method) [64], 43 mN m^{-1} (equation of state method) [64], 45.2 mN m^{-1} [66,67]

Surface Tension:

No.	Value	Note
1	40.7 mN/m	20°, MV 44000 [5]
2	31.4 mN/m	150°, MV 44000 [5]
3	27.8 mN/m	200°, MV 44000 [5]
4	33–43 mN/m	[63]
5	34–39.6 mN/m	[61,65]
6	3.8–7 mN/m	[61,65]

Transport Properties:

Transport Properties General: The melt flow index depends on MW and storage temp. [2]

Melt Flow Index:

No.	Value	Note
1	1.6 g/10 min	ASTM D1238, condition G, MW 300000, M_n 130000 [2]
2	7.5 g/10 min	ASTM D1238, condition G, MW 225000, M_n 92000 [2]
3	16 g/10 min	ASTM D1238, condition G, MW 218000, M_n 74000 [2]
4	9 g/10 min	ASTM D1238, condition G, MW 195000, M_n 95000 [2]
5	9 g/10 min	DIN 53735, standard [8]
6	1 g/10 min	DIN 53735, 30% glass reinforced [8]

Polymer Solutions Dilute: Theta temps. for various solvents have been reported [5,104] θ -49° (isoamyl acetate), -9° (*n*-butyl formate), 34–35° (cyclohexane), 20–154.2° (cyclopentane), 22° (bis(2-ethylhexyl)phthalate), -44–139° (EtOAc), 70° (ethyl cyclohexane), 60–70.5° (methyl cyclohexane), 28.0–30.6° (1-phenyldecane), -80–178° (*n*-propyl acetate), -46° (isobutyl acetate), 6° (1-chlorodecane), 58.6° (1-chlorododecane), 79–87.8° (cyclohexanol), 31–35.9° (diethyl malonate), 51.5–59.6° (diethyl oxalate), 108.5° (ethyl acetoacetate),43–114° (methyl acetate), 8.0° (3-methyl cyclohexanol), -27–107° (isopropyl acetate). Theta temps. have also been reported for solvent mixtures [5,104]. The different concentration regimes for rheology have been reported for different MWs [2,106]. The intrinsic viscosity of dilute solns. is relatively insensitive to temp. over the usual measurement range (25–55°) [2,107] and depends on the value of MW and also the solvent quality [108]. The effect of MW on intrinsic viscosity in toluene (10% w/w, ASTM D445) has been investigated [109]. Various values for the Mark-Houwink equation parameters have been reported for different solvents [5,105,108,110]

Polymer Solutions Concentrated : For more conc. polymer solns., the zero shear viscosity depends on both the concentration and the average MW [106,111]. This relationship has been investigated for polystyrene solns. in toluene and *trans*-decalin at 25° and *n*-butylbenzene at 30° [112]. The zero shear viscosity at polymer concentrations of 50–100% (w/w) and 60–225° in ethylbenzene have been studied [113]

Polymer Melts: A mathematical relationship between the melt viscosity and MW has been reported [1,5,114,115]. In the melt, polystyrene exhibits both linear and non-linear viscoelastic behaviour. The flow characteristics of the polymer melt using capillary rheometry have been reported [118]. Rheological studies in the melt and in soln. have been reported [2,119,120]

Permeability and Diffusion General: The oxygen permeabilities of styrene polymers decrease as the temp. decreases, but this effect is smaller than that observed for other polymers [2]. The gas and vapour diffusion coefficients of many small molecules have been determined [96]. The permeation of CO_2 depends on M_n but a similar effect is not observed for the diffusion coefficient [97]. The diffusion coefficient of O_2 at 25° is constant at high MW ($M_n \geq$ 20000) but varies at lower MWs [98]. The diffusion coefficient of organic vapours, e.g. Me_2CO, is slightly dependent on M_n [96]. Organic vapour transmission rates have been measured for over pure liquids [MeOH] 0.14–0.84 nmol ms^{-1} (23°) [2]; [EtOH] 0.1 nmol ms^{-1} (23°) [2]; [formaldehyde] 0.6–0.8 nmol ms^{-1} (23°) [2]; [C_6H_6] 70 nmol ms^{-1} (35°) [2]. Diffusion coefficient for styrene [99] 8×10^{-15} m^2 s^{-1} (1100 ppm, 25°); 2×10^{-15} m^2 s^{-1} (300 ppm, 25°). Activation energy for diffusion [100,101] [N_2] 42.3 kJ mol^{-1}; [EtOH] 41 kJ mol^{-1} (T < Tg); 87.9 kJ mol^{-1} (T > Tg); [CH_2Cl_2] 41.8 kJ mol^{-1} (T < Tg); 100.4 kJ mol^{-1} (T > Tg); [Ethyl bromide] 51.9 kJ mol^{-1} (T < Tg); 108.8 kJ mol^{-1} (T > Tg). The activation energy for diffusion has also been measured for other gases and organic compounds [96]. The diffusion props. of $CHCl_3$ [103],

2-butanone [103], Me_2CO [103] and alkanes [102,103] have been reported. The gas permeability of isotropic and biaxially oriented polystyrene film has been reviewed [116]. Uv radiation increases the permeability of polystyrene films to air [117]
Water Content: Water vapour transmission rate 0.5–2.5 nmol ms^{-1} (24–38°, 90% relative humidity) [2]
Water Absorption:

No.	Value	Note
1	0.03–0.05 %	24h, ASTM D570, general purpose polystyrene [3]
2	0.07 %	24h, ASTM D570, 20% w/w glass reinforced [3]
3	0.05 %	24h, ASTM D570, 30% w/w glass reinforced and 40% w/w glass reinforced [3]

Gas Permeability:

No.	Gas	Value	Note

2	O_2	166.3 cm^3 mm/(m^2 day atm)	1.9 × 10^{-13} cm^3 cm^{-2} (s Pa)$^{-1}$, 25° [5,95]
3	N_2	7.7–9.7 cm^3 mm/(m^2 day atm)	40–50 nmol (m s GPa)$^{-1}$ [2]
4	CO_2	387.4–581 cm^3 mm/(m^2 day atm)	2000–3000 nmol (m s GPa)$^{-1}$ [2]
5	CO_2	65.6–525.2 cm^3 mm/(m^2 day atm)	0.75–6 × 10^{-13} cm^3 cm^{-2} (s Pa)$^{-1}$, 25°, ultradrawn [5]

Mechanical Properties:

Mechanical Properties General: Polystyrene is generally hard and rigid but brittle. The mech. props. depend on the MW of the sample and the processing conditions. They may be altered by rubber modification or by glass reinforcement. The relation between tensile strength and elongation has been reported in a graphical form [3]. There are several general reviews of mech. props. [126,127]. A graph of flexural strength against tensile strength has been reported [2]. Variation of Young's modulus with temp. has been reported [5,122]. Stress-strain curves have been reported [1]. The dependence of tensile strength on MW has been reported [2,153]

Tensile (Young's) Modulus:

Impact Strength: Pigments and other fillers typically lower the Izod impact strength [124]. Glass reinforcement increases Izod impact strength, depending on fibre length [2]. Izod impact toughness shows slight temp. dependence for toughened polystyrene [3]. Izod impact strength is affected by MW and processing conditions [2]. Dart drop impact strength of general purpose grade is very low [1] as this polymer is completely brittle under this test [2]. For glass-filled polystyrene the dart drop impact strength is medium high [1]

Viscoelastic Behaviour: Polystyrene polymers exhibit linear viscoelastic behaviour in the melt and in conc. soln. [2]. Viscoelastic props. are characterised by storage and loss moduli under shear deformation, relaxation time, the steady state shear compliance and the zero shear viscosity. The storage and loss moduli depend on the polymer MW and MW distribution [2]; data have been reported [128,129,130,131,132,133]. The zero shear viscosity depends on the weight average MW of the polystyrene and this effect has been reported [2,131,134,135]. The steady state shear compliance is less dependent on MW than the zero shear viscosity but is more sensitive to MW distribution [2]. Compliance data have been reported [136,137]. The storage modulus changes with temp. [2] and the data obtained may be used to determine the glass-transition temp. and other transitions [138]. Changes in viscoelastic behaviour with temp. are characterised by the shift factor α_T which is obtained using the Williams, Landel and Ferry equation [2]. Values of the shift factor for samples at 150–260° have been reported [128,139,140]. The Williams-Landel-Ferry equation constants used to calculate the shift factors for polystyrene samples of various MWs have been reported [119] as have the experimental and calculation methods used [119,128,141,142,143,144,145,146,147,148]. Viscoelastic props. are also affected by pressure and the shift for polystyrene has been reported [149,150]. Non-linear viscoelastic props. are observed for molten and conc. polystyrene solns. under conditions of large strain or high shear rates [2]. A master plot of viscosity and melt elasticity as a function of shear rate [2,139,140] illustrates this non-linear behaviour. Non-linear behaviour may also affect the steady state elongational and shear viscosities at high tensile or shear stresses [151]. Conversion graphs for melt flow rate (MFR) to apparent melt viscosity at various shear rates for commercial polystyrene resins have been reported [152]

Hardness: Rockwell M65-M90 (various grades). [3] Variation of hardness with MW has been reported [2]. Ball indentation hardness 150 N mm^{-2} (DIN 53 456; increases for a 30% w/w glass fibre reinforced sample) [13]

Failure Properties General: Creep tests involving the measurement of deformation as a function of time at constant stress or load have been reported [1,154,155,156]. Fatigue testing of polystyrene polymers in air and harsh environments has been reported [1,157,158]

Fracture Mechanical Properties: Fracture toughness 0.7–1.1 J cm^{-3} $m^{1/2}$ [119]. Fracture surface energy 250–1000 J m^{-2} [125]

Izod Notch:

No.	Value	Notch	Note
1	0.0013–0.0034 J/m	N	20°, ASTM D256 [3]
2	13–25 J/m	N	ASTM D256 [119]

11	19 J/m	N	MW 218000, M_n 74000 [2]

Electrical Properties:

Electrical Properties General: Polystyrene has good electrical insulation props. It has a very low power factor and very low permittivity in high frequency electric fields [3]. The dissipation factor of pure, atactic polystyrene is relatively unaffected by frequency [2,91]. Dielectric constant decreases with increasing temp. [2]. This effect is most marked near T_g [2,90]

Surface/Volume Resistance:

No.	Value	Note	Type
1	0.00084×10^{15} Ω.cm	dry	S
2	0.02×10^{15} Ω.cm	93% relative humidity [88]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.49–2.55		amorph. [5,6]
2	2.61		crystalline [5,6]
3	2.45–3.1	60 Hz	[3]

Dielectric Strength:

No.	Value	Note
1	20–28 kV.mm^{-1}	[3]

Arc Resistance:

No.	Value	Note
1	60–140s	[3]

Strong Field Phenomena General: Electrical breakdown has been reported [88]. Intrinsic voltage breakdown strength 600 kV mm^{-1} (20°), 720 kV mm^{-1} (-200°). Thermal breakdown - limiting stress 16 kV mm^{-1} (60 Hz). Tracking resistance 2.5 kV/50 mm spacing (ASTM D2303) [88]
Static Electrification: Triboelectric charge -5.5 kV (25°, 60% relative humidity) [92]. The half decay time at 5 kV and -5 kV is greater than 1h [92]. Percentage decay has been reported [92]. The charge transfer from metals to polymers has been reported [93]. Charge transfer -0.04–0.05 pC (gold) [93], -0.01–0.03 pC (platinum) [93], -0.04–-0.03 pC (aluminium) [93], -0.08–-0.04 pC (magnesium) [93]. The charge transfer to polystyrene is smaller than that for other polymers, but the value increases when the polystyrene samples are oxidised [93]
Magnetic Properties: The magneto-optical props. of transparent polystyrene materials have been reported [94]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00015		amorph. [5,6]
2	0.0003		cryst. [5,8,9]
3	0.0001–0.0006	60 Hz	[3]

Optical Properties:

Optical Properties General: Atactic polystyrene is transparent to visible light [2]. Polystyrene has a relatively high refractive index compared to other polymers because of the high polarisability of the phenyl groups [2]
Refractive Index:

No.	Value	Note
1	1.59	ASTM D542 [2]
2	1.59–1.6	[3,5,6]

Transmission and Spectra: Ir spectra of atactic and isotactic forms have been reported [78,79,80,81,82]. Uv absorption bands at 260, 194 and 80 nm, *in vacuo* [5,83]. Other uv absorption spectra have been reported [84,85]. H-1 nmr spectral data have been reported [5,86,87]
Molar Refraction: Abbé value 30.8 [68]. Dispersion 0.0325 [68]; dη/dC 0.226, 0.217, 0.215 (2-butanone, 25°) [69], dη/dC 0.214, 0.203, 0.201 (ethyl butyrate, 25°) [69], dη/dC 0.184, 0.172, 0.17 (dioxane, 25°) [69], dη/dC 0.167, 0.155, 0.153 ($CHCl_3$, 25°) [69], dη/dC 0.161, 0.149, 0.147 (CCl_4, 25°) [69], dη/dC 0.116, 0.112, 0.112 (toluene, 25°) [69], dη/dC 0.086, 0.085, 0.084 (chlorobenzene, 25°) [69]. The temp. and MW dependence of refractive index have been reported [70]
Total Internal Reflection: Birefringence can be induced by stressing the polymer below T_g (photoelastic effect); by orientation in the melt above T_g; or by orientation in soln. (flow birefringence) [2]. Birefringence occurs when the refractive indices parallel and perpendicular to the applied stress are different and indicates the level of orientation in a transparent polymer article [2]. Intrinsic birefringence -0.10±0.05 (amorph.) [71,72]. Birefringence -0.001--0.002 (melt drawn) [2,73]. Birefringence of polymer solns. [74] -1.5 × 10^{-8} s cm^3 g^{-1} (MW 10000) -2.95 × 10^{-7} s cm^3 g^{-1} (MW 390000). Optical polarisability -0.65 × 10^{-23} cm^3 (MW 10000) [74], -1.48 × 10^{-23} cm^3 (MW 390000) [74]. Birefringence dispersion has been reported [2,75]. Stress optical coefficient C -4700 × 10^{-12} Pa^{-1} (atactic PS in the melt) [76], -2942 × 10^{-12} Pa^{-1} (dilute soln., 25°, MW 10000) [74], -6695 × 10^{-12} Pa^{-1} (dilute soln., 25°, MW 390000) [74], 10.1 × 10^{-12} Pa^{-1} (glassy monofilament) [2,77], 9.5 × 10^{-12} Pa^{-1} (extruded sheet) [2,77], 8.7 × 10^{-12} Pa^{-1} (compression moulded, MW 145000) [2,77], 8.3 × 10^{-12} Pa^{-1} (compression moulded, MW 225000) [2,77]. The optical stress coefficient changes sign for glassy polystyrene [2]. Optical strain coefficients for glassy polystyrene 29600 (monofilament) [77], 30500 (extruded sheet) [77], 31000 (compression moulded, MW 145000) [77], 26400 (compression moulded, MW 225000) [77]
Volume Properties/Surface Properties: Unmodified polystyrene is normally colourless [2]. Degradation may cause yellowing. Atactic polystyrene is transparent [2]. Isotactic polystyrene is not transparent because crystallites in the material scatter light [2]

Polymer Stability:

Thermal Stability General: Polystyrene is easy to fabricate thermally into a wide variety of shapes without significant decomposition. However, conditions do exist where polystyrene will degrade thermally in the absence of oxygen or in the presence of oxygen by thermal-oxidative degradation
Upper Use Temperature:

No.	Value	Note
1	105°C	standard [3]

Decomposition Details: Decomposes to monomer, dimer and trimer with small amounts of toluene, α-methyl styrene and 1,3-diphenylpropane [2,46,47]. Degradation mechanism involves depropagation and first order termination [2,44]. Initial decomposition temp. 300–330° [2]. Rate of degradation depends on the method of synth. [44]. Anionically initiated polystyrene is more stable thermally than that prod. thermally or from free-radical initiators, e.g. benzoyl peroxide or azoisobutyronitrile (AIBN) [44]. After about 10% weight loss all polystyrene polymers degrade at about the same rate [45]. E_{act} 188 kJ mol^{-1} (dec.) in vacuum or flowing nitrogen. Oxygen plays a very important role in degradation. The activation energy for the thermal degradation of polystyrene above 350° decreases to 90 kJ mol^{-1} with an excess of oxygen [2]. Degradation mechanism involves depropagation. Thermal-oxidative products include benzaldehyde, benzoic acid, acetophenone, phenol, benzyl alcohol, cinnamaldehyde, styrene, styrene dimer (diphenyl butene) and styrene trimer (triphenyl hexene). Antioxidants retard oxidative degradation by scavenging peroxy radicals as they are formed [2]. Oxidation during moulding or extrusion may be reduced by removing absorbed oxygen from the resin before melting. Complete oxygen removal can be accomplished by storage under vacuum or in an inert atmosphere [2]
Flammability: Limiting oxygen index 17.6–18.3% (23°, ISO 4589/ASTM D2863) [23,40]. The flammability of styrene polymers has been reduced by incorporating fire resistant comonomers or flame retardant additives. Effective flame retardant compounds generally contain phosphorus or halogen. Synergists and diluents (or fillers) are also significant. Monochlorostyrene (comonomer), dibromostyrene (comonomer), vinyl bromide, bis(dibromopropyl)fumarate, pentabromophenyl methacrylate (comonomer) and ammonium bromide are used as flame retardants [41]. The effect of systems containing phosphorus, nitrogen and bromine on flammability has been reported [48]. Phosphorus decreases flammability but increases smoke formation [48]
Environmental Stress: Uv radiation of wavelength 254 nm is strongly absorbed resulting in significant physical and chemical changes. [49] Polystyryl radicals are formed from the scission of the tertiary CH bond. Cross-linking of two polystyryl radicals results in rapid embrittlement of the polymer [50]. Cross-linking is the dominant reaction under short wavelength irradiation in the absence of oxygen [50]. In the presence of oxygen (or under vacuum) short wavelength uv radiation causes yellowing. Experimental evidence shows that yellowing is primarily due to the formation of conjugated polyene structs. Weathering may cause chain scission, yellowing and oxidation [2]. Impurities in the

polymer, e.g. monomer residues, acetophenone end groups, in-chain peroxides (formed by copolymerisation with oxygen in free radical polymerisation) and hydroperoxides are thought to initiate uv degradation reactions. In outdoor weathering both uv degradation and oxidation reactions occur in competition. Weatherability is improved by using stabilisers, e.g. hindered amine light stabilisers (0.1–1.0% w/w) [52] and benzotriazoles/benzophenones (0.25% w/w as uv stabilisers) [1]. Pigments such as TiO_2 can contribute to polymer stability by screening the damaging wavelengths. Pigments can also mask colour changes making yellowing less noticeable [2]. Polystyrene is susceptible to environmental stress cracking and crazing by oils, esters, higher alcohols, ketones, aromatics and chlorinated hydrocarbons [3]. The critical stress required for the onset of craze and crack formation generally depends on the difference in solubility parameters between the polymer and the solvent. This critical stress is low when the solubility parameters of polymer and solvent are close together [53]. The critical stress can also be lowered by decreasing the interfacial tension [54]. Environmental stress cracking is affected by MW, MW distribution and composition (for copolymers) [2]. The environmental stress crack resistance increases with MW and narrowing MW distribution for polystyrene and *n*-butanol [55]. Environmental stress cracking is also affected by orientation (see oriented film polystyrene) and rubber modification (see high-impact polystyrene). Environmental stress cracking may also be induced by gases. Helium, nitrogen, carbon dioxide and hydrogen have been shown to be very mild craze growth enhancers [2,56,57]. Trichlorofluoromethane is a very aggressive cracking agent [2]

Chemical Stability: Affected by conc. acids but has some chemical resistance when the acid is diluted. Unaffected by conc. or dilute alkali [3]. Dissolution, swelling and environmental stress cracking occurs for a range of chemicals; aromatic and halogenated hydrocarbons, ethers, ketones, esters and higher alcohols [23]

Hydrolytic Stability: Has low water absorption [2,23]. Stability is generally unaffected by dilute aq. solns.

Biological Stability: Resistant to biodeterioration [58]. Micro-organisms and insects have little effect, although surface growths of fungi can impair electrical props. [4]

Recyclability: Suitable for recycling because there is a large, dependable source of material, it is easy to sort and separate, the recycled resins are relatively high in value and there are acceptable (non-food) applications for the recycled material [42]. Industrial scrap (regrind) from moulding, blowing, extrusion and thermoforming is usually melted down and reprocessed which satisfies both economic and environmental considerations [2,18]. Polystyrene foam products and other polystyrene resins may be recycled [42,43]

Stability Miscellaneous: High resistance to x-rays and γ-rays due to the protective action of the phenyl groups [2,4] which dissipate excitation energy without decomposing [51]. In the absence of air flexural strength and tensile strength are not decreased by γ-irradiation at doses up to 500 Mrads. These mech. props. decrease at this radiation level in the presence of oxygen. Even in the presence of oxygen, changes in props. and discoloration are negligible at γ-radiation levels of 2–3 Mrads (the dose range of γ-radiation used for sterilising medical supplies) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polystyrene can be prod. via anionic, cationic, Ziegler-Natta and free radical mechanisms using appropriate initiators. The free radical process is the most important commercially and typically uses peroxide, persulfate or azo initiators [1,2]. Free radical polystyrene can be prod. by bulk (or mass), soln., suspension or emulsion processes. The division between bulk and soln. processes is ill-defined; however, bulk polymerisation is usually defined as a system where pure styrene monomer is polymerised and soln. polymerisation as a system where the styrene monomer is diluted with solvent. Bulk polymerisation of styrene monomer may be accomplished by thermal initiation alone, without an added initiator [17]. Bulk, soln., suspension and emulsion polymerisation reactions may use a batch process. In a batch process all reagents are added to the reactor initially and remain in the reactor for the same length of time. Batch processes enable a high conversion of monomers to polymer. However, there may be difficulties with heat control and in maintaining batch-to-batch uniformity. For bulk and soln. polymerisation reactions, a process where reagents are fed continuously into the reactor and waste products are removed is preferred for polystyrene manufacture. Batch processes are however used for emulsion polymerisation and suspension polymerisation reactions. Emulsion polymerisation is used on a semi-commercial scale for the production of polystyrene latex. It is not attractive commercially for the production of general purpose polystyrene due to the high recovery costs of washing and drying the polymer in order to remove the emulsion stabilisers, pelleting of dried polymer and treatment of waste water. Suspension polymerisation is used almost exclusively to produce expandable polystyrene. Because a blowing agent can be introduced during polymerisation, residual monomer requirements are not severe and the spherical particle form prod. in suspension can be used directly in the product. Products for injection moulding and extrusion applications are usually extruded to the pellet form. The suspension polymerisation process is declining in importance for general purpose polystyrene. The main commercial route for production is the soln. (or bulk-soln.) continuous process. Main technical challenges are controlling the exothermic heat of polymerisation and handling the highly viscous partially converted polymer. The addn. of ethylbenzene solvent reduces the viscosity. Temp. control and mixing (stirring) are important factors in controlling the product. For thermal initiation the typical temp. range is 120–180°; for chemical initiation the temp. may be reduced to 90°. A chain transfer agent may be added to control the MW. Anionic polymerisation of styrene is limited to the production of narrow MW distribution polystyrenes in laboratory quantities. Typical initiators are organolithium compounds. Cationic polymerisation is used to produce low MW resins. Typical initiators are strong protonic acids and Lewis Acids. Polystyrene obtained with any heterogeneous Ziegler-Natta catalyst is a mixture of products with different tacticities usually atactic and isotactic. The isotactic and atactic products may be separated by utilising their different solubility props. The syndiotactic form can be prod. with some homogeneous Ziegler-Natta catalysts. Typical catalyst systems contain tetrabenzyltitanium or tetrabenzylzirconium and methylaluminoxane in aromatic solvents [9,10,11,12]. Injection moulding is used to make polystyrene plastics for a wide variety of applications. Easy-flow resins are used for injection moulding of thin-walled parts. 3–4% Mineral oil is added to the resin to decrease the melt viscosity. Medium flow resins containing 1–2% added mineral oil are also used for injection moulding applications. Colour concentrates and other additives are added to the resin at the extrusion stage which takes place before injection moulding [2]. Extrusion methods are used for processing styrene polymers and copolymers. PS resins are easy to plasticate and have good melt strength. They are readily fabricated into sheet, film, rod, pipe, profiles, tubing and monofilament products

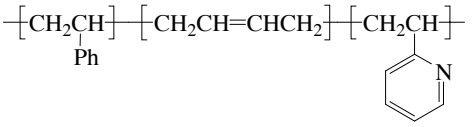
Mould Shrinkage (%):

No.	Value	Note
1	0.2–0.6%	unreinforced [3]
2	0.05–0.1%	glass reinforced [3]

Applications: Non-foamed polystyrene are used in appliances and consumer electronics (air conditioners, refrigerators and freezers, small appliances, cassettes and related products, cabinets, light fittings, furniture and toilet seats, toys and novelties e.g. used in advertising and photographic accessories). They are used in the building and construction industry but the use of foamed materials is more common. Non-foamed products are used in medical and cosmetic applications as table phials and tablet packaging. Polystyrene is used in a wide range of packaging applications including rigid packaging, closures and produce baskets. It is also used for disposable products such as tumblers and cocktail glasses, flatware and cutlery, dishes, bowls and cups. Heat resistant products are used for vending machine products

and hot food and drink containers. Other applications include prismatic reflectors and diffusers. Narrow MW distribution polystyrenes are used for instrument calibration. Low MW resins are used for coatings and glues. Injection moulding is used to produce furniture, toys, radio, television and computer cabinets, automotive parts, medical ware, houseware, bottle caps and containers. Blow moulding is used to form bottles, containers, furniture and automotive parts. Extrusion is used to manufacture film products (multilayer and oriented), profiles, light diffusers and wall coverings. Extrusion and thermoforming are used to make refrigerator and freezer parts; luggage; food containers, both solid and formed; disposable cups and dinnerware; and large automotive parts. Coextruded PS composites include dairy containers, two-colour dinnerware and drink cups, and sheet for outdoor use

Trade name	Details	Supplier
A/CSO/H/NSC/SE/SH/Y	various grades	Thermofil Inc.
AIM	4800/4810/4900	Dow Chemical
API	various grades	American Polymers
Amoco	unfilled	Amoco Chemical Company
Arloy	1000/1100	ARCO Chemical Co.
Arprylene	glass-reinforced	Thermofil
Arpylene	glass-reinforced	TPA
Bapolan	6050/6445/6450	Bamberger Polymers
Carinex	unfilled	Shell Chemicals
Comalloy	various grades	Comalloy Intl. Corp.
Conductomer	PSC-20/SC-26	Synthetic Rubber
DC-1007		Spartech
Dart	PS	Dart Polymers Inc.
Dylark	polystyrene and styrene-maleic anhydride copolymer	ARCO Chemical Company
Dylene	glass-reinforced and unfilled products	ARCO Chemical Company
Dylite	R2595B EPS	ARCO Chemical Co.
EA/EB/EC/EH	various grades	Chevron Chemical
EMI-X	PDX-C-89603	LNP Engineering
EPS	54/84/86	Huntsman Chemical
ES	various grades	BASF
Edistir	unfilled and uv stabilised	Montedison
Electrafil	J-30/PS-31	DSM Engineering
Emiclear	EC-1300 PS	Toshiba Chem. Prod.
Empee	Jenahrd/PS	Monmouth Plastics
Esbrite	various grades	Sumitomo Chem. Co.
Eslorite	unfilled product	Sumitomo Chem Co
FPC	various grades	Federal Plastics
Fiberstran	G-30/G-35	DSM Engineering
Fina	various grades	Fina Oil and Chem.
Fostalite	unfilled	Foster Grant
Fostarene	unfilled	Foster Grant
G31/35		DSM Engineering
Gedex		Cd F Chemie
Gordon (Superdense)	unfilled	Hammond
Gordon (Superflow)	unfilled	Hammond
HIPS	0014-L	Multibase
Hostyren	unfilled, uv stabilised	Hoechst
Huntsman	unfilled, uv stabilised	Huntsman Chemical
J-30	CF/30	DSM Engineering
Kaofulex	GPS/HPS	Kaofu Chemical
Kaofulon	various grades	Kaofu Chemical
Kaofulux	ABS	Kaofu Chemical
Kaofusan	SAN	Kaofu Chemical
Lacqrene	miscellaneous and high-impact grades	Atochem Polymers
Lastirol	glass-reinforced	Freeman
Lubricomp	CL series	LNP Engineering
Lucky	PS series	Lucky
Lustrex	unfilled, uv stabilised	Monsanto Chemical
MA/MB/MC/MD	various grades	Chevron Chemical
Marvaloy	750	Marval Indust.
Metastyrene	miscellaneous grades	BP Chemicals
Metastyrol		BP Chemicals
Mobil	various grades	Mobil Chem. Co.
Multi-Alloy	3006/4006	Multibase
Novalite		Cole
PS	various grades	BASF
PS	2835	Multibase
PS	various grades	Huntsman Chemical
PS	H23MF-1/H63CC-1	Washington Penn
PS	GF20 IM	TP Composites
Piccolastic	low MW resin	Hercules
Polyflam	RMS/RS	A.Schulman Inc.
Polyrex	P series	Chi Mei Corporation
Polystyrene	various grades	Novacor Chemicals
Polystyrene	various grades	Ricard Group/RRT
Polystyrene High Impact		IPC/GWC
Polystyrol	miscellaneous grades	BASF
RTP	glass-reinforced	Fiberite (Vigilant)
Replay	RP series	Huntsman Chemical
Resoglass	glass-reinforced	BP Chemicals
Resoglaz	glass-reinforced	BP Chemicals
Restirolo		SIR
Retain	PS Series	Dow Chemical
Rexene		Rexene Products
SC2F-1090		Spartech
Shuman	various grades	Shuman Plastics
Stat-Kon	C	LNP Engineering
Sternite	moulding powder	Sterling



Stilletex		Cole
Stycond	E	United Composites
Styrafil	flame retardant and glass-reinforced	Fiberfil
Styrol	various grades	Denka
Styron	unfilled and uv stabilised products	Dow
Styronol		Allied Resinous
Stystat	Q	United Composites
Styvex	22000/22001	Ferro Corporation
Superstyrex		BP Chemicals
Thermacomp	glass-reinforced, PTFE filled, glass bead/sphere filled	LNP Engineering
Toporex		Mitsui Petrochemicals
Trolitul		Dynamit Nobel
Valtra	various grades	Chevron Chemical
Vestypor		Hüls AG
Vestyron	polystyrene and styrene-butadiene copolymer products	Hüls AG
Vistron		BP Chemicals
XU	70016.01/70029.00	Dow Chemical

Poly(styrene-*block*-butadiene-*block*-vinylpyridine) P-522

Synonyms: *Poly(ethylbenzene-co-1,3-butadiene-co-ethylenepyridine). Styrene-butadiene-vinylpyridine terpolymer. PS/PBD/PVP. Styrene-vinylpyridine-butadiene triblock polymer. Poly(styrene-butadiene-vinylpyridine) triblock copolymer. SBP block polymer. Poly(1,3-butadiene-co-ethenylbenzene-co-ethenylpyridine). Styrene/butadiene/vinylidene terpolymer rubbers*
Monomers: Styrene, 1,3-Butadiene, 2-Vinylpyridine, 4-Vinylpyridine
Material class: Copolymers, Synthetic Elastomers
Polymer Type: polybutadiene, polystyrenepolyvinyls
CAS Number:

CAS Reg. No.	Note
130196-29-1	4-vinylpyridine; block/graft
122720-06-3	4-vinylpyridine, block
135819-00-0	2-vinyl pyridine, graft
26658-72-0	4-vinylpyridine
9019-71-0	vinyl pyridine
130193-99-6	4-vinylpyridine; graft
25053-48-9	2-vinyl pyridine
109881-14-3	2-vinyl pyridine, block

Molecular Formula: $[(C_8H_8)_x(C_4H_6)_y(C_7H_7N)_z]_n$
Fragments: C_8H_8 C_4H_6 C_7H_7N
General Information: Commercial materials may be poly(styrene-*block*-butadiene-*block*-4-vinylpyridine) or Poly(styrene-*block*-butadiene-*block*-2-vinylpyridine). Commercial materials may contain either 2-vinylpyridine or 4-vinylpyridine [5,6] as terpolymer component, or a derivative such as 2-methylvinylpyridine. Block and graft copolymers (terpolymers) [10,11,12] are also available. Terpolymers used mainly as latices (40–42% total solids) and typically have the composition styrene/butadiene/vinylpyridine (15/70/15). May be regarded as styrene butadiene (30/70) rubber in which half of the styrene units have been replaced by more polar vinylpyridine units [7]
Morphology: Electron microscopy of graft (4-vinylpyridine) terpolymer shows a microphase-separated domain struct. [11]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.98 g/cm^3	typical polymer latex; 3–10% of vinylpyridine replacing styrene; 40–42% total solids; solids 0.95–0.98 g cm^{-2} [5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$; insol. MeOH (4-vinylpyridine graft copolymer) [11,12]
Surface Tension:

No.	Value	Note
1	48–54 mN/m	48–54 dyne cm^{-1}, typical latex formulation; 40–42% total solids; styrene/butadiene/vinylpyridine (15/70/15) [6]

Transport Properties:

Polymer Solutions Dilute: Viscosity 30–150 cP s (typical latex formulations, 40–42% total solids; styrene/butadiene/vinylpyridine (15/70/15)) [6]
Permeability of Gases: Permeability of (4-vinyl pyridine) graft copolymers, i.e. 'modified SBS triblock copolymers' has been reported; such modifications reduce permeability to both O_2 and N_2 [10,12]. The effects of the degree of grafting and operating temp. have also been reported [12]. Gas permeability behaviour is related to morphological struct. [10]

Mechanical Properties:

Mechanical Properties General: Mechanical props of 4-vinylpyridine graft copolymers have been reported; correlations between modulus and tensile strength with grafting ratio have been reported [11]

Optical Properties:

Transmission and Spectra: Ir spectral data for 4-vinylpyridine graft copolymers have been reported [11]

Polymer Stability:

Polymer Stability General: Polymer latices (40–42% total solids) have excellent chemical, mechanical, storage and thermal (freeze-thaw) stability [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Terpolymer latices are produced by emulsion copolymerisation at 50–60°, using reaction systems similar to those used for SBR latices [7,8,9]. Typically potassium peroxodisulfate is used as initiator [7,8,9]. Copolymerisation takes place more rapidly than corresponding emulsion polymerisation of styrene and butadiene under similar conditions [7,9]. Graft copolymers containing 4-vinylpyridine are synth. by reaction of latter with SBS triblock copolymer using γ-irradiation; rate of grafting depends on irradiation dose [11,12]
Applications: Terpolymer latices have been developed principally for applications as rubber-to-textile adhesives, in particular for tyre cords; latices are used either alone or mixed with styrene/butadiene latices to give stronger and more fatigue-resistant rubber/textile bond than latter latex alone. Particularly useful for nylon and polyester cords and for belts requiring good rubber/textile adhesion, e.g. V-belts and conveyor belting [6], hoses [6] and adhesive systems with rayon, cotton, fibreglass and aramid fabrics. Other applications (mainly as latex formulations) include use in impact-resistant moulding compositions, printing inks, composites, laminates, fast-curing rubber blends; (glass and carbon) fibre compositions, (pigmented) coatings. Graft copolymers (2-or 4-vinylpyridine) produced by γ-irradiation are used for ion-exchange and gas-separation membranes, and various coatings

Trade name	Details	Supplier
Gen-Tac	latex formulation; (40–42% solids)	Gencorp
Pliocord	LVP-4668; latex formulation (42% solids); S/BD/VP (15/70/15). LVP-5263; latex formulation (41% solids); S/BD/VP (19/70/11). LVP-5622 latex formulation; (40–42% solids)	Gencorp
Pyratex	J1904; latex formulation (40–41.5% solids); terpolymer containing 2-vinyl pyridine	Bayer Inc.
VP-100		Goodyear

Polystyrene, Foamed P-523

Synonyms: *Polystyrene, Cellular. Polystyrene, Expanded. Polystyrene, Expandable. EPS*
Related Polymers: Polystyrene General information, Polystyrene Latex, Polystyrene Oriented Film and Sheet, High-impact polystyrene
Monomers: Styrene
Material class: Fibres and Films, Thermoplastic
Polymer Type: polystyrene
CAS Number:

CAS Reg. No.
9003-53-6

Molecular Formula: $(C_8H_8)_n$
Fragments: C_8H_8
Molecular Weight: For extruded products high MW polystyrene is used MW 320000. For expanded foam products medium MW polystyrene is used MW 250000 [3]
Additives: For building applications flame retardants are added which are typically organic bromine compds. e.g. hexabromocyclododecane and pentabromomonochlorocyclohexane [1,2]
General Information: Polystyrene foam is a rigid plastic material [3]. There are several types depending on the manufacturing conditions and physical props. such as foam density and thickness. Extrusion processes are used to produce extruded board and sheet products. Extruded board has a typical thickness of 25 mm and density in the range 27–40 kgm^{-3}, whereas extruded sheet is in the range 0.4–6.5 mm with density of 40–160 kgm^{-3}
Miscellaneous: Expanded polystyrene beardboard is prod. by low-moulding of expandable polystyrene beads. This product has densities in the range 13–48 kgm^{-3}. Expanded PS loosefill has a bulk density of 4.0–4.8 kgm^{-3} and is usually prepared by a blow moulding process [1,3]. Polystyrene structural foam may be prepared by injection moulding or extrusion

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

3	d 0.027–0.066 g/cm^3	extruded foam board [3]
4	d 0.008–0.03 g/cm^3	expanded, loose-fill [3]
5	d 0.7 g/cm^3	injection-moulded structural foam [4]
6	d 0.2–0.4 g/cm^3	PS bead foam [14]
7	d 0.7 g/cm^3	PS structural foam [4,37]
8	d 0.84 g/cm^3	PS structural foam, 20% (w/w) glass reinforced [4,37]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6.3×10^{-5} K^{-1}	extruded plank, density 0.035 g cm^{-3} and 0.053 g cm^{-3}, ASTM D696 [4,9,24]	L
2	5.4×10^{-5} – 7.2×10^{-5} K^{-1}	expanded plank, densities 0.016 and 0.08 g cm^{-3}, ASTM D696 [4,9,31]	L
3	5×10^{-5} K^{-1}	PS bead foam, density 0.2–0.4 g cm^{-3} [14]	L
4	0.0001 K^{-1}	PS structural foam [5]	L

Volumetric Properties General: Density depends on processing conditions
Thermodynamic Properties General: Linear thermal expansion coefficient varies with density [4,24]. Thermal conductivity depends on the density of the foam [29,30], the thermal conductivity of the gas used as the blowing agent in the foam manufacture, the temp., the foam thickness, the amount of absorbed water [4,9,54] and the cell struct. [4]. The plasticising effect of the blowing agent on the polymer affects the thermal props. in the same way as it affects the unfoamed polymer [4]. Other thermal conductivity data have been reported [32]. Thermal conductivity is related to insulation props [4,9,54,56], and increases with time [56] and moisture absorption [54]
Thermal Conductivity:

No.	Value	Note
1	0.03 W/mK	extruded plank, density 0.035 g cm^{-3}, ASTM C177 [4,9,24]
2	0.035 W/mK	extruded sheet, density 0.096 g cm^{-3}, ASTM C177 [4,9,24]
3	0.035 W/mK	extruded sheet, density 0.16 g cm^{-3}, ASTM C177 [4,9,24]
4	0.035 W/mK	expanded plank, density 0.032 g cm^{-3} and 0.08 g cm^{-3}, ASTM C177 [4,9,31]
5	0.037 W/mK	expanded plank, density 0.016 g cm^{-3}, ASTM C177 [4,9,31]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.1 kJ/kg.C	extruded plank, ASTM C351 [4,9]	P

Transition Temperature General: The max. service temp. of polymer foams cannot be defined precisely because polymer foams gradually decrease in modulus as the temp. increases as opposed to undergoing a sharp change in props. [4]. The upper value of T_{use} depends strongly on the plastic phase. When a polymer foam is manufactured this process imposes a stress on the polymer phase. This stress may tend to relax at a temp. below the heat distortion temp. of the unfoamed polymer [4]
Deflection Temperature:

No.	Value	Note
1	82–83°C	Contin, ISO 175A [16]
2	88–90°C	Marten, DIN 53458, ISO 175B [16]
3	80°C	PS bead foam [14]
4	85°C	foam sheet/PS bead board (moulded) [1]

Vicat Softening Point:

No.	Value	Note
1	90°C	DIN 53460 [16]

Transport Properties:

Permeability of Gases: The diffusion of dichlorodifluoromethane, pentane, N_2 and O_2 in extruded foams has been reported [57]. The permeability of water vapour in expanded foam and particle board has been reported [60]. Moisture vapour transmission rate 35 g m^{-1} s^{-1} G Pa^{-1} (extruded plank, density 0.035 g cm^{-3}, ASTM E96) [4,9,24], <120 g m^{-1} s^{-1} G Pa^{-1} (expanded plank, density 0.016 g cm^{-3}, ASTM E96) [4,9,31], 35–120 g m^{-1} s^{-1} G Pa^{-1} (expanded plank, density 0.032 g cm^{-3}, ASTM E96) [4,9,31], 23–35 g m^{-1} s^{-1} G Pa^{-1} (expanded plank, density 0.08 g cm^{-3}, ASTM E96) [4,9,31], 86 g m^{-1} s^{-1} G Pa^{-1} (extruded sheet, density 0.096 g cm^{-3}, ASTM E96) [4,9], 56 g m^{-1} s^{-1} G Pa^{-1} (extruded sheet, density 0.016 g cm^{-3}, ASTM E96) [4,9]. Other gas diffusion data have been reported [61]

Water Absorption:

No.	Value	Note
1	0.02 %	extruded plank, density 0.035 g cm^{-3}, ASTM C272 [4,9,24]
2	0.05 %	extruded plank, density 0.053 g cm^{-3}, ASTM C272 [4,9,24]
3	1–4 %	expanded plank, ASTM C272 [4,9,31]
4	0.2–0.27 %	24h, 23°, foam, DIN 53495 [16]

6	8–30 %	5 years, moulded [4,9,54]

Gas Permeability:

No.	Gas	Value	Note
1	Chlorotri-fluorome-thane	426.1 cm^3 mm/(m^2 day atm)	2200 nmol (m s G Pa)$^{-1}$, 24° [3,58]

Mechanical Properties:

Mechanical Properties General: The mechanical props. of rigid polymer foams, e.g. polystyrene, are different to those of flexible foams [4]. The compressive strength and modulus, and the shear strength and modulus are affected by plastic phase composition, density, cell struct. and plastic state; the effect of gas composition is small [4,35]. PS foams do not exhibit a definite yield point, but show an increased deviation from Hooke's Law as the compressive load is increased [4,33]. The effect of density and polymer composition on the compressive props. has been reported [4,24]. Strengths and moduli and shear props. increase with decreasing temp. [4]. The tensile strength and modulus of rigid foams vary with density in a similar manner to the compressive strength and modulus [4,18,23,24]. Tensile props. are affected by the polymer composition, density and cell shape [4]. Flexural strength and modulus of PS foams are also affected by density [4]. Variations in the strength props. of expanded PS caused by the block moulding process have been reported [50]. The compressive modulus of PS bead foam depends on temp. and is very low at high temps. [14]

Tensile (Young's) Modulus:

No.	Value	Note
1	10–28 MPa	PS bead foam [14]

Flexural Modulus:

No.	Value	Note
1	41 MPa	extruded plank, density 0.035 g cm^{-3}, ASTM D790 [4,9,24]
2	9–26 MPa	expanded plank, density 0.032 g cm^{-3}, ASTM D790 [4,9,31]
3	1400 MPa	PS structural foam [4,37]
4	5200 MPa	PS structural foam, 20% glass reinforced [4,37]
5	1600 MPa	20°, PS structural foam [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	2.1–9.1 MPa	ASTM D882 [31,36]	2–8%
2	2.07–6.89 MPa	[14]	1–2%
3	0.517 MPa	extruded plank, density 0.035 g cm^{-3}, ASTM D1623 [4,9,24]	
4	0.145–0.193 MPa	expanded plank, density 0.016 g cm^{-3}, ASTM D1623 [4,9,31]	
5	0.31–0.379 MPa	expanded plank, density 0.032 g cm^{-3}, ASTM D1623 [4,9,31]	
6	1.02–1.186 MPa	expanded plank, density 0.08 g cm^{-3}, ASTM D1623 [4,9,31]	
7	2.07–3.45 MPa	extruded sheet, density 0.096 g cm^{-3}, ASTM D1623 [4,9]	
8	4.137–6.9 MPa	extruded sheet, density 0.16 g cm^{-3}, ASTM D1623 [4,9]	
9	12.4 MPa	PS structural foam [4,37]	
10	34.5 MPa	PS structural foam, 20% glass reinforced [4,37]	
11	15–17 MPa	DIN 53455 [16]	14–21%
12	22 MPa	20°, PS structural foam [5]	2%

Flexural Strength at Break:

No.	Value	Note
1	1.138 MPa	extruded plank, density 0.035 g cm^{-3}, ASTM D790 [4,9,24]
2	0.379–0.517 MPa	expanded plank, density 0.032 g cm^{-3}, ASTM D790 [4,9,31]
3	34–37 MPa	DIN 53452 [16]
4	31 MPa	PS structural foam [4,37]
5	58.6 MPa	PS structural foam, 20% glass reinforced [4,37]

Compressive Modulus:

No.	Value	Note
1	10.3 MPa	extruded plank, density 0.035 g cm^{-3}, ASTM D1621 [4,9,24]
2	3.4–14 MPa	expanded plank, density 0.032 g cm^{-3}, ASTM D1621 [4,9,31]

Elastic Modulus:

No.	Value	Note
1	10.3 MPa	extruded plank, density 0.035 g cm^{-3}, ASTM C273 [4,9,24]
2	7.6–11 MPa	expanded plank, density 0.032 g cm^{-3}, ASTM C273 [4,9,31]

Compressive Strength:

No.	Value	Note
1	0.31 MPa	10% deflection, extruded plank, density 0.035 g cm^{-3}, ASTM D1621 [4,9,24]
2	0.862 MPa	10% deflection, extruded plank, d ensity 0.053 g cm^{-3}, ASTM D1621 [4,9,24]
3	0.09–0.124 MPa	10% deflection, expanded plank, density 0.016 g cm^{-3}, ASTM D1621 [4,9,31]
4	0.207–0.276 MPa	10% deflection, expanded plank, density 0.032 g cm^{-3}, ASTM D1621 [4,9,31]
5	0.586–0.896 MPa	10% deflection, expanded plank, density 0.08 g cm^{-3}, ASTM D1621 [4,9,31]
6	2.07–8.27 MPa	max., PS bead foam, density 0.2–0.4 g cm^{-3} [14]
7	0.29 MPa	10% deflection, extruded sheet, density 0.096 g cm^{-3}, ASTM D1621 [4,9]
8	0.469 MPa	10% deflection, extruded sheet, density 0.16 g cm^{-3}, ASTM D1621 [4,9]

Impact Strength: The relationship between the impact strength of the foam and that of the polymer has been reported [4,44]. The impact characteristics of foamed plastics have been reported [45]
Mechanical Properties Miscellaneous: The hydrostatic compression curves for PS foams show three stages of deformation; bending of the cell walls (low pressure); buckling of the walls; contact between the cell walls (high pressure) [62]
Hardness: Rockwell M30 (PS structural foam) [5]
Failure Properties General: Shear strength 241 kPa (extruded plank, density 0.035 g cm^{-3}, ASTM C273) [4,9,24]. The min. load required to cause long-term creep in moulded PS increases with increasing foam density 50 kPa (density 0.016 g cm^{-3}); 455 kPa (density 0.16 g cm^{-3}) [4,38]. Shear strength 241 kPa (expanded plank, density 0.032 g cm^{-3}, ASTM C273) [4,9,31]. Preloading of rigid foams reduces tensile modulus and affects the dependency of absorbed energy on the compressive stress [39]. The relationship between the fatigue and creep behaviour of PS foams and those of the polymer has been reported [4,44]. The stress relaxation of PS foams and its relation to the cushioning behaviour of the foams has been reported [45,46,47]
Fracture Mechanical Properties: The creep characteristic of polymer foams is important in structural applications. The percentage deformation against time under various static loads has been reported [4,38]. Fracture toughness of PS bead foams depends on the processing conditions and increases with moulding time, steam pressure, temp. and decreasing foam density (increasing bead fusion) [48]. However, brittle interbead failure also increases with decreasing toughness [49]
Izod Notch:

No.	Value	Notch	Note
1	30 J/m	Y	20°, PS structural foam [5]

Izod Area:

No.	Value	Notch	Note
1	11–16 kJ/m^2	Unnotched	DIN 53453 [16]

Electrical Properties:

Electrical Properties General: PS foams have good electrical insulation props. [4]
Dielectric Permittivity (Constant):

Dielectric Strength:

No.	Value	Note
1	0.1 $kV.mm^{-1}$	PS structural foam [5]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0007		expanded plank [4,9,31]
2	0.00011		extruded sheet, density 0.096 g cm^{-3} [4,9]
3	0.00014		extruded sheet, density 0.16 g cm^{-3} [4,9]
4	<0.0004		max., extruded plank [4,9,24]
5	0.0005	1 kHz	PS structural foam [5]

Optical Properties:

Optical Properties General: The penetration of visible light through PS foam approximates to the Beer-Lambert Law [4,24]
Transmission and Spectra: Ir spectral data have been reported [32]
Molar Refraction: Complex refractive index for PS foams has been reported [32]
Volume Properties/Surface Properties: Colour white

Polymer Stability:

Thermal Stability General: Polymer beads collapse at approx. 110–120°. The collapsed beads melt at 160° and start to vaporise above 275° (approx.). Complete volatilisation occurs at 460–500°. The heat of degradation of expanded PS is estimated to be 912 J g^{-1} [51]
Upper Use Temperature:

No.	Value	Note
1	74°C	max. service temp., extruded plank [4,9,24]
2	74–80°C	max. service temp., expanded plank [4,9,31]
3	77–80°C	max. service temp., extruded sheet [4,9]

Decomposition Details: Decomposition temp. 265°; 50% weight loss occurs at 355° [72]. For flame retardant material decomposition temp. 320°; 50% weight loss at 381° [72]

Flammability: Continuous ingress of oxygen into PS foams is made easier by their open, cellular struct. and burning tends to be more rapid than in solid materials [63]. The fire resistance of PS foams can be improved by incorporating appropriate chemical additives and/or fire retardant interlayers [2,18,64,65,66,67,68,69,70], *e.g.* halogenated aliphatic, alicyclic and aromatic compounds, phosphorus compounds and inorganic diluents and fillers [65]. The combustion rate of hexabromocyclohexane treated PS foam brands is 100–160 mm min^{-1} and the extinguishing time 10–50 s [68]. The smoke and gas evolution rates of PS foams have also been reported [71]. Flammability tests for PS foams have been reported [73]

Environmental Stress: Has poor resistance to uv radiation [31,36]. Outdoor exposure of expanded, extruded PS foam results in rapid discoloration and embrittlement of the surface, increased uv absorbance, and the formation of a possibly protective yellow surface layer, the thickness of which varies with time. Yellowing is accompanied by marked decreases in the average MW and tensile strength of the material. The protective yellow surface layer decreases, but does not eliminate, the effects of degradation in the underlying foam layers. Although initially the rate of deterioration is faster in air, in the long-term the rate of deterioration is greater in sea water, which is due to the continuous loss of the yellowed surface [52,53]. Outdoor exposure of PS insulation increases its thermal conductivity [54,56]

Chemical Stability: Has good resistance to strong acids and strong alkalis. Has fair resistance to greases, and poor resistance to organic solvents [31,36]

Biological Stability: The resistance of cellular polymers to rot, mildew and fungus can be related to the amount of moisture that can be absorbed by the foam [55]. Open-celled foams are much more likely to support growth than are closed cell-foams [4,9]. Very high temps. and humidity are needed for the growth of microbes on plastic foam [4,9]

Recyclability: PS foam products can be recycled [40,41,42,43]. The critical props. of PS foams are unaffected by the recycling process [43]

Applications/Commercial Products:

Processing & Manufacturing Routes: Extruded foam sheet is prepared using polystyrene resin, blowing agent, nucleating agent, colour concentrate (optional) and regrind. A high MW unplasticised PS resin with MW $\leq$ 320000 is used [3]. The most common blowing agents are aliphatic hydrocarbons (potential fire hazard) and partially halogenated chlorofluorocarbons. Carbon dioxide and nitrogen may also be used [27]. For aliphatic hydrocarbon blowing agents, a blend of citric acid and sodium bicarbonate is typically used as nucleating agent and for chlorofluorocarbons a fine particle size talc. For food applications all ingredients must meet the apllicable government regulations. Rolls of PS foam sheet are stored and allowed to age for 2–5 days. During ageing blowing agent diffuses out of the cells at a slower rate than air diffuses into the cells. The increased cell pressure allows the proper concentration of blowing agent and air in the cells for optimium postexpansion of the sheet when it is reheated before thermoforming. The PS foamed sheet is thermoformed to produce the desired products. Polystyrene extruded foam board is prod. in a similar way to extruded foam sheet. Additives to control cell nucleation, extrusion performance, colour and flammability behaviour are used. Halogenated aromatic, aliphatic and cycloaliphatic hydrocarbons are used to increase the foams resistance to ignition. Particulate inorganics e.g. silica or clay or organics e.g. indigotin may be used as nucleating agents. Typical blowing agents are CFC's, hydrocarbons, halocarbons or mixtures of these. Expanded PS beadboard is manufactured from preformed expandable beads or granules prepd. by suspension polymerisation. The polymer in the expandable beads is a styrene polymer or copolymer with MW $\leq$ 250000 containing a minimal amount of volatile material or additives. Polystyrene, styrene-acrylonitrile copolymer and styrene-maleic anhydride copolymers may be used. Blowing agents for expandable foam are hydrocarbons and chlorofluorocarbons. Other additives may be used to change the flammability of the final expanded objects; to control the cell size of the foam, and to control the cohesion of the expanded beads to themselves in the pre expansion step. Expanded PS loose-fill packaging materials are prod. by suspension polymerisation with blowing agent incorporated into the polymer during the polymerisation or by extrusion followed by multiple steam expansions. Expansion with steam produces a low-density foam in the shape of an S, 8 or a hollow shell. Pentane, CFC-11 or a mixture of these may be used as a blowing agent. Two or three expansions are carried out using steam with at least one day of ageing after each expansion. Stabilisation is accomplished by cooling the polymer phase below its glass-transition temp. during the expansion process. Structural foam may be prod. by injection moulding or by extrusion. The process reduces the density of the solid polymer by 25 to 30%. Decomposable chemical blowing agents e.g. azodicarbonamide give a high density foamed product. Medium-density products can be prod. with a physical or chemical blowing agent, or a mixture of both. Most PS structural foam is prod. from impact modified polystyrene or high-impact polystyrene. Composite syntactic foam [1,19], using expandable polystyrene or styrene-acrylonitrile copolymer particles (in either the unexpanded or prefoamed state) are mixed with a resin or a resin containing a blowing agent which has a large exotherm during curing. The mixture is then placed in a mould and the exotherm from the resin cure causes the expandable particles to foam and squeeze the resin or foamed matrix to the surface of the moulding

Applications: Extruded foam board is used as an insulating material in building construction, due to high insulation value per unit thickness, high dimensional stability, excellent resitance to moisture and freeze-thaw deterioration, excellent compression strength and good handling props. (non-flammable and non-toxic). The main construction applications are residential and industrial sheathing and roofing in commercial buildings. The use of extruded foam as a highway underlayment to prevent frost damage to roads and pavements has been successfully tried out in the USA, Canada and Japan [1]. Extruded foam products may be used as perimeter and floor insulation under concrete and combined plaster base and insulation for walls. It may also be used for floral, decorative and buoyancy products. Foam sheet is primarily used as a packaging material. It is often thermoformed into diposable packaging (egg cartons, produce trays; fast-food containers, dinnerware and drinking cups) Foam sheet has the advantages for disposable packaging, reduced weight, high flexural modulus, low water absorption and low cost. Expanded foam may be used as billets in the building and construction industry and for buoyancy and decorative applications, due to good insulating value, light weight, low water pick up and low cost. Expanded foam can also be used as backing e.g. on aluminium siding to provide heat and sound insulation. Expanded foam has been used in Europe in the design of sound-absorbing floors but cost, flammability and cleaning difficulties have prevented market penetration in this area. Expanded shapes are used as loose-fill packaging due to good shock absorbency, excellent resiliency, light weight and reuseable. Common shapes include S or 8 shapes and rounded discs. Expanded beads may be mixed with concrete for light-weight masonry structs. Expanded spheres may also be used as stabilisers for explosives. Foam insulation is used in refrigeration for large commercial refrigerators, freezers and cold storage areas including cryogenic equipment and gas tanks. Foam is used in load bearing sandwich panels for low temp. applications, as solid propellant for rocket motors and for low frequency electrical insulation. Foam is used where cost and moisture resistance are important. Expandable bead-foam is used for encapsulation of electronic packages. The advantages of this material are low density, low modulus, good vibration and thermal shock resistance and it is solvent removable, but props. depend on the degree of bead fusion and the residual solvent content. A high temp. polystyrene bead foam is also used for encapsulation. Injection moulded structural foam is used widely for high-density articles (picture frames, furniture appliances, housewares, utensils, toys, pipes and fittings). Impact modified polystyrene (HIPS) is the most common structural foam, and is used as a replacement for wood, metals and solid plastics. Injection moulded foam may also be used for display and novelty pieces. Expandable polystyrene can be steam-moulded

into useful, light-weight, low cost, closed cell foam shapes (beverage cups, packaging components, picnic chests, ice-buckets and insulation board). Insulation prepd. from expanded polystyrene beads has different props. to that prepd. from extruded foam board. It has inferior insulation value, moisture resistance and other physical props., though the cost of expanded PS beadboard is less than extruded PS foam board. Polystyrene composite syntactic foam (Voraspan, an expandable PS in flexible polyurethane foam matrix) is used for cushioning appliactions such as automobile crash pad and moulded furniture

Trade name	Details	Supplier

Polystyrene, Glass filled P-524

Synonyms: *Poly(1-phenylethylene). Poly(vinyl benzene). Poly(-phenyl ethene). Poly(phenyl ethylene). Poly(1-vinyl benzene). Poly(ethenyl benzene). PS*
Related Polymers: Polystyrene, High-impact polystyrene, Polystyrene, wood filled
Monomers: Styrene
Material class: Thermoplastic
Polymer Type: polystyrene
Additives: Flame-retardant, anti-static and flow-enhanced grades are available.
General Information: Glass fibre and beads are used as fillers. High-impact grades also available.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1–1.27 g/cm^3	10–30% filler, ASTM D792 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2965–9998 MPa	10–30% filler, ASTM D638 [1]
2	4137–8274 MPa	10–30% filler, high-impact grade, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	4826–9308 MPa	10–30% filler, ASTM D790 [1]
2	3792–7584 MPa	10–30% filler, high-impact grade, ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	59–79 MPa	10–30% filler, ASTM D638 [1]	1.0–2.5%
2	34–53 MPa	10–30% filler, high-impact grade, ASTM D638 [1]	1.0–2.5%

Flexural Strength Yield:

No.	Value	Note
1	97–124 MPa	10–30% filler, ASTM D790 [1]
2	50–76 MPa	10–30% filler, high-impact grade, ASTM D790 [1]

Izod Notch:

No.	Value	Notch	Note
1	48 J/m	Y	10–30% filler, ASTM D256, 3.2 mm section [1]

2	160–187 J/m	N	10–30% filler, ASTM D4812, 3.2 mm section [1]
3	53–80 J/m	Y	10–30% filler, high-impact grade, ASTM D256, 3.2 mm section [1]
4	160 J/m	N	10–30% filler, high-impact grade, ASTM D4812, 3.2 mm section [1]

Polymer Stability:
Flammability: HB at 1.5mm (ASTM D635) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Processing for injection molding [1]:
Injection pressure: 69–103 Mpa
Melt temperature: 210–249°C
Mold temperature: 38–66°C
Drying: 2 hrs at 82°C

Applications/Commercial Products:
Mould Shrinkage (%):

No.	Value	Note
1	0.1–0.4%	10–30% filler, ASTM D955 [1]

Applications:

Poly(styrene-*block*-isoprene-*block*-2-vinylpyridine) P-525

Synonyms: *Styrene-isoprene-2-vinylpyridine triblock copolymer. ISP triblock copolymer. Poly(ethenylbenzene-block-2-ethenylpyridine-block-2-methyl-1,3-butadiene). Poly(ethenylbenzene-block-2-methyl-1,3-butadiene-block-2-ethenylpyridine)*
Monomers: 2-Methyl-1,3-butadiene, Isoprene, Styrene, 2-Vinylpyridine, 4-Vinylpyridine, 2-Vinylpyridine
Material class: Copolymers
Polymer Type: polydienes, polybutadienepolystyrene
CAS Number:

CAS Reg. No.	Note
143106-01-8	Block
53895-47-9	Styrene

Morphology: The variation of morphology with composition has been reported. Four different morphologies are identified in a series of isoprene-styrene-vinylpyridine polymers where the end block polymer volume fractions are kept constant and the middle block (polystyrene) is varied: a three-phase, four-layer lamellar struct., an ordered tricontinuous double diamond struct., a cylindrical struct. and a spherical struct. The ordered tricontinuous double-diamond struct. is also found in styrene-isoprene-vinylpyridine polymers. More recent work, however, indicates that the double-diamond morphology of isoprene-styrene-vinylpyridine terpolymers is actually gyroid [1,2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Can be prepared by anionic polymerisation [1]

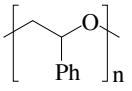
Molecular Formula: $(C_8H_{8n}$
Fragments: C_6H_8
Molecular Weight: Polystyrene prod. by emulsion polymerisation has high MW. The size or diameter of the latex particles is usually used to identify latex products
Additives: Polystyrene latex may be stabilised by surface active agents (surfactants) or by an adsorbed layer of a polymeric stabiliser
General Information: Polystyrene latex is generally a milky white suspension of small, discrete particles of polymer dispersed in aq. soln. When the diameter of the particles is a similar order of magnitude to the wavelength of light, the scattering of white light gives an irridescent appearance [2]. When the latex particle diameter is very small (approx. 30 nm or less) a coloured dispersion may be observed [2]
Miscellaneous: The PS latex particle size affects both its physical props. and stability. The PS latex particle size may be determined by electron microscopy and light scattering techniques [12]. Large particles, with diameters greater than 1 μm may also have their particle sizes measured by optical microscopy and electronic counting techniques e.g. the Coulter Counter [10]. PS latex particles are observed as solid spheres using electron microscopy, but the particle consists of many chains of entangled polystyrene polymer with charged end groups, arising from initiator fragments, located at the particle surface. These initiator fragments may be anionic or cationic [11,12], depending on the type of initiator used. Persulfate initiator systems give rise to sulfate end groups which are liable to hydrol. producing carboxyl and hydroxyl groups in addition to sulfate. The initiator 4,4′-azobis-4-cyanopentanoic acid gives carboxyl groups which are stable to hydrol. Cationic surface groups include amidine derivs. from 2,2′-azobisisobutyramidine and 2,2′-azobis-*N,N′*-dimethyleneisobutyramidine initiators. The solids content of polystyrene latex prepd. by emulsion polymerisation may be up to 50% (w/w) for latex particle sizes in the range 0.1 μm-0.5 μm. However when PS latex is prepd. by emulsifier-free polymerisation the solids content is lower (typically 10% w/w) [12]



Applications/Commercial Products:

Poly(styrene oxide) P-527

Synonyms: *Poly(oxy(1-phenyl)ethylene). Poly[oxy(1-phenyl-1,2-ethanediyl)]. Poly(phenyloxirane). Poly[(epoxyethyl)benzene]*
Monomers: Styrene oxide
Material class: Thermoplastic
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
25189-69-9	homopolymer
105390-15-6	isotactic
105761-00-0	(*R*)-form
101062-46-8	
105369-63-9	homopolymer, isotactic

Molecular Formula: $(C_8H_8O)_n$
Fragments: C_8H_8O
Molecular Weight: M_w/M_n 1.23; M_n typically 1600, 1450
General Information: Bright yellow crystalline solid [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.118 g/cm^3	[2]
2	d^{25} 1.147–1.151 g/cm^3	[3]

Melting Temperature:

No.	Value	Note
1	149°C	[2,3]
2	162°C	[2,3]
3	179°C	[2,3]

Glass-Transition Temperature:

No.	Value	Note
1	40–41°C	[2,3]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. C_6H_6, toluene, $CHCl_3$, CCl_4 [2]. Insol. paraffins, Me_2CO, MeOH, 2-butanone

Mechanical Properties:
Failure Properties General: Max. shear stress 3 g cm^{-1} s^{-2} [2]

Optical Properties:
Molar Refraction: $[M]^{15}_D$ 121.2 (c.1 in dioxan, *S*-form). $[M]^{15}_D$ -127.2 (c.0.9 in dioxan, *R*-form) [4]

Molecular Formula: $[(C_8H_8).(C_7H_7N)]_n$
Fragments: C_8H_8 C_7H_7N
Morphology: Block copolymer exhibits a mesomorphic struct. in presence of a preferential or selective solvent for one of the blocks [9]. Depending on polymer and solvent the structural element is lamellar or cylindrical [9,19]. Morphology investigated by near-field optics [25]

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: Soln. deposited film surface density has been reported [2]. Thermal expansion of adsorbed diblock copolymers on mica has been reported [16]
Melting Temperature:

No.	Value	Note
1	125–175°C	random copolymer [17]
2	150–240°C	block copolymer [17]

Glass-Transition Temperature:

No.	Value	Note
1	85–100°C	linear block copolymer [6]
2	101–106°C	macrocyclic block copolymer [6]
3	102°C	random copolymer [17]
4	105°C	block copolymer [17]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$/1,4-dioxane (6:4) [4], DMF [20], pyridine [21,22], THF [21], 1,1,2-trichloroethane [21]. Slightly sol. 2-butanone [22], C_6H_6 [22]
Surface and Interfacial Properties General: Contact angle of water on deposited film has been reported. Wetting behaviour of polystyrene on PS-block-P2VP films [27] has been studied by AFM, neutron scattering and SIMS.
Surface Tension:

No.	Value	Note
1	1.2 mN/m	block copolymer [7]

Transport Properties:
Polymer Solutions Dilute: Zero shear viscosities and values for the Mark-Houwink-Sakurada equation for pyridine, 2-butanone and C_6H_6 for the block copolymer have been reported [22]. Critical concentration for microphase separation in pyridine has been reported [22]. Flory interaction parameters for block copolymers are temp. dependent [16]

Mechanical Properties:
Compressive Modulus:

No.	Value	Note
1	0.1 MPa	1000000 dyn cm^{-2}, block copolymer, calc. [7]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.3 MPa	3000000 dyn cm^{-2}, block copolymer, calc. [7]	Splay modulus

Mechanical Properties Miscellaneous: Forces between layers of adsorbed block copolymer have been reported [5,8]. Maximum stretch of 40% in lamellar configuration on silicon (block copolymer). [7] Forces between layers of adsorbed block copolymer [5,8] have been reported. Maximum stretch of 40% in lamellar configuration on silicon. [7] (block copolymer)Forces

between layers of adsorbed block copolymer [5,8] have been reported. Maximum stretch of 40% in lamellar config. on silicon [7] (block copolymer)
Fracture Mechanical Properties: The fracture toughness of the glass-deutero PS-P2VP interface has been investigated [24]; the mechanism of interface failure has been assigned to chain scission or crazing followed by chain scission, depending on the areal chain densities [24]

Electrical Properties:
Electrical Properties General: Electrical anisotropy of cast films has been reported. Conductivity of quaternised film and iodine doped block copolymers has been reported. Conductivity increases parallel to film orientation [4]
Surface/Volume Resistance:

No.	Value	Note	Type
1	0.0018×10^{15} Ω.cm	quaternised film [4]	S

Optical Properties:
Transmission and Spectra: Electron micrographs of graft ABB polymers have been reported [15]. SAXS diffraction of graft ABB polymers has been reported [15]. Ir spectral data (star copolymer) have been reported [18]. Atomic force microscopy has been reported [26]. H-1 nmr spectral data (star copolymer) have been reported [18]. Transmission electron microscopy [20] (block copolymer) has been reported [21]. Electron paramagnetic resonance (epr) of charge-transfer complexes [23]. Near-field optical microscopy has been reported [25]. XPS data have been reported [1,2,3]. FTIR and SIMS spectral data have been reported [3]. Transmission electron microscopy of films has been reported [4]. Atomic force microscopy of block copolymer has been reported [7]. Cryo-electron microscopy of block copolymer has been reported [10]. Scanning force microscopy (SFM) on block copolymer has been reported [13]. Laser-induced desorption photoelectron ionisation LD/PEI mass spectrum of copolymer [14]. TEM of block copolymer has been reported [7]

Polymer Stability:
Decomposition Details: Decompostion temp. 399–407° (linear block copolymer) [6]. Decomposition temp. 372–406° (macrocyclic block copolymer) [6]

Polystyrene, Wood filled P-530

Synonyms: *Poly(1-phenylethylene). Poly(vinyl benzene). Poly(-phenyl ethene). Poly(phenyl ethylene). Poly(1-vinyl benzene). Poly(ethenyl benzene). PS*
Related Polymers: Polystyrene, High-impact polystyrene, Polystyrene, glass filled
Monomers: Styrene
Material class: Thermoplastic
Polymer Type: polystyrene
General Information: Molding and extrusion grades available.

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.074–1.156 g/cm^3	20–40% filler, ASTM D792 [1]

Deflection Temperature:

No.	Value	Note
1	75–81°C	at 264 psi, ASTM D648, 20–40% filler [1]

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	0.5–1.6 g/10 min	at 190°C, 20–40% filler, ASTM D1238 [1]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	4000–5800 MPa	20–40% filler, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	3200 MPa	20–40% filler, ASTM D790 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	19.9–28.7 MPa	20–40% filler, ASTM D638 [1]	1.5–5.8%

Tensile Strength Yield:

No.	Value	Note
1	22.5–28.9 MPa	20–40% filler, ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	48.3–56.3 MPa	20–40% filler, ASTM D790 [1]

Izod Notch:

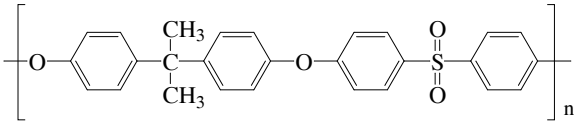
No.	Value	Notch	Note
1	20.3–40.5 J/m	Y	20–40% filler, ASTM D256 [1]
2	50–80 J/m	N	20–40% filler, ASTM D256 [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Injection molding [1]:
Dryer inlet temperature: 87.8°C
Dew point: -28.9°C
Drying time: 2–4 hours
Processing temperatures: rear <182°C, middle <188°C, front <193°C, nozzle °193°C
Residence time: <15 mins
Extrusion [1]:
Temperature settings [1]:
Zone 1: <149–171°C
Zone 2: <160–188°C
Zone 3: <171–193°C
Zone 4: <182–193°C
Adapter and die: <182–204°C
Screen packs: <20 mesh
Draw down: 0–5%

Applications/Commercial Products:

Mould Shrinkage (%):



No.	Value	Note
1	0.08–0.26%	20–40% filler, ASTM D955 [1]

Polysulfone P-531

Synonyms: *Polysulfone unreinforced. Bisphenol A polysulfone. PSF. PSU. Poly[oxy-1,4-phenylenesulfonyl-1,4-phenyleneoxy-1,4-phenylene(1-methylethylidene)-1,4-phenylene]*
Related Polymers: Polysulfone, 30% Glass fibre reinforced, Polysulfone, 30% Carbon fibre reinforced, Polysulfone, 15% PTFE lubricated, Polysulfone, Mineral filler modified, ABS/PSU blend, Crystalline modified polysulfone with glass fibre, Polysulfone-based proprietary blend
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
Molecular Weight: M_n 20400 and MW 40000 (determined by osmometry and light scattering on unfractionated polymer)
Additives: Fillers include carbon fibre, glass, PTFE and minerals
General Information: Polysulfone is a tough, rigid, high-strength amorph. thermoplastic for moulding and extrusion. Its principal features are good high temp. performance, resistance to creep, transparency and self-extinguishing characteristics. It maintains its props. over a wide temp. range (-101° to above 149°). Its excellent physical and electrical props. are virtually unaffected by long-term thermal ageing at 149°. Hydrolytically stable, it has exceptional steam resistance. On a cost to performance basis, it replaces metals and glass. Polysulfone is available in transparent and opaque forms in both moulding and extrusion grades (unfilled). A special medical grade is certified for contact with blood and other body parts. Also available are polysulfone compounds with fillers such as glass fibre, carbon fibre and Teflon. Glass-fibre reinforced polysulfone grades offer materials which can be used for strength purposes and can compete with metal die castings. Strength, stiffness and dimensional stability are increased with glass-fibre reinforcement

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.24 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.6×10^{-5} K^{-1}	ASTM D696 [1]	L

Volumetric Properties General: Has a higher coefficient of linear thermal expansion compared to reinforced grades
Thermal Conductivity:

No.	Value	Note
1	0.26 W/mK	ASTM C177 [1]

Specific Heat Capacity:

No.	Value	Note	Type
1	1 kJ/kg.C	23° [1]	P

Melting Temperature:

No.	Value	Note
1	310–390°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	185°C	[3]

Transition Temperature General: Heat deflection temp. increases significantly with thermal ageing [6]
Deflection Temperature:

No.	Value	Note
1	174°C	1.8 MPa, ASTM D648 [3]
2	181°C	0.5 MPa, ASTM D648 [3]

Vicat Softening Point:

No.	Value	Note
1	188°C	ASTM D1525 [3]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	[1]	Second order (β)

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 21.8 $J^{1/2}$ $cm^{-3/2}$ [1]
Solvents/Non-solvents: Sol. polar solvents, DMF, *N*-methylpyrrolidinone, chlorinated aliphatic hydrocarbons, CH_2Cl_2, $CHCl_3$, trichloroethylene [1]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	6.5 g/10 min	0.3 MPa, 343°, ASTM D1238 [6]

Polymer Solutions Dilute: Weight average MW intrinsic viscosity relationships for polysulfone have been reported [9]. Theta temp. θ - 105.5° [9]
Water Absorption:

No.	Value	Note
1	0.3 %	24h, 23°, 3.2 mm, ASTM D570 [6]

Mechanical Properties:

Mechanical Properties General: Rigid and tough with practical engineering strength and stiffness. Exhibits ductile yielding over a wide range of temps. and deformation rates. Continues to exhibit useful mech. props. at temps. up to 160° under prolonged or repeated thermal exposure [3,8]

Tensile (Young's) Modulus:

No.	Value	Note
1	2480 MPa	ASTM D638 [6]

Flexural Modulus:

No.	Value	Note
1	2690 MPa	ASTM D790 [6]

Tensile Strength Break:

No.	Note	Elongation
1	ASTM D638 [3]	50–100%

Compressive Modulus:

No.	Value	Note
1	2579 MPa	ASTM D695 [3]

Poisson's Ratio:

No.	Value	Note
1	0.37	0.5% strain [3]

Tensile Strength Yield:

No.	Value	Note
1	70.3 MPa	ASTM D638 [3]

Flexural Strength Yield:

No.	Value	Note
1	106 MPa	ASTM D790 [3]

Compressive Strength:

No.	Value	Note
1	96 MPa	ASTM D695 [3]

Miscellaneous Moduli:

No.	Value	Note	Type
1	917 MPa	[3]	Shear

Complex Moduli: Tensile creep modulus 2500 MPa (1000h, 23°, Dehnung ≤0.5%, ISO/IEC 899) [7]
Impact Strength: Tensile impact strength 420 kJ m^{-2} (ASTM D1822) [3]
Viscoelastic Behaviour: Creep under continuous load is unusually low, even at elevated temps. [6]. Creep modulus under ambient conditions and applied stress of 28 MPa is 2.413 MPa (1h), 2200 MPa (100h) and 2137 MPa (1000h) [15]
Hardness: Rockwell M69, R120 (ASTM D785) [3]
Failure Properties General: Shear strength 41.4 MPa (yield). Shear strength, 62.1 MPa (ultimate ASTM D732) [3]
Fracture Mechanical Properties: Fatigue endurance limit (10000000 cycles 1800 cycles min^{-1}) at room temp. is approx. equivalent to the performance of bisphenol A polycarbonate but lower than that of most crystalline engineering thermoplastics [1]
Friction Abrasion and Resistance: Abrasion resistance 20 mg (1000 cycles)$^{-1}$ (ASTM D1040, Taber CS-17 test) [3]
Izod Notch:

No.	Value	Notch	Note
1	64 J/m	Y	6.35 mm, ASTM D256 [3]
2	3200 J/m	N	3.18 mm, ASTM D256 [3]

Electrical Properties:

Electrical Properties General: Offers excellent electrical props., which are maintained over a wide temp. range and after immersion in water

Surface/Volume Resistance:

No.	Value	Note	Type
2	30×10^{15} Ω.cm	ASTM D257 [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.07	60 Hz	ASTM D150 [6]
2	3.06	1 kHz	ASTM D150 [6]
3	3.03	1 MHz	ASTM D150 [6]

Dielectric Strength:

No.	Value	Note
1	16.6 kV.mm^{-1}	3.2 mm thick, ASTM D149 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0008	60 Hz	ASTM D150 [6]
2	0.001	1 kHz	ASTM D150 [6]
3	0.003	1 MHz	ASTM D150 [6]

Optical Properties:

Optical Properties General: Exhibits optical transparency
Refractive Index:

No.	Value	Note
1	1.63	ASTM D1505 [3]

Transmission and Spectra: Light transmittance 80% [3]
Volume Properties/Surface Properties: Haze <7% (3.1 mm thick, ASTM D1004). Light yellow colour [3]

Polymer Stability:

Thermal Stability General: Excellent thermal stability [3] is reflected in long-term retention of electrical props. at elevated temp.
Upper Use Temperature:

No.	Value	Note
1	160°C	UL 746 [1]

Decomposition Details: Degrades gradually *in vacuo* above 400°. Rapid decomposition begins above 460° [10]
Flammability: Flammability rating V0 (6.1 mm thick, UL 94) [1]. Limiting oxygen index 30% (ASTM D286) [1]. Exhibits excellent resistance to burning, and requires no flame-retardant additives [1]. Smoke density 90 at 1.5 mm (ASTM E662) [3]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light. Absorbance in the uv region occurs with attendant discoloration and losses in mechanical props. due to polymer degradation. For outdoor applications, protective lacquers or grades of the material containing carbon black are recommended [3]. Resistant to most forms of radiation [12,13,14]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resistance to detergents, oils and alcohols is good. Attacked by polar organic solvents [6]. Is crazed, swollen or dissolved by chlorinated hydrocarbons, aromatic hydrocarbons, esters and ketones [1]
Hydrolytic Stability: Exceptional hydrolytic stability and steam resistance. In contaminated steam, its useful life is calculated to be at least 12 years [6]
Biological Stability: Good resistance to bacterial and fungal attack [15]
Stability Miscellaneous: Good dimensional stability [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polysulfone is made by treating the sodium salt of bisphenol A with 4,4′-dichlorodiphenyl sulfone in a mixed solvent of chlorobenzene and DMSO. The polymerisation is carried out at 130–160°. At these temps. unacceptably high reaction rates and MW of 250000 (after 1h) occur. Terminators regulate chain growth to a range that facilitates commercial melt processing. A comonomer mole ratio of 1 results in the highest MW. Contamination with air has to be avoided and all traces of water must be removed. Polysulfone resin can be melt-processed on conventional equipment. Injection moulding is the most common fabrication technique used for all natural, coloured, filled and otherwise modified grades of the resin. Blow moulding, thermoforming, structural-foam moulding, soln. casting, and continuous-fibre reinforced polysulfone prepregging have been carried out. The polymer has a high melt viscosity and melt processing should be performed under the recommended conditions in order to produce parts of low residual stress levels. Conditions include the use of mould temp. of 95–150°, depending on part configuration. The resin's viscosity is quite insensitive to shear and its excellent thermal and oxidative stability within the broad melt-temp. processing range of 330–400° makes possible the use of melt temp. as the primary moulding parameter. Prior to melt processing, the resin must be dried to reduce the absorbed atmospheric moisture to below 0.05% wt. Once formed, parts made of polysulfone can be annealed. Polysulfones are extruded on conventional extrusion equipment as sheet, film, pipe or wire coating. Melt temps. of the extruded stock are in the range of 315–375°. Extrusion-grade polysulfones have excellent drawdown props. for the production of thin film due to their high melt strengths [1,3,10]
Mould Shrinkage (%):

No.	Value	Note
1	0.7%	ASTM D955 [6]

Applications: The primary uses of polysulfones include appliances and cookware. Also used in chemical, food and beverage processing; electrical and electronic components; medical products and some aerospace and automotive components. Polysulfone is suitable for use in articles intended for repeated use in contact with foods, particularly in microware cookware due to the polymer's outstanding transparency to microwave radiation. Electrical and electronic applications include automotive fuses, integrated-circuit carriers, connectors, switch housings and printed circuit boards. The resistance of polysulfones to chemical attack has resulted in their use in chemical processing equipment. Examples of components in this area are corrosion-resistant pipes, filter modules, support plates and tower packing. One unique application area for PSF is in membrane separation uses. Asymmetric PSF membranes are used in ultrafiltration, reverse osmosis and ambulatory hemodialysis (artificial kidney) units. The PRISM (Monsanto) gas-separation system is based on a polysulfone coating applied to a hollow-fibre support. Glass-reinforced grades of polysulfone have substantially enhanced tensile and flexural props. as well as resistance to cracking in chemical environments. Proprietary blends based on polysulfone are sold under the Mindel trademark. They offer maximum cost-effectiveness while maintaining key props.. Polysulfone meets U.S. Food and Drug Administration (FDA) requirements for direct food contact

Polysulfone-based proprietary blend P-532

Synonyms: *Polysulfone-based proprietary resin*
Related Polymers: Polysulfone
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: polysulfone

CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
General Information: Polysulfone-based proprietary resin is developed to fit a cost/performance niche in medical and food service applications. It has chemical resistance comparable to polysulfone, steam and hot water resistance and autoclavability with excellent electrical and mech. props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.23 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type

No.	Value	Frequency	Note
1	0.001	1 kHz	ASTM D150 [1]
2	0.007	1 MHz	ASTM D150 [1]

Optical Properties:

Volume Properties/Surface Properties: Opaque [1]

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range
Thermal Stability General: Excellent thermal stability
Upper Use Temperature:

No.	Value	Note
1	105°C	UL 746B, provisional rating [1]
2	160°C	UL 746 [1]

Flammability: Flammability rating V0 (3.3 mm thick, UL 94) [1]
Environmental Stress: High degree of oxidative stability [3]
Chemical Stability: Chemical resistance comparable to polysulfone [1]
Hydrolytic Stability: Superior hydrolytic stability and steam resistance [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Melt temp. range is 315–345° and mould temp. range is 90–140° for injection moulding. Prior to melt processing, the resin must be dried for 3h at 135° [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.66%	ASTM D955 [1]

Applications: Food processing application, has FDA approval. Used in medical devices, for biological contact and institutional feeding systems. Mindel S-1000 resin provides strength and sterilisability to components of medical analysers

Trade name	Details	Supplier

Polysulfone, 30% carbon fibre reinforced P-533

Synonyms: *PSU, 30% carbon fibre reinforced. PSF, 30% carbon fibre reinforced*
Related Polymers: Polysulfone
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
Additives: Carbon fibre
General Information: A tough rigid engineering thermoplastic. Compared with unreinforced grades it has superior tensile strength, creep resistance and rigidity, low coefficient of thermal expansion and very good mould skrinkage. It is expensive and has poor electrical insulation characteristics. Due to the incorporation of carbon fibre it offers full resistance to uv light.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.37 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.9×10^{-5} K^{-1}	ASTM D696 [3]	L

Volumetric Properties General: Low coefficient of thermal expansion compared with unreinforced PSU [1]
Thermal Conductivity:

No.	Value	Note
1	0.45 W/mK	ASTM C177 [3]

Melting Temperature:

No.	Value	Note
1	310–390°C	[1]

2	185°C	1.8 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	[4]	Second order (β)

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents such as DMF and *N*-methylpyrrolidinone, chlorinated aliphatic hydrocarbons such as CH_2Cl_2, $CHCl_3$ and trichloroethylene [4]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.15–0.25 %	1/8" thick, 24h, ASTM D570 [2]

Mechanical Properties:

Mechanical Properties General: Superior tensile strength, creep resistance and rigidity compared with unreinforced PSU [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	14822–19303 MPa	2150–2800 kpsi, ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	15500 MPa	ASTM D790 [3]

Tensile Strength Break:

No.	Value	Note
1	160 MPa	ASTM D638 [3]

Flexural Strength at Break:

No.	Value	Note
1	220 MPa	ASTM D790 [3]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	1 MPa	2%	ASTM D638 [3]

Compressive Strength:

No.	Value	Note
1	140 MPa	ASTM D695 [3]

Hardness: Rockwell M96 (ASTM D785) [3]
Failure Properties General: Shear strength 105 MPa (ASTM D732) [3]
Friction Abrasion and Resistance: Coefficient of friction (static) 0.17 (LNP SOP). Coefficient of friction (dynamic) 0.14 (LNP SOP) [3]
Izod Notch:

No.	Value	Notch	Note
1	90 J/m	Y	ASTM D256 [3]
2	400 J/m	N	ASTM D256 [3]

Electrical Properties:

Electrical Properties General: Due to the incorporation of carbon fibre this material is conductive. Surface and volume resistivities are in the range 10–100 Ω cm (ASTM D257) [3]

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range (-100° to above 149°)
Thermal Stability General: Excellent thermal stability
Upper Use Temperature:

No.	Value	Note
1	160°C	UL 746 [3]

Flammability: Flammability rating V0 (UL 94) [1]. Limiting oxygen index 32% [1]. Excellent resistance to burning and, in most applications, requires no flame-retardant additive [4]
Environmental Stress: High degree of oxidative stability. Resistant to uv light [5]
Chemical Stability: Highly resistant to aq. mineral acid, alkali and salt solns. Resistant to aliphatic hydrocarbons and most alcohols, but is crazed, swollen or dissolved by chlorinated hydrocarbons, aromatic hydrocarbons, esters and ketones [4]
Hydrolytic Stability: Excellent hydrolytic stability. Withstands many hours exposure to hot water and steam [4]
Biological Stability: Good resistance to bacterial and fungal attack [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Mould temp. of 120–160° and melt temp. of 310–390° are recommended for injection moulding. Prior to melt processing, the resin is dried for 5h at 120° to prevent bubbling, surface streaks, and splash marks in moulded parts [1]

Mould Shrinkage (%):

No.	Value	Note
1	0.15%	ASTM D-955, very good mould shrinkage compared with unreinforced PSU, moulded components can be highly anisotropic [1]

Applications: Automotive applications for under the bonnet components, aricraft interior and exterior components. Chemical plant pumps and valves, process pipe and plumbing components, pump impellers, switch devices, reflectors, knobs and buttons

1	-100°C	[6]	Second order (β)

Surface Properties & Solubility:

Solubility Properties General: δ 21.8 J$^{1/2}$ cm$^{-3/2}$ [1]
Solvents/Non-solvents: Sol. polar solvents such as DMF and *N*-methylpyrrolidinone, chlorinated aliphatic hydrocarbons such as CH_2Cl_2, $CHCl_3$ and trichloroethylene [6]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	7–8 g/10 min	ASTM D1238 [2]

Water Absorption:

No.	Value	Note
1	0.3 %	1/8" thick, 24h, ASTM D570 [2]

Mechanical Properties:

Mechanical Properties General: Tensile strength, flexural strength, notched Izod impact strength and creep resistance are superior to those of unreinforced. Elongation at break is significantly reduced compared with unreinforced [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	9300–10000 MPa	1350–1450 kpsi, ASTM D638 [2]
2	7380 MPa	ASTM D638 [4]

Flexural Modulus:

No.	Value	Note
1	8500 MPa	ASTM D790 [3]

Tensile Strength Break:

No.	Value	Note
1	130 MPa	ASTM D638 [3]

Flexural Strength at Break:

No.	Value	Note
1	150 MPa	ASTM D790 [3]

Tensile Strength Yield:

No.	Elongation	Note
1	2–3%	ASTM D638 [3]

Compressive Strength:

No.	Value	Note
1	110 MPa	ASTM D695 [3]

Complex Moduli: Tensile creep modulus 8300 MPa (23°, 1000h, Dehnung $\leq$0.5%, ISO/IEC 899) [5]
Impact Strength: Tensile impact strength 109 kJ m^{-2} (ASTM D1822) [4]
Viscoelastic Behaviour: Significantly increased creep resistance compared with unreinforced PSU [7]
Hardness: Rockwell M96 (ASTM D785) [3]
Failure Properties General: Shear strength 75 MPa (ASTM D732) [3]
Friction Abrasion and Resistance: Coefficient of friction (static) 0.24 (LNP SOP). Coefficient of friction (dynamic) 0.22 (LNP SOP) [3]
Izod Notch:

No.	Value	Notch	Note
1	85 J/m	Y	ASTM D256 [3]
2	350 J/m	N	ASTM D256 [3]

Electrical Properties:

Electrical Properties General: Has excellent electrical props. which are maintained over a wide temp. range and after immersion in water [4]
Surface/Volume Resistance:

No.	Value	Type
1	0.1×10^{15} Ω.cm	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.5	60 Hz	ASTM D150 [3]
2	3.5	1 MHz	ASTM D150 [3]

Dielectric Strength:

No.	Value	Note
1	19 $kV.mm^{-1}$	ASTM D149 [3]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001	60 Hz	ASTM D150 [3]
2	0.007	1 MHz	ASTM D150 [3]

Optical Properties:

Volume Properties/Surface Properties: Opaque [4]

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range (-101° to above 149°)
Thermal Stability General: Excellent thermal stability. A high proportion of its initial props. are retained upon exposure to temps. of 149° to 177° during continual or long-term intermittent service [4]
Upper Use Temperature:

No.	Value	Note
1	160°C	UL 746 [3]

Flammability: Flammability rating V0 (UL 94) [1]. Limiting oxygen index 35% [1]. Excellent resistance to burning. Requires no flame-retardant additives [6]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light. Improved stress cracking resistance compared with unreinforced [12]. Resistant to many forms of ionising radiation [9,10,11,12]
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resistance to detergents and hydrocarbon oils is good. Attacked by polar organic solvents [4]
Hydrolytic Stability: Exceptional hydrolytic stability and steam resistance. In contaminated steam, its useful life is calculated to be at least 12 years [4]
Biological Stability: Good resistance to bacterial and fungal attack [13]
Stability Miscellaneous: Improved dimensional stability compared with unreinforced [8]

Applications/Commercial Products:

Processing & Manufacturing Routes: Moulded in modern injection-moulding equipment. A mould temp. of 120–160° and a melt temp. of 340–400° are recommended. Prior to melt processing, the resin is dried for 4h at 150° to prevent bubbling, surface streaks, and splash marks in moulded parts [4]

Mould Shrinkage (%):

No.	Value	Note
1	0.25%	ASTM D955, good mould shrinkage compared with unreinforced. Mech. props. of moulded components can be anisotropic [1]

Applications: Electrical components - connectors, circuit boards, TV components, hairdryer parts, oven, projector and fan heater components. Pumps and valves for use in chemical and petrochemical industries, suitable also for use with hot water. Appliance housings, process equipment and food service items

Polysulfone, Mineral filler modified P-535

Synonyms: *PSF, Mineral filler modified. PSU, Mineral filler modified*
Related Polymers: Polysulfone
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: polysulfone

CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
Additives: Mineral fillers
General Information: Polysulfones modified with mineral filler are formulated for maximum cost-effectiveness while maintaining key props. They have special props. such as improved environmental stress crack resistance, dimensional stability, creep resistance, toughness and mouldability.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.48 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.4×10^{-5}–0.00039 K^{-1}	ASTM D696 [1]	L

Glass-Transition Temperature:

No.	Value	Note
1	190°C	[1]

Deflection Temperature:

No.	Value	Note
1	174–179°C	345–354°F, 1.8 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	100°C	[3]	Second order (β)

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents such as DMF and *N*-methylpyrrolidinone, chlorinated aliphatic hydrocarbons such as CH_2Cl_2, $CHCl_3$ and trichloroethylene [3]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	7–8.5 g/10 min	ASTM D238 [1]

Water Absorption:

No.	Value	Note
1	0.5–0.6 %	$\frac{1}{8}$" thick, saturation, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Good creep resistance, toughness and mouldability [2]

Tensile (Young's) Modulus:

No.	Value	Note
1	3791–4481 MPa	550–650 kpsi, ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	4136–5170 MPa	22.8°, ASTM D638 [1]
2	3929–4894 MPa	93.3°, ASTM D638 [1]
3	3792–4757 MPa	121.1°, ASTM D638 [1]

Tensile Strength Break:

No.	Value	Note
1	65.5–67.6 MPa	9500–9800 psi, ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	98.6–106 MPa	14300–15400 psi, ASTM D790 [1]

Viscoelastic Behaviour: Creep resistant [2]
Hardness: Rockwell M70-M74 (ASTM D785) [1]
Izod Notch:

No.	Value	Notch	Note
1	34.6–53.1 J/m	N	0.65-1 ft lb in^{-1}, $\frac{1}{8}$" thick, ASTM D256A [1]

Electrical Properties:

Electrical Properties General: Has excellent electrical props., which are maintained over a wide temp. range and after immersion in water. Props. are virtually unaffected by long-term ageing at 149° [2]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.7–3.8	60 Hz	ASTM D150

Dielectric Strength:

No.	Value	Note
1	17 $kV.mm^{-1}$	ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	125s	ASTM D495

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.003	60 Hz	ASTM D150

Optical Properties:

Volume Properties/Surface Properties: Provides a smooth surface [2]

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range (-101° to above 149°) [2]
Thermal Stability General: Excellent thermal stability
Flammability: Flammability rating V0 (UL 94) [2]. Excellent resistance to burning. Requires no flame-retardant additives [4]
Environmental Stress: Improved environmental stress crack resistance compared with unreinforced [2]. High degree of oxidative stability
Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resistance to detergents and hydrocarbon oil is good. Attacked by polar organic solvents [2]
Hydrolytic Stability: Has excellent hydrolytic stability and has demonstrable long-term resistance to steam [2]
Stability Miscellaneous: Has long-term dimensional stability

Applications/Commercial Products:

Processing & Manufacturing Routes: Mould temp. range is 357–413° in injection moulding
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.5%	ASTM D955 [1]

Applications: Applications in electrical devices, food handling equipment, and medical equipment. Qualified for FDA approved devices

Polysulfone, 15% PTFE lubricated P-536

Synonyms: *PSU, 15% PTFE lubricated. PSF, 15% PTFE lubricated*
Related Polymers: Polysulfone
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: polysulfone
CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
Additives: PFTE as lubricant
General Information: A tough rigid engineering thermoplastic with high resistance to creep, good high temp. performance and self-extinguishing characteristics. Good chemical resistance and hydrolytic stability. Compared with unreinforced grades it has low coefficient of friction and lower tensile strength

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.32 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.5×10^{-5} K^{-1}	ASTM D696 [3]	L

Thermal Conductivity:

No.	Value	Note
1	0.17 W/mK	ASTM C177 [3]

Melting Temperature:

No.	Value
1	310–390°C

Transition Temperature General: Slightly better heat deflection temp. compared with unreinforced polysulfone [1]
Deflection Temperature:

No.	Value	Note
1	260°C	0.45 MPa [1]
2	177°C	1.8 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	-100°C	[4]	Second-order (β)

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents such as DMF and *N*-methylpyrrolidinone, chlorinated aliphatic hydrocarbons such as CH_2Cl_2, $CHCl_3$ and trichloroethylene [4]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.25 %	24h, ASTM D570 [3]
2	0.6 %	saturation, ASTM D570 [3]

Mechanical Properties:

Mechanical Properties General: Lower tensile strength, elongation at break and notched Izod impact strength compared with unreinforced polysulfone [1]
Flexural Modulus:

No.	Value	Note
1	2600 MPa	ASTM D790 [3]

Tensile Strength Break:

No.	Value	Note
1	55 MPa	ASTM D638 [3]

Flexural Strength at Break:

No.	Value	Note
1	90 MPa	ASTM D790

Tensile Strength Yield:

No.	Elongation	Note
1	10–20%	ASTM D638 [3]

Compressive Strength:

No.	Value	Note
1	60 MPa	ASTM D695 [3]

Hardness: Rockwell M81 (ASTM D785) [3]
Failure Properties General: Shear strength 40 MPa (ASTM D732)
Friction Abrasion and Resistance: Coefficient of friction (static) 0.09 (LNP SOP). Coefficient of friction (dynamic) 0.14 (LNP SOP) (low coefficient of friction compared with unreinforced polysulfone) [3]
Izod Notch:

No.	Value	Notch	Note
1	65 J/m	Y	
2	350 J/m	N	ASTM D256 [3]

Electrical Properties:

Electrical Properties General: Has excellent electrical props. which are maintained over a wide temp. range and after immersion in water. Unaffected by long-term ageing at 149° [2]. Arc resistance values have been reported [3]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.15	60 Hz	ASTM D150[3]
2	3.1	1 MHz	ASTM D150 [3]

Dielectric Strength:

No.	Value	Note
1	17 $kV.mm^{-1}$	ASTM D149 [3]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0011	60 Hz	ASTM D150 [3]
2	0.005	1 MHz	ASTM D150 [3]

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range (-101° to above 149°) [2]
Thermal Stability General: Excellent thermal stability. A high proportion of its initial props. are retained upon exposure to temps. of 149° to 177° during continual or long-term intermittent service [2]
Upper Use Temperature:

No.	Value	Note
1	160°C	UL 746 [3]

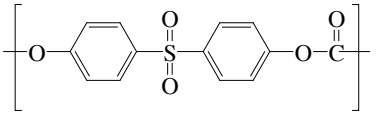
Flammability: Flammability rating V1 (UL 94) [1]. Limiting oxygen index 32% [1]. Excellent resistance to burning. Requires no flame-retardant additives [4]
Environmental Stress: High degree of oxidative stability. Poor resistance to uv light [5]

Chemical Stability: Highly resistant to mineral acids, alkali and salt solns. Resistance to detergents and hydrocarbon oil is good. Attacked by polar organic solvents [2]. Is crazed, swollen or dissolved by chlorinated hydrocarbons, aromatic hydrocarbons, esters and ketones [4]
Hydrolytic Stability: Has excellent hydrolytic stability and has demonstrable long term resistance to steam [2]
Biological Stability: Good resistance to bacterial and fungal attack [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Melt temp. range of 310–390° and mould temp. range of 90–150° are recommended for injection moulding. Prior to melt processing, the resin is dried for 5h at 120° to prevent bubbling, surface streaks, and splash marks in moulded parts [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.55%	3mm section, ASTM D955 [3]



Applications: Used in the manufacture of electrical components - coil bobbins, connectors, terminal blocks, cooking appliances, milking machine parts, process and sanitary pipes, brushes for compact hair stylers, housing for electrical appliances, pumps and valves and medical equipment that requires sterilisation

Poly[sulfonyl bis(4-phenyl)carbonate] P-537

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylenesulfonyl-1,4–phenylene]. 4,4′-Dihydroxydiphenylsulfone polycarbonate. Poly(4,4′-sulfonylbisphenol-co-carbonic dichloride)*
Monomers: 4,4′-Sulfonylbisphenol, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
28930-33-8

Molecular Formula: $(C_{13}H_8O_5S)_n$
Fragments: $C_{13}H_8O_5S$

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	200–210°C	[3]
2	233°C	cryst. [4]

Glass-Transition Temperature:

No.	Value	Note
1	132°C	[2]
2	195°C	cryst. [4]

Surface Properties & Solubility:

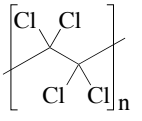
Solvents/Non-solvents: Sol. *m*-cresol, cyclohexanone, THF, pyridine, DMF [1], *N*-methylpyrrolidinone, DMSO [2], phenol (above 60°); insol. CH_2Cl_2, EtOAc, C_6H_6, Me_2CO [1], THF, MeOH, $CHCl_3$, 1,4-dioxane [2]. Reported to be both sol. and insol. in THF [1,2]
Wettability/Surface Energy and Interfacial Tension: Contact angle 78° (H_2O in air, 25°, 65% relative humidity) [2]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [2]

Polymer Stability:

Decomposition Details: Weight loss of 10%, at 380° [2]. Residual mass at 500°, 45.3% [2]
Flammability: Limiting Oxygen Index 34 (ASTM D2863-77) [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification, in which the dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2, with elimination of phenol. Reaction rates are increased by catalysts (basic salts such as zinc acetate) and the use of a medium-high vacuum in the final stages [1,2,3]

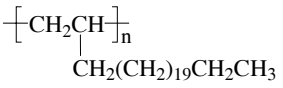
Polytetrachloroethylene P-538



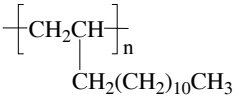
Synonyms: *Polytetrachloroethene*
Monomers: Tetrachloroethene
Polymer Type: polyhaloolefins
CAS Number:

CAS Reg. No.
25135-99-3

Applications/Commercial Products:
Processing & Manufacturing Routes: Hydrophobic films synth. by radiofrequency glow-discharge (Ar plasma) polymerisation of monomer, often on supporting layer of another polymer, e.g. PET [10,11]. Conducting films can be produced by electrolytic reaction polymerisation, in methyl cyanate, of monomer in presence of $Bu_4N\ BF_4$ [7]
Applications: Used as component of binding agents in electro-thermal materials in anti-corrosion coatings (flexible), e.g. for batteries; in laminates/filters for gases as hydrophobic filter papers for spot tests in membranes for sensors, reflection spectroscopy boards, paints; adhesives and sorbents. Plasma-produced polymer films have potential medical applications (diagnostic assays, immunoassays, catheters, vascular graft and vascular assist devices) also have potential application as chromatography packing material. Conducting films have potential applications in batteries, semiconductor batteries, semiconductor devices and switching elements

Poly(1-tetracosene) P-539

Synonyms: *Poly(1-docosyl-1,2-ethanediyl). Poly(1-docosylethylene)*
Monomers: 1-Tetracosene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:



CAS Reg. No.	Note
31259-31-1	atactic

Molecular Formula: $(C_{24}H_{48})_n$
Fragments: $C_{24}H_{48}$

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. from 1-tetracosene using $AlEt_3$ at 198–200° and 2 mm pressure [1]

[1] *Brit. Pat.,* 1966, 1 048 984, (synth)

Poly(1-tetradecene) P-540

Synonyms: *Poly(1-dodecylethylene). Poly(1-dodecyl-1,2-ethanediyl)*
Monomers: 1-Tetradecene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25608-58-6	atactic
26746-87-2	isotactic

Molecular Formula: $(C_{14}H_{28})_n$
Fragments: $C_{14}H_{28}$
General Information: Stiff rubber [2]
Morphology: Three polymorphic forms: form I orthorhombic, a 0.75, b 5.6, c 0.67, helix 4_1; form II orthorhombic, a 0.75, b 5.60, c 0.67 [5,7,8,9,17]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.882 g/cm^3	[10]

Poly(tetrafluoroethylene-*co*-ethylene), Glass fibre filled P-541

Synonyms: *ETFE, Glass fibre filled. ETFE copolymer, Glass fibre filled. Tetrafluoroethylene-ethylene copolymer, Glass fibre filled*
Related Polymers: Poly(tetrafluoroethylene-*co*-ethylene), Polytetrafluoroethylene
Monomers: Tetrafluoroethylene, Ethylene
Material class: Thermoplastic, Composites, Copolymers
Polymer Type: polyethylene, PTFE
Additives: Glass fibre
General Information: Glass fibre filler improves high temp. props.

Volumetric & Calorimetric Properties:

Density:

Poly(tetrafluoroethylene-*co*-hexafluoropropylene) P-542

Synonyms: *FEP. Tetrafluoroethylene-hexafluoropropylene copolymer. FEP fluorocarbon. Fluorinated ethylene-propylene copolymer. Poly(tetrafluoroethene-co-1,1,2,3,3,3-hexafluoro-1-propene)*
Related Polymers: Polytetrafluoroethylene, Polyhexafluoropropylene copolymers
Monomers: Tetrafluoroethylene, Hexafluoropropylene
Material class: Thermoplastic, Copolymers
Polymer Type: PTFE, FEP
CAS Number:

CAS Reg. No.
25067-11-2

Molecular Formula: $[(C_2F_4).(C_3F_6)]_n$
Fragments: C_2F_4 C_3F_6
Molecular Weight: M_n 52000–260000; 248000–629000
General Information: This copolymer has a lower melt temp. than PTFE and is thus easier to process using conventional techniques. The perfluoromethyl side groups reduce crystallinity to approx. 30–45%. The copolymer is random. Lower service temp. than virgin PTFE

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2.14–2.17 g/cm^3	ASTM D792-50 [3]

2	20 $kV.mm^{-1}$	3.2 mm sheet, 23°, ASTM D149 [4]

Arc Resistance:

No.	Value	Note
1	>300s	min. [1]
2	165s	ASTM D495 [9]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0003	100 kHz	ASTM D1531 [4,9]
2	0.0007	1 MHz	ASTM D1531 [4,9]

Optical Properties:

Optical Properties General: Transmits more uv, visible light and ir than ordinary window glass [4]
Refractive Index:

No.	Value	Note
1	1.341–1.347	[4,9]

Volume Properties/Surface Properties: Gloss 70–90% (ASTM D2457) [10]. Haze 2.0% (ASTM D1003) [10]. Light transmittance 94–96% (ASTM E424, 1 mm) [10]

Polymer Stability:

Polymer Stability General: Excellent weatherability, chemical resistance and thermal stability
Thermal Stability General: Mech. props. retained in continuous service at 200° [4]
Upper Use Temperature:

No.	Value	Note
1	-250–206°C	[1]
2	200°C	

Decomposition Details: Very low weight loss at elevated temps.; hourly weight loss 0.0004% (230°), 0.3% (370°) [4]
Flammability: Non-flammable (ASTM D635) [3]; flammability rating VE0 (UL 94) [1]. Limiting Oxygen Index 34% (ASTM D2863) [9]

Environmental Stress: After 15 years' outdoor exposure in Florida tensile strength, light transmission and clarity remained unchanged (25 μm film) [4]
Chemical Stability: Resistant to most chemicals but does react with fluorine, molten alkali metal, and molten sodium hydroxide [3]
Hydrolytic Stability: Unaffected by aq. solns.
Stability Miscellaneous: Processed at approx. 370°; long hold up times can cause degradation [4]. Ten times more resistant to radiation in air than PTFE

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by aq. and non-aq. dispersion polymerisation. Processed by injection moulding, compression moulding and extrusion. Films can be heat sealed and vacuum formed
Applications: Used in bearings, seals, coatings, linings, chemically resistant mouldings, wire insulation and other electrical and electronic applications

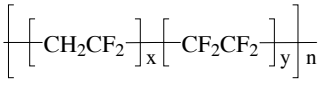
Poly(tetrafluoroethylene-*co*-perfluoropropyl vinyl ether) P-543

Synonyms: *Tetrafluoroethylene-perfluoropropyl vinyl ether copolymers. Poly(1,1,1,2,2,3,3-heptafluoro-3-[(trifluoroethenyl)oxy]propane-co-tetrafluoroethene)*
Related Polymers: Polytetrafluoroethylene
Monomers: Tetrafluoroethylene, Perfluoro(propyl vinyl ether)
Material class: Thermoplastic, Copolymers
Polymer Type: PTFE, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.
26655-00-5



Molecular Formula: $[(C_2F_4).(C_5F_{10}O)]_n$
Fragments: C_2F_4 $C_5F_{10}O$
Additives: Stable inorganic pigments at 0.1–1.0%
General Information: Polymer contains approx. 65–75% crystallinity

Applications/Commercial Products:

Processing & Manufacturing Routes: For aq. polymerisation, water soluble initiators and a perfluorinated emulsifying agent are used. For non-aq. copolymerisation, fluorinated acyl peroxides that are soluble in the medium are used as initiators. Processed by injection moulding, transfer moulding, dispersion processing, powder coating
Applications: Electrical insulation, mechanical parts, coatings and linings, speciality tubing, injection moulded articles

Teflon PFA	DuPont

Poly(tetrafluoroethylene-*co*-vinylidene fluoride) P-544

Synonyms: *Poly(vinylidene fluoride-co-perfluoroethylene). Poly(vinylidene fluoride-co-tetrafluoroethylene). Tetrafluoroethylene-vinylidene fluoride copolymer. PTFE-PVdF copolymer. Poly(1,1-difluoroethene-co-tetrafluoroethene). PVDF-co-PTFE*
Related Polymers: Polyvinylidene fluoride, Polytetrafluoroethylene
Monomers: Tetrafluoroethylene, Vinylidene fluoride
Material class: Thermoplastic, Copolymers
Polymer Type: PVDF, PTFE
CAS Number:

CAS Reg. No.
25684-76-8

Molecular Formula: $[(C_2H_2F_2)_x(C_2F_2)]_n$
Fragments: C_2F_2 CH_2F_4
Additives: Fillers (alkaline earth metals oxides)
General Information: Copolymers can be produced across the entire composition range (very close reactivity ratios) [17] Addition of further comonomer, e.g. hexafluoropropylene (10 wt%), gives terpolymers with increased solubility in organic solvents, plus reduction in degree of crystallinity and T_m; chlorotrifluoroethylene also used as additional comonomer. Such formulations are used in paint preparations which dry at room temp. [17]. Is of interest owing to its dielectric, piezoelectric and pyroelectric props.
Morphology: Copolymers exhibit high degree of crystallinity, which increases with increasing TFE content over wide composition range [8,12]. X-ray studies show struct. is very similar to that of PVDF, form I [1]. Semicrystalline films can be made from copolymer containing 27 wt% TFE. The degree of crystallinity may be 35–50%, depending on rate of cooling from melt. Crystallites are surrounded by amorph. regions; addition of TFE to VDF induces crystallisation into an all-*trans* conformn. of PVDF (β-phase) hexagonal struct. to within 0.1% [3]. Vinylidene fluoride blocks in the copolymer have same struct. as polyvinylidene fluoride [11]. Copolymer (containing 27 wt% TFE) crystallises directly from the melt into cryst. phase analogous to the β-phase of PVDF [13] Degree of crystallinity 20–40 mol% (39–34 mol% TFE) [14]. The presence of tetrafluoroethylene units favours crystalline transformation of disordered γ-form into ordered phase; head-to-head struct. favours γ-phase formation and transformation of disordered γ-form into ordered phase [30]. The effects of mechanical and electrical stresses on struct. have been reported [7]. Addition of tetrafluoroethylene comonomer does not introduce new chemical species (as with other fluorinated

comonomers e.g. trifluoroethylene), but merely increases head-to-head defect content [24].The relationship between composition and solid-state transformations have been reported [25,26]. Isothermal crystallisation from the melt first produces paraelectric crystal phase. This then undergoes a crystal-crystal transition into a ferroelectric phase [26]. Crystallisation and transition kinetics are extremely temp. dependent [26]. The morphology during stretching has been reported [40]
Identification: Elemental anal. of such insol., partially hydrogenated, partially fluorinated polymers is difficult [9]
Miscellaneous: Reviews of physical props, mech. props., compounding, processing and uses have been reported [16,17]. At a TFE content of less than 30%, copolymer shows β-PVDF type packing. At a TFE content above 30%, copolymer displays X-ray patterns analogous to those of PTFE. Extensive isodimorphism appears to occur between monomeric units in general [12]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.865–1.896 g/cm^3	17.8–30.7 mol% TFE [4]
2	d 1.88 g/cm^3	average value, commercial material; 20 wt% TFE, ISOR 1183D [17]
3	d 1.79–1.95 g/cm^3	4–39 mol% TFE [14]
4	d 1.849–1.865 g/cm^3	slow and fast cooling after heat-pressing, 17.8 mol% tetrafluoroethylene [4]
5	d 1.89–1.94 g/cm^3	slow and fast cooling after heat-pressing, 25.1 mol% tetrafluoroethylene [4]
6	d 1.896 g/cm^3	no difference between cooling methods, 30.7 mol% tetrafluoroethylene [4]

Latent Heat Crystallization: ΔH_f 13–21 J g^{-1} (average value, commercial material, 20 wt% TFE) [17]
Melting Temperature:

No.	Value	Note
1	126°C	27 wt% TFE [13]
2	132–155°C	16–4 mol% TFE [8]
3	243–272°C	55 mol% TFE [7]
4	122–126°C	average values, commercial material, 20 wt% TFE, ISO 12086 [17]
5	120°C	approx., 20 mol% TFE [17]
6	136.4°C	commercially available copolymer, 19 wt% tetrafluoroethylene; slow cooled from melt [24]
7	124–325°C	dependent on vinylidene fluoride content
8	410–420°C	[36]

Glass-Transition Temperature:

No.	Value	Note
1	-50°C	amorph. regions, 27 wt% TFE [3]
2	-50–-44°C	16–4 mol% TFE [8]

Transition Temperature General: Copolymer containing 19% TFE displays conformational change at 110–115° ascribed to Curie transition [4,15]. For copolymers containing 17–30 mol% TFE, small endotherms occurring below T_m can be correlated with Curie transitions [4]. T_m increases with increasing TFE content [17]. T_m increases with decreasing vinylidene fluoride content [37]. Compositions with a vinylidene fluoride content greater than 82% show no phase transitions between room temp. and the melting point. Curie transitions are observed at vinylidene fluoride content of 70–82% decreasing in temp. with decreasing vinylidene fluoride content. When the vinylidene fluoride content is less than 70% more gradual transitions are observed [36,38]. Mechanical relaxations have been reported [39]. The effects of poling on the Curie temp. have been reported [36,38]
Deflection Temperature:

No.	Value	Note
1	39–43°C	average values, commercial material, 20 wt% TFE, ISO 75 [17]

Transition Temperature:

No.	Value	Note	Type
1	72–176°C	30.7–17.8 wt% TFE [3,4]	Curie temp.
2	120.4°C	commercially available copolymer, 19 wt% tetrafluoroethylene, slow cooled from melt [24]	Curie temp.

Surface Properties & Solubility:

Solubility Properties General: Solubility in several solvents is better than that of PVDF [17]
Solvents/Non-solvents: Commercial material (20 wt% TFE) sol. Me_2CO, 2-butanone, EtOAc, dimethyl acetamide, DMF, isophorone; spar. sol. isobutylmethylketone, cyclohexanone, THF, dioxane; insol. hydrocarbons, alcohols [17]

Transport Properties:

Transport Properties General: The relationship between melt index and molecular characteristics such as MW and MW distribution has been reported. There is an inverse correlation between high-MW MW distribution component and melt index [5]
Melt Flow Index:

No.	Value	Note
1	2.3 g/10 min	6 mol% tetrafluoroethylene [40]

Polymer Melts: Melt flow index increases with comonomer content (TFE) and temp. [21]
Permeability of Gases: Permeability of copolymer films to ammonia increases with time and thermal treatment [28]. Permeability to N_2, O_2, CO_2 and He decreases after exposure to fluoride and fluorine/hydrogen fluoride mixtures [34]
Permeability and Diffusion General: Diffusion of hydrogen chloride and effect on service life have been reported [33]

Mechanical Properties:

Mechanical Properties General: Tensile strength increases with decreasing temp. down to -253°, and then decreases down to temp. of -268.8°. Breaking elongation decreases with decreasing temp. Addition of fillers gives increased tensile strength at room temp., but lower values at low temps. [10] Tensile strength and elongation increase with increasing high MW component (in MW distribution curve) [5]. Copolymer fibres may be strengthened by stretching six or seven times at 90–135° [27]. Mechanical props are significantly affected by exposure to fluorine and fluorine/hydrogen fluoride mixtures

Tensile (Young's) Modulus:

No.	Value	Note
1	2360 MPa	20°, isotropic [40]
2	4350 MPa	20°, cold-stretched [40]
3	3600 MPa	20°, isometric annealing [40]
4	2700 MPa	20°, free annealing [40]

5	38300 MPa	-160°, cold stretched [40]
6	40000 MPa	-160°, isometric annealing [40]
7	26200 MPa	-160°, free annealing [40]

Flexural Modulus:

No.	Value	Note
1	600–700 MPa	23°, commercial material, 20 wt% TFE, ISO 178 [17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	32–45 MPa	23°, commercial material, 20 wt% TFE, ISO R527-2/ISO 12086 [17]	500–800%

Tensile Strength Yield:

No.	Value	Note
1	15–19 MPa	23°, commercial material, 20 wt% TFE, ISO R 527-2/ISO 12086 [17]

Viscoelastic Behaviour: Longitudinal speed of sound 1300 m s^{-1} (200 kHz, 20°, isotropic), 1550 m s^{-1} (200 kHz, 20°, cold-stretched), 1410 m s^{-1} (200 kHz, 20°, isometric annealing), 1220 m s^{-1} (200 kHz, 20°, free annealing), 2430 m s^{-1} (200 kHz, -160°, isotropic), 4600 m s^{-1} (200 kHz, -160°, cold-stretched), 4700 m s^{-1} (200 kHz, -160°, isometric annealing), 3800 m s^{-1} (200 kHz, -160°, free annealing) [40]
Mechanical Properties Miscellaneous: Copolymers containing 17–30 mol% TFE show relaxations that can be correlated with Curie transitions [4]
Izod Notch:

No.	Value	Notch	Note
1	1100 J/m	Y	23°, commercial material, 20 wt% TFE, ISO 180 [17]

Electrical Properties:

Electrical Properties General: Dielectric loss angle (tan δ_{max}) decreases with increasing tetrafluoroethylene content and decreasing degree of branching [31]. Dielectric constant as a function of temp. for copolymer containing 27 wt% TFE has been reported [13]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	7.2	1 Hz	23°, commercial material, 20 wt% TFE [17]
2	1.09		quenched, degree of crystallinity 43%, 80% vinylidene fluoride) [41]
3	0.95		crystallised at 120°, degree of crystallinity 60%,80% vinylidene fluoride [41]
4	0.76		crystallised at 250°, degree of crystallinity 80%,80% vinylidene fluoride [41]

Complex Permittivity and Electroactive Polymers: The dielectric props., charge distribution and change transport props. of thin films in combination with Si in FET structs. have been reported [3]. Ferroelectric props. of copolymer (27 wt% TFE) have been reported. Ferroelectricity results from each CH_2CF_2 unit and copolymer crystallising into polar (β) crystal phase. Exhibits reversible remnant polarisation [13]. Undergoes a ferroelectric transition to a paraelectric state [15,20], which is induced by electron irradiation [15]. Brillouin scattering experiments have also been reported [19]. Copolymers (4–39 mol% TFE) have piezoelectric d-constants that are dependent on degree of crystallinity and film compliance [14]. A basic relationship exists between charging behaviour and bulk/surface polymer struct. [32]. Ferroelectric/paraelectric transitions have been reported [26]
Magnetic Properties: Ferroelectric, piezoelectric and pyroelectric props., and with pyroelectric and piezoelectric constants for drawn and undrawn copolymer have been measured [41,42]. Piezoelectric stress constants 3.7 kC m^{-2} (quenched; degree of crystallinity 43%, 80% vinylidene fluoride, 4.6 kC m^{-2} (crystallised at 120°, degree of crystallinity 60%,80% vinylidene fluoride), 10.2 kC m^{-2} (crystallised at 250°, degree of crystallinity 80%, 80% vinylidene fluoride) [41]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.013	1 Hz	23°, commercial material, 20 wt% TFE [17]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.59	25 wt% TFE [1]
2	1.4	commercial material, 20 wt% TFE [17]

Transmission and Spectra: Wide-line F-19 nmr, [9,12] far-ir (15–400 cm^{-1}) [1,7,40], esr, [6] Raman [24] and secondary emission mass [11] spectral data have been reported
Total Internal Reflection: Stretched samples show high dichroism [7]. H-1 nmr, C-13 nmr and F-19 nmr spectral data have been reported [35]

Polymer Stability:

Polymer Stability General: Addition of fillers (e.g. alkaline earth oxides), reportedly gives up to 25-fold improvement in both service life and chemical stability [33]
Decomposition Details: The products of thermal decomposition have been evaluated [22]
Flammability: Fire resistance is inferior to that of the chlorine-substituted analogue. Oxygen index 60.5–69.0% (approx.) for copolymer containing 26 wt% TFE (various MWs) [2]. Fl. pt., ignition temp. and self-ignition temp. are dependent on comonomer ratio [23]. Limiting oxygen index 44% (average value; commercial material; 20 wt% TFE ISO 4589) [17]. Flammability rating V0 (average value, commercial material (0.8mm thick), 20 wt% TFE, UL94) [17]
Chemical Stability: Reacts with ammonia; two types of bonds are formed: thermally unstable ammonium salt bonds and thermally stable bonds ($CF\text{-}NH_2$, CF-NH-CF, C=NH) [28]. Is resistant to AcOH [29]
Stability Miscellaneous: Stability to γ-irradiation has been reported [43]

Applications/Commercial Products:

Processing & Manufacturing Routes: Typical synth. involves aq. emulsion copolymerisation of mixture of comonomers, e.g. using ammonium persulfate as free-radical initiator at 80° and 8 atm [12], or at 90° and 8–11 atm [8]. Suspension and soln. polymerisation are also used [17]. Melt processed by standard extrusion and moulding techniques at 190–260° [17]. Film, sheet, tube, pipe, cable jackets and other standard or special shapes produced by extrusion or moulding [17]
Applications: Industrial applications in general limited to two compositions, i.e. 5% and 20 wt% TFE, the latter being the most important. Applications due to solubility and relatively low T_m in paint industry (coatings). May often be formulated with acrylic

resins. Also used as components of high-performance greases, cellular and porous plastics and membranes. Applications due to piezoelectric and pyroelectric props. in microphones (and other acoustic transducers), temperature sensors. Has potential uses (doped with Si) in field-effect transistors. Other applications include use in pipelines, pumps and valves (for use in harsh environments, e.g. wood chemistry industry), membranes for separation of gas mixtures, and in electrophotography

Trade name	Details	Supplier
Ftorlon	42, 42A, 2M, non-exclusive; used for other VDF-based polymers; former USSR	
Kynar	various grades; non-exclusive; used for other VDF-based polymers	Pennwalt Chemical Corporation
Kynar	7200/SL (200 wt% TFE); 7201 (30 wt% TFE, semi-crystalline)	Atochem Polymers
Neoflon	non-exclusive, used for other VDF-based polymers	Daikin Kogyo

Poly(tetramethylene adipate) P-545

Synonyms: *PBA. PTA. Poly(butylene adipate). Poly(oxytetramethyleneoxyadipoyl). Poly(oxytetramethylene oxycarbonyl tetramethylene carbonyl). Poly(butylene glycol adipate). Poly[oxy-1,4-butanediyloxy(1,6-dioxo-1,6-hexanediyl)]. PTMA. Polybutilate. Poly(1,4-butylene adipate)*
Monomers: Hexanedioic acid, 1,4-Butanediol
Material class: Thermoplastic
Polymer Type: saturated polyester
CAS Number:

CAS Reg. No.	Note
25103-87-1	Poly(tetramethylene adipate)
24936-97-8	

Molecular Formula: $[(C_{10}H_8O_4).(C_{10}H_{16}O_4)_n$
Fragments: $C_{10}H_8O_4$ $C_{10}H_{16}O_4$
Morphology: Two polymorphic forms [1,9], α-form monoclinic a 0.670, b 0.800, c 1,420, β 45.5° [1], β-form orthorhombic a 0.505, b 0.736, c 1.44 [1], α-form monoclinic a 0.673, b 0.794, c 1.420, β 45.5° [2], β-form orthorhombic a 0.5062, b 0.7352, c 1.467 [2]. α-form monoclinic a 0.677, b 0.811, c 1.466, β 43° 47' [3], a 0.561, b 0.727, c 1.465, β 115.5° [3], a 1.005, b 0.811, c 1.466, β 90.0° [3]. The struct. has been studied [5]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Thermodynamic props have been reported [24,26]
Latent Heat Crystallization: ΔH_f 50.5 J g^{-1} [5]. ΔH_f 75.4–80.4 J g^{-1} [9]. ΔH_f 95.3 kJ kg^{-1} (high MW). ΔH_f 104.1 kJ kg^{-1} (low MW) [28]. ΔH_m 24.8 kJ mol^{-1} [26]. S_0 24 J mol^{-1} K^{-1} [26]. $\Delta H_{combustion}$ -5564 kJ mol^{-1}, ΔH_f -973 kJ mol^{-1} [26]. C_p values over temp. range -193° to -197° have been reported [11,12,26]

Melting Temperature:

No.	Value	Note
1	60°C	[5]
2	63–65°C	[7]
3	57.2–60.2°C	330.4–333.4 K [9]
4	54°C	327 K [13]
5	58°C	α-form [1]
6	48°C	β-form [1]
7	58°C	[16]
8	55.6°C	328.8 K [26]
9	60°C	[33]

Glass-Transition Temperature:

No.	Value	Note
1	-59°C	[5]
2	-61°C	212 K [13]
3	-74°C	199 K [26]
4	-68°C	[32]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Energy of cohesion has been reported [21]
Internal Pressure Heat Solution and Miscellaneous: Phase diagram with 1,4-dioxane has been reported [16]
Solvents/Non-solvents: Sol. $CHCl_3$. Insol. MeOH [5]
Wettability/Surface Energy and Interfacial Tension: Surface tension values have been reported [7,21]

Transport Properties:

Polymer Solutions Dilute: Soln. props. have been reported [6,14]. θ 77° (cyclohexanol) [31]. [η] 0.288 dl g^{-1} ($CHCl_3$, 30°, MW 6700). [η] 0.488 dl g^{-1} ($CHCl_3$, 30°, MW 14500). [η] 0.322 dl g^{-1} (25°, C_6H_6) [29]. Theta temp. θ 25° (C_6H_6/hexane 83.3:16.7, chlorobenzene/hexane 75.9:24.1, hexane, nitrobenzene 43.3:56.7) [6]. Other viscosity values have been reported [19]
Permeability of Liquids: Diffusion coefficient has been reported [18]. D_o 367.9–550.8 μm^2 s^{-1} (octadecane, 130–145°) [29]
Water Content: Water absorption has been reported [18]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	66 MPa	[28]

Electrical Properties:

Electrical Properties General: Other dielectric constants have been reported [30]
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.19	
2	2.21	[6]

Optical Properties:

Transmission and Spectra: Ir [4,22,28], C-13 nmr [8,27,28], H-1 nmr [20,27,28], Raman [22] and mass spectral data [15,25] have been reported
Molar Refraction: dn/dc 0.1 (50°, AcOH), 0.0784 (35°, THF), 0.084 (35°, diethyl carbonate), 0.091 (70°, diethyl carbonate), 0.0518 (35°, dioxane) [6]

Polymer Stability:

Decomposition Details: Thermal degradation [25] at 500° produces a mixture of esters of the monomer, whereas at 700° adipic acid is a major constituent [17]
Biological Stability: Biodegradation details have been reported [23]. The high MW material degrades more slowly than the low MW material [28]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by condensation polymerisation of dimethyl adipate with 1,4-butanediol using $Ti(OBu)_4$ as catalyst at 150–210° [14,4,5,8]
Applications: Plasticisers. Used in polyurethane industry for manufacturing of pre-polymers, thermoplastic elastomers, coatings and adhesives, dispersing agents, and cast elastomers

Trade name	Supplier
Formrex 44	Witco

Polytetramethylene ether P-546

Synonyms: *Polytetramethylene glycol. PTMEG*
Monomers: Tetrahydrofuran
Material class: Oligomers
Polymer Type: polyalkylene ether, polyol
CAS Number:

CAS Reg. No.
25190-06-1

Molecular Formula: $(C_4H_8O)_n$
Fragments: C_4H_8O
Additives: Antioxidants
Miscellaneous: The standard commercial grades available have MW of 650, 1000 and 2000. Used in the formation of elastomeric materials, these form the "soft segments" of a polymer chain

Applications/Commercial Products:

Processing & Manufacturing Routes: Tetrahydrofuran is polymerised using fluorosulfonic acid catalyst (HSO_3F)
Applications: Used in polyester and polyamide elastomers and polyurethanes. Used in Spandex fibres

Trade name	Supplier
Polymeg	QO Chemicals
Terathane	DuPont

Poly(tetramethylene isophthalate) P-547

Synonyms: *PBI. PBIP. Poly(butylene isophthalate). Poly(oxytetramethyleneoxyisophthaloyl). Poly(oxy-1,4-butanediyloxycarbonyl-1,3-phenylenecarbonyl). PTMI*
Monomers: 1,4-Butanediol, Isophthalic acid
Material class: Thermoplastic
Polymer Type: unsaturated polyester
CAS Number:

CAS Reg. No.	Note
28087-45-8	repeating unit
26615-64-5	from isophthalic acid
59199-72-3	from isophthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$
Morphology: c 2.6 [4]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.268 g/cm^3	amorph. [1]
2	d^{25} 1.309 g/cm^3	cryst. [1]
3	d^{152} 1.14 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4×10^{-5} K^{-1}	0° [13]	L

Volumetric Properties General: ΔC_p 5.4 J mol^{-1} K^{-1} (1.3 cal mol^{-1} °C^{-1}) [6], 0.32 J g^{-1} K^{-1} [19], 85 J mol^{-1} K^{-1} [25]
Latent Heat Crystallization: ΔH_f 42.3 kJ mol^{-1} (10.1 kcal mol^{-1}); ΔS_f 99.2 J mol^{-1} K^{-1} [1]; ΔH_f 27.2 J g^{-1} [4]; ΔH_f 9.84 kJ mol^{-1} (2.351 cal mol^{-1}) [7]; ΔH_f 39.4 J g^{-1} (9.4 cal g^{-1}) [18]; ΔH_f 8.1 kJ mol^{-1} [25], $\Delta H_f°$ 121.7 J g^{-1}; $\Delta S_f°$ 0.278 J g^{-1} K^{-1} [19]. Melt flow activiation energy 63 kJ mol^{-1} (15 kcal mol^{-1}) [24]
Specific Heat Capacity:

No.	Value	Note	Type
1	234 kJ/kg.C	56 cal mol^{-1} °C^{-1}, 34° [6]	P

Melting Temperature:

No.	Value	Note
1	152.5°C	[1]
2	150°C	[4,8]
3	135°C	[6]
4	141°C	[7]
5	137°C	410K [9]
6	128°C	[13]
7	147°C	[18]
8	146°C	[20]
9	145°C	418K [25]

Glass-Transition Temperature:

No.	Value	Note
1	17°C	[3,18]
2	34°C	[6]
3	24°C	[8,19]
4	23–26°C	[40]
5	26°C	[25]

Transition Temperature General: Other transition temps. have been reported [9]
Deflection Temperature:

No.	Value	Note
1	35°C	[13]

Vicat Softening Point:

No.	Value	Note
1	144°C	[13]

Transition Temperature:

No.	Value	Note	Type
1	85°C	[1]	Softening temp.
2	161°C	[19]	Equilbrium melt temp.
3	60°C	[6]	$T_{\beta max}$

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Constant of solvent interaction parameters -3 cal cm^{-3} (α-methylnaphthalene), -3.1 cal cm^{-3} (isophorone), -1 cal cm^{-3} (benzonitrile) [1]. Energy of cohesion has been reported [21]

Solvents/Non-solvents: Sol. CH_2Cl_2 [10]. Insol. MeOH [10]
Wettability/Surface Energy and Interfacial Tension: Critical surface tension 33.7 mJ m^{-2} (33.7 dynes cm^{-1}) [5]. Other critical surface tension values have been reported [21,22]

Transport Properties:

Polymer Solutions Dilute: [η] 0.39 dl g^{-1} (phenol/tetrachloroethane, (60:40)) [1]; $[\eta]_{inh}$ 1.01 dl g^{-1} (phenol/tetrachloroethane, (60:40), 25°) [3]; [η] 0.61 dl g^{-1} (phenol/tetrachloroethane, (60:40), 25°) [7]; $[\eta]_{inh}$ 0.31 dl g^{-1} (phenol/tetrachloroethane, (60:40), 30°) [11]; [η] 1.14 dl g^{-1} (phenol/tetrachloroethane, (60:40), 30°) [13]. Calculated viscosity values have been reported [17].
Polymer Melts: Melt flow viscosity has been reported [24]

Mechanical Properties:

Mechanical Properties General: Dynamic tensile storage and loss moduli (-150–140°) have been reported [20]

Tensile (Young's) Modulus:

No.	Value	Note
1	940 MPa	[15]

Viscoelastic Behaviour: Stress relaxation modulus (-34–35°) has been reported [14]. Stress-strain curves [15], stress relaxation [16] and creep [16] have been reported. Viscoelastic props have been reported [23]
Mechanical Properties Miscellaneous: T-peel strength 7 lb in^{-1} (23°) [3]

Electrical Properties:

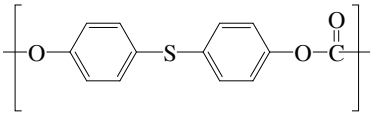
Electrical Properties General: Variation of tan δ with temp. has been reported in graphical form [6,20]

Optical Properties:

Transmission and Spectra: C-13 nmr [10], mass [11] and fluorescence spectral [12] data have been reported

Polymer Stability:

Decomposition Details: Thermal degradation has been studied by ms [11]. Polymer decomposition temp. 410° [11]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification of dimethyl isophthalate or isophthaloyl chloride with 1,4-butanediol at 240° followed by condensation polymerisation at 240° under vacuum [1,2,4,7,9,10,17]

Poly[thio bis(4-phenyl)carbonate] P-548

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylenethio-1,4-phenylene]. Poly(4,4′-dihydroxydiphenylsulfide-co-carbonic dichloride)*
Related Polymers: Copolymers of Thiobisphenol and Bisphenol A, Poly[1,1-cyclohexane bis(4-(2,6-dichlorophenyl)carbonate)]
Monomers: 4,4′-Thiobisphenol, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
28930-32-7
94411-09-3

Molecular Formula: $(C_{13}H_8O_3S)_n$
Fragments: $C_{13}H_8O_3S$

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	220–240°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	156°C	[3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. *m*-cresol, cyclohexanone, pyridine, DMF; swollen by THF; insol. CH_2Cl_2, EtOAc, C_6H_6, Me_2CO [1]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification in view of its poor solubility in many solvents The dihydroxy compound and a slight excess of diphenyl carbonate are mixed together in the melt (150–300°) in the absence of O_2, with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,2]

Poly(thiophene) P-550

Benzoid form Quinoid form

Synonyms: *PT*
Monomers: Thiophene
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
25233-34-5

Molecular Formula: $(C_4H_2S)_n$
Fragments: C_4H_2S
General Information: Polymer struct. has two forms, an aromatic benzenoid and a quinoid form [1,2]
Morphology: Orthorhombic; a 7.80, b 5.55, c 8.03; monoclinic; a 7.83, b 6.55, c 8.20, β 96° [7]
Miscellaneous: Major product on polymerisation is a trimer [3,4,5,6]

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	187°C	approx. [8]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. C_6H_6, CCl_4, $CHCl_3$, CH_2Cl_2, nitrobenzene. Insol. pentane, EtOH, H_2O [9]

Transport Properties:
Polymer Solutions Dilute: [η] 0.028 (C_6H_6, 25°) [9]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	2000–3300 MPa	room temp., neutral film [10]

Tensile Strength Break:

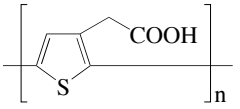
No.	Value	Note
1	30–82 MPa	room temp., neutral film [10]

Mechanical Properties Miscellaneous: Stress-strain curves have been reported [10]

Electrical Properties:
Electrical Properties General: Electrical conductivity increases through doping with various chemicals [14,15,16,17,28]
Complex Permittivity and Electroactive Polymers: Conductivity 2 × 10^{-8} Ω^{-1} cm^{-1} [12,13]

Optical Properties:
Transmission and Spectra: Ir [13,18,19,20], Raman [21,22], uv [13], H-1 nmr [9], C-13 nmr [8] and mass [4] spectral data have been reported

Polymer Stability:
Thermal Stability General: Polymer is thermally stable up to 200°; weight loss occurs at 400° [8]



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by chemical or electrochemical oxidn. polymerisation of thiophene with various catalysts [24,25]; by oxidn. polymerisation of bithiophenes [26] or redox elimination of poly(5,5′-bithiophenediyl-*p*-acetoxybenzylidene, [27]
Applications: Potential applications in photoelectric solar cells, membranes, semiconductors, solid electrolytes, diodes and transistors

Poly(3-thiopheneacetic acid) P-551

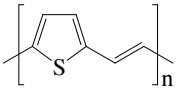
Synonyms: *3-Thiopheneacetic acid homopolymer. PTAA. P3TA*
Monomers: 3-Thiopheneacetic acid
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
114815-74-6

Molecular Formula: $(C_6H_4O_2S)n$
Fragments: $C_6H_4O_2S$
General Information: Conductive polymer with electrochromic and photoluminescent properties. Prod. as red or black film.

Surface Properties & Solubility:
Solubility Properties General: Solubility of polymer increases in some solvents such as THF when protonated [1].
Solvents/Non-solvents: Sol. aqueous alkali, DMSO, DMF, THF; insol. $CHCl_3$ [1,2,3]

Electrical Properties:
Electrical Properties General: Polymer in undoped form has typical conductivity of 1.9×10^{-4} S cm^{-1} [4]. A self-doping mechanism can be excluded because of the weak acidity of the carboxyl group [5]. Photovoltaic properties are exhibited particularly in multilayer films [6] or as sensitiser for titanium dioxide devices [7]. Polymer doped with perchloric acid exhibits electro-rheological props. [8].



Optical Properties:
Optical Properties General: In aqueous NaCl solutions the UV absorption band is very sensitive to pH in the region 5–6, with a sharp increase of λ_{max} from *ca*. 405 to 445nm, corresponding to a change in conformation with more extended conjugation [2,9]. Photoluminescence band recorded with λ_{max} 545nm [10]. Polymer exhibits electrochromism, changing colour from red or yellow in reduced state to blue or black in oxidised form [1,11].
Transmission and Spectra: Pmr [2,8], ir [1,2,4,8] and uv [3,8,10,11,12] spectral data have been reported.

Polymer Stability:
Thermal Stability General: Thermal degradation at 253°C and 542°C corresponds to side chain and backbone breakdown [8].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. chemically by polymerisation of the methyl ester [2,13] or ethyl ester [3] of 3-thiopheneacetic acid with $FeCl_3$ and subsequent hydrolysis of the ester polymer. Direct polymerisation of acid monomer has also been used [1]. Electrochemical synthesis from 3-thiopheneacetic acid in acetonitrile or chlorobenzene with tetrabutylammonium perchlorate or lithium perchlorate as supporting electrolyte is an alternative method [4,5,11,12].

Poly(thiophene vinylene) P-552

Synonyms: *PTV. Poly(2,5-thiophenediyl-1,2-ethenediyl)*
Related Polymers: Poly(thiophene), Poly(phenylene vinylene)
Monomers: 5-Methyl-2-thiophenecarboxaldehyde
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.	Note
26498-02-2	
144240-81-3	(*E*)-form

Molecular Formula: $(C_6H_4S)_n$
Fragments: C_6H_4S

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	1100 MPa	[1]

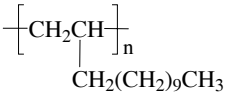
Tensile Strength Break:

No.	Value	Note
1	500 MPa	[1]

Electrical Properties:
Electrical Properties General: Chemical doping increases conductivity [2,3,4,5,6,7]. Band gaps are lowered compared to poly(thiophene) [8]
Complex Permittivity and Electroactive Polymers: Conductivity for doped materials has been reported, 60 Ω^{-1} cm^{-1} [4]

Optical Properties:
Refractive Index:

No.	Value	Note
1	2.42–3.56	700–2500 nm [9]



Transmission and Spectra: Ir [10,11,12,13,14], Raman [12,13,14,15], Mössbauer [16], epr [2], uv [10,18] and mass [17] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by elimination of a precursor polymer derived from a bissulfonium salt [1,2,7,19]; or by polycondensation of 5-methyl-2-thiophenecarboxaldehyde when reacted with strong base [10]
Applications: Development of applications as electrical conductors and in transistors

Poly(1-tridecene) P-553

Synonyms: *Poly(1-undecylethylene). Poly(1-undecyl-1,2-ethanediyl)*
Monomers: 1-Tridecene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
29758-00-7	atactic
59284-10-5	Isotactic

Molecular Formula: $(C_{13}H_{26})_n$
Fragments: $C_{13}H_{26}$
Morphology: Three forms: form I monoclinic, a 0.59, b 5.88, c 1.34, β 96° [5]

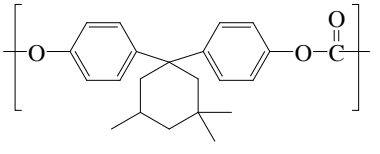
Volumetric & Calorimetric Properties:
Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00073 K^{-1}	[3]	V

Latent Heat Crystallization: ΔH_m 48 J g^{-1} (form I); 15 J g^{-1} (form III) [5]
Melting Temperature:

No.	Value	Note
1	48°C	321 K [4]
2	50°C	323 K, Form I [5]
3	37°C	310 K, Form II [5]
4	-9°C	264 K, Form III [5]

Transport Properties:
Polymer Solutions Dilute: Theta temp. has been reported [1]
Polymer Melts: Flow activation energy 33.5 kJ mol^{-1} (8 kcal mol^{-1}) [2,3,7]. Zero shear viscosity η_0 820000 [6]



Optical Properties:
Transmission and Spectra: Ir and Raman spectral data have been reported [4]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts, such as $TiCl_3$-$AlEt_2Cl$ [4,5]

Poly[1,1-(3,3,5-trimethylcyclohexane) bis(4-phenyl)carbonate] P-554

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylene(3,3,5-trimethylcyclohexylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-1,1-(3,3,5-trimethylcyclohexane)-co-carbonic dichloride). Bisphenol TMC polycarbonate*
Related Polymers: Copolymers of Bisphenol TMC and Bisphenol A
Monomers: Bisphenol TMC, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)

CAS Number:

CAS Reg. No.
129510-27-6

Molecular Formula: $(C_{22}H_{24}O_3)_n$
Fragments: $C_{22}H_{24}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.107 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	239°C	[2,3]
2	233°C	[1]

Transition Temperature:

No.	Value	Note	Type
1	-108°C	[4]	Gamma relaxation temp.

Transport Properties:

Permeability of Gases: The polycarbonate from trimethylcyclohexanone shows high gas permeabilities and diffusivities, but relatively low selectivities [1]. The permeability of CO_2 is found to decrease with increasing pressure
Gas Permeability:

No.	Gas	Value	Note
1	CO_2	2456 cm^3 mm/(m^2 day atm)	2.8 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [1]
2	CH_4	147 cm^3 mm/(m^2 day atm)	1.68 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [1]
3	O_2	497 cm^3 mm/(m^2 day atm)	5.69 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [1]
4	N_2	113 cm^3 mm/(m^2 day atm)	1.29 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [1]
5	He	2723 cm^3 mm/(m^2 day atm)	3.111 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [1]

Mechanical Properties:

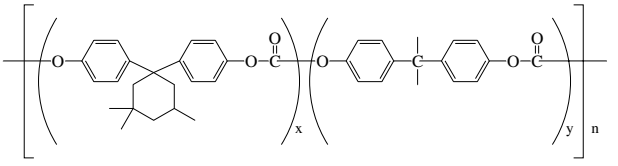
Impact Strength: Possesses good impact strength. Impact strength test results mainly no break or 150 kJ m^{-2} (ISO 180) [3]

Optical Properties:

Volume Properties/Surface Properties: Transparent [1,3]

Polymer Stability:

Thermal Stability General: Short term exposure to air at 400° results in minimal discolouration [4]
Environmental Stress: Shows excellent uv stability [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by interfacial polycondensation. Phosgene is introduced into a soln. of the monomer in aq. NaOH at 20–25°, in an inert solvent (CH_2Cl_2/chlorobenzene). *N*-Ethylpiperidine as a catalyst results in high MWs [3]

Poly(tripropargylamine) P-556

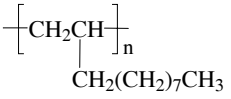
Synonyms: *Poly(TPA)*
Monomers: Tripropargylamine
Polymer Type: polyacetylene

CAS Number:

CAS Reg. No.
177743-09-8

Molecular Formula: $(C_9H_9N)_n$
Fragments: C_9H_9N
Morphology: Black or occasionally brown. Calculated identity period 11.97Å. Quasi-helical trans-gauche three-step struct. (TG_3) [1]

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. almost all organic solvents [1]



Electrical Properties:
Electrical Properties General: Highly conjugated polymer struct. may confer electrical conduction props.

Optical Properties:
Transmission and Spectra: C-13 nmr and ir spectral data have been reported [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerised by the use of transition-metal chlorides, namely $PdCl_2$, $PtCl_2$ and $RuCl_3$ [1]
Applications: Has potential use due to electrically conducting props.

Polyurethane, Adhesive applications P-558

Related Polymers: Polyurethane General information
Polymer Type: polyurethane
General Information: Two component polyurethane adhesive which has good resistance to water, oil and fuel. The struct. is unknown

Volumetric & Calorimetric Properties:
Thermal Conductivity:

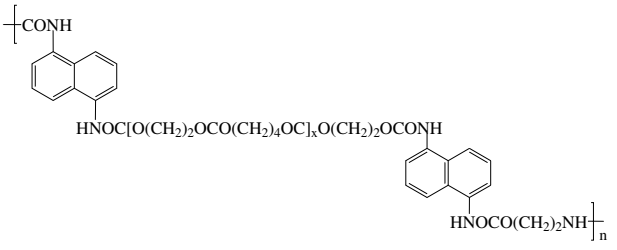
No.	Value	Note
1	0.122 W/mK	0.122 J (m s °C)$^{-1}$ [1]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note	Elongation
1	1.03 MPa	[1]	265%

Viscoelastic Behaviour: Compression set 14% (ASTM D395-55)
Hardness: Shore D95

Electrical Properties:
Dielectric Strength:



No.	Value	Note
1	9 kV.mm^{-1}	kV mm^{-1} [1]
2	8.5 kV.mm^{-1}	kV mm^{-1}, 48h, in H_2O [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: The two compounds are mixed and applied with a spatula or trowel. Working time 25–45 mins.; cure time 24h at 25°
Applications: Used as a contact adhesive for repairing rubber rolls, rubber hoses and belting. Also used to bond metals (e.g. iron, steel, aluminium), and wood, glass and canvas

Polyurethane, Diisocyanate deficient P-559

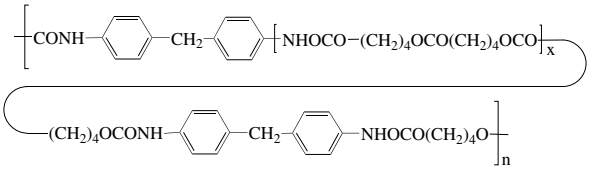
Related Polymers: Polyurethanes General Information
Monomers: Hexanedioic acid, Ethanediol, 1,5-Naphthalene diisocyanate, Ethanolamine
Material class: Synthetic Elastomers, Gums and resins
Polymer Type: polyurethane
General Information: A diisocyanate deficient gum that is stable over relatively long time periods. Full cure is affected by adding further diisocyanate, often during processing. One of the first urethane elastomers to make a commercial entry in Europe and U.S.

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	6 MPa	880 psi, 300% elongation [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	24.8 MPa	3600 psi [1]	730%



Hardness: Shore A65 [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Final curing of the prepolymer is achieved by mixing a small amount of diisocyanate on a mill roll and completing the cure in the mould by oven heating
Applications: Uses are restricted by relatively high cost and are thus used only when high performance is the main consideration; in oil seals, shoe soles, forklift truck tyres, diaphragms, chute linings, fabric coatings resistant to dry cleaning, bicycle tyres, traction drive wheels, tail wheels of carrier based aircraft

Polyurethane elastomer P-560

Related Polymers: Polyurethanes General Information
Monomers: 1,6-Hexanedioic acid, 1,4-Butanediol, 4,4′-Diphenylmethane diisocyanate
Material class: Thermoplastic, Synthetic Elastomers
Polymer Type: polyurethane
Molecular Weight: M_n 36000
Additives: Fillers, pigments, lubricants and certain plasticisers
General Information: Shows good extensibility and high elasticity. Considered to be 'virtually cross-linked'; does not require vulcanising agents

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d_4^{23} 1.21 g/cm^3	ASTM D1505-57T [2]

Vicat Softening Point:

No.	Value	Note
1	67°C	ASTM D1525-58T [2]

Brittleness Temperature:

No.	Value	Note
1	-65°C	ASTM D746-57T [2]

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	1 g/10 min	ASTM D1238-52T, 0.3 MPa [2]

Mechanical Properties:
Tensile Strength Break:

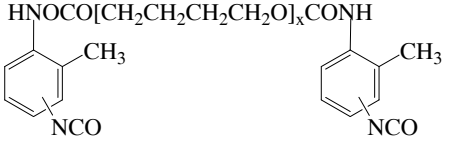
No.	Value	Note	Elongation
1	39.9 MPa	4560 psi, ASTM D638-58T [2]	415%

Hardness: Shore A85 (durometer, ASTM D676-55T) [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Processed by extrusion, injection moulding [3] and calendering. Can also be soln. cast.

Mould Shrinkage (%):

No.	Value	Note
1	0.9%	[3]



Applications: Are relatively expensive so are used where their excellent toughness and abrasion resistance, resistance to lubricating and fuel oils, and wide range of operating temps. are required. Used in automotive brushes and bearings. As injection moulded gears, bearings and diaphragms for hydraulic systems. In moulded shoe soles, wear resistant moulded heel pieces for ladies' shoes, and in ski boots. Previously used as a biomedical material but abandoned due to degradation *in vivo*

Trade name	Details	Supplier
Estane	5740X1(general purpose); 5740X2 (low modulus for soln. applications); 5740X7 (high modulus)	B.F. Goodrich

Polyurethane, Liquid prepolymer P-561

Related Polymers: Polyurethanes General Information
Monomers: 2,4-Diisocyanatotoluene, 3,4-Diisocyanatotoluene, 1,4-Butanediol, 2,6-Diisocyanatotoluene
Material class: Fluids
Polymer Type: polyurethane
Molecular Weight: MW 2000
Additives: Carbon black, fillers and plasticisers
General Information: A liq. prepolymer cured by reaction with polyols, diamines, or water. Cross-linked by catalysts such as potassium acetate. Physical props. are dependent upon type and conc. of curing agent, mixing and curing temp. and time

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.05 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7.1×10^{-5} K^{-1}	[2]	L

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3.7 MPa	540 psi, 10% elongation, cured, ASTM D638-52T [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	18.9 MPa	2750 psi, cured, ASTM D412-51T [1]	565%

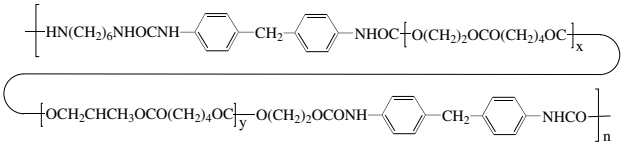
Hardness: Shore A77 (cured) [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	11.8 kV.mm^{-1}	300 V mil^{-1}, 125 mil thick ASTM D149 [2]

Applications/Commercial Products:



Processing & Manufacturing Routes: Processed by a liq. casting technique. Chain extension and cross-linking are controlled by the type and conc. of curing agent as well as the temp. and time of cure. Curing agents may be polyols, diamines or water. Metal salt catalysts can also be used to promote cross-linking
Applications: Used in shoe heels and soles. Friction drives and belts; in washing machines, tape recorders, record players, oil seals, rings and diagphragms. Also used in encapsulation of electrical components

Polyurethane, Peroxide cured P-562

Related Polymers: Polyurethanes General information
Monomers: 1,6-Hexanediamine, 1,6-Hexanedioic acid, 4,4′-Diphenylmethane diisocyanate, 1,2-Propanediol, Ethanediol
Material class: Synthetic Elastomers
Polymer Type: polyurethane
Additives: Carbon black
General Information: Is designed to be cured by peroxides

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	20 MPa	2900 psi, 300% elongation, cured, carbon black filled [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	28.9 MPa	4200 psi, cured, carbon black filled [1]	400%

Hardness: Shore A65 (cured, carbon black filled) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: The polymer gum is compounded with either dicumyl peroxide or 2,5-dimethyl-2,5-di-*tert*-butylperoxyhexane to yield a stable compound. Curing is effected by heating (3 min., 177°)
Applications: Used in oil seals, tyres, drive wheels, fabric coatings and diaphragms

Trade name	Supplier
Vibrathane	US Rubber Co.

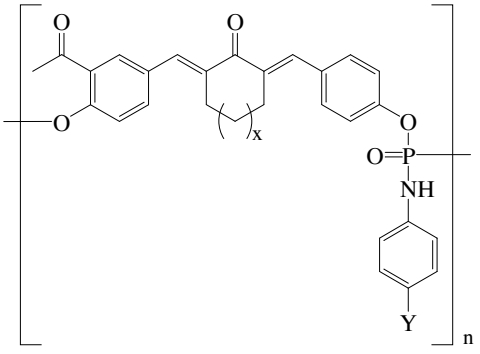
Polyurethanes General Information P-563

Related Polymers: Polyurethane, elastomers, Spandex fibres, Urethane coating, Polyurethane, diisocyanate deficient, Polyurethane, liquid prepolymer, Urethane rubber, multrathane based, Polyurethane, adhesive, Polyurethane, peroxide cured
General Information: Polyurethanes are a family of heterogeneous polymers which are the product of the reaction of isocyanates (NCO) with a hydroxy compound RNCO + HOR′ → RNHCOOR′. They contain the urethane linkage RHNC(O)OR′ and may be considered as esters of carbamic acid, or ester amides of carbonic acid. When a diisocyanate and a diol react together, a linear polyurethane is obtained, whilst a diisocyanate and a polyol lead to a cross-linked polymer. The urethane group does not usually constitute the majority of the functional groups within a polyurethane, and it is the ability to incorporate other functional groups into the polymer network that contributes to the range of props. shown by polyurethane materials. Polyurethanes range from rigid thermosetting materials to soft elastomers. Interest in polyurethanes stems from Otto Bayer's work on the commercial production of urethane polymers in 1937 [1]. This was followed in 1938 by the first US patent application by Rinke [2]. The patent application for Lycra(R) was filed in 1954 [3]
Morphology: Composed of short alternating blocks of soft and hard segments. The soft segment is typically a low T_g polyether, polyester or polyalkanediol, and the hard segment is usually a high T_g aromatic diisocyanate, linked with a low MW chain extender. Polyurethanes are generally synth. with chain extenders consisting of low MW diols or diamines which produce additional urethane or urethane-urea segments respectively. A degree of immiscibility between the hard urethane segments and the soft polyol segments means that on a microscopic level polyurethanes are not structurally homogeneous. The structure may be considered as hard segment domains dispersed in a soft segment matrix
Identification: Polyols: The earliest polyurethanes were based on aliphatic diols (glycols) with 1,4-butanediol being most frequently used. However, now most polyurethane production involves polymeric hydroxy compounds, mainly polyesters and polyethers. Approx. 90% of commercial polyurethanes are based on polyethers, while polyesters are used in the remainder. Diisocyanates: Isocyanates are commonly prepared by the reaction of phosgene and primary amines: $RNH_2 + COCl_2 \rightarrow RNCO + 2HCl$ The most commonly used diisocyanates are tolylene diisocyanate (TDI) (as a mixture of isomers), diphenylmethane diisocyanate(MDI), naphthylene 1,5-diisocyanate (NDI), hexamethylene diisocyanate (HDI) and isophorone diisocyanate (IPDI)



Applications/Commercial Products:

Processing & Manufacturing Routes: Polyurethanes are often prepared in two stages with the production of a prepolymer followed by a chain extension reaction. This type of process is normally used in the production of elastomeric-type polymers. During the first step the diisocyanate is reacted with a short chain polyether or polyester (e.g. poly(ethylene adipate), poly(η-caprolactone)) with MW 1000–3000. This product is then chain-extended by subsequent reaction with a short chain diol (e.g. 1,4-butanediol, ethylene glycol) or a diamine. Using a diamine gives a urea linkage and a poly(urethane-*co*-urea) struct. which can also react with other isocyanate groups, leading to the formation of Biuret links. Cross-linked systems can also be obtained by using multifunctional monomers. For the production of rigid and flexible foams the chain extender molecule can be omitted, and polyols with more than 3 hydroxy groups are used. The reaction is base catalysed by tertiary amines or organotin compounds and the reaction mixture must also include a blowing agent. This is often achieved by adding controlled quantities of H_2O to the system. The H_2O reacts with an isocyanate group to form an unstable carbamic acid which then decomposes to produce the corresponding amine and CO_2 gas. The released gas forms bubbles which then expand through the polymer matrix to form a foam struct. Volatile liqs. such as fluorocarbons can be used as alternative blowing agents. In the past CFC-11 (1,1,1,2,2-pentachloro-2-fluoroethane) was extensively used in the production of thermal insulation foams, but the worldwide ban on ozone-depleting CFCs has led to the search for alternative blowing agents (e.g. HCFC-141b, 1,1-dichlorofluoroethane, bp 32°, pentane, bp 36°) as well as modifying to urethane-foaming processes. For flexible foams, high MW polyoxypropylene triols are used with toluene diisocyanate. To produce rigid foams polymeric methylene diphenylisocyanates are used in conjunction with low MW high-functionality polyols
Applications: Elastomers: Solid polyurethane elastomers may be divided into 3 categories- cast, millable and thermoplastic. (a) Cast elastomers are produced by pouring a liq. reaction mixture comprising low MW material into a heated mould wherein the material is converted to a solid high MW elastomer. A wide range of physical props. can be obtained by appropriate formulation but in general cast elastomers are characterised by high tensile strength, abrasion resistance and tear strength. These props. have lead to such uses as solid tyres, bearings and rollers. (b) Millable elastomers are rubber-like gums which may undergo mill pounding and vulcanisation. Their props are similar to those of cast elastomers, but with a narrower use range. (c) Thermoplastic elastomers have functional props. of conventional vulcanised rubbers but may be processed as normal thermoplastics. Their props. are relatively similar to those of cast polyurethanes but the absence of cross-linking results in higher compression set and a more pronounced loss of strength with increasing temp. A major use is in the production of ski boots. They may also be produced in fibre form to give elastic fibres (spandex fibres). These fibres are extensively used in the clothing industry in sportswear, swimwear, underwear and foundation garments. Foams: these can be classified as rigid and flexible foams. Rigid foams are closed cell structures which are highly cross-linked polymers with good resistance to organic solvents and inorganic substances. The major interest in rigid foams is for thermal insulation. They are also widely used in the fabrication of composite structures for aircraft components such as doors, bulkheads, and wing tips, and dinghy hulls, packaging and shock absorption. Flexible foams are open cell structures and highly resistant to detergents and solvents. and inert to oxidation. They find use in the clothing industry (shoulder pads, interlinings), upholstery (cushions, pillows, seating) and packaging. Coatings: several polyurethanes are used in coating applications, and can be divided into 2 broad categories: one-component systems, which cure by reaction with atmospheric O_2, moisture or heat, and two-component systems which cure through interaction of two materials on mixing. They find use as wood varnishes, quick-drying enamels, lacquers, electrical wire coatings and floor paints. Adhesives: Three general categories of polyurethane adhesives may be distinguished (a) Isocyanate-polyol adhesives are two-component systems similar to those used for surface coatings and may be used for bonding wood, plastics and metals. They are low in viscosity and tack. (b) Soluble elastomers may be used as adhesives provided the MW is low enough to permit solubility in organic solvents. Such adhesives give flexible bonds and are used in the footwear industry (c) Polyisocyanates, especially triphenylmethane 4,4′,4′′-triisocyanate, are used for bonding of rubber to rubber, metals, glass and synthetic fibres

Polyvanillylidenecycloalkanone phosphoramide esters P-564

x = 0 (cyclopentanone)
x = 1 (cyclohexanone)

Y = H, OMe, CH_3, Cl, Br

Monomers: 2,5-Bis(4-hydroxy-3-methoxybenzylidene)cyclopentanone, 2,6-Bis(4-hydroxy-3-methoxybenzylidene)cyclohexanone
Molecular Formula: $(C_{21}H_{20}O_5)_n(C_{22}H_{22}O_5)_n$
Fragments: $C_{21}H_{20}O_5$ $C_{22}H_{22}O_5$

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	172–182°C	cyclopentanone derivative [1]
2	168–174°C	cyclohexanone derivative [1]

Glass-Transition Temperature:

No.	Value	Note
1	80–87°C	cyclopentanone derivative
2	80–85°C	cyclohexanone derivative [1]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. CH_2Cl_2, $CHCl_3$, Me_2CO, THF, DMF, dimethyl acetamide and DMSO. Insol. C_6H_6, toluene, pentane [1]

Optical Properties:

Transmission and Spectra: H-1 nmr, C-13 nmr and ir spectral data have been reported [1]

Polymer Stability:

Polymer Stability General: Cyclohexanone-based polymers have increased thermal stability (less ring strain). Halogens in the phosphoramide also increase thermal stability [1]
Thermal Stability General: 290–330° (10% wt. loss); 430–520° (50% wt. loss) (20°, N_2) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by interfacial condensation using a phase transfer catalyst (hexadecyltrimethyl ammonium bromide) [1]
Applications: Applications in photo-resists for integrated circuits, printing plates and inks, photocurable coatings and energy exchange systems

Poly(vinyl acetal) P-565

Related Polymers: Polyvinyl formal, Polyvinyl butyral, Polyvinyl alcohol
Monomers: Vinyl acetate, Acetaldehyde
Material class: Thermoplastic
Polymer Type: polyvinyls
Molecular Formula: $[(C_6H_{10}O_2)_x(C_2H_4O)_y(C_4H_6O_2)_z]_n$
Fragments: $C_6H_{10}O_2$ C_2H_4O $C_4H_6O_2$
Additives: Weak alkalis act as stabilisers
General Information: Props. depend on degree of acetalisation and free hydroxyl groups present in terpolymer. [1]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	81°C	10% free OH

Transition Temperature General: Increase in hydroxyl group content increases T_m, softening and brittle temps
Vicat Softening Point:

No.	Value	Note
1	97°C	12% free OH [1]
2	82°C	10% free OH [1]

Brittleness Temperature:

No.	Value	Note
1	36°C	12% OH [1]
2	27°C	10% OH [1]

Surface Properties & Solubility:

Internal Pressure Heat Solution and Miscellaneous: Sol. MeOH, EtOH, AcOH, dioxane. Insol. Me_2CO, EtOAc, C_6H_6. [1] Increased free hydroxyl content increases solubility in polar solvents. High acetate content increases solubility in less polar solvents
Plasticisers: Addition of dibutyl phthalate decreases T_m, softening and brittle temps. and decreases mech. props markedly [1]

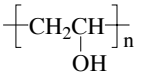
Mechanical Properties:

Mechanical Properties General: High hydroxyl content increases mech. props, which decrease with increasing temp.
Tensile Strength Break:

No.	Value	Note	Elongation
1	78.6 MPa	11.4 kpsi, 9% OH [1]	6%

Elastic Modulus:

No.	Value	Note
1	3585 MPa	520 kpsi, 0°, 12% OH [1]



2	3102 MPa	450 kpsi, 40°, 12% OH [1]
3	2688 MPa	390 kpsi, 0°, 12% OH [1]
4	2316 MPa	336 kpsi, 40°, 10% OH [1]

Polymer Stability:
Environmental Stress: Oxidation my cause cleavage of chain leading to acid autocatalytic decomposition. Should not be stored indefinitely or without stabilisers
Hydrolytic Stability: Unstable to acids and strong base

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by treating acid hydrolysed polyvinyl acetate in EtOH with acetadehyde at 60–75°
Applications: Now of little commercial importance

Poly(vinyl alcohol) P-566

Synonyms: *Poly(1-hydroxyethylene). Poly(hydroxyethylene). Poly(1-hydroxyethene). Poly(hydroxyethene). Poly(ethenol). PVA. PVOH. PVAL*
Related Polymers: Poly(vinyl alcohol) fibres, Poly(vinyl alcohol) films, Poly(vinyl alcohol) foamed material
Monomers: Vinyl acetate
Material class: Gums and resins
Polymer Type: polyvinyl alcohol
CAS Number:

CAS Reg. No.	Note
9002-89-5	
25067-41-8	isotactic
27101-67-3	syndiotactic

Molecular Formula: $(C_2H_4O)_n$
Fragments: C_2H_4O
Molecular Weight: There are four MW ranges which are commercially important; low grade M_n 25000; intermed. grade 40000; medium grade 60000; high grade 100000
General Information: Pure PVA is a light, white, powdery solid. Degree of hydrol. is important in controlling polymer props. The three main grades available are fully hydrolysed (98–98.8 mol % hydrolysed); intermed. (95–97 mol %) and partially hydrolysed (87–89 mol %). Additional grades are super (>99.3 mol %) and low (79–81 mol %). Polymers with other degrees of hydrol. are prod. but have a smaller market value
Tacticity: Tacticity of PVA is determined by the struct. and props. of the polymer used in preparation. Most commercially available PVAs are called atactic, consisting of a random mixture of isotactic and syndiotactic sequences. The nomenclature as regards tacticity is not applied as literally to PVA as it is to other polyolefins because PVAs with syndiotacticity values close to 100 or 0 % have not been obtained [5]
Morphology: PVA can be amorph. or polycrystalline depending on mechanical treatment [5]
Identification: Fully hydrolysed PVA forms a complex with iodine which has a blue colour (λ_{max} 620 nm). The colour of this complex varies with the degree of hydrol.

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.345 g/cm^3	cryst. [11]
2	d 1.269 g/cm^3	amorph. [11]
3	d 1.27–1.31 g/cm^3	[1,2,3,4,5]
4	d^{25} 1.02 g/cm^3	10% w/w aq. soln. [5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7×10^{-5}–0.00012 K^{-1}	[1]	L
2	0.0001 K^{-1}	[3]	L
3	2.9×10^{-5}–0.0005 K^{-1}	[2]	V

Volumetric Properties General: Degree of crystallinity increases with heat treatment and the degree of hydrol. [1]. Density increases with the degree of crystallinity, and is affected by moisture content [3] and tacticity [12]. The relationship between density and concentration has been reported [2]
Equation of State: Mark-Houwink constants have been reported [4,16,18,82,83,84,85,89]
Thermodynamic Properties General: Thermal conductivity of PVA solns. increases with temp. and decreases with increasing PVA concentration [14]. Thermal diffusity increases with temp. and decreases with PVA concentration [14]. C_v of aq. solns. of PVA increases with temp. but decreases with PVA concentration [14]
Latent Heat Crystallization: Heat of fusion 78.7–98.8 J g^{-1} (18.8–23.6 cal g^{-1}, degree of crystallinity 0.55–0.58) [12]. Heat of formation 6.28 kJ mol^{-1} (1.5 kcal mol^{-1}, cryst., per segment) [2]. Entropy of fusion 13.8 J K^{-1} mol^{-1} (3.3 cal °C^{-1} mol^{-1}, cryst., 1 mole of segments) [2]
Thermal Conductivity:

No.	Value	Note
1	0.2 W/mK	[1,5]
2	0.02–0.4 W/mK	[14]

Thermal Diffusivity: 0.08–1.4 × 10^{-7} m^2 s^{-1} [14]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.04 kJ/kg.C	45.9 J mol^{-1} K^{-1}, cryst. [15]	P
2	1.67 kJ/kg.C	[1]	P
3	1.5 kJ/kg.C	[5]	P
4	0.2674 kJ/kg.C	11.78 J mol^{-1} K^{-1}, solid	P
5	0.7187 kJ/kg.C	31.66 J mol^{-1} K^{-1}, solid	P
6	1.185 kJ/kg.C	52.21 J mol^{-1} K^{-1}, solid	P
7	1.546 kJ/kg.C	68.11 J mol^{-1} K^{-1}, solid [16,17,18]	P

Melting Temperature:

No.	Value	Note
1	230°C	unplasticised, 98–99% hydrolysed [1,5]
2	180°C	unplasticised, 87–89% hydrolysed [1,5]
3	220–267°C	fully hydrolysed [1,22,23,24,25]
4	212–235°C	isotactic

5	228–240°C	atactic
6	230–267°C	syndiotactic [4,22]

Glass-Transition Temperature:

No.	Value	Note
1	85°C	high MW, 98–99% hydrolysed [1]
2	58°C	87–89% hydrolysed, depends on the degree of polymerisation [1]
3	85°C	[18,19,20,21]
4	75–85°C	[5]

Transition Temperature General: Determination of T_m is difficult because decomposition occurs above 130° [1]. Second-order transition temps. have been reported [2]. T_m depends on tacticity [4] and crystallinity [12]. T_g is reduced by the presence of plasticisers [5] and by absorption of H_2O. Absorption of 6% w/w H_2O lowers T_g to room temp. [2]

Surface Properties & Solubility:

Solubility Properties General: Solubility in H_2O is controlled by the degree of hydrol. and the degree of polymerisation. Fully hydrolysed PVA must be dissolved in hot to boiling H_2O but remains in soln. on cooling [5]. The optimum hydrol. range for solubility in both cold and hot H_2O is 87–89% [5]. The temp. for H_2O solubility decreases as the degree of hydrol. decreases. At 75–80% hydrol., PVA is fully sol. cold H_2O but precipitates upon heating above 40° [1,2,5]. PVA solubility is improved by decreasing the particle size and the polymer MW but is decreased by heat treatment [1] or increasing crystallinity [5]. The heat of soln. of PVA in H_2O has a negative value [1,2]
Cohesive Energy Density Solubility Parameters: δ 7.26 $J^{1/2}$ $cm^{-3/2}$ (5.78 MPa) $^{1/2}$ [16,18,27]
Plasticisers: H_2O [3,5]. Water sol. polyhydric alcohols, *e.g.* glycerol, poly(ethylene glycol), glycol, triethylene glycol, sorbitol; hydroxy-esters (glyceryl lactate), amides (urea), and calcium chloride [3,5]. Pentaerythritol and 1,2,6-hexanetriol are used in high temp. processing [5]
Solvents/Non-solvents: All commercial PVA samples sol. H_2O. Atactic sol. glycols (hot), glycerol (hot), piperazine, formamide, H_2O, triethylenediamine, hexamethylphosphoric triamide [18], DMF, mixtures of lower alcohols and H_2O (up to 50% w/w) [5], acetamide [1]; mod sol. DMSO; insol. hydrocarbons, chlorinated hydrocarbons, lower alcohols, THF, ketones, carboxylic acids, esters, conc. aq. salt solns [18], gasoline, kerosene, C_6H_6, xylene, MeOH, trichloroethylene, CCl_4, Me_2CO, methyl acetate [5]. Syndiotactic sol. H_2O (above 160°), propanediol (above 160°) [18]
Surface and Interfacial Properties General: The surface tension of PVA solns. in DMSO/H_2O mixtures has been reported [48]. The surface tension of aq. PVA solns. varies with concentration and degree of hydrol., and is at its lowest with a degree of hydrol. of 78–81% [1]. Surface tension decreases slightly with decreasing MW. Surface tension increases linearly with degree of hydrol. from 88–98% but then increases sharply for fully hydrolysed samples [5]
Wettability/Surface Energy and Interfacial Tension: γ_c 37 mN m^{-1} [16,28,29], γ_d 42 [16,29,30], γ_a0 [16,29,30]. Has exceptional adhesion to cellulosic surfaces and exceptional binding power in cement formulations. All PVA samples show good adhesion to hydrophilic materials but fully hydrolysed products have the best adhesive props. Partially hydrolysed PVA is the only grade that gives good adhesion to hydrophobic materials, *e.g.* glass, metal and many plastics [5]. The adhesive props. of PVA films have been reported [5]. Contact angle 22° (H_2O, receding), 54° (H_2O, advancing) [2]. γ_{LV} 50 mN m^{-1} (50 dyne cm^{-1}, 25°, 1% w/w PVA soln. in H_2O) [2]. Other values of contact angle have been reported [37]

Transport Properties:

Polymer Solutions Dilute: Theta temps. 97° (H_2O) [16,31], 25° (EtOH/H_2O 41.5/58.5% (w/w)), 25° (MeOH/H_2O 41.7/58.3% (w/w)), 25° (1-propanol/H_2O 35.1/64.9% (w/w)), 25° (2-propanol/H_2O 39.4/60.6% (w/w)), 25° (*tert*-butanol/H_2O 32/68% (w/w)) [16,32]. Soln. viscosity increases with concentration and MW (degree of polymerisation) and decreases with increasing temp. [1,5]
Polymer Solutions Concentrated : The degree of hydrol. does not affect the soln. viscosity as strongly but the viscosity is proportional to the degree of hydrol. at constant MW and concentration [1,5]. The concentration of PVA solns. is limited by the viscosity rather than the polymer solubility. The practical concentration limits are 30% (w/w) for low MW, 15 and 20% (w/w) for high MW [5]. The stability of the soln. viscosity depends on the PVA concentration, degree of hydrol., storage temp. and dissolution temp. [1]. The viscosities of partially hydrolysed PVA solns. remain constant over a wide range of concentrations if the solns. are stored at high temp. [5]. The viscosities of concentrated solns. of fully hydrolysed PVA gradually increase over several days' storage at room temp. Gelation occurs in products containing less than 1 mol % acetate groups. This viscosity increase or gelation can be reversed by reheating. The effect of ageing on the soln. viscosity of PVA has been reported [22,75,76,77,78,79,80]. The viscosity of PVA solns. may be stabilised by adding small amounts of lower aliphatic alcohols [81], urea or salts, *e.g.* thiocyanates [1]. Intrinsic viscosity - MW relationships for PVA have been reported [4,18]. The concentration dependence of intrinsic viscosity has been reported [87]. The effect of temp. on intrinsic viscosity and the Mark-Houwink parameters for PVA in H_2O has been studied from 20–80° [4,88]. Intrinsic viscosity decreases steadily as the temp increases [1]. Intrinsic viscosity - MW relationship for PVA samples with different degrees of hydrol. has been reported [1,4,40,90,91]. Intrinsic viscosity decreases as the acetate content increases [4,40,91]. The effect of temp. on the intrinsic viscosity of PVA samples with different acetate contents has been reported [91]
Permeability of Gases: The oxygen barrier props. of PVA at low humidity are greater than those of any other synthetic resin [5]. Fully hydrolysed PVA has transmission rates that are two to four times lower than those of poly(vinylidene chloride). However PVA, as a water sensitive polymer, exhibits rapid loss of barrier performance above 50% relative humidity [1,5,74]. The gas barrier performance of PVA increases with increasing degree of hydrol. and rapidly diminishes below a degree of hydrol. of 98% [1,5]. High sodium acetate content also increases the gas transmission rates and must be less than 0.1% w/w for optimum performance [5]. PVA is highly impermeable to most organic vapours, inert gases and H_2. It is relatively impermeable to alcohol vapour but permeable to water vapour and NH_3 [3]
Permeability and Diffusion General: Permeability of H_2O vapour at 20–30° has been reported [3]. The permeability of H_2O vapour depends on relative humidity and temp. [2] and is about 100000 times greater than that for O_2 and CO_2
Water Content: 4% (approx., room temp., 50% relative humidity) [5], 8% (80% relative humidity) [5], 6–9% (65% relative humidity) [3]. For samples of relatively low crystallinity, the amount of water absorbed per unit volume is proportional to the external vapour pressure of H_2O up to 50% relative humidity. The coefficient of absorption at 25° is 0.0039 (moles H_2O) (cm^3 polymer)$^{-1}$ (cm Hg pressure of H_2O vapour)$^{-1}$ [2]. At 40° this absorption coefficient is reduced to 0.0019 [2]. At relative humidities higher than 50% the amount absorbed increases greatly with increasing external water vapour pressure but amount absorbed is no longer proportional to the vapour pressure [2]
Water Absorption:

No.	Value	Note
1	25–30 %	100% relative humidity [94]

Mechanical Properties:

Mechanical Properties General: Most of the mechanical props. reported in the literature are for films and fibres. Mechanical props. of extruded PVA [3] and PVA gels [92,93,95,96,97,98,99,100,101] have been reported. Mechanical props. are sensitive to moisture (humidity) [3] and are also affected by temp. and processing conditions [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	34 MPa	3.5 kgf mm^{-2}, extruded material fully hydrolysed [3]	225% extension

Viscoelastic Behaviour: PVA gels formed from concentrated soln. (in H_2O or aq. solvent mixtures) have viscoelastic props. The effects of temp., MW, concentration and other additives on viscoelastic props. have been reported [92,95,96,97,98,99,100,101]
Failure Properties General: At high humidity, PVA samples creep under load [3]. Force-extension curves for PVA gels have been reported [93]

Electrical Properties:

Electrical Properties General: The electrical props. of PVA are very limited because of the absorption of H_2O under normal atmospheric conditions [3]. Most measurements of the electrical props. of PVA have been carried out on films [2,3]. Volume resistivity 31–38 M ohm^{cm} [1,5]. Dielectric constant increases with increasing water content [2]
Dielectric Permittivity (Constant):

No.	Value	Note
1	40	room temp., dry PVA in bulk [2]

Strong Field Phenomena General: Intrinsic breakdown strength 300 kV mm^{-1} (20°), 1500 kV mm^{-1} (-180°) [38]
Static Electrification: The electrostatic charge on PVA samples induced by contact with metals has been reported [73]

Optical Properties:

Optical Properties General: The refractive index of aq. PVA solns. increases linearly with concentration with a discontinuity at a (critical) PVA concentration [2,4,36]. The critical concentration depends on MW and the soln. viscosity [2,4]
Transmission and Spectra: Ir [2,4,22,41,42,43], C-13 nmr [16,43,44,45,46] and H-1 nmr [47] spectral data have been reported. Pure PVA should show no uv/visible absorption [2,4] Uv spectral data regarding films have been reported [102]
Volume Properties/Surface Properties: Colour white (solid)

Polymer Stability:

Polymer Stability General: The presence of hydroxyl groups in PVA gives the polymer a range of chemical reactions [1,2,22]
Thermal Stability General: The thermal decomposition of PVA in the absence of oxygen is a two stage process: dehydration at 200° accompanied by the formation of volatile products [1,2,49,50,51,52,53]; decomposition at 400–500° to yield carbon and hydrocarbons [1,2,53]. The residue from the first stage is predominantly polyenes [1,53]. The decomposition products may depend on the manufacturing conditions of the PVA [1]. In the presence of oxygen, oxidation of the unsaturated polymeric residue introduces ketone groups into the polymer chain [1,26]. Thermal decomposition is inhibited by carbon dioxide. [2] Dehydration at high temps. is catalysed by dil. acids and alkalis [2]. Other studies of the thermal degradation have been reported [56,57,58]
Decomposition Details: $T_{½}$ 268°; monomer yield 0% [16]. Initial decomposition temp. 100° [3]. Activation energy of decomposition 14–18 kJ mol^{-1} (60–75 kcal mol^{-1}) (in the absence of O_2) [2], 8–13 kJ mol^{-1} (35–55 kcal mol^{-1}) (in the presence of O_2) [2]. Decomposition products include H_2O, MeOH, Me_2CO, EtOH, propanol, AcOH, crotonaldehyde, C_6H_6, acetaldehyde, benzaldehyde, acetophenone and carbon monoxide [1,2]
Flammability: Limiting oxygen index 22.5% [16,54]. Burns in a similar manner to paper [1,5]. Fire retardant props. have been reported [55]
Environmental Stress: Has excellent resistance to sunlight [1,5], showing only slight loss in strength after prolonged exposure [3]. Oxidised by air, oxygen or ozone to form ketone groups along the chain. Air oxidation at 60–100° in the presence of alkali during manufacture produces impurities [2]
Chemical Stability: Oxidised by hydrogen peroxide, acidified potassium dichromate, ceric nitrate and periodate [2]. Swollen by polyhydric alcohols, especially when hot [3]. Stable to hydrocarbons (including petrol), chlorinated hydrocarbons, alcohol, Me_2CO, carboxylic acid esters, greases, animal and vegetable oils and fats [1,3,5]. Resistance to organic solvents increases with increasing hydrol. [1,5]
Hydrolytic Stability: Small concentrations of strong inorganic acids and bases do not precipitate PVA from soln. However, for partially hydrolysed PVA in aq. soln., addition of strong acid or base can cause an increase in the degree of hydrol. over a period of several days. Under extreme conditions of pH, the hydrol. reaction continues to completion. Fully hydrolysed PVA samples are essentially unaffected by pH [5]. PVA can absorb large amounts of H_2O. It needs to be stored in bags with moisture barriers to keep the polymer dry and prevent caking [5]. Reacts with aq. alkali to form gels [60]
Biological Stability: Aq. solns. of PVA must be protected from bacterial and mould growth by the addition of a biocide [3,5]. PVA can be effectively biodegraded in acclimatised, activated sludge wastewater systems [1,5,65,66]. The presence of PVA does not appear to interfere with the treatment of other biodegradable materials normally present in waste water [5]. PVA is biodegradable under both aerobic [67,68,69] and anaerobic conditions [70] using bacteria isol. from soil and water. The effect of MW and struct. on biodegradability has been reported [71]
Stability Miscellaneous: γ-Irradiation in air at room temp. induces oxidation of hydroxyl groups to carbonyl groups. Chain scission with the production of carboxyl and carbonyl end groups occurs, and cross-linking occurs particularly at elevated temps. [2]. The irradiation of aq. PVA solns. causes a substantial amount of cross-linking [2], which may be prevented by the addition of thiourea [4]. The effect of x-rays and γ-rays on the stability of PVA in aq. soln. has been reported [72]. γ-Irradiation also affects thermal props. owing to an increase in MW [14]

Applications/Commercial Products:

Processing & Manufacturing Routes: Poly(vinyl alcohol) is most commonly synth. from poly(vinyl acetate) by acid or base catalysed alcoholysis. NaOH is most common catalyst and MeOH is the most common alcohol used. Reaction is terminated by neutralising or removing the catalyst to give degree of hydrol. required [2]. Fully hydrolysed PVA is obtained if the reaction is allowed to go to completion. PVA can also be synth. via the hydrol. of other poly(vinyl esters) and poly(vinyl ethers). These reactions are not commercially significant. Syndiotactic PVA may be synth. on a laboratory scale by the hydrol. of poly(vinyl trifluoroacetate). Isotactic poly(vinyl alcohol) may be synth. on a laboratory scale from the saponification of isotactic poly(vinyl benzyl ether)
Applications: Used as an intermed. in the production of poly(vinyl acetals), e.g. poly(vinyl butyral) and poly(vinyl formal) and in the preparation of poly(vinyl sulfates), poly(vinyl phosphates), poly(vinyl carbonates) and poly(vinyl nitrates). PVA is used in adhesives. All grades show good adhesion to hydrophilic materials where fully hydrolysed PVA is the best adhesive. Partially hydrolysed PVA is the only grade that gives good adhesion to hydrophobic substrates e.g. glass, metal and many plastics. PVA is also used as a modifier for other aq. adhesive systems to improve film forming props. PVA based adhesives are used in paper laminating, the manuf. of plasterboard, re-moistenable adhesive for envelopes and stamps, binder for ceramics and non-woven fabrics and as a concrete additive. PVA may be used as a stabiliser for vinyl monomers during emulsion polymerisation. PVA may be used as an emulsion stabiliser in the photographic industry (silver halide emulsions); paints; printing inks; cosmetics (hair cream, sun-tan cream and skin conditioners). Also used as a thickening agent in cosmetics. PVA may be used as a coating. PVA-amylose mixture makes paper greaseproof. It can also be used as a paper sizer prior to the paper being coated with wax. PVA coatings have excellent grease, oil and oxygen barrier performance. PVA coated paper is used to package food and chemicals. PVA soln. may be used as a blood plasma extender to maintain the normal volume and osmotic pressure of the systematic blood. The largest worldwide application is warp sizing of textiles. On changing

degree of hydrol. PVA can be used for natural fibres e.g. cotton (fully hydrolysed PVA) to synthetic fibres and fibre-blends (partially hydrolysed PVA). PVA may be used as a textile finisher so fibres slip over each other on weaving and are used as wash and wear finishes for knit and woven fabrics. PVA is also used as a binder for non-woven fabrics, important when solvent resistance is required. Thin films have potential applications in microelectronics and optical engineering

Poly(vinyl alcohol), Fibres P-567

Synonyms: *Vinal. Vinylon*
Related Polymers: Poly(vinyl alcohol) general information, Poly(vinyl alcohol) films, Poly(vinyl alcohol) foamed material, Poly(vinyl alcohol)-poly(vinyl chloride) fibre blend
Monomers: Vinyl acetate
Polymer Type: polyvinyl alcohol
CAS Number:

CAS Reg. No.
9002-89-5

Molecular Formula: $(C_2H_4O)_n$
Fragments: C_2H_4O
Additives: To make fibres water insol. cross-linking agents (formaldehyde, acetaldehyde, benzaldehyde) may be used. For gel spinning process, boric acid is added to poly(vinyl alcohol). A plasticiser (glycerol, low MW polyethylene glycol) may also be used for extrusion process
General Information: PVA fibre is prod. extensively in Japan, China and the Far East, Russia and Eastern European countries e.g. Hungary, Romania. The high cost of production (compared to other fibres) has limited its use in the UK, USA and Europe [1,2,3,4,5]
Miscellaneous: The US Federal Trade Commission defines vinal fibres as having the following composition: at least 50% vinyl alcohol units and at least 85% total vinyl alcohol and acetal units

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.348 g/cm^3	cryst. [8]
2	d 1.345 g/cm^3	cryst. [10,11]
3	d 1.265 g/cm^3	amorph. [8]
4	d 1.269 g/cm^3	amorph. [10,11]
5	d 1.26 g/cm^3	[7]
6	d 1.26–1.32 g/cm^3	depending on the degree of crystallinity [8]
7	d 1.34 g/cm^3	[16]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.7×10^{-5} K^{-1}	[23]	L

Melting Temperature:

No.	Value	Note
1	220–230°C	[7]
2	246°C	[12]
3	237°C	[13]
4	235°C	[26]
5	222°C	[1]
6	250°C	[16]

Glass-Transition Temperature:

No.	Value	Note
1	50°C	[18]

Transition Temperature General: T_m increases with increasing crystallinity [26]. T_g is lower than for isotropic PVA, which may be due to the presence of plasticiser [18]. A secondary transition is observed at low temps. [17]
Transition Temperature:

No.	Value	Note	Type
1	-3°C	[23]	characteristic temp.

Surface Properties & Solubility:

Solubility Properties General: PVA fibres can be rendered insol. H_2O by heat treatment and chemical cross-linking [1,3,8,9]. PVA fibres are compatible with cement [6]

Solvents/Non-solvents: Water insol. fibres: sol. formic acid; sl. sol. *m*-cresol [8]. Insolubilised fibres are slightly swollen by H_2O [8]
Wettability/Surface Energy and Interfacial Tension: Fibres containing boric acid are hydrophilic and have excellent adhesion to hard materials such as cement and slate [2]

Transport Properties:

Water Content: Water retention 30–35% (staple fibres) [8]
Water Absorption:

No.	Value	Note
1	1.3–1.8 %	20–25°, 20% relative humidity [8]
2	4.5–5 %	20–25°, 65% relative humidity [8]
3	10–12 %	20–25°, 95% relative humidity [8]
4	3.5–5 %	equilib. [7]

Mechanical Properties:

Mechanical Properties General: Mechanical props. depend on the processing conditions (drawing [12,21], heat setting temp., moisture absorption [5,13,27] and the amount of cross-linking) [7]. Tensile strength at break 0.41 N tex^{-1} (max., draw ratio 7.6) [19], 0.79 N tex^{-1} (10–20% elongation) [7]. Young's modulus 8.562 N tex^{-1} (max.) [19], 8.8 N tex^{-1} [7]. The tensile modulus and tensile strength of PVA fibres increase with increasing birefringence and decrease with decreasing hydrol. [18]. Tensile modulus increases with draw ratio [3,10,13,14,19,20,26] and is slightly dependent on crystallinity [14,19,20,26]. Tensile strength also increases with draw ratio [10,14,19] and this increase is greatest for low MW PVA [13]. Elongation at break decreases with increasing draw ratio [19,21]. The wet strength of PVA fibres is approx. 80% of the dry air strength [8]. Tensile modulus decreases rapidly as the temp. exceeds the glass-transition temp. [3,23]. Insolubilised PVA fibres retain 70% of their normal strength at 100° [8]. Although it is expected that fibre from high MW PVA has high tensile modulus and strength [24,25] it has been found that the increase in draw ratio with MW (degree of polymerisation) is small [20]

Tensile (Young's) Modulus:

No.	Value	Note
1	4800 MPa	amorph. [14]
2	12000–18000 MPa	max. [18]
3	<70000 MPa	approx., max. [20]
4	76000 MPa	65% relative humidity, degree of polymerisation 3420, draw temp. 190°, max.draw ratio 21.5 [13]
5	6300 MPa	draw ratio 4 [21]
6	14000–19800 MPa	draw ratio 14.0–19.8 [21]
7	90000 MPa	mean value, 20–22°, 50% relative humidity [22]
8	<120000 MPa	max. [22]
9	3.92 MPa	40 kg mm^{-2} [3]
10	29.4–117.7 MPa	300–1200 kg f mm^{-2}, 25–100 gf den^{-1}, 20–25°, 65% relative humidity [8]
11	<196.2 MPa	max., 2000 kg f mm^{-2}, 180 gf den^{-1}, 20–25°, 65% relative humidity [8]
12	<60000 MPa	max.[10]
13	51760 MPa	dry [27]
14	46000 MPa	[16]
15	49000 MPa	[28]
16	2200 MPa	longitudinal [16]
17	4200 MPa	transverse [16]

Tensile Strength Break:

No.	Value	Note	Elongation
1	900–1100 MPa	max. [18]	
2	<2300 MPa	max. [20]	
3	400 MPa	draw ratio 4 [21]	59.0%
4	2000–2500 MPa	draw ratio 14.0–19.8 [21]	3.9–5.2%
5	5000 MPa	max., 20–22°, 50% relative humidity [22]	
6	4.91–7.36 MPa	50–75 kg f mm^{-2} [8]	15–26%
7	<10.3 MPa	max., 105 kg f mm^{-2}, 9 gf den^{-1} [8]	approx. 10% elongation
8	<2800 MPa	max. [10]	
9	1820 MPa	dry [27]	
10	1800 MPa	[16]	
11	2500 MPa	[28]	4.3%
12	690 MPa	longitudinal [16]	3.2%
13	10 MPa	transverse [16]	0.24%

Elastic Modulus:

No.	Value	Note
1	7.85–245 MPa	80–2500 kg mm^{-2}, 8% strain, 0.0001–2 s [3]
2	2550070 MPa	2550000 kg cm^{-2} [25]
3	240000 MPa	[10]
4	1900 MPa	[16]

Complex Moduli: Dynamic modulus 90600 MPa (20°), 26600 MPa (200°, draw ratio 13.6, 62.2% crystallinity) [15], 115000 MPa (max., room temp.), 42000 MPa (max., 200°) [12]. Dynamic modulus decreases with increasing temp. and increases with processing [12,15]. The temp. dependence of the dynamic modulus and loss factor at 1 Hz has been reported [17]. The effect of applied stress at constant temp. on the dynamic modulus showsan increase in the dynamic modulus of 30000 MPa over a stress range 50–900 MPa [17]
Viscoelastic Behaviour: Elastic recovery of PVA fibres 75% (1% short-term strain), 30% (5% short-term strain), 20% (10% short-term strain), 70–80% (3% short-term strain, special fibres), 45–60% (5% short-term strain, special fibres) [8]. Stress relaxation of PVA fibres at 0.5, 1 and 2.0% strain at 30°, 50° and 70° has been reported [17]. Stress relaxation is less time dependent at high loads [17]. The amorph. regions in PVA fibre display strong viscoelastic effects upon loading at room temp. [17]. The non-linear viscoelastic behaviour of PVA fibres in relation to its fatigue props. has been reported [28]
Failure Properties General: Creep props. and their relation to brittle failure and viscoelastic props. have been reported [16]. Fatigue behaviour using zone non-linear viscoelastic analysis has been reported [28]. Shear strength 16 MPa [16]
Friction Abrasion and Resistance: The abrasion resistance of PVA fibres is at least as good as that of cotton [8]

Optical Properties:

Optical Properties General: Refractive index depends on the fibre type [8]
Refractive Index:

No.	Value	Note
1	1.532–1.55	parallel to draw [8]
2	1.505–1.526	perpendicular to draw [8]

Transmission and Spectra: Ir spectral data have been reported [23]
Total Internal Reflection: Birefringence 0.022–0.037 [8], 0.04 (max., highly oriented fibres) [8], 0.047 (crystallinity 62.2%, draw ratio 13.6) [15]. Intrinsic birefringence 0.0079 (amorph.), 0.0052 (cryst.) [14]. Birefringence increases with increasing draw ratio [14,15], attributed to an increase in chain orientation in the amorph. phase of the fibre [14]. Birefringence is also affected by crystallinity [15]

Polymer Stability:

Thermal Stability General: On heating, PVA fibres shrink [8,26]. In addition to the decomposition products for PVA, formaldehyde is prod. from the cross-links for insol. fibres [8]. Dehydration of PVA fibres occurs at temps. above about 170°, causing discolouration. However, dehydrated PVA fibres retain most of their normal strength [3,8]. PVA fibres can be completed carbonised to give graphite fibres under prolonged heating conditions [3]
Flammability: Has good fire resistance [6]
Chemical Stability: Decomposed by conc. mineral acids [8] and warm, dil. nitric acid. Warming with 20–25% sulfuric acid produces formaldehyde in 3% yield from the cross-links. Commercial PVA fibre is resistant to alkalis [2]. Insolubilised PVA fibres have good chemical resistance [1,6]
Hydrolytic Stability: Insolubilised fibres show only slight shrinkage in boiling H_2O [8]. Insolubilised PVA fibres are unaffected by immersion in sea water [6,8]
Biological Stability: Water insol. PVA fibres are resistant to biological attack and are unaffected by burial in soil [1,8]

Applications/Commercial Products:

Processing & Manufacturing Routes: Water sol. PVA fibre may be formed by wet spinning of poly(vinyl alcohol) from hot water into a coagulating bath containing salt soln. e.g. sodium sulfate, sodium carbonate, ammonium sulfate or an organic solvent e.g. ethanol, propanol or acetone. The fibres are drawn under wet or dry conditions (or both) to develop orientation and crystallinity. Heat treatment at temps. up to 220° induces further crystallisation and improves water resistance. Water insol. fibres are prod. by cross-linking fibres e.g. with formaldehyde under acid conditions or with formalin and heat. The processing conditions used drawing and heat setting and degree of cross-linking affect the mechanical and physical props. Superhydrolysed grade poly(vinyl alcohol) is used for water-insol. fibres. High MW fibres may be prepared by gel-spinning PVA containing boric acid and drying/drawing at high temps. PVA fibres have also been prepared by extrusion
Applications: PVA fibres may be blended with cotton, wool and other fibres and used to produce knitted and woven fabrics. PVA fibres are used to make Japanese fishing nets, in making artificial fur, plush pile, carpeting, tarpaulins, fire hose and coarse canvas-like cloth. PVA fibre is used in the building industry to form reinforced slate and mortar cement, and is used as an asbestos substitute in insulating board due to its fire resistance. Plastics reinforced with PVA fibres have improved impact and weathering props. PVA fibres are used in bristles and sewing thread (including medical sutures). Suitably sized fibres can be used to make filter cloths and pads which are effective in trapping fine particles (e.g. bacteria), and fibres may be used in waste water treatment. Fibres are water absorbent and may be used in nappies and sanitary products. Fibres can be used as a base in the fabrication of good quality paper, and fibrous PVA can also be used as a binder in the manufacture of conventional paper from wood pulp

Trade name	Details	Supplier
Mewlon		Toray Industries
Tac board	PVA reinforced plasterboard	Taconic Plastics Ltd.
Vinal	USA	Allied Inc (USA)
Vinylon	Japan	Kuroshiki Rayon Co (Japan)
		Kuraray-Mitsui Toatsu
		Nichibo Co (Japan)

Poly(vinyl alcohol), Films P-568

Related Polymers: Poly(vinyl alcohol), Ethylene-vinyl alcohol copolymer films
Monomers: Vinyl acetate
Material class: Fibres and Films
Polymer Type: polyvinyl alcohol
CAS Number:

CAS Reg. No.	Note
9002-89-5	atactic
27101-67-3	syndiotactic

Molecular Formula: $(C_2H_4O)_n$
Fragments: C_2H_4O
Additives: A plasticiser needs to be added when films are produced by extrusion. Plasticisers used are typically high boiling, water sol. compounds containing hydroxyl groups e.g. glycerol and low MW poly(ethylene glycol). Water is the best plasticiser but produces a foamy product. High boiling methylol compounds e.g. pentaerythritol and 1,2,6-hexanetriol are preferred for high temp. processing

General Information: Water solubility of the films can be controlled by changing the degree of hydrolysis of the poly(vinyl alcohol) used. The cost of producing film is high and vinyl films only have a very small share of the market [3]
Tacticity: As well as atactic PVA films, syndiotactic PVA films have been prepared on a laboratory scale
Miscellaneous: The physical and mechanical props. of vinyl films (including PVA) are highly dependent on the method of manufacture. Can retain fragrances and aromas [15]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26 g/cm^3	[2]
2	d 1.302 g/cm^3	[16]
3	d 1.294 g/cm^3	dry [6]
4	d 1.22 g/cm^3	200 mol% H_2O [6]

Volumetric Properties General: The density of PVA films increases with increasing crystallinity [11,12]
Latent Heat Crystallization: ΔH_f 0.071 J kg^{-1} (17 cal g^{-1}) [16], ΔH_f 0.1 J kg^{-1} (24 cal g^{-1}) [17]
Melting Temperature:

No.	Value	Note
1	220°C	428°F [15]
2	227°C	442°F [15]
3	225°C	[16]

Transition Temperature General: Transition temps. are affected by the polymer MW (degree of polymerisation), degree of hydrol., crystallinity and tacticity. T_g is affected by the presence of plasticisers, especially H_2O. T_g is also reduced by iodine absorption [18]
Transition Temperature:

No.	Value	Note	Type
1	260–275°C		Heat sealing temp.
2	240–265°C	20 μm film thickness, depending on manufacturing conditions [15]	Heat sealing temp.

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. H_2O [2,38,39]
Wettability/Surface Energy and Interfacial Tension: The adhesion props. of PVA have been expressed as peel strength of PVA film on polyester film [1] and plotted against the degree of hydrol. The peel strength sharply decreases above 95% hydrol., showing that partially hydrolysed PVA gives the best adhesion to hydrophobic surfaces [1]. MW does not significantly affect PVA adhesion to a substrate [1]. PVA shows good adhesion to hydrophilic materials with fully hydrolysed materials having the best adhesive props. [1]. PVA adhesives can also be formed by modifying the PVA with boric acid [1,6]. The adhesive props. of PVA are related to its film forming ability [31,40]

Transport Properties:

Permeability of Gases: Other gas permeability data have been reported [2,4,7,30]. Dry PVA films have excellent gas barrier props. and form barriers to H_2, He, O_2, N_2, CO_2, SO_2 and H_2S [15,31]. However, the gas barrier props. of PVA decrease at high humidity (greater than 50% relative humidity) when the permeability of films to CO_2 and O_2 increases rapidly [1,3,30]
Permeability of Liquids: PVA is permeable to H_2O and NH_3 vapour [7,31]. The H_2O and NaCl transport props. of untreated and heat treated PVA film membranes have been reported [33]. Permeabilities of H_2O and NaCl both decrease as a result of heat treatment but this effect is greater for NaCl permeability [33]. Radiation cross-linking of PVA films does not give a significant improvement over untreated PVA with regard to the selective transport of H_2O and NaCl [34]. The hydraulic permeability of H_2O in PVA membranes increases with increasing degree of hydration [35]. The diffusion coefficients for H_2O and EtOH in PVA membranes with different degrees of crystallinity have been reported [36]. The diffusion coefficient increases exponentially with the average H_2O content in the membrane. The limiting diffusion coefficient decreases as the crystallinity of the PVA increases and is greater for H_2O than for EtOH [36]
Permeability and Diffusion General: Permeability of H_2O, alcohols and aq. alcohols through syndiotactic PVA films has been reported [4]. For very thin films (0.3 μm), the permeability of alcohols decreases with increasing MW of the alcohol and the permeability of aq. alcohol mixtures is lower than those of pure H_2O and alcohols [4]. The temp. dependence of the H_2O permeability for syndiotactic PVA films has also been reported [5]. The sorption and permeation of sodium chloride, Congo red dye and Sunset Yellow dye in PVA membranes and the relationship between the degree of hydration, permeability and the diffusion coefficient has been reported [37]
Water Content: Water-sol. plasticisers *e.g.*, propylene glycol, glycerol and polyethylene glycol decrease water resistance [39]. PVA films are hygroscopic [6] and the amount of H_2O absorbed depends on the film thickness, degree of crystallinity, temp. and whether the polymer has been heat-treated or plasticised [11]. The presence of syndiotactic PVA in the films lowers their hygroscopicity [38]
Gas Permeability:

No.	Gas	Value	Note
1	H_2O	39.4 cm^3 mm/(m^2 day atm)	0.04 m^3 m m^{-2} day^{-1} (PPa)$^{-1}$, 23°, 0% relative humidity [30]
2	H_2O	21.4 cm^3 mm/(m^2 day atm)	0.3 cm^3 m^{-2} day^{-1} atm^{-1}, 20°, 0% relative humidity, 14 μm thick [15]
3	H_2O	428.6 cm^3 mm/(m^2 day atm)	6 cm^3 m^{-2} day^{-1} atm^{-1}, 20°, 92% relative humidity, 14 μm thick [15]
4	H_2O	600 cm^3 mm/(m^2 day atm)	3 cm^3 m^{-2} day^{-1} atm^{-1}, 20°, 0% relative humidity, 25 μm thick [15]
5	CO_2	67.8 cm^3 mm/(m^2 day atm)	0.95 cm^3 m^{-2} day^{-1} atm^{-1}, 20°, 0% relative humidity, 14 μm thick [15]
6	N_2	2.85 cm^3 mm/(m^2 day atm)	0.04 cm^3 m^{-2} day^{-1} atm^{-1}, 20°, 0% relative humidity, 14 μm thick [15]
7	H_2O	2720474 cm^3 mm/(m^2 day atm)	14045 × 10^{-15} mol (m s Pa)$^{-1}$, 25°, 100% relative humidity [32]

Mechanical Properties:

Mechanical Properties General: Mechanical props. are affected by the relative humidity, method of synth. [5,17,44] and temp. Tensile strength depends on the degree of hydrol., MW and relative humidity; it decreases linearly with increasing humidity and increases with degree of hydrol. and degree of polymerisation (MW) [1]. Tensile strength yield 26 m^2 (kg mm)$^{-1}$ (ASTM D2103) [2]. The tensile response to MW is non-linear [1]. Heat treatment of PVA films increases their tensile strength [3]. The addition of plasticisers reduces the tensile strength of PVA films in proportion to the amount added. Tensile elongation increases from 10–400% (dry - 80% relative humidity) with increasing humidity and the addition of plasticiser [1,3]. Elongation of PVA films is relatively independent of degree of hydrol. but is proportional to MW.

Storage modulus is affected by the solvent composition [8]. Young's modulus depends on the preparation method, draw ratio, polymer concentration and film thickness [5]. Young's modulus increases with increasing draw ratio [43]. The tensile strength of PVA films is higher than that of other water sol. polymers [31]

Tensile (Young's) Modulus:

No.	Value	Note
1	12300 MPa	25°, atactic [42]
2	27800 MPa	25°, 55.2% syndiotactic [42]
3	17500 MPa	25°, 63.0% syndiotactic [42]
4	166.7–196.1 MPa	1700–2000 kg cm^{-2}, 20°, 65% relative humidity, film thickness 25 μm [15]
5	6668.5 MPa	68000 kg cm^{-2}, 20°, 65% relative humidity, film thickness 14 μm [15]
6	<62000 MPa	max., gel film
7	<50300 MPa	max., cast film
8	6600–23200 MPa	degree of polymerisation 1570, film thickness 180 nm [5]
9	2400–30000 MPa	degree of polymerisation 1970, film thickness 180 nm [5]
10	3500–31400 MPa	film thickness 26–116 nm [5]
11	4903 MPa	500 kg mm^{-2} [17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	27.6–69 MPa	ASTM D882 [2]	180–600%
2	67–110 MPa	98–99% hydrolysed [3]	0–300%
3	24–79 MPa	87–89% hydrolysed [3]	0–300%
4	55–69 MPa	50% relative humidity, fully hydrolysed, unplasticised [1]	
5	0.39–1.2 MPa	4–12 kg mm^{-2}, cast film with 2% H_2O [7]	2–15%
6	0.2–0.49 MPa	2–5 kg mm^{-2}, with 10% H_2O [7]	100–280%
7	30–35 MPa	80% relative humidity, fully hydrolysed [1]	
8	0.04–0.12 MPa	0.4–1.2 kg mm^{-2}, with 25% H_2O [7]	200–550%
9	0.98–1.5 MPa	10–15 kg mm^{-2}, dry unplasticised film [7]	
10	53.9 MPa	550 kg cm^{-2}, max., 20°, 65% relative humidity, film thickness 25 μm [15]	290–330%
11	2098 MPa	2100 kg cm^{-2}, max., 20°, 65% relative humidity, film thickness 14 μm [15]	50–55%
12	472 MPa	[16]	10.6%
13	190–610 MPa	dependent on preparation conditions and film thickness [5]	6.1–11.0%
14	100–1500 MPa	dependent on preparation conditions and film thickness [5]	1.3–20.0%

Elastic Modulus:

No.	Value	Note
1	12600 MPa	[16]
2	333.4 MPa	3400 kg mm^{-2} [44]

Miscellaneous Moduli:

No.	Value	Note	Type
1	19400–31400 MPa	degree of polymerisation 4400[8]	Storage modulus
2	22000–28500 MPa	degree of polymerisation 2000 [8]	Storage modulus
3	240000 MPa	[8]	Crystal lattice modulus

Impact Strength: Pendulum impact strength 300–500 kg cm^{-1} (3.2 mm thick) [2], 2.56 kg m mm^{-1} (20°, 65% relative humidity) [15]. The impact strength of PVA films is high [7]
Mechanical Properties Miscellaneous: Tear strength 60 g μm^{-1} (min., 20°, 65% relative humidity, film thickness 25 μm) [15], 1.4–1.5 g μm^{-1} (20°, 65% relative humidity, film thickness 14 μm) [15], 250–800 g mm^{-1} [2]. Tear strength increases with increasing relative humidity or with the addition of small amounts of plasticiser [1,3]. Tear resistance increases with increasing degree of hydrol. and with increasing MW (viscosity) [31]. Pinhole strength 300 g (20°, 65% relative humidity, film thickness 14 μm) [15]
Hardness: Hardness increases with MW and varies inversely with moisture content [7]
Failure Properties General: Is resistant to repeated flexure [7]. PVA film is flexible and flexibility increases with increasing degree of hydrol. and increasing MW [1,3,31]. Plasticised PVA remains flexible at -40° or lower [7]
Friction Abrasion and Resistance: Coefficient of friction 0.5 μs (against self, 20°, 65% relative humidity, film thickness 14 μm) [15]. Abrasion resistance is good [7]

Electrical Properties:

Electrical Properties General: Electrical props. are affected by H_2O absorption under normal atmospheric conditions [7], and may also depend on the film thickness and the presence of doping materials such as iodine. The electrical conduction of very thin PVA films has been reported [19,20]. Electrical conductivity increases for films doped with iodine [20]. Specific surface resistance 24–35 G Ω (20°, 65% relative humidity) [15]. Specific surface resistance increases with decreasing film thickness [15]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.5–10	1 kHz	65% relative humidity [7]

Dielectric Strength:

No.	Value	Note
1	>40 $kV.mm^{-1}$	min., dry
2	0.4 $kV.mm^{-1}$	under humid conditions [7]

Strong Field Phenomena General: Electric field breakdown 30 MV cm^{-1} [19], 3000 kV cm^{-1} (room temp., film thickness 0.001–0.006 cm) [6]
Static Electrification: Static electricity charging voltage 12 V (20°, 65% relative humidity, film thickness 25 μm), 95 V (20°, 65% relative humidity, film thickness 14 μm) [15]. Static electricity half-value period 1 s (20°, 65% relative humidity, film thickness 25 μm), 1.9s (20°, 65% relative humidity, film thickness 14 μm) [15]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.03–0.1	1 kHz	65% relative humidity [7]

Optical Properties:

Optical Properties General: Refractive index depends on the temp. and the amount of absorbed H_2O. The refractive index - temp. correlation has been used to measure the T_g of PVA [11,21]. Transmittance is affected by the addition of a polarising agent *e.g.*, iodine or dichroic dye [20,22]

Refractive Index:

No.	Value	Note
1	1.55	20° [1,5]
2	1.51	[11,13]
3	1.5–1.53	depending on moisture content [7]
4	1.483–1.485	25° [14]

Transmission and Spectra: Uv permeability 75% (λ 200–400 nm, 50 μm thick film) [15], ir permeability 0% (λ 600–1700 cm^{-1}) [15]. The relationship between the transmittance at 3300 cm^{-1} in the ir spectra and film thickness for syndiotactic PVA films has been reported [5]. The optical absorption of PVA film is very low, decreasing from 8% (λ 300 nm) to 3% (λ 700 nm) with no absorption maximum [20]. Ir [6,11,13,23,24,25], C-13 nmr [25,26,27,28] and H-1 nmr [29] spectral data have been reported

Total Internal Reflection: Birefringence 0.00404–0.00481 (20°, degree of polymerisation 4400), 0.00205–0.00462 (20°, degree of polymerisation 2000) [8]. Birefringence is affected by degree of polymerisation, the concentration of PVA soln. used to form a gel and the composition of solvent (aq. DMSO) used. Solvent composition has the greatest effect on the physical props. Birefringence has a maximum value at a DMSO/H_2O composition of 70:30 [8]

Volume Properties/Surface Properties: Transparency 90.5–91.5% (decreases with increasing film thickness, ASTM D1003-61) [15]. Haze 1.5–2.5% (increases with film thickness, ASTM D1003-61) [15]. Gloss high [13,15]. Clarity high [13,15] to excellent [1]

Polymer Stability:

Polymer Stability General: Plasticised films are heat sealable at approx. 150° [7]

Thermal Stability General: Heat resistance of PVA film 206° (film thickness 25 μm, ASTM D1637) and 220° (film thickness 14μm, ASTM D1637) [15]. PVA film is not heat shrinkable [2]

Upper Use Temperature:

No.	Value	Note
1	120–140°C	[2,7]

Decomposition Details: Undergoes slow degradation above 100° [7]

Flammability: Burn rate 2.5 cm s^{-1} [2]

Environmental Stress: Has excellent resistance to uv radiation (ASTM D1435) [2,41]. Has good weathering resistance [15]. Mechanical loading of PVA films during photo- and γ-irradiation-induced degradation increases the rate of formation of oxide groups. A similar effect is observed for thermal degradation [45]

Chemical Stability: Has excellent resistance to greases and oils (ASTM D722) [2,31,41]. Has poor resistance to strong acids (ASTM D534) and strong bases (ASTM D534) [2,41]. Has good to excellent resistance to organic solvents (ASTM D543) [2,15,31,41]

Hydrolytic Stability: Has poor resistance to high relative humidity (ASTM D756) [41]

Stability Miscellaneous: Dimensional stability -3.2% (100°) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: PVA films are made by casting from soln. One method of film preparation involves gelation/crystallisation from DMSO/water solns. by drawing the film in an oven at 125° under nitrogen. Films can also be prepared by extrusion. This is difficult because the melting point and decomposition temps. are close together and a plasticiser must be added. Soln. casting is the most common method of preparation, and the film is then biaxially stretched

Applications: Water-sol. films are used for disposables such as detergent packages, dyes, composting bags and hospital laundry bags; may be used in food packaging or as a semi-permeable membrane e.g. for osmotic pressure measurements and ion exchange. Film is used as a temporary protective coating for metals, plastics and ceramics. The coating reduces damage from mechanical or chemical agents during manufacture, transport and storage. The protective films can be removed by peeling or washing with water. Film may be used as packaging for pesticides and agrochemical products, and as a laminate because of its gas barrier props. PVA films made from PVA-iodine complexes may be used as polarisers

Poly(vinyl alcohol), Foamed P-569

Related Polymers: Poly(vinyl alcohol) general information
Monomers: Vinyl acetate
Material class: Gums and resins
Polymer Type: polyvinyl alcohol
CAS Number:

CAS Reg. No.
9002-89-5
26876-25-5

Molecular Formula: $(C_2H_4O)_x$
Fragments: C_2H_4O
Additives: Formalin (formaldehyde/methanol mixture) is used as a cross-linking agent

Applications/Commercial Products:

Processing & Manufacturing Routes: A concentrated, very viscous solution of PVA in acidified formalin is impregnated with air bubbles to form a foam. The foam is treated to about 60° to form a sponge via cross-linking [1]
Applications: Poly(vinyl alcohol) sponge has medicinal uses and may also be used as a water-absorbent material

Supplier
DuPont
Hoechst
Sekisui Chem. Co Ltd

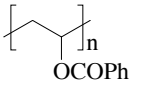
Poly(vinyl alcohol)/poly(vinyl chloride), Fibre blend P-570

Synonyms: *PVA/PVC fibre blend. Polychlal fibres*
Related Polymers: Poly(vinyl alcohol) fibres
Monomers: Vinyl chloride, Vinylacetate
Material class: Blends, Fibres and Films
Polymer Type: PVC, polyvinyl alcohol
CAS Number:

CAS Reg. No.
25822-51-9

Molecular Formula: $[(C_2H_4O).(C_2H_3Cl)]_n$
Fragments: C_2H_4O C_2H_3Cl
Additives: The fibres are treated with formaldehyde (cross-linking agent)
General Information: These fibres are unique to Japan and are closely related to poly(vinyl alcohol) and poly(vinyl chloride) fibres. Production in Japan occurs on a modest scale

Applications/Commercial Products:



Processing & Manufacturing Routes: Polychlal fibres are prod. from an emulsion of poly(vinyl chloride) and a matrix of poly(vinyl alcohol). This is wet spun into aq. sodium sulfate and treated with formaldehyde
Applications: Used in the manufacture of flame retardant apparel

Trade name	Details	Supplier
Polychlal	Japan	Nissin Spinning
Polychlal		Kojin KK

Poly(vinyl benzoate) P-571

Synonyms: *Poly(benzoyloxyethylene). PVB*
Monomers: Vinyl benzoate
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
24991-32-0

Molecular Formula: $(C_9H_8O_2)_n$
Fragments: $C_9H_8O_2$
Tacticity: Very little is given on specific tacticities; an isotactic preparation has been reported [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.198 g/cm^3	[1]
2	d^{25} 1.198 g/cm^3	[7]

Glass-Transition Temperature:

No.	Value	Note
1	71°C	[1]

Transition Temperature:

No.	Value	Note	Type
1	-70°C	100 Hz [2]	β

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(phenyl acrylate) in all proportions [9]
Solvents/Non-solvents: Sol. EtOAc, $CHCl_3$, Me_2CO, dioxane and CCl_4 [14]

Transport Properties:

Transport Properties General: Gas permeability measurements suggest that the permeability of heavier (larger) gases is greater for PVB than for PVAC; for the lighter (smaller) gases the inverse is true [11]
Polymer Solutions Dilute: [η] 0.29 dl g^{-1} (MW 133000) [5]
Permeability of Gases: [O_2] 8.05 × 10^{-8} (below T_g); 3.68 × 10^{-4} (above T_g); [N_2] 1.38 × 10^{-7} (below T_g); 1.68 × 10^{-4} (above T_g); [CO_2] 2.66 × 10^{-8} (below T_g); 9.79 × 10^{-5} cm^2 (s cmHg)$^{-1}$ (above T_g) [11]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.3	1 kHz	room temp.; monolayer [22]

Optical Properties:

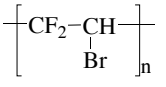
Refractive Index:

No.	Value	Note
1	1.513–1.516	[6,15]
2	1.57	30° [1]

Transmission and Spectra: Main area of interest 10–15μ region of ir spectrum. Bands of significance at 11.8 and 12.48μ, 13.25μ. Vinyl group deformations are shifted, relative to established position - a characteristic of vinyl esters [16]

Polymer Stability:

Environmental Stress: Frost resistant but may coagulate if aq. phase freezes [12]
Biological Stability: Unprotected emulsions may be susceptible to attack from microorganisms [12]



Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation of vinyl benzoate [10,12] using a typical peroxide initiator [14,3] or other radical sources e.g. azobisisobutyronitrile [4] may be stabilised with water-soluble protective colloids, anionic or non-ionic emulsifiers. Can also be prod. heterogeneously by emulsion polymerisation [8]. A number of catalysts have been developed for the preparation of polyvinyl benzoate. These include amine oxides [17], organic polyperoxides [18] and a three-component initiator system, comprising an oxidising agent, metal chelate and electron donors [19,20]. Metal-halide silane cocatalysts have also been used [21]

Poly(vinyl bromide) P-572

Synonyms: *Poly(bromoethene)*
Monomers: Vinyl bromide
Polymer Type: polyhaloolefins
CAS Number:

CAS Reg. No.
25951-54-6

Polymer Stability:

Thermal Stability General: Has poor thermal stability and is substantially less stable than PVC [1,3,4,12]
Decomposition Details: Decomposition begins at approx. 100°, dehydrobromination is the dominant reaction. Kinectics studies of decomposition shows evidence for autocatalytic reactions [1]. Activation energy of decomposition is 17 KJ mol^{-1} less than the corresponding value for PVC. Decomposition products include HBr, and aromatic compounds (e.g. C_6H_6 and naphthalene) [2,9]. Thermal degradation leads to approx. 100% of available bromine as HBr via chain-stripping reaction, after which resultant polyene undergoes degradation [15]. Mechanism of decomposition appears to be 'gradual zip growth' type; initiation step for this is not autocatalytic. Activation energy of decomposition 153 KJ mol^{-1} (for random elimination of HBr). Long polyene sequences are formed during dehydrobromination reaction (longer than those formed during corresponding dehydrochlorination reactions of PVC [16]
Environmental Stress: May darken on exposure to uv light [24]

Poly(vinyl butyral) P-573

Synonyms: *PVB*
Related Polymers: Polyvinyl formal, Polyvinyl acetal, Polyvinyl alcohol
Monomers: Vinyl acetate, Butyraldehyde
Material class: Thermoplastic
Polymer Type: polyvinyls
Molecular Formula: $[(C_8H_{14}O_2)_x(C_2H_4O)_y(C_4H_6O_2)_z]_n$
Fragments: $C_8H_{14}O_2$ C_2H_4O $C_4H_6O_2$
Molecular Weight: 30000–250000
General Information: Atactic, isotactic and syndiotactic forms known. Tacticity depends on that of poly (vinyl acetate) percursor. Isotactic chain portions acetalise more rapidly than syndiotactic. [1]. In general, commercial resins have low acetate content. Increasing acetate groups decreases hydrophobicity, lowers distortion temp. and decreases toughness. The inherent terpolymer struct. gives excellent adhesion props. May cross-link in presence of acid
Tacticity: Props. of polymer depend on MW and degree of acetalisation. Manuf. process yields a terpolymer struct, consisting of acetal, free OH and acetate groups. May contain up to 10–20% acetate and 10% OH groups. [2,3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
0	d 1.083 g/cm^3	Butvar B76 [4]
1	d 1.1 g/cm^3	Butvar B72 [4]

Glass-Transition Temperature:

No.	Value	Note
1	62.72°C	Butvar B79 [4]
2	72–78°C	Butvar B72 [4]

Deflection Temperature:

No.	Value	Note
1	50–54°C	Butvar B79, ASTM D648 [4]
2	56–60°C	Butvar B72, ASTM D648 [4]

Brittleness Temperature:

No.	Value	Note
1	-40°C	18% OH [3]
2	-32°C	25% OH [3]

Surface Properties & Solubility:

Solubility Properties General: Compatible with epoxy resins, phenolics, polyurethanes and other plasticising resins [9]
Plasticisers: Platicisers include dibutyl phthalate, dibutyl sebacate, triethylcitrate, dihexyl adipate, castor oil, phosphates, polyethylene glycols, triethylene glycol-2,2-diethyl butyrate. Compatibility with plasticisers has been reported [6]
Solvents/Non-solvents: Sol. MeOH (25% OH), EtOH, AcOH, Me_2CO (12% OH), dioxane, EtOAc (12% OH). Insol. C_6H_6 (12% OH), Me_2CO (25% OH), EtOAc (25% OH), C_6H_6 (25% OH). High degree free-hydroxyl group increases solubility in polar solvents, decreases solubility in non-polar solvents [3]
Surface and Interfacial Properties General: Adhesion increases with increasing free hydroxyl groups. [8] Potassium and lithium salts are added to reduce film adhesion.

Transport Properties:

Polymer Solutions Dilute: Viscosity 170–260 cP (MW 170000–250000) [4]; 6.0–9 (MW 40000–70000) [4]
Water Absorption:

No.	Value	Note

Refractive Index:

No.	Value	Note
1	1.485–1.49	Butvar, ASTM D542 [4]

Transmission and Spectra: Nmr spectral data have been reported [4]

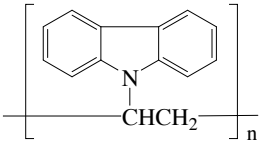
Polymer Stability:

Polymer Stability General: Colours with ageing and thermal degradation
Upper Use Temperature:

No.	Value	Note
1	93°C	200°F

Flammability: Fl. pt 370° (min.). Burns smoothly and completely
Chemical Stability: Stable to aromatic hydrocarbons, aliphatic hydrocarbons, esters, ketones; attacked by alcohols. High butyral content decreases solvent resistance
Hydrolytic Stability: Good resistance to weak and strong bases (ASTM D543) [4] and to weak acids
Biological Stability: Non toxic

Applications/Commercial Products:



Processing & Manufacturing Routes: Produced by 2 methods. Poly(vinyl acetate) is saponified in MeOH with NaOH, the alcohol purified and dissolved in water and created with butyraldehyde and hydrochloric acid at 0° - hetergeneous acetalisation. [10] Alternatively, the saponified poly(vinyl acetate) in MeOH is treated with butyraldehyde and hydrochloric acid at -60° - homogeneous acetalisation [11]
Applications: Major use of film is as a laminate in safety glass for automotive use eg windscreens. Also used in bullet-proof and other glass products. Other uses are as ceramic binders. Surface coatings for wood, structural adhesives (combined with other resins) in printed circuits, inks and dyes, paints; solder masks and hot melt adhesives. Improves water and stain resistance of textiles

Poly(*N*-vinylcarbazole) P-574

Synonyms: *Poly(9-ethenyl-9H-carbazole). PVK. PVCZ. Poly[1-(N-carbazolyl)ethylene]. PNVK. PNVC. PVCA*
Monomers: *N*-Vinylcarbazole
Material class: Thermoplastic
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
25067-59-8	homopolymer

Molecular Formula: $(C_{14}H_{11}N)_n$
Fragments: $C_{14}H_{11}N$
Molecular Weight: M_n 11000 (film)
Additives: Addition of additive changes wavelength of radiation which produces photoconduction [2,3]. Small amounts of styrene (0.1–2%) as a copolymer increase workability [34]
General Information: A brittle photoconductive polymer. The polymer has some toxicity due to residual monomer being present
Morphology: Unit cell of PVK is orthorhombic with pseudo hexagonal packing of the polymer chains. Orthorhombic unit cell a 21.6Å, b 12.5Å [15] (melt extruded PVK). Previously assigned as hexagonal unit cell $a_1=a_2=a_3$ 12.3Å [2,15]. X-ray spacings 10.8Å, 21.5Å, 8.44Å, 6.15Å [15] (melt extruded PVK)
Miscellaneous: First known organic photoconducting polymer; conducts on exposure to uv wavelengths [2,3]. A green conducting form of PNVK is formed by electropolymerisation of *N*-vinylcarbazole [12]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.184 g/cm^3	amorph. [15]
2	d 1.191 g/cm^3	approx., extruded
3	d 1.193 g/cm^3	crystallisation [2,15]
4	d 1.2 g/cm^3	Polectron, Luvican [2,34]
5	d 1.19 g/cm^3	DIN 1306 [35]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4.5×10^{-5}–5.5×10^{-5} K^{-1}	Polectron [2,34]	L
2	5.7×10^{-5} K^{-1}	20–100°, Luvican [2,34]	L

Equation of State: Mark-Houwink equation of state parameters have been reported [17,18,26]
Thermodynamic Properties General: Specific heat values have been reported [2,34]
Thermal Conductivity:

No.	Value	Note
1	2.51 W/mK	0.006 cal cm^{-1} s^{-1} K^{-1}, Luvican [34]
2	0.125 W/mK	0.0003 cal cm^{-1} s^{-1} K^{-1}, 20° [35]
3	0.164 W/mK	0.00039 cal cm^{-1} s^{-1} K^{-1}, 173° [35]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.6 kJ/kg.C	160° [14]	P

Melting Temperature:

No.	Value	Note
1	290°C	[34]

Glass-Transition Temperature:

No.	Value	Note
1	227°C	amorph. [2]
2	195–200°C	values in this range contain approx. 4% carbazole and other impurities in the polymer [9]
3	225°C	[21,22]

Transition Temperature General: Flow temp. 270° (Luvican) [2]. Shape stability temp. 160–170° (Martens); 200° (Vicat); 150° (ASTM) [35].
Deflection Temperature:

No.	Value	Note
1	100–150°C	ASTM [2,34]

Vicat Softening Point:

No.	Value	Note
1	150°C	Martens [2], Luvican [34]
2	190°C	Vicat [2], Luvican [34]

Transition Temperature:

No.	Value	Note	Type
1	80°C	carbazole wagging motion [21,22]	β
2	-60°C	rotational libration of pendant carbazole group, only in presence of oxygen [21,22]	γ
3	-160°C	carbazole localised backbone motion [21,22]	δ

Surface Properties & Solubility:

Plasticisers: Plasticisers to reduce brittleness include benzyl tetralin, amyl naphthalene, phenanthrene, diamylbiphenyl terphenyl, tritolyl phosphate, diphenyl and polyglycols [34]
Solvents/Non-solvents: Sol. C_6H_6 [34], dioxane [10], THF, $CHCl_3$, tetrachloroethane [17], aromatic hydrocarbons [34], 1,2-dichloroethane, nitrobenzene, chlorobenzene [26]. Mod. sol. cyclohexanone [17]. Insol. MeOH, hexane [9], aliphatic alcohols, esters, ethers, ketones [34]

Transport Properties:

Polymer Solutions Dilute: Theta temp. θ -36.5° (chlorobenzene) [28], θ -20.4° (nitrobenzene), θ 37° (toluene) [18]. Table of interaction parameter (B) for chlorobenzene and nitrobenzene at 25–45° have been reported [26]. Dipole moment vs. weight fraction of solute in 1,4-dioxan has been reported [34]. Kerr constants of PVK in 1,4-dioxan [32] have been reported. Viscosity coefficient 40–100 (Luvican) [34]
Water Absorption:

No.	Value	Note
1	0.1 %	Polectron [2,34]
2	0.012 %	1 week, Luvican [2,34]

Mechanical Properties:

Mechanical Properties General: Strain failure 1.1% (extruded) [14]; 0.3% (amorph.) [14]

Tensile (Young's) Modulus:

No.	Value	Note
1	4120 MPa	597 kpsi, extruded PNVK [14]
2	4000 MPa	580 kpsi, amorph., Polectron [2,14,34]
3	3240 MPa	470 kpsi, Luvican [2,34]

Tensile Strength Break:

No.	Value	Note	Elongation
1	12.41 MPa	1800 psi, Polectron [2,34]	0.32%
2	14.13 MPa	2050 psi, Luvican [2,34]	
3	124–138 MPa	18–20 kpsi, oriented fibres [2,34]	

Flexural Strength at Break:

No.	Value	Note
1	10.34–12.41 MPa	1500–1800 psi, Polectron [34]
2	37.9–47.5 MPa	5500–6900 psi, Luvican [34]

Compressive Strength:

No.	Value	Note
1	33 MPa	4800 psi, Luvican [2,34]

Impact Strength: Impact strength 9.8 J m^{-1} (0.19 ft lb in^{-1}, Polectron) [2]; 117 J m^{-1} (2.2 ft lb in^{-1}, Luvican) [2,34]. Impact bending stress 10–15 cm kg^{-1} cm^{-1} (Luvican) [2,34]
Hardness: Rockwell R113–R125 (Polectron) [2,34]
Fracture Mechanical Properties: Shear strength 24.13 MPa (3500 psi, Polectron) [34]

Electrical Properties:

Electrical Properties General: Dipole moment and dielectric permittivity values have been reported. [10,11,13] DC dark

conductivity has been reported [31]. $\Delta\epsilon \cong 0.39$ eV. Threshold ionisation potential 5.85 eV [20]. Conductivity of green film prod. by electrochemical polymerisation of *N*-vinylcarbazole 3×10^{-5} Ω^{-1} cm^{-1} [19]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4.96	100 kHz	AIBN polymerised [14]
2	4.6	1 MHz	AIBN polymerised [14]
3	2.99	10 Hz	[10]

Dielectric Strength:

No.	Value	Note
1	11–86 $kV.mm^{-1}$	25–150° [34]
2	40 $kV.mm^{-1}$	2.5 mm thick samples [34]
3	120 $kV.mm^{-1}$	0.225 mm thick samples [34]

Arc Resistance:

No.	Value	Note
1	20s	0.15 in. thick, ASTM D495-42 [34]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0027	100 kHz	[14]
2	0.0022	1 MHz	[14]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.68	[23]
2	1.69	20° [2,34]

Transmission and Spectra: H-1 nmr [5,6,19,34], C-13 nmr [7,8,13,25], ir [12,15,30], Raman [12], x-ray [15,16], electron diffraction [16], uv [23,35] and fluorescence [35] spectral data have been reported

Volume Properties/Surface Properties: Electrochemically polymerised PNVK has a green colour due to bicarbazoyl groups [19]. The 'normal' PNVK is white [19]

Polymer Stability:

Thermal Stability General: Degradation studies have been reported [4,14,24]

Upper Use Temperature:

No.	Value	Note
1	120°C	Luvican [2,34]
2	150–200°C	[34]
3	300°C	approx.

Decomposition Details: Below 260° minimal weight loss occurs, above 300° noticeable weight loss due to depolymerisation occurs and above 410° pyrolysis is complete after 18h [4]. Polymer becomes cross-linked and insol. when heated up to 410° [4,14]

Environmental Stress: Sunlight causes slight discoloration [34]

Chemical Stability: Decomposes to carbazole when soln. is passed through silica gel [4]. Attacked by conc. sulfuric acid or conc. nitric acid [34]. Resistant to alkalis (60% sodium hydroxide at 160°), dilute acids (including hydrofluoric acid) [34]. Unaffected by paraffinic compounds and mineral oils [34]

Hydrolytic Stability: Rapidly attacked by 0.5% sodium chlorite soln. at 80°. [34] Resistant to water

Stability Miscellaneous: Low temp. mech. destruction leads to radical products. Room temp. destruction gives more stable products [33]

Applications/Commercial Products:

Processing & Manufacturing Routes: Thin films can be obtained by vapour deposition polymerisation of *N*-vinylcarbazole using a heated filament [39] or a low pressure mercury lamp. [40] The moulded polymer may be turned, sawn, milled and polished by machines with cutting angles set for brass [34]

Applications: Used as a capacitor dielectric, in switch parts, cable connectors, coil formers, cable spacers, stand-off insulators. Has photoconducting applications in electric photographic processes such as photocopying. Has also found applications in micro-lithography, holographic recording, blue-green electrochromic displays and optical switching devices. Thin films used as layer in organic electroluminescent devices for flat optical displays

Poly(vinyl chloride-*co*-acrylonitrile) P-575

Synonyms: *Vinyl chloride-acrylonitrile copolymer. Poly(chloroethene-co-2-propenenitrile). VCA. VCl/AN copolymer. Modacrylic fibres*
Related Polymers: PVC Copolymers, Polyvinyl chloride, unplasticised, Polyacrylonitrile
Monomers: Vinyl chloride, Acrylonitrile
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, acrylonitrile and copolymerspolyhaloolefins
CAS Number:

CAS Reg. No.
9003-00-3
30642-67-2

Molecular Formula: $[(C_2H_3Cl).(C_3H_3N)]_n$
Fragments: C_2H_3Cl C_3H_3N
Additives: Plasticisers; heat stabilisers
General Information: Copolymers form the basis of useful fibres with low flammability; typical compositions often contain vinyl chloride as minor constituent (10–15%); original Dynel modacrylic fibres, however, had copolymer composition of 60/40 vinyl chloride/acrylonitrile; cheaper than materials with higher acrylonitrile content, and PAN homopolymer [6]. Fibres show good dyeing characteristics [3]
Morphology: Fibres have low degree of crystallinity; no significant changes after stretching or heating [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3 g/cm^3	approx., fluxed resin [3]

Glass-Transition Temperature:

No.	Value	Note
1	90°C	40 wt.% acrylonitrile [2,3]

Transition Temperature General: Softening points are higher than PVC homopolymer; lower than PAN homopolymer (fibres readily shrink unless stabilised) (40 wt.% acrylonitrile) [6]; softening points are increased after prolonged exposure to elevated temps. [3]

Deflection Temperature:

No.	Value	Note
1	85°C	approx., 40 wt.% acrylonitrile, moulded resin, ASTM D648 [3]

Surface Properties & Solubility:

Solubility Properties General: Resins become markedly less sol. in organic solvents as a result of exposure to elevated temps. [3]; copolymers show improved solubilities in organic solvents, particularly in Me_2CO, compared with both homopolymers
Plasticisers: *o*- and *p*-toluene ethyl sulfonamides; tetrahydrofurfuryl phthalate [3]
Solvents/Non-solvents: Sol. Me_2CO, cyclohexanone, DMF. Spar. sol. higher aliphatic ketones [3]

Transport Properties:

Transport Properties General: Flow characteristics of copolymer resins are poor compared to those of PVC/PVA, [3]
Polymer Solutions Dilute: η_{sp} 0.25–0.3 (40 wt.% acrylonitrile, 0.2% soln. in cyclohexanone) [3]
Polymer Melts: Has higher melt viscosity than PVC homopolymer
Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	43.34 cm^3 mm/(m^2 day atm)	0.66×10^{-10} cm$_2$ (s cm Hg)$^{-1}$, 23°, 40 wt% acrylonitrile, 20% cryst. [1]
2	[CO_2]	131.33 cm^3 mm/(m^2 day atm)	2.0×10^{-10} cm$_2$ (s cm Hg)$^{-1}$, 23@0, 40 wt% acrylonitrile, 20% cryst. [1]

Mechanical Properties:

Mechanical Properties General: Fibres have slightly lower strengths than those of higher acrylonitrile copolymers or PAN homopolymer [6]; outdoor ageing leads to decline in strength [3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.53	40 wt.% acrylonitrile [6]

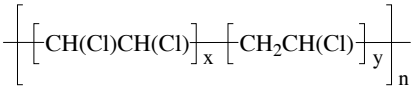
Total Internal Reflection: Birefringence 0.003 (approx., 40 wt.% acrylonitrile) [6]
Volume Properties/Surface Properties: Colour light amber to dark brown (fluxed resin, 40 wt.% acrylonitrile) [3]; fibres display high gloss

Polymer Stability:

Flammability: Fibres have low flammability [6]
Environmental Stress: Fibres display good resistance to sunlight [6]; however, bleaching occurs after exposure to strong sunlight [3]
Chemical Stability: Moderately resistant to acids and alkalis, but attacked by hot alkalis [6]; more readily swollen or dissolved by common organic solvents, as compared to PAN homopolymer [6]
Hydrolytic Stability: Fibres display good resistance to water (e.g. moisture regain 0.5–1% at 65% relative humidity) [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation of comonomer mixture occurs by free-radical initiation (e.g. azo-compounds, peroxides, persulfates, etc.) in aq. emulsions or organic solvents (e.g. Me_2CO, ethylene carbonate, THF, etc.). Polymer soln. can be spun directly into hot H_2O, followed by stretching, to give 'modacrylic' fibres [6]. Graft copolymers are prepared by the reaction of acrylonitrile [4] (or acrylonitrile/ethyl acrylate [5]) in the presence of PVC. Resin can also be compression moulded but has comparatively poor flow characteristics compared to PVC/PVA



Applications: Fibres find applications due to flameproof props. and low cost (cf. PAN homopolymer fibres) in blankets, carpets, curtains/draperies; filter cloths and media (e.g. dust collection bags); work clothes; children's nightwear; mouldable fabrics. Miscellaneous uses of fibres as membranes in ultra filtration - e.g. will preferentially extract partially sol. alcohols from H_2O; in felts, as electrode binders and absorbers, and vented cell separators in secondary batteries/alkaline cells; in triboelectric valves (for air pollution control). Terpolymer (with ethyl acrylate) used for flooring

Trade name	Details	Supplier
Dynel	Fibres; also used to refer to other acrylic-based materials	Union Carbide
Dynel NYGL	Fibres; AN/VC copolymer	Union Carbide
Vinyon N	Fibres; AN/VC copolymer; 'Vinyon' also used to refer to other vinyl-based materials	Carbide and Carbon Chem.

107248-35-1

Molecular Formula: $[(C_2H_2Cl_2).(C_2H_3Cl)]_n$
Fragments: $C_2H_2Cl_2$ C_2H_3Cl
General Information: Higher softening point and better solubility than PVC. Obtained by post-chlorinating PVC to a chlorine content of 62–70%; typical commercial materials contain 66–67% chlorine [1,2]. Can be regarded as hypothetical 'copolymer' of vinyl chloride and symmetrical dichloroethylene [1]. Fibres (62–65% chlorine) have x = y in struct. unit; mainly CHCl-CHCl, but with some CH_2-CCl_2 [1]. Heat-resistant chlorinated form ("high-temp. PVC") has x > > y in struct. unit (high chlorine content) [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.54 g/cm^3	[1]
2	d 1.44 g/cm^3	fibres, 62–65% chlorine content [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.7×10^{-5}–8×10^{-5} K^{-1}	25–50° [1]	L
2	9.4×10^{-5} K^{-1}	50–70° [1]	L
3	4×10^{-5}–6.9×10^{-5} K^{-1}	70–100° [1]	L

Thermodynamic Properties General: C_p/C_v 0.29 [1]
Thermal Conductivity:

No.	Value	Note
1	0.039 W/mK	0.00039 cal cm^{-1} s^{-1} °C^{-1} [1]

Glass-Transition Temperature:

No.	Value	Note
1	110°C	approx., typical commercial material, 66–67% Cl content [2]

Deflection Temperature:

No.	Value	Note
1	98–105°C	1.8 MPa, 0.185 kg f mm^{-2}, normal grades [1]
2	83.2°C	1.8 MPa, 0.185 kg f mm^{-2}, transparent grade [1]
3	90.6°C	0.45 MPa, 0.046 kg f mm^{-2}, transparent grade [1]

Vicat Softening Point:

No.	Value	Note
1	110–128°C	normal grades [1]
2	96°C	transparent grade [1]

Transition Temperature:

No.	Value	Note	Type
1	100°C	approx., typical commercial material, 66–67% Cl content [2]	Softening temp.
2	102–107°C	normal grades [1]	Softening temp.
3	87°C	transparent grades [1]	Softening temp.

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends with PVC at 62.2% chlorine; multiphase system produced above 67.5% chlorine [4,5]
Cohesive Energy Density Solubility Parameters: Solubility parameter, δ 19 J$^{1/2}$ cm$^{-3/2}$ (9.3 cal$^{1/2}$ cm$^{-3/2}$, 25°) [3]
Solvents/Non-solvents: Displays better solubility than 'ordinary' PVC. Sol. aromatic hydrocarbons, $CHCl_3$, chlorobenzene, THF, dioxane, Me_2CO, cyclohexane, cyclohexanone, butyl acetate, tetrachloroethylene, nitrobenzene, DMF, DMSO (63% chlorine

content) [1,6]. Swollen by butanol, conc. hydrochloric acid, nitric acid [1]. Insol. aliphatic hydrocarbons, cycloaliphatic hydrocarbons, CCl_4, methyl acetate, nitromethane, organic acids, dil. inorganic acids, conc. sulfuric acid, dil. alkalis, glycerol, petroleum [1,6]

Transport Properties:

Polymer Melts: Effects of temp., frequency and strain amplitude on dynamic viscosity for varying chlorinated compositions have been reported; results obtained compare with those of PVC. Strong temp. dependence of rheological behaviour reflects significant structural changes [7]

Water Absorption:

No.	Value	Note
1	0.048–0.08 %	0.75" pipe, 24h, 23° [1]
2	0.49 %	28 days, 23°
3	14.3 %	100° [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2840–3236 MPa	290–330 kg f mm^{-2} [1]

Compressive Modulus:

No.	Value	Note
1	1863–1961 MPa	190–200 kg f mm^{-2} [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	58.8–65.7 MPa	8.9%	6.0–6.7 kg f mm^{-2} [1]

Compressive Strength:

No.	Value	Note
1	80.4–86.2 MPa	8.6–9.1% compression, 8.2–8.8 kg f mm^{-2} [1]

Hardness: Rockwell R117-R119 [1]

Izod Notch:

No.	Value	Notch	Note
1	3.92–10.8 J/m	Y	0.4–1.1 kg f mm^{-1}, impact modified [1]

Charpy:

No.	Value	Notch	Note
1	4.7–14.7	Y	0.48–1.5 kg f mm^{-1}, impact modified [1]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.93	60 Hz	30°, 55% relative humidity [1]
2	2.92	10 kHz	30°, 55% relative humidity [1]
3	2	1 MHz	20°, 55% relative humidity [1]

Dielectric Strength:

No.	Value	Note
1	39 kV.mm^{-1}	30° [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0109	60 Hz	30°, 55% relative humidity [1]
2	0.011	1 kHz	30°, 55% relative humidity [1]
3	0.009	1 MHz	30°, 55% relative humidity [1]

Optical Properties:

Molar Refraction: dn/dc 0.045–0.73 ml g^{-1} (56–66% Cl, 25°, tetrachloroethane) [8]

Polymer Stability:

Thermal Stability General: Longitudinal heat shrinkage 0–3% (80–140°, transparent sheet) [1]. Transverse heat shrinkage 0.5–1% (80–140°, transparent sheet) [1]. Thermal stability during processing is inferior to that of ordinary PVC, [1]

Hydrolytic Stability: Slightly hygroscopic

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by post-chlorinating PVC to a chlorine content of 62–70% PVC dissolved in chlorinated solvent; can be carried out at low temps.; photochemical methods can be used. Products can be moulded (injection or compression), extruded, thermo-formed or calendered into sheets. Fibres for textiles are stretch-spun into hot H_2O from dil. (30%) Me_2CO solns. [1,2]. Drying at 90–100° for 1–2h recommended before processing/fabrication [1]

Applications: Hot water pipes, containers (heat tolerant), adhesives. Applications due to high softening point and superior chemical resistance. Moulded products include waste and soil systems (passing hot water); chemical plant. Calendered sheet used in hot filling techniques (*e.g.* jam packing). Fibres used in filter fabrics; tarpaulins; belting; nets (fishing). Miscellaneous uses include adhesives and lacquers

Poly(vinyl chloride), Crystalline P-577

Synonyms: *PVC, Crystalline. Crystalline PVC. Crystalline poly(-vinyl chloride)*
Related Polymers: Polyvinyl chloride, unplasticised, Polyvinyl chloride, Plasticised
Monomers: Vinyl chloride
Material class: Thermoplastic
Polymer Type: PVC, polyhaloolefins
Molecular Formula: $(C_2H_3Cl)_n$
Fragments: C_2H_3Cl
Molecular Weight: Can be produced in a wide range of MWs; chain-transfer reaction suppressed at low temps., with greater control over MW by adjustment of initiator concentrations; very high MW material (K-values $\geq$130) can be easily prepared [3]
Additives: Plasticisers (esters); stabilisers; toughening agents and impact modifiers (EVA polymers most effective)
General Information: The effects of polymerisation temp., degree of branching and stereoregularity affect the struct. and physical props.; syndiotacticity is the major contributing factor. Development of stereoregular polyolefins and polydienes arising from discovery of Ziegler-Natta-type catalysts stimulated attempts to produce vinyl chloride polymers with increased stereoregularity. Usual Ziegler-Natta catalysts cannot be used for vinyl chloride as they react with both monomer and polymer. Production of highly crystalline PVC can be achieved by low-temp. free-radical polymerisation using γ-irradiation and active substances such as alkyl boranes. Major differences when compared to conventional PVC, are considerable change in microstruct., *i.e.* degree of crystallinity and syndiotacticity increased; solubility (and swelling) reduced; resistance to solvents increased; increase in heat distortion temp.; tensile strength and creep resistance increased; T_g raised (consequence of decreased polymerisation temp.); T_m increased; Vicat softening point increased; increased brittleness (major disadvantage) as direct consequence of increased crystallinity. Changes in physical props. are caused primarily by differences in stereoregularity
Tacticity: Syndiotactic propagation is favoured over isotactic propagation in radical polymerisation of vinyl chloride if polymerisation temp. is reduced [4]; difference in activation enthalpy between two forms is approx. 600 cal mol^{-1} [4,5,6]; degree of syndiotacticity approx. 0.65 for material polymerised at -50° (measured by high-resolution pmr and ir spectroscopy) [1,4]
Morphology: Level of crystallinity 25% (polymerisation temp. -60°) [3]; 20% (polymerisation temp. -50° [1,3,4,6,7]. Degree of branching (from ir spectroscopy) reduced when compared to conventional PVC, (reduction in polymerisation temp.) [4]. Generally agreed that only syndiotactic sequences in PVC are capable of crystallisation [4]; x-ray cryst. struct.: orthorhombic, a 10.6, b 5.4, c 5.1 Å [9,10]; crystallites have small dimensions, of the order of 50–100 Å, or even less; order is poor along chain length [8]. Preparation of (apparently) completely syndiotactic polymer, by the x-ray irradiation of vinyl chloride-urea canal complex at -78°, has been reported. Highly stereoregular struct. indicated by ir spectroscopy and reduced solubilities in common organic solvents [11]
Miscellaneous: Extensive details on props. of crystalline form have been reported [3,4]. Plasticised materials can be produced, although mixing temps. of up to 190° are necessary [1]; some evidence that degree of crystallinity slightly higher in plasticised compositions, with consequent increase in brittleness for such materials [2]

Volumetric & Calorimetric Properties:

Volumetric Properties General: Shrinkage of oriented material can be much lower than that of conventional PVC; *e.g.* 10% shrinkage of fibres at 150° [4]. More dense than conventional PVC
Melting Temperature:

No.	Value	Note
1	273°C	syndiotactic, calc. [4,7]
2	310°C	77% syndiotactic, 84% crystalline [2]

Glass-Transition Temperature:

No.	Value	Note
1	81°C	polymerised at 50° [4]
2	100°C	polymerised at -30° [4]
3	106°C	polymerised at -50° [4]

Transition Temperature General: T_m increases with increasing stereoregularity. T_g increases with a decrease in polymerisation temp.; consequence of both stereoregularity and degree of crystallinity [4]; influenced by additives and processing conditions. Vicat softening point increases with a decrease in polymerisation temp. [15]; consequence of both stereoregularity and degree of crystallinity [4]; 15° higher than conventional PVC; influenced by additives and processing conditions [4]; has effect on processing, *e.g.* critical processing temp. 210° (min.) required [3]
Deflection Temperature:

No.	Value	Note
1	92°C	1.88 MPa (264 lb ft in^{-2}), polymerised at -40° [4]

Vicat Softening Point:

No.	Value	Note
1	100°C	approx., polymerised at -40° [4]

Surface Properties & Solubility:

Solvents/Non-solvents: Solubility in organic solvents much lower than that of conventional PVC; sol. THF, cyclohexanone (130°); insol. THF, cyclohexanone (room temp.) [4]

Mechanical Properties:

Mechanical Properties General: Has higher tensile strengths (at break) and Young's moduli than conventional PVC [17], plus greater resistance to creep [4]. Mech. props. are greatly influenced by processing conditions [4]. Plasticised compositions display different mech. props. to those of equivalent plasticised conventional PVC materials [4]; elasticity modulus is 3 times as large, with rupture strain being usually much smaller [4]. Fibres made from crystalline PVC have high tensile strength [4]; Young's modulus above softening point much higher than that of conventional PVC [4]
Impact Strength: Has lower impact strengths than conventional PVC [4]; typical value 3.92 kJ m^{-2} (4 kgf cm cm^{-2}) [18]; improved by addition of EVA 11.8 kJ m^{-2} (12 kgf cm cm^{-2}) [18]
Mechanical Properties Miscellaneous: Dynamic mech. props. (such as storage modulus) are very similar to conventional PVC from -150–50° [4,19]; above 50°, show significant differences; at 140°, storage modulus improved by factor of 4 [4]; such differences also maintained in plasticised compositions, *e.g.* creep compliance can be 4–6 times lower than that of normal PVC up to relatively high temps. [4]. Higher crystallinities lead to increased brittleness; further increased by presence of plasticisers [2]; harder and stiffer products produced [2]

Polymer Stability:

Thermal Stability General: Does not differ markedly from that of conventional polymer; consequently has effect on processing conditions [16]
Hydrolytic Stability: Is resistant to hot H_2O [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical polymerisation of vinyl chloride at low temps. (-80°) using γ-irradiation or very active reagents such as boron or aluminium alkyls [2,3], in conjunction with oxygen, halogens or peroxides [3]; conventional redox catalysts [3] and uranyl nitrate (photopolymerisation) [10] have also been used as initiators. Preparation of crystalline material has been the subject of extensive investigation [12,13,14]. Ziegler-Natta catalysts cannot be used as both monomer and polymer react with them [1,3]
Applications: Although of great potential interest, *e.g.* increased heat distortion temp. and greater tensile strength and creep resistance than conventional polymer, no appreciable commercial development of crystalline material appears to have taken place. Increased temps. needed for thermoplastic processing and relatively brittle, expensive products obtained which are rather expensive, preclude any significant developments

Poly(vinyl chloride-*co*-*N*-cyclohexylmaleimide) P-578

Synonyms: *Vinyl chloride-N-cyclohexylmaleimide copolymer. Vinyl chloride-cyclohexylmaleimide copolymer*
Related Polymers: Polyvinyl chloride, unplasticised, PVC copolymers
Monomers: Vinyl chloride, *N*-Cyclohexylmaleimide
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, polyhaloolefins
CAS Number:

CAS Reg. No.
28210-06-2

Molecular Formula: $[(C_2H_3Cl).(C_{10}H_{13}NO_2)]_n$
Fragments: C_2H_3Cl $C_{10}H_{13}NO_2$

General Information: Improved heat deformation props. compared to PVC without affecting processing or clarity. Incorporation of approx. 5% cyclohexylmaleimide as comonomer improves softening point of PVC homopolymer; no detrimental effects on processing temps./conditions and hence stability; clarity also maintained [1]
Morphology: Degree of crystallinity increases with polymerisation temp. [5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.47 g/cm^3	approx., bulk, DIN 53468 [4]

Glass-Transition Temperature:

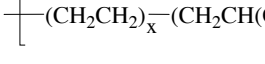
No.	Value	Note
1	90°C	transparent film, increases with polymerisation temp. [4]

Transition Temperature General: Introduction of 5% comonomer increases Vicat and heat distortion temps. by 7° [3], and significantly increases T_g [3]. Copolymer displays higher heat distortion temp. than polyvinyl chloride, good workability and high resistance to heat fatigue [4]
Vicat Softening Point:

No.	Value	Note
1	87°C	5% comonomer [4]

Transport Properties:

Polymer Melts: [η] 8.8 dl g^{-1} (approx., 5% *N*-cyclohexylmaleimide, DIN 53726) [4]



Applications/Commercial Products:

Poly(vinyl chloride-*co*-ethylene) P-579

Synonyms: *VC/E copolymer. Vinyl chloride-ethylene copolymer. Poly(chloroethene-co-ethene). VCE*
Related Polymers: PVC Copolymers, Polyvinyl chloride, unplasticised
Monomers: Vinyl chloride, Ethylene
Material class: Thermoplastic, Copolymers
Polymer Type: polyethylene, PVCpolyhaloolefins

CAS Number:

CAS Reg. No.
25037-78-9

Molecular Formula: $[(C_2H_3Cl).(C_2H_4)]_n$
Fragments: C_2H_3Cl C_2H_4
Molecular Weight: MW decreases with increasing ethylene content. M_n 26000, 50000. MW 109000 (84.3 mol% vinyl chloride copolymer, reductive dechlorination of PVC); MW 38000 (13.6 mol% vinyl chloride copolymer, reductive dechlorination of PVC)
Additives: Plasticisers; stabilisers; lubricants
General Information: Copolymers contain relatively small amounts of ethylene comonomers; softer, easier flowing material than homopolymer; can be processed at lower melt temps. [1]. Copolymers have generally similar props. and uses to those of propylene copolymers. Limited commercial use, as considerably more expensive than poly(vinyl chloride)-*co*-vinyl acetate
Miscellaneous: Random copolymer produced, with broad compositional distribution, using Ziegler-Natta catalyst system (Al/Ti <2.5 (molar)); block copolymer (rich in ethylene), along with random copolymer (rich in vinyl chloride), produced when Al/Ti >3 (molar) [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.43–0.58 g/cm^3	bulk density; dependent on copolymer composition [26]

Glass-Transition Temperature:

No.	Value	Note
1	38°C	20% PE [3,7]
2	60°C	10% PE [3,7]

Surface Properties & Solubility:

Plasticisers: Ethylene as internal plasticiser is 2–3 times more efficient than bis(2-ethylhexyl) phthalate; crystallinity still retained in all copolymers examined [21]

Transport Properties:

Transport Properties General: Ease of melt flow increases with increasing ethylene content [5]
Melt Flow Index:

No.	Value	Note
1	>0.5 g/10 min	min., 2–10% PE [8]
2	70.4 g/10 min	4.7% PE, typical value; resin blended with stabiliser [8]
3	17 g/10 min	suspension polymerisation, 6.3 wt% ethylene, ASTM D1238-57T-F [10]

Polymer Solutions Dilute: Reduced specific viscosity η_{sp} 0.1734–0.4234 (66–77 mol% vinyl chloride, THF) [9]. Inherent viscosity η_{inh} 1.17 dl g^{-1} (1 wt% ethylene), 1.18 dl g^{-1} (3.7 wt% ethylene), 1 dl g^{-1} (4 wt% ethylene), 0.94 dl g^{-1} (5.5 wt% ethylene) [21]
Polymer Melts: Intrinsic viscosity decreases with increasing PE content; typical values 0.76 dl g^{-1} (2.5% PE) [6]; 0.67 dl g^{-1} (2.7% PE) [6]; 0.6 dl g^{-1} (4.7% PE; resin blended with stabiliser) [8]; 0.8 dl g^{-1} (suspension polymerisation, 6.3 wt% ethylene) [10]; 0.5–1.5 dl g^{-1} (2–10% PE) [8]

Mechanical Properties:

Mechanical Properties General: Presence of comonomer has comparatively little adverse effect on mech. props. of PVC homopolymer (in contrast to PVCA) [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	>6864.6 MPa	min., 7000 kg mm^{-2}, 'apparent' values; 2–10% PE at 40–75° [8]

Izod Notch:

No.	Value	Notch	Note
1	21.2 J/m	Y	0.4 ft lb in^{-1}., 4.7% PE; typical value; resin blended with stabiliser [8]

Optical Properties:

Transmission and Spectra: Ir 750 cm^{-1} (THF soluble fraction; random copolymer) [9]. C-13 nmr spectral data have been reported for series of copolymers (97.6–14.7 mol% ethylene) [22]. Comprehensive study of ir spectral data of full range of copolymers (97.6–14.7 mol% ethylene) has been reported [19,20]

Polymer Stability:

Thermal Stability General: Presence of comonomer has comparatively little adverse effect on thermal stability of PVC homopolymer [5]
Flammability: Inherently flame retardant (emulsion/latex forms) [2]
Chemical Stability: Displays excellent resistance to alcohols and greases (emulsion/latex forms) [2]
Hydrolytic Stability: Displays excellent resistance to water (emulsion/latex forms) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Free-radical polymerisation of mixture of comonomers; emulsion and suspension polymerisation most commonly used; melt processing of latter using injection moulding and vacuum moulding techniques [2,4]. Copolymerisation reactivity parameters have been reported [3]. Offers outstanding plasticiser absorption, quick gelation and excellent flow behaviour [2]. Copolymerisation can be effected by using a Ziegler-Natta catalyst system of $AlEtCl_2$/Ti(*n*-OBu)$_4$; mixture of block and random copolymers produced, dependent on Al/Ti ratio [9]. Synth. of copolymers by partial reduction of PVC using tributyltin hydride has also been reported [22]. Copolymerisation occurs by the following methods: suspension polymerisation to produce materials with high melt indexes [10]; bulk polymerisation (or in inert solvent) with reaction stopped at 5–20% conversion by addition of Lewis base. Semi-rigid copolymers produced, exhibiting improved transparencies and surface smoothness [11]; emulsion polymerisation to produce coatings [15], pastos (under pressure) [12], and non-sticky, transparent elastic films (graft polymers) [18]; production of elastomeric materials for use as self-extinguishing mastics, adhesives or coatings [17], and for mouldings with enhanced impact strength and elongation [13]
Applications: Applications of moulded components: phonographic discs; electrical components; sheets; formed and rigid profiles; vacuum moulded plates Film applications highly elastic forms; flexible and rigid transparent forms. Miscellaneous uses in blown bottles; flexible tubes; leather (shoes, boots); crash pads; wire and cable insulation. Applications due to flexibility and water resistance in caulks, mastics and barrier coats (building industry); non-conductive and dielectric products; carpet backings; surfactant stabilisation (emulsion polymerisation). Applications due to flame retardancy as non-woven binder for fibrefill and high loft stock; binder for flame-retardant fabrics and heat-sensitive nonwovens; filters; textiles (latex). Also used as cross-linkable flexible binder and saturant for paper and paperboard applications (latex)

Poly(vinyl chloride), Plasticised P-580

Synonyms: *Plasticised PVC. Plasticised poly(vinyl chloride). Plasticised poly(chloroethene). PPVC. PVC-P*
Related Polymers: Polyvinyl chloride, unplasticised, Poly(vinyl chloride-*co*-vinyl acetate), PVC copolymers
Monomers: Vinyl chloride
Material class: Thermoplastic
Polymer Type: PVC, polyhaloolefins

CAS Number:

CAS Reg. No.
9002-86-2

Molecular Formula: $(C_2H_3Cl)_n$
Fragments: C_2H_3Cl
Additives: Thermal stabiliser and plasticiser required. Sometimes used: fire retardants, blowing agents, lubricants. Lubricants include lead stearate, stearic acid, 12-hydroxystearic acid, calcium stearate, paraffin wax, stearamide, cetyl/stearyl acetate, cetyl/stearyl alcohol, polyethylene waxes. Plasticisers include phthalates, phosphates, adipic esters, azelaic esters, sebacic esters, epoxidised soybean oil, chlorinated paraffins and trimellitates. Blowing agents include azodicarbonamide and sodium bicarbonate. Thermal stabilisers include lead salts, barium/cadmium, barium/zinc, calcium/zinc, epoxidised oils, polyols and organic phosphates. Flame retardants include antimony oxide, aluminium trihydrate, zinc borate and chlorinated paraffins
General Information: Plasticisers are added to PVC compounds in order to confer flexibility, softness and ease of processing to the resulting material
Morphology: There are significant differences between orientation distributions for crystalline and non-crystalline regions of various samples; amorph. chains behave in a rubber-like way during orientation; behaviour dependent on plasticiser content and draw temp. [26,27,28]
Identification: For general identification and distinction from polychloroprene, see polyvinyl chloride, unplasticised

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1–1.7 g/cm^3	dependent on plasticiser [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00017–0.000175 K^{-1}	$T > T_g$ [3]	L
2	0.000246–0.000537 K^{-1}	$T < T_g$, extruded rods, phthalate plasticisers [3]	V
3	0.000504–0.00055 K^{-1}	$T > T_g$, extruded rods, phthalate plasticisers [3]	V
4	0.00025 K^{-1}	approx., typical value [2]	L

Volumetric Properties General: At 20–25% crystallinity isotactic or crystalline PVC has a higher softening temp. and reduced solubility compared to commercial PVC. Crystalline PVC has not been developed as a commercial product. A PVC with a high degree of plasticiser becomes stiff and brittle. Changes in various physical props. (e.g. density, degree of crystallinity, T_m and T_g) with variations in polymerisation temp. attributed principally to corresponding changes in stereoregularity, rather than degree of branching, particularly for samples polymerised at low temps. [14] Degree of branching decreases with decreasing polymerisation temp. of resin; [14] with corresponding increase in syndiotacticity over same temp. range. [14] Degree of crystallinity increases with decreasing polymerisation temp. of resin
Transition Temperature:

No.	Value	Note	Type
1	66–88°C	[4]	Softening temp.

Surface Properties & Solubility:

Plasticisers: Di-2-ethylhexyl phthalate, tricresyl phosphate, di-2-ethyl adipate. Colour tests for plasticisers include fluorescence test

(phthalates); Gibbs iodophenol; Liebermanns test; diazo test; phenolphthalein (aryl esters, tritolyl phosphate) [2]; ammonium molybdate/benzidine test (phosphate plasticisers) [2]
Solvents/Non-solvents: Swollen by aromatic and chlorinated hydrocarbons, nitroparaffins, Ac_2O, aniline, Me_2CO [2]. Sol. plasticisers leached out by aliphatic hydrocarbons [2]
Wettability/Surface Energy and Interfacial Tension: Values for contact angles (e.g. with H_2O, methylene iodide) increase on addition of plasticisers (see poly(vinyl chloride), unplasticised) [1]

Transport Properties:

Polymer Melts: Zero shear viscosity studies of PVC containing di-2-ethylhexylphthalate and dioctyltin stabiliser (also functions as plasticiser) have been reported. η_o is dependent on MW (24000–100000) in simple shearing flow experiments; monomolecular melts follow same struct.-viscosity relationships as found for other linear melts in viscometric flow [19]. Studies of the primary (first) normal stress difference coefficient (σ_{11}-σ_{22}) have been reported; complex behaviour is exhibited [19,22,23,24]. Effect of plasticiser content on melt flow activation energy has been reported; increases with amount of plasticiser for $T < T_b$, but decreases with amount of plasticiser for $T > T_b$ (T_b, break temp., di-2-ethylhexylphthalate plasticiser) [24]
Permeability of Gases: Effect of plasticiser content on gas permeability has been reported [13]
Water Content: Surface absorption 200 g m^{-2} (max., 32 days, 20°) [2]
Water Absorption:

No.	Value	Note
1	0.6 %	48h, 50°, without filler [2]
2	11 %	max., 48h, 50°, with mineral fillers [2]

Gas Permeability:

No.	Gas	Value	Note
1	H_2O	16.41 cm^3 mm/(m^2 day atm)	0.25 × 10^{-10} cm^2 (s cm Hg)$^{-1}$, 30°, 25% tritolyl phosphate [2]
2	H_2O	72.2 cm^3 mm/(m^2 day atm)	1.1 × 10^{-10} cm^2 (s cm Hg)$^{-1}$, 30°, 25% dioctylphthalate [2]
3	H_2	122.6–236 cm^3 mm/(m^2 day atm)	1.4–2.7 × 10^{-13} cm^2 (s Pa)$^{-1}$, 5–40% tricresyl triphosphate [13]
4	CO	1.05–24.6 cm^3 mm/(m^2 day atm)	0.012–0.28 × 10^{-13} cm^2 (s Pa)$^{-1}$, 5–40% tricresyl triphosphate [13]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	19.6 MPa	2 kg f mm^{-2}, 60% plasticiser content [2]	200–450%

Viscoelastic Behaviour: Stress at 100% elongation 2.7–18.6 MPa (0.28–1.9 kg f mm^{-2}) [2]
Hardness: Shore A50–A100 [2]
Friction Abrasion and Resistance: Abrasion resistance is better for suitably compounded plasticised polymers at room temp. than vulcanised rubber; however, soon becomes too soft at elevated temps. [2]. Coefficient of friction μ_{stat}, 0.350–0.797 (25.9–39.4% plasticiser); μ_{dyn}, 0.719–0.925 (25.9–39.4% plasticiser); di-2-ethylhexylphthalate, diisodecylphthalate, *n*-octyl, *n*-decylphthalate as plasticisers [11]. μ_{stat} increases with plasticiser content; may pass through a max. [2]: μ_{dyn} 0.45 (grey cotton yarn; running at 1 m s^{-1}, 65% relative humidity) [2]

Electrical Properties:

Electrical Properties General: Certain electrical props., *e.g.* dielectric constant, power factor, volume resistivity, etc., are highly dependent on plasticiser type, concentration and test temp. [2]. Dielectric props., i.e. dielectric constant and dielectric loss factor have been reported, -110–110° and 20 Hz to 100 kHz; effects of type of resin, plasticiser (di-2-ethylhexylphthalate) content and ageing have been studied [20]. Where electrical props. are of importance in PVC formulation, essential to use suspension or bulk polymer and not emulsion polymer [2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.52	40% dioctylphthalate [8]
2	1.55	40% tricresylphosphate [8]
3	1.55–1.6	[2]

Transmission and Spectra: CPMAS C-13 nmr spectral data have been reported; discrimination by contact time allows identification of plasticiser [26]. Raman spectral data of drawn samples containing 0–20 pph dioctyl sebacate plasticiser have been reported; CCl stretching region examined; [27,28] data used in conjunction with birefringence measurements in studies of molecular orientation [27]
Total Internal Reflection: Effect of added plasticiser (e.g. phthalate, adipate) on stress optical coefficient of PVC homopolymer has been reported, positive values found, even at lowest loads, except at low temps.; large positive values at $T > T_g$; increases with increasing plasticiser content [17] Birefringence measurements have been reported for drawn samples containing 0–20 pph dioctyl sebacate plasticiser; data used to complement Raman spectroscopy results in studies of molecular orientation [27]

Polymer Stability:

Polymer Stability General: Stability almost entirely controlled by type and amount of plasticiser and stabiliser present
Flammability: Not easy to ignite; has self-extinguishing props. [4]; when ignited, burns with yellow and smoky flame; biting, acidic odour; melts, forming burning droplets [4]. Limiting oxygen index (*ca.* 45% for unplasticised material) considerably reduced by presence of plasticiser [21]
Environmental Stress: Under certain circumstances, low MW plasticisers can diffuse out of plasticised PVC formulations; of particular concern with food packaging; although no evidence that such plasticisers are toxic, systems involving polymeric plasticisers with lower rates of diffusion have been developed as precaution [1]. Major problems are loss of plasticiser by volatilisation or exudation on exposure to uv-radiation [5]; extenders (used in conjunction with plasticisers), such as chlorinated paraffins, particularly prone to exude under effects of uv-radiation [5]
Chemical Stability: Has good chemical resistance in general
Hydrolytic Stability: Unaffected by H_2O and salt solns.; dil. acids and alkalis have little effect at room temp., but some hydrolysis and extraction of plasticiser may occur at elevated temps.; conc. acids and alkalis hydrolyse plasticisers slowly when cold, but more rapidly on heating; most organic solvents extract plasticisers; such 'leaching out' leads to compound hardening [4]
Biological Stability: Plasticisers such as adipates, azelates, ricinolates, and sebacates are prone to microbial attack; phosphates and phthalates are usually resistant; biological attack can lead to stiffening and consequently cracking of material [5]
Stability Miscellaneous: γ-Irradiation leads to cross-linking of plasticised PVC [9]. Addition of small quantities of tetrafunctional monomer, *e.g.* ethylene glycol dimethacrylate, is reported to reduce radiation dose required for cross-linking and improves thermal stability; graft cross-linking process [9]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation of vinyl chloride carried out by using bulk (mass), suspension or emulsion techniques [2,14,15]; suspension and bulk polymer contain porous particles (100 μm in size); readily absorb plasticisers (and other additives). Premixing of polymer mixing usually carried out by employing trough mixer at room temp., or dry blending (with vigorous stirring and/or gentle heating); latter product known as easy processing (EP) resin [2]. Processed using injection moulding, compression moulding, blow moulding, extrusion, casting, rotational moulding, calendering and laminating techniques [2]; calendered sheet can be prod. with excellent surface finish and/or with remarkable transparency; such sheet can be rapidly and strongly welded into large and complex shapes using process of high or radio-frequency welding. Emulsion polymer contains fine particles (1 μm in size); much of this type of polymer used to make pastes (plastisols); dispersed with stabilisers etc. in plasticiser to form creamy paste (spreadable and free-flowing); plasticisation achieved by heating to >150–160°; such gel form is similar to plasticised polymer prod. by other means, although inferior in some physical props. [2]. In addition to plastisols (no diluents), other pastes, with different viscosities and processing considerations, can be prod.: organosols (with diluents, reduced viscosities); aerogels (high viscosities); rigisols (incorporate polymerisable plasticiser - give hard mouldings on gelation); plastigels (incorporate thickening agents; thick putty-like form) [2,4,5]. Pastes processed by using spread-coating, rotational casting, dipping and spraying techniques [2,16]. Paste injection-moulding techniques have also been developed [14]. Lattices prod. from emulsion polymer by coagulation with conc. acids, polyvalent cations and by dehydration with water-miscible liquids; plasticisers, fillers, thickening agents, etc. added and processed for coating applications using similar techniques to those employed for pastes [14]. Cellular form can be prod. by incorporating blowing agents [2]

Mould Shrinkage (%):

No.	Value	Note
1	1.5–5%	0.015–0.05 in in [4]

Applications: PVC leathercloth, cable coating, packaging, clothing, household goods, toys. Injection moulded components used for toys; watch straps; cable grommets/ends; gaskets; washers; handle coverings; footwear (beach shoes, sandals); heel tags; electrical shields; plugs and other electrical components; knobs; components for medical industry (prosthetics). Extruded components used in cable sheathing and domestic wiring insulation (low frequency); decorative trim; flexible hose and ducting; sachets for household items. Calendered sheet used in protective coverings; flooring (vinyl and vinyl/asbestos); fabric-backed wall coverings; curtaining; cover-sheets and tarpaulins; clothing (aprons, raincoats); hats; galoshes; inflammable toys; air-beds; fancy goods; 'transparent' windows in flexible doors; swimming pool linings. Lattices used in paper and textile impregnation and coatings. Pastes: spreading techniques used in fabric-backed leathercloth and other coated substrates for upholstery in transport, furniture; handbags; clothing (heavy duty); shoes; wall coverings; carpet backing; flooring; automobile parts; tool handles; inks; sealants; rotational casting and slush moulding techniques used for toys; balls; arm rests; dip-forming and dip-coating techniques can be used where degree of cushioning and anti-corrosion is required for gloves; handle-bar grips; spouts; wire-basket coverings; anti-corrosion sealants; spraying techniques used for tank linings. Pastes also used as binding resins for viscosity-building, low-gloss finishes. Cellular form can be bonded to woven or knitted fabrics: garment and upholstery uses

Molecular Formula: $[(C_2H_3Cl).(C_3H_6)]_n$
Fragments: C_2H_3Cl C_3H_6
Molecular Weight: MW decreases with increasing propylene content (at given copolymerisation reaction temp.)
Additives: Stabilisers; processing aids; waxes; lubricants; impact-modifiers
General Information: Typically contains 2–10% propylene. Reduced tendency to dehydrochlorination compared with PVC, leading to improved heat stability. Copolymer more stable than PVC homopolymer; has lower melt viscosity, thus requires lower processing temps and hence less need for stabilisers; latter fact improves rigidity at high temps, and lowers permeability [1]. Restricted commercial use of copolymers, as considerably more expensive than PVC/PVA [3]
Tacticity: Low-propylene-content (<15 mol%) materials contain long uninterrupted runs of vinyl chloride units. Copolymers exhibit reduced sensitivity to stereosequencing [14,15] Theoretical conformational model has been reported [16] based on rotational isomeric state (RIS) theory; calculations for obtaining random-coil dimensions (mean-square unperturbed dimensions), $[r^2]_0$ and dipole moments, $[\mu^2]$

Miscellaneous: A comprehensive review of the struct. and physical props. of a series of propylene copolymers, and the processing and uses of such copolymer resins developed for rigid applications has been reported [17]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.286–1.445 g/cm^3	[1,12]

Volumetric Properties General: Density decreases with increasing propylene content [1,12]

Glass-Transition Temperature:

No.	Value	Note
1	60–80°C	[2]

Transition Temperature:

No.	Value	Note	Type
1	60–80°C	[2]	Degradation temp.
2	178–181°C	2.7 wt% propylene [5]	Equiviscous temp.

Surface Properties & Solubility:

Plasticisers: Polypropylene acts as internal (permanent) plasticiser [7]

Transport Properties:

Transport Properties General: Ease of melt flow increases with increasing propylene content (for the same MW) [3,11]; may be varied by 100-fold according to composition [9]

Melt Flow Index:

No.	Value	Note
1	0.75–180 g/10 min	1.9%–7.6% propylene ASTM D 1238 [10]
2	3.8 g/10 min	3.5 wt% propylene, ASTM D1238-57T-F [13]

Polymer Melts: Intrinsic viscosity of commercially available resins decreases with increasing propylene content [10,11]; [**η**] 1.393–1.356 dl g^{-1} (1.9–7.6 wt% propylene) [10]. Melt viscosity 69000P (simple formulation (minimum additives), shear rate 50 s^{-1}); 2400P (simple formulation, shear rate 250 s^{-1}); 52000P (blow-moulded formulation (various additives), shear rate 50 s^{-1}); 17000P (blow-moulded formulation, shear rate 250 s^{-1}) (2.7 wt% propylene) [5]

Permeability of Gases: [O_2] 45 cm^3(m_2 day cm^3 atm)$^{-1}$ 250°, film; typical value [8]

Permeability of Liquids: [H_2O] 4.3g m^2 mil, 95% relative humidity, 37.7° (100°F), film; typical value [8]

Water Absorption:

No.	Value	Note
1	0.05–0.25 %	24h, 3mm H_2 [2]

Mechanical Properties:

Mechanical Properties General: Presence of comonomer has comparatively little adverse effect on mechanical props., compared to PVC homopolymer [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	2353–3138 MPa	240–320 kgf mm^{-2} [1]

Flexural Modulus:

No.	Value	Note
1	2647–3206 MPa	270–327 kgf mm^{-2} [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	29.4–48 MPa	3–4.9 kgf mm^{-2}	100–200%

Flexural Strength at Break:

No.	Value	Note
1	59.8–76 MPa	6.1–7.75 kgf mm^{-2} [1]

Tensile Strength Yield:

No.	Value	Note
1	46–59.8 MPa	4.7–6.1 kgf mm^{-2}

Compressive Strength:

No.	Value	Note
1	54–78.4 MPa	550–800 kg cm^{-2} [2]

Hardness: Rockwell R105-R118 [1]

Izod Area:

No.	Value	Notch	Note
1	16–1600 kJ/m^2	Unnotched	0.3–30 ft lb in^{-1}, 23° [1]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.8–3.5	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.01–0.02	1 MHz	[2]

Optical Properties:

Optical Properties General: Copolymers show lower light absorbance and 'yellowness' index than PVC homopolymer; (ASTM D1925-637) [5] commercial significance; e.g. formulations for blow-moulded products [4,5]

Transmission and Spectra: High resolution C-13 nmr spectral data have been reported [15]

Polymer Stability:

Polymer Stability General: Has better thermal stability than PVC homopolymer; presence of propylene units, randomly distributed in small amounts (also terminate polymer chains), break up zipper dehydrochlorination (decomposition) reactions; need less heat stabiliser in processing [1,6,7]; importance both in application and during processing - greater ease of moulding [9]

Flammability: Self-extinguishing [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical suspension [1] polymerisation of comonomer mixture; melt processing involving injection-moulding (150–165°; mould temp

40–60°) and extrusion (150–175°) techniques; lower melt-extrusion range than PVC homopolymer (190–210°) [6]; ease of moulding is an advantage; can also be blow-moulded. Also synth. by suspension polymerisation at 56° involving intermittent addition of vinyl chloride to reaction mixture. The product, containing 3.5 wt% propylene, has good mech. props. and high melt index [13]. In the copolymerisation reaction propylene acts as a degradative chain-transfer reagent; thus both polymerisation rate and resulting copolymer(s) MW are lower than those of PVC homopolymer; decrease with increasing propylene content . The copolymerisation process is kinetically controlled by propylene [18]

Applications: Injection and blow-moulded products used in gramophone records; sheets; (glass-clear) blown bottles; coatings; flame-resistant films; thermoformed packaging; extended films for packaging/food wrapping (fresh meat); rigid/transparent compositions used for moulded/extended components in medical applications

Poly(vinyl chloride-*co*-trifluoro chloroethylene) P-582

Synonyms: *Poly(vinyl chloride-co-chlorotrifluoroethylene). Vinyl chloride-trifluorochloroethylene copolymer. Poly(chloroethene-co-chlorotrifluoroethene). VC/TFCE copolymer. VC/CTFE copolymer. Poly(vinyl chloride-co-(1-chloro-1,2,2-trifluoroethylene)). Vinyl chloride-chlorotrifluoroethylene copolymer*
Related Polymers: Polyvinyl chloride, unplasticised, PVC copolymers
Monomers: Vinyl chloride, Chlorotrifluoroethylene
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, PCTFEfluorocarbon (polymers)polyhaloolefins

CAS Number:

CAS Reg. No.
24937-97-1

Molecular Formula: $[(C_2H_3Cl)_x.(C_2ClF_3)_y]_n$
Fragments: C_2H_3Cl C_2ClF_3
Additives: Stabilisers include Cd, Ba, Zn, Ca compounds
Morphology: Studies of monomer sequence distribution have been reported [1]
Miscellaneous: Finds main application as surface coatings; has good solubility characteristics and particularly good service props.; displays poor adhesion to metals unless stoved at high temp. after application [19]. Struct. and physical props. have been reviewed [1]. Graft copolymers have been reported [14,22]; possess good heat, impact and abrasion resistance [22]; flexible, elastomeric, melt-processable systems [14]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.7 g/cm^3	FPC 461 [23]

Melting Temperature:

No.	Value	Note
1	100°C	approx., 50% chlorotrifluoroethylene [1]

Transition Temperature General: Minimum melting point observed at 50% chlorotrifluoroethylene content; linear decrease in T_g observed with increasing chlorotrifluoroethylene content [1]; heat resistance decreases with increasing chlorotrifluoroethylene content [1]

Surface Properties & Solubility:

Solubility Properties General: Solubility characteristics (with respect to coatings applications) have been reviewed in comparison with PVC homopolymer, terpolymers and other copolymers [26]
Solvents/Non-solvents: (FPC 461) sol. toluene, xylene, ketones, chlorinated hydrocarbons, esters [23]

Transport Properties:

Polymer Solutions Dilute: η_{rel}1.5 (FPC 461) [23]; η 210 cP (80% chlorotrifluoroethylene; 20% 2-butanone, 20°) [27]
Polymer Melts: Viscosity decreases sharply with increase in chlorotrifluoroethylene content; related to decrease in chain length of copolymer [1]

Mechanical Properties:

Impact Strength: Notched impact strength is independent of chlorotrifluoroethylene content; values remain constant [1]
Hardness: Hardness decreases with increasing chlorotrifluoroethylene content [1]; Pencil hardness HB (film, 80% chlorotrifluoroethylene) [27]

Optical Properties:

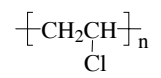
Transmission and Spectra: XPES and ion scattering spectroscopy studies (thin film coatings) have been reported [17,18]. H-1 nmr and F-19 nmr electron-nuclear double resonance (ENDOR) spectral data have been reported [2]

Polymer Stability:

Polymer Stability General: Displays good heat and light stability (FPC 461) [23]
Thermal Stability General: Thermal stability (plus processability) increases with increase in chlorotrifluoroethylene content and MW of copolymer [1]
Decomposition Details: Rate of hydrogen halide cleavage decreases with increase in chlorotrifluoroethylene content [1]; blackening and carbonisation occur after heating at 195° for 10 min. [24]

Chemical Stability: Has good resistance to chemicals (80% chlorotrifluoroethylene) [27]; acid/alkali resistance 2% (80% chlorotrifluoroethylene) (JIS K-5400) [27]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by suspension [20] or emulsion [19] polymerisation of a mixture of comonomers. Dry processing material fabricated by moulding, extrusion, calendering or coating techniques [23,24]. Graft copolymers prod. by radical suspension polymerisation in alkaline solns. [22]
Applications: Main applications as surface coatings and films, thin coatings (5–10 Å) on plastic-bonded and other explosives; in precision detonator compositions, *e.g.* pentaerythritaltetranitrate (PETN); typically 1.5/1 vinyl chloride/chlorotrifluoroethylene molecular ratios. Major use in electrophotographic toner/developer compositions (xerography), including formulations with PMMA, and liq. cryst. polymers; colour toner systems also reported: such developers provide excellent and stable electrostatic behaviour, good chargeability, high durability, and good environmental stability. Used in blend compositions with other fluorinated polymers (*e.g.* PTFE), with copolymer as minor component, as lubricants for various substrates; gives improved lubricity characteristics and abrasion resistance; lowers friction coefficients of substrates such as photographic films and magnetic surfaces and tapes. Miscellaneous uses include compositions of magnetic cleaning systems; release agents for heat shrinkable films; mould release agents for epoxy (thermosetting) resins. Medically acceptable polymer (non-thrombogenic material) used in conjunction with amphiphilic polyethers or polysulfides, with latter bound to copolymer surface; potential applications as artificial arteries, heart valves, oxygenation membranes for heart-lung machines for cardiovascular surgery, dialysis shunts, intravenous or intraarterial catheters

CAS Reg. No.	Note
37331-71-8	
8050-05-3	
88813-65-4	
9002-86-2	
26793-37-3	isotactic
74192-23-7	

Molecular Formula: $(C_2H_3Cl)_n$
Fragments: C_2H_3Cl
Molecular Weight: MW 100000–200000, MW 45000–64000. (MW can range from as low as 40000 to as high as 450000)
Additives: Stabilisers, plasticisers, extenders, lubricants, fillers, pigments, processing aids, impact modifiers, fire-retardants, blowing agents. Process aids can include PMMA or SAN. Heat stabilisers: basic lead carbonate (white lead), tribasic lead sulfate, dibasic lead phosphite (also acts as light stabiliser), and dibasic lead phthalate; cadmium-barium mixed systems, of stearates, ricinoleates, palmitates and octoates; organotin systems; epoxide resins and oils; amines, diphenylurea, 2-phenylindole and aminocrotonates. Antioxidants include trisnonyl phenyl phosphite; hindered phenols. Uv absorbers: modified benzophenones and benzotriazoles. Extenders (used in conjunction with plasticisers): chlorinated paraffin waxes and liq. paraffinic fractions; oil extracts. Lubricants: (external) calcium stearate, stearic acid, normal and dibasic lead stearate; (internal) wax derivatives glyceryl esters and long-chain esters. Fillers: china clay; various forms of calcium carbonate; talc; baryter; silicas; silicates. Impact modifiers/processing aids: ABS graft terpolymers; MBS terpolymers; chlorinated polyethylene; EVA-PVC graft polymers; polyacrylates. Fire-retardants: antimony oxide. Blowing agents: azodicarbonamide; azodiisobutyronitrile. Antistatic agents: quaternary ammonium compounds. Viscosity depressants: poly(ethylene glycol) derivatives
General Information: Major thermoplastic material; as a consequence of all-round generally good props. and exceptionally wide range of additives that may be employed to modify these props., may be regarded as the most widely used plastic material [1]. Polymer is characterised by extreme flexibility, resiliency and toughness, has excellent resistance to water and low flammability. PVC has limited thermal stability and requires the addn. of

stabilisers before or during processing. Typically chlorine content: 57%

Tacticity: Approx. 55% syndiotactic with the rest largely atactic. This results in some short-range ordering of the molecules, corresponding to approx. 10% 'crystallinity' [1] typically head-to-tail linkages; molecules contain slight branching; branching has been estimated as approx. 1.5 branches per 100 monomer units [2]

Morphology: Typically head to tail linkages. Substantially amorph. Typical commercial material contains approx. 5% crystallinity. Molecules contain slight branching. Branching content as function of polymerisation temp. has been reported. [17,71,72] Formation of anomalous structs., e.g. those containing labile (tertiary) chlorine groups, has significant effect on thermal stability. [71] Various branch structs. contribute to mechanism of chain transfer to monomer during polymerisation process. [72] Orthorhombic; space group, Pacm; 2 monomers per unit cell: a 10.6, b 5.40, c 5.1 (commercial material, polymerised at 50–60°) [17,28]; a 10.4, b 5.30, c 5.1 (solution blended high-MW, low-cryst. polymer; low-MW, high cryst. polymer) [17,91]; a 10.32, b 5.32 (single crystals, polymerised at -75°) [17,92]; a 10.24, b 5.24, c 5.08 (single crystals, low-MW, polymer produced in n-butyraldehyde). [17,93] Readily forms thermoreversible gels on cooling solns. of polymer in a variety of solvents, e.g. dioxane, [45,46,47,48] dichloroethane, [46] bromobenzene, [45,46,47,48] nitrobenzene, [45,47,48] 1,2-dichlorobenzene, [47,48] butanone, [45,47,48] DMF, [45] diisopropyl ketone, [47,48] etc. Various PVC/dialkyl phthalate gel systems also reported [46,47,48,49]; gelation believed to be associated with crystallisation; [48] has important technological implications concerning plasticisation. [47] Crystalline regions in commercial materials have syndiotactic structure; repeat distance 5.1 Å [28,55]

Identification: Distinguished from polychloroprene ($\leq$40% chlorine) as polychloroprene decomposes in conc. HNO_3 or boiling 80% H_2SO_4, while PVC is unaffected. Polychloroprene fairly rapidly decolorises dil. soln. of I_2 (e.g. 0.02%) in CCl_4, while PVC remains ineffective (subject to type of plasticiser present). Various colour tests are available for plasticisers [13]

Miscellaneous: At 20–25% crystallinity isotactic or crystalline PVC has a higher softening temp. and reduced solubility compared to commercial PVC. Crystalline PVC has not been developed as a commercial product. A PVC with a high degree of plasticiser becomes stiff and brittle. Changes in various physical props. (e.g. density, degree of crystallinity, T_m and T_g) with variations in polymerisation temp. attributed principally to corresponding changes in stereoregularity, rather than degree of branching, particularly for samples polymerised at low temps. [14] Degree of branching decreases with decreasing polymerisation temp. of resin, [14] with corresponding increase in syndiotacticity over same temp. range. [14] Degree of crystallinity increases with decreasing polymerisation temp. of resin; [14,17] low-temperature values are greatly overestimated owing to assumptions made in calculations [17]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.385 g/cm^3	x-ray density, amorph. [28]
2	d 1.44 g/cm^3	[28]
3	d 1.34 g/cm^3	high impact [13]
4	d 1.4 g/cm^3	fibres [13]
5	d 1.39 g/cm^3	carboxylated powder, normal impact [1,13]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00017–0.000175 K^{-1}	$T > T_g$ [15]	L
2	6.6×10^{-5}–7.5×10^{-5} K^{-1}	$T < T_g$, before annealing [15]	L
3	6.9×10^{-5} K^{-1}	$T < T_g$, after annealing [15]	L

Volumetric Properties General: Heat capacity components related to various modes of vibration, on basis of literature spectral data or Debye functions, have been reported. [24] Effect of thermal history on C_p for PVC samples of different stereoregularities has been reported; partially syndiotactic materials have higher C_p values than atactic samples; differences reduced after annealing. [56] Reviews of C_p measurements have been reported. [24,40,59] Comparative studies of commercially available material (suspension-, emulsion-, and bulk-polymerised; high-impact PVC) have been reported. [61,62] Activation energies for free-radical polymerisation of vinyl chloride E_{prop} 16 kJ mol^{-1} [32,57]; E_{ter} 17.6 kJ mol^{-1}. [32,51] Heat of polymerisation -96 - -109 kJ mol^{-1}. [33,34,35] Temp. variation of C_p for amorph. polymer 3.38–26 cal deg^{-1} mol^{-1} (60–420 K). [40] Density increases with decreasing polymerisation temp. of resin; [14,21] dependence on thermal history has also been reported. [17,22] Isothermal compressibility studies of uniaxially stretched PVC have been reported [17,73,74]

Equation of State: Tait and Simha-Somcynsky equation of state parameters have been reported [42,43]

Thermodynamic Properties General: Heat of polymerisation -95.88–131.88 kJ mol^{-1}. [33,34,35] Other thermodynamic props. have been reported [24].Thermal conductivities not significantly influenced by MW, polymerisation temp., and syndiotacticity, except for cases where tacticity leads to crystallisation. [17] Thermal conductivity increases with temp. up to T_g and then decreases. [18]

Latent Heat Crystallization: Enthalpy and entropy functions of amorph. PVC have been reported. [59] Entropy as a function of pressure and temp. has been reported. [60] Heat of fusion of 2.76–12.65 kJ mol^{-1} [17] ΔH_u 3.28 kJ mol^{-1} (785 cal mol^{-1}) appears to be most probable value [14,17]

Thermal Conductivity:

No.	Value	Note
1	0.1588 W/mK	20° [20]
2	0.129–0.165 W/mK	-170–100° [16]

Thermal Diffusivity: 0.00144–0.000706 cm^2 s^{-1} (-73–207°) [16]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.046–1.255 kJ/kg.C	0.25–0.3 cal (g k)$^{-1}$, $T < T_g$	P
2	1.757 kJ/kg.C	0.42 cal (g k)$^{-1}$, $T > T_g$ [21,24]	P

Melting Temperature:

No.	Value	Note
1	273°C	syndiotactic, estimated [53]
2	155–300°C	polymerisation temp. 125–80° [14,17,21,23]

Glass-Transition Temperature:

No.	Value	Note
1	81°C	can be increased to 98° on increasing syndiotactic content [58]
2	68–110°C	polymerisation temp. 125–-60° [21,23,25,26]
3	81°C	approx., pure commercial resins [23,27]

Transition Temperature General: Heat distortion temp. increases with increasing syndiotactic contact. [53] Gel melting (gel-sol transition) points have been reported for a wide range of PVC/organic solvents and PVC/dialkyl phthalate systems [49,50]; T_m increases with increasing size of phthalate [49]. Variation of T_g with polymerisation temp., [17,56] MW, [17] degree of crystallinity (syndiotactic content) [56,57] and thermal history (annealing) has been reported. [56,57,58] Partially syndiotactic materials have

higher T_g values than atactic samples; differences reduced after annealing. [56] Effect of pressure on T_g has been reported. [17] T_g displays an approx. linear increase with decreasing polymerisation temp. of resin. [21] T_m cannot be measured directly because of thermal instability of PVC resin; usual method is to determine from T_m* of polymer-diluent (stabiliser) systems using Flory relationship; [14,21] increases linearly with decreasing polymerisation temp. of resin [17,21]

Deflection Temperature:

No.	Value	Note
1	75–80°C	[53]

Vicat Softening Point:

No.	Value	Note
1	70–80°C	[54]
2	100°C	syndiotactic

Transition Temperature:

No.	Value	Note
1	>165°C	min., critical processing temp. [53]
2	>210°C	min., syndiotactic, polymerisation at -40° [53]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameters δ_h 44.35–46.44 $J^{1/2}$ $cm^{-3/2}$ (poor solvent); [63] δ_h 38.91–41.42 $J^{1/2}$ $cm^{-3/2}$ (moderate solvent); [63] 0 (strong solvent) [63] δ 19.19–22.1 $J^{1/2}$ $cm^{-3/2}$ (9.38–10.8 $cal^{1/2}$ $cm^{-3/2}$) [63,64]

Internal Pressure Heat Solution and Miscellaneous: Values for heats of solution (and dilution) in THF and cyclohexanone at 30° have been reported [3]

Plasticisers: Plasticisers used in PVC more than other polymer; typical amounts 50–70 phr; can be as high as 85 wt.%; often incorporated at high temps. [1,13]. [13,31] Primary plasticisers include phthalates, phosphates, sebacates and various fatty acid derivatives; polymeric species such as sebacates, adipates and azelates of propylene glycol. Phthalates used as general-purpose plasticisers, aliphatic esters for low-temp. applications, phosphates used in products for good flame-resistance. Most common are dioctyl (or 2-ethylhexyl) and diisooctyl phthalates, 'dialphanyl' (C_7–C_9) phthalate, trixylyl phosphate, dioctyl sebacate, polypropylene sebacate and epoxidised soya bean oil. Phthalates prepared from C_8–C_{10} alcohols are the most important class; approx. 75% of plasticisers used. Secondary plasticisers (limited compatibility) include esters of fatty acids, petroleum residues, alkyl or aryl hydrocarbons and nitrated or halogenated derivatives, always used in conjunction with primary plasticisers. Special-purpose plasticisers include trimellitates (high-temp. applications); epoxidised oils (light-stability); solid ethylene-vinyl acetate modified polymers (biodegradation resistance); diallyl phthalate (adhesives/metal finishing). Internal (permanent) plasticisation occurs when vinyl chloride is copolymerised with certain monomers, e.g. propylene and vinyl acetate, where the comonomers function as plasticisers; plasticiser cannot be lost or extracted [7]

Solvents/Non-solvents: High MW sol. THF, DMF, DMSO, nitrobenzene, methyl ethyl ketone, cyclopentanone, cyclohexanone, Me_2CO/CCl_4, C_6H_6, $EtOAc/CCl_4$, trichloroethylene/nitromethane. [13,44] Swollen by aromatic hydrocarbons and chlorinated hydrocarbons, nitroparaffins, Ac_2O, aniline, Me_2CO. [13,44] Insol. aliphatic hydrocarbons, esters, alcohols, carboxylic acids, carbon disulfide, vinyl chloride, H_2O, conc. alkalis, non-oxidising acids, oils. [13,44] Low MW sol. warm tetrahydrofurfuryl alcohol, Me_2CO, dioxane, ethylene dichloride, *o*-dichlorobenzene; diisopropyl ketone, mesityl oxide, isophorone, hexamethylphosphorustrisamide, warm toluene [13,44]

Wettability/Surface Energy and Interfacial Tension: Contact angles 75° (H_2O); 20° (methylene iodide); 0° (hexadecane) (bulk polymer, 25°). [1] Values increase on addition of plasticiser [4]

Surface Tension:

No.	Value	Note
1	419 mN/m	polarity 0.146, 20° [5,6]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink parameters have been reported for cyclohexanone, cyclopentanone and THF. [85] Second virial coefficients for cyclohexanone have been reported. [90] Unperturbed dimensions are reported for cyclohexane, THF and benzyl alcohol. [89,95,96] Values for Huggins constant, K_H (20–25°) in wide range of solvents have been reported. [82,88] Comprehensive studies of the thermodynamics of solns. in cyclohexanone, [83,89] cyclopentanone, [84] benzyl alcohol, [89] chlorobenzene [89] and THF, [85,89] have been reported

Polymer Melts: η_{inh} 0.51–1.4 ('research' grades) [1]. Relative viscosity 2.23–3.04 ('research' grades). [1] Dynamic viscosity studies have been reported: effects of temp., frequency and strain amplitude studied. [80] Rheological characterisation, using capilliary and parallel plate rheometers, has been reported; results obtained from oscillatory shear experiments show importance of thermomechanical history and time-independent viscoelastic response; capilliary experiments indicate importance of stabilisers and lubricants on flow behaviour. [81] Dependence of melt-flow activation energy on polymerisation temp., [100] MW and shear-rate has been reported [17,97,99]

Permeability of Gases: Other gas permeability and diffusivity values have been reported [65,66,67]

Water Content: Water absorption increases with increasing temp.; greater for emulsion than suspension polymerised material. [13] Moisture retention 8% (fibres, 60% relative humidity), [13] regain 0.1–0.15% [13]

Water Absorption:

No.	Value	Note
1	0.95 %	0.4 mm, 32d, 20° [13]
2	11.7 %	0.4 mm, 32d, 60° [13]
3	0.4–0.6 %	emulsion polymerised [13]
4	0.2–0.3 %	suspension polymerised [13]

Gas Permeability:

No.	Gas	Value	Note
1	He	131 cm^3 mm/(m^2 day atm)	1.5×10^{-13} cm^2 ($Pa)^{-1}$, 25° [65,66]
2	H_2	113.8 cm^3 mm/(m^2 day atm)	1.3×10^{-13} cm^2 ($Pa)^{-1}$, 25° [65,66]
3	Ne	25.4 cm^3 mm/(m^2 day atm)	2.9×10^{-14} cm^2 ($Pa)^{-1}$, 25° [65,66]
4	N_2	0.78 cm^3 mm/(m^2 day atm)	8.9×10^{-16} cm^2 ($Pa)^{-1}$, 25° [65,66]
5	O_2	2.98 cm^3 mm/(m^2 day atm)	3.4×10^{-15} cm^2 ($Pa)^{-1}$, 25° [65,66]
6	CO_2	10.5 cm^3 mm/(m^2 day atm)	1.2×10^{-14} cm^2 ($Pa)^{-1}$, 25° [65,66]
7	CH_4	1.84 cm^3 mm/(m^2 day atm)	2.1×10^{-15} cm^2 ($Pa)^{-1}$, 25° [65,66]
8	H_2O	18034 cm^3 mm/(m^2 day atm)	2.06×10^{-11} cm^2 ($Pa)^{-1}$, 25° [65,66]
9	NH_3	324 cm^3 mm/(m^2 day atm)	3.7×10^{-13} cm^2 ($Pa)^{-1}$, 20° [67]
10	CO	1.66 cm^3 mm/(m^2 day atm)	1.99×10^{-15} cm^2 ($Pa)^{-1}$, 27° [68]

Mechanical Properties:

Mechanical Properties General: Young's modulus and tensile strength fall with increasing temp. Fibre wet tensile strength is same as dry strength. [13] Mech. props. vary with MW, polymerisation temp. and additives

Tensile (Young's) Modulus:

No.	Value	Note
1	7584 MPa	-196° [17,75,94]
2	276 MPa	70° [17,75,94]
3	2745 MPa	280 kg f mm^{-2} [13]
4	4900 MPa	approx., 500 kg f mm^{-2}, filled fibres [13]
5	980 MPa	approx., 100 kg f mm^{-2}, fibres [13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	19.6 MPa	2 kg f mm^{-2}, 60° [13]	
2	14.7 MPa	1.5 kg f mm^{-2}, 70° [13]	
3	41.6–54.9 MPa	approx., 4.25–5.6 kg f mm^{-2} [13]	5–25%
4	333 MPa	34 kg f mm^{-2}, filled fibres [13]	20%
5	147 MPa	15 kg f mm^{-2}, relaxed fibres [13]	180%

Flexural Strength at Break:

No.	Value	Note
1	93.2 MPa	9.5 kg f mm^{-2} [13]
2	83.4 MPa	8.5 kg f mm^{-2}, elastomer modified [13]

Poisson's Ratio:

No.	Value	Note
1	0.38	[29]

Compressive Strength:

No.	Value	Note
1	54.9–65.7 MPa	5.6–6.7 kg f mm^{-2} [13]

Viscoelastic Behaviour: Deformational behaviour, tensile creep curves and creep recovery have been reported. [75] Room temp. viscoelastic props. may vary with additives; at higher temp. thermal history becomes a factor [76]
Mechanical Properties Miscellaneous: Dynamic mech. props., elastic moduli, shear moduli and loss factor have been reported. [17,80,81,100] Deformation props. at high pressure have been reported, brittle to ductile transition at 10 MPa. [39] Elastic recovery of fibres 100% (1% extension, filled), 95% (2% extension), 85% (4% extension), 75% (9% extension) [13]
Hardness: Rockwell R110-R120. [13] Vickers diamond pyramid 14.3 (bulk polymer, 25°) [4]
Fracture Mechanical Properties: Factors affecting fatigue resistance in UPVC pipe compositions have been reported; effects of processing on crack propagation and lifetime of specimens have important practical implications both for designing and processing rigid polymers. [77] Effects of MW and presence of modifiers on fatigue, crack propagation response have been reported: addition of 6–14 phr MBS enhances resistance of PVC; increases significantly with increasing MW (at given level of modifier) [78]
Friction Abrasion and Resistance: Coefficient of friction of bulk polymer μ_{stat} (polymer/steel): 0.5 (as moulded, 25°); 0.39 (abraded, 25°); 0.46 (reheated, 25°); [4] μ_{dyn} (polymer/steel): 0.42 (as moulded, 25°); 0.34 (abraded, 25°); 0.37 (reheated, 25°). [4] Values decrease on addition of plasticisers [4]. μ_{stat} 0.4–0.45; [13] μ_{dyn} 0.23 (grey cotton yarn, running at 1 m s^{-1}, 65% relative humidity [13]
Izod Notch:

No.	Value	Notch	Note
1	42.5 J/m	Y	0.8 ft lb in^{-1} [13]
2	799 J/m	Y	max. ,15 ft lb in^{-1}, impact modified [13]

Electrical Properties:

Electrical Properties General: Behaves as typical polymer insulator; additives influence max. retention of insulation props. Where electrical props. are of importance, essential to use suspension or bulk polymer, not emulsion polymer. [13] Other values for dielectric constant and loss factor have been reported [79]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	800 Hz	23° [13]
2	3.3	800 Hz	high impact, 23° [13]
3	3.5	60 Hz	25° [17]
4	3.39	1 kHz	25° [17]
5	3.29	10 kHz	25° [17]
6	11.76	60 Hz	140° [17]
7	11.27	1 kHz	140° [17]
8	10.94	10 kHz	140° [17]

Dielectric Strength:

No.	Value	Note
1	14–16 kV.mm^{-1}	[13]

Static Electrification: Has good resistance to tracking [13]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.02	800 Hz	23° [13]

Optical Properties:

Optical Properties General: Specific refractive index increment values have been reported for dil. solns. in a wide range of solvents and plasticisers
Refractive Index:

No.	Value	Note
1	1.53–1.56	[13]
2	1.54	fibres [13]
3	1.54–1.55	[19]
4	1.54806	486 nm [15,17]
5	1.54151	589 nm [15,17]
6	1.53843	656 nm [15,17]

Transmission and Spectra: Ir, [30] H-1 nmr [36] and C-13 nmr [38] spectral data have been reported
Total Internal Reflection: Birefringence essentially zero (fibres). [13] Stress optical coefficient -6.5 (-200–50°); becomes positive at T_g [17,69,70]
Volume Properties/Surface Properties: Transparent, colourless; becomes translucent or opaque with appropriate additives

Polymer Stability:

Polymer Stability General: Decomposition may be caused by excessive shear, such as in resin processing
Thermal Stability General: Anomalous structs. within bulk polymer may promote thermal instability, e.g. tertiary or allylic chlorine. [71] Thermal degradation decreases mech. props.
Upper Use Temperature:

No.	Value	Note
1	60°C	[7]
2	90°C	modified [7]

Decomposition Details: Decomposition of PVC is a complex chemical mechanism. [1,13,31] Dehydrochlorination occurs above 300° up to 200°, leading to conjugated polymers above 300°, hydrocarbons also released, and above 400° benzene and other aromatics are detected. [8,9] Free radical mechanism postulated. [8] HCl liberated may autocatalyse decomposition, ionic complexes may also be involved [10] with recombination to double bonds. Decomposition in oxygen leads to deepening of colour, and oxygen may also be responsible for scission and cross-linking reactions. Stabilisers added to scavenge HCl. Under photodegradation oxidation may occur first, then HCl evolution
Flammability: Limiting oxygen index 45% (reduced by plasticisers). [1] Has self extinguishing props.; [7] burns with yellow flame, acidic odour, and softens and blackens. [7] Burning releases CO_2 and HCl, no monomer, phosgene or Cl_2 [102] contrary to popular opinion. [103] PVC dust not reported to be explosive [102]
Environmental Stress: Stable to Uv radiation in moderate climates for outdoor use; may be stabilised by Pb. Uv radiation may cause loss of plasticisers. [11] Residual monomer unconverted in polymerisation process is environmental hazard [102] as are heat stabilisers (Pb, cadmium salts) and low MW plasticisers [102]
Chemical Stability: Resistant to salt, oxidising agents, reducing agents, aliphatic hydrocarbons, detergents, oils, fats, petrol. Attacked by conc. oxidising agents, accelerated by metals. Unsuitable for use with chlorinated hydrocarbons, aromatics, ketones, esters, ethers. Attacked by bromine and fluorine at room temp. [7]
Hydrolytic Stability: Stable to water, dil. acid and conc. alkali, and to conc. acids below 60°. Hot acids e.g. nitric acid and sulfuric acid, may cause oxidation
Biological Stability: Generally resistant to microbial attack. Certain plasticisers and lubricants can be attacked by microbes, leading to stiffening and cracking. [11] Organotin species inhibit microbial attack
Recyclability: May be recycled and reformulated when material is free from other polymers; if not, then separation must take place. Used as fuel in incinerators [102] HCl gas is major decomposition product so must be removed from flue gases [102]
Stability Miscellaneous: γ-Radiation leads to cross-linking [11] with loss of chlorine and increase of mech. props., [52] shear and impact strength. Copolymers are degraded; colour deepens [52]

Applications/Commercial Products:

Processing & Manufacturing Routes: Vinyl chloride can be polymerised [12,13,31] by high-energy radiation, or in commercial practice by free-radical initiators; currently used initiators include peroxydicarbonates, *tert*-butylperpivalate, azobis(2,4-dimethylvaleronitrile) and acetyl cyclohexylsulfonyl peroxide; polymerisation can be effected by bulk (mass), suspension, emulsion or solution techniques, although latter rarely used; suspension and emulsion methods are most common heterogeneous polymerisation, as polymer is insol. in its monomer; low polymerisation temps. used when high MW material required. In bulk polymerisation, vinyl chloride, liquefied under pressure, is polymerised with initiators such as benzoyl peroxide or azobisisobutyronitrile; polymer is precipitated from the monomer; purest product obtained by this method; e.g. using benzoyl peroxide, 80% conversion achieved after 17h at 55°. Suspension polymerisation employs water-sol. suspension agents, e.g. poly(vinyl alcohol) or methylcellulose, and monomer-sol. initiators, e.g. benzoyl or lauroyl peroxide; polymerisation is effected by heating, and stirred to maintain suspension; product removed by filtration. Emulsion polymerisation is a similar process to that used for suspension technique, except that emulsifying agents are employed. Initiator system is initially contained in aq. phase, and polymer is obtained in very finely divided state, e.g. particle diameters $<10^{-3}$ mm, cf. approx. 0.1 mm diameter in suspension process; higher MW materials produced by emulsion process, and this coupled with greater surface area/weight ratios allows greater compatibility with plasticisers; more expensive process, however, and presence of residual emulsifying agents (which cannot be completely removed) leads to inferior water resistance and electrical props. In addition, 'highly crystalline' (20–25% crystalllinity) polymer with increased stereoregularity can be produced by using low temp. free-radical polymerisation techniques using γ-irradiation and active species such as alkyl boranes. Ziegler-Natta catalyst systems cannot be used, due to reaction with both vinyl chloride monomer and polymer. Cannot be processed successfully in the absence of stabilisers, severe discoloration and progressive deterioration result from oxidation and elimination of hydrogen chloride during heating at high temps.; in use, action of heat and light can have same effects. [12] Pre-mixing of polymer with stabilisers and other additives achieved by using dry-blending techniques. [31] Emulsion-, suspension- and bulk-polymerised materials are processed by using injection moulding, blow moulding, compression moulding, extrusion, vacuum- and thermo-forming, calendering, high-pressure laminating and coating techniques. [13] Films produced by solvent casting, calendering (emulsion polymer) or extrusion (latter being usual method). Fibres can be wet-spun from, e.g. THF or cyclohexanone, or dry-spun from mixed solvents. [13] Cellular polymer (foam) can be produced by incorporating suitable blowing agents, e.g. azodicarbonamide and azodiisobutyronitrile, into formulations [31]
Mould Shrinkage (%):

No.	Value	Note
1	0.2–0.4%	0.002–0.004 in/in or mm/mm [7]

Applications: Versatility and low cost leads to extensive use in a variety of applications where toughness, abrasion and chemical resistance, and self-extinguishing props. are required. Injection moulded components to pipe fittings for rainwater and irrigation projects (large market); housings for electrical equipment (e.g. televisions, computers); textile bobbins; electrical conduit fittings; bottles; junction boxes; door handles; telephone handsets; chair backs and seats; water filtration pressure tanks; ventilation grilles; corrugated roofing; general chemical engineering applications. Extruded components used as pipes for potable and non-potable water supplies, chemical plant and waste and soil systems (largest market); profiles for building industry, e.g. window and door frames (large market), shiplap wall cladding, fencing and bench-type seating; rainwater goods; curtain rails; computer housings; tube; wire; rod. Extruded films: in-stove packaging; thin (shrink-film) for foods, e.g. cooked meats, cheese and other produce; packing of toys, games, stationery, cosmetics, confectionery, pharmaceuticals; magnetic tapes. Blow moulded articles used in tubing; bottles and containers for consumable liquids (e.g. fruit squashes), liquids for household use (e.g. detergents, disinfectants, cosmetics and toiletries, pharmaceuticals). Calendered (rigid) sheets used in internal wall-cladding for chemical plant, food stores and tunnels; light fittings, reflectors and signs; fume ducting; tank linings; food processing equipment; general chemical engineering applications. Cellular forms: cushioning; mattresses, pillows etc.; battery separators; thermal insulation. Fibres used in garments (also used in blends with wool). Foils used in decorative signs and displays; refrigerator components; liners; trays; packaging; liners for concrete shuttering. Powders used as coatings for metal protection; pyrotechnics

Poly(vinyl chloride-*co*-vinyl acetate) P-584

Synonyms: *Poly(ethenyl acetate-co-chloroethene). Poly(chloroethene-co-ethenyl acetate). VC/VAC. VC/VA. PVCA. Poly(vinyl chloride-co-ethenyl acetate)). PVC/PVAc*
Related Polymers: PVC copolymers, Poly(vinyl chloride), unplasticised, Poly(vinyl chloride), plasticised, Epoxidised poly(vinyl chloride-*co*-vinyl acetate), Carboxylated poly(vinyl chloride-*co*-vinyl acetate), Hydroxylated poly(vinyl chloride-*co*-vinyl acetate), Poly(vinyl chloride-*co*-vinyl acetate-*co*-2-hydroxypropyl acrylate), Poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid), Poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol), Poly(vinyl chloride-*co*-ethylene-*co*-vinyl acetate)
Monomers: Vinyl chloride, Vinyl acetate
Material class: Gums and resins, Copolymers, Thermoplastic
Polymer Type: PVC, polyvinyl acetatepolyhaloolefins
CAS Number:

CAS Reg. No.
9003-22-9
59740-43-1
25034-86-0

Molecular Formula: $[(C_2H_3Cl).(C_4H_6O_2)]_n$
Molecular Weight: M_n 12000–44000
Additives: Polymers, stabilisers, plasticisers, extenders, lubricants, fillers (e.g. carbon black), pigments, processing aids, impact modifiers, fire retardants, blowing agents. Stabilisers include solid calcium/zinc complex, barium/cadmium/zinc complex, epoxidised soybean oil. Lubricants include stearic acid
General Information: The most important vinyl chloride copolymer; typically contains 20 wt% vinyl acetate; it is softer and more easy flowing than the homopolymer; can be processed at lower melt temps. Useful range: 5–20% vinyl acetate content although can be as high as 40%; 48.4% Cl for copolymer containing 15% vinyl acetate (cf. 56.7% Cl in PVC). Variation in vinyl acetate content and degree of polymerisation leads to range of copolymers for which physical properties such as tensile strength, elongation, impact strength, and solubility may be varied over wide range
Tacticity: Presence of vinyl acetate comonomer interrupts regular polymer sequences in PVC homopolymer; syndiotacticity reduced by increase in vinyl acetate content (from ir measurements); degree of crystallinity reduced in a similar way; interference with crystallisability of polymer caused by both large size of acetate group (cf. Cl) as well as interruption of syndiotactic sequences; ΔH(syndio-iso) approx. 0.3 kcal mol^{-1} [7]
Morphology: Typically head-to-tail linkages; molecules contain slight degree of branching; estimated as >1.5 branches per 100 monomer units; higher than PVC homopolymer. [12] Crystallinity reduced with increasing vinyl acetate content (from transmission electron microscopy and electron diffraction techniques): e.g. non-uniform structure, i.e. large crystallinites plus amorph. regions for copolymer containing 3 wt% acetate, small crystallites in amorph. matrix for material with 10 wt% acetate, while copolymer with 17 wt% acetate shows only amorph. structure [28]; essentially amorph. even when stretched [18]
Identification: Vinyl acetate content determined by hydrolysis of acetate groups and back-titration (ISO 1159). [33]
Miscellaneous: Copolymers are colourless, water- and flame-resistant, and flexible (as thin films); in addition, are non-toxic, odourless and tasteless, and thus find uses in food-contact applications. [13,37] Initial attempts were made to combine properties of poly(vinyl chloride) and poly(vinyl acetate) by blending, but they show poor compatibility and no worthwhile properties. [37] Often copolymerised in the presence of a third comonomer to give range of terpolymers poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid) and poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol); find major uses in coating applications. US Food and Drug Administration have published details of maximum levels of vinyl chloride monomer allowed in food-contact applications; established under 'The Federal Food, Drug and Cosmetic Act'; levels of 5–50 ppb (based on vinyl chloride component weight of material), depending on polymer and specific use [35]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.36 g/cm^3	10% vinyl acetate [18]
2	d 1.39 g/cm^3	15% vinyl acetate [19]
3	d 1.34–1.36 g/cm^3	fibres [13]
4	d 1.34–1.45 g/cm^3	high vinyl acetate [37]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7×10^{-5} K^{-1}	[13]	L

Volumetric Properties General: C_p/C_v 0.2–0.5 [13]
Thermal Conductivity:

No.	Value	Note
1	0.146–0.167 W/mK	0.00035–0.0004 cal (cm s °C)$^{-1}$ [13]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.96 kJ/kg.C	0.23 cal (g °C) $^{-1}$ [37]	P

Glass-Transition Temperature:

No.	Value	Note
1	63°C	5% vinyl acetate [1]
2	59°C	10% vinyl acetate [1]
3	68°C	12% vinyl acetate; M_n 12000 [18]

4	72°C	14% vinyl acetate; M_n 22000–27000 [18]
5	72°C	15% vinyl acetate; M_n 26000 [19]
6	66.3°C	DSC [29]
7	71.7°C	TMA [29]
8	72.3°C	3 wt% acetate [29]
9	66.2°C	calc., DSC [29]
10	66.9°C	TMA [29]
11	67.9°C	calc., 10 wt% acetate [29]
12	66.1°C	DSC [21]
13	60.1°C	TMA [29]
14	65.1°C	calc., 17 wt% acetate [29]

Transition Temperature General: T_g of copolymers is an approximately linear function of composition (approx. 80°, PVC homopolymer - approx. 30°, PVAc homopolymer). [26] Plasticised material flexible to very low temp., -50°; unplasticised material becomes rubbery in boiling water, and fluid at 125–150°; fibres shrink at 60–65°; becomes tacky at 85°; fluid at 135–150° [13]
Deflection Temperature:

No.	Value	Note
1	60–65°C	[37]

Transition Temperature:

No.	Value	Note
1	70–125°C	softening temp. [37]

Surface Properties & Solubility:

Solubility Properties General: Solubility characteristics and coating properties (cf. applications as coatings) have been reviewed. [14] Copolymer much more soluble in wider range of solvents and solvent mixtures than PVC homopolymer
Cohesive Energy Density Solubility Parameters: Solubility parameter δ 43.51–44.35 $J^{1/2}$ $cm^{-3/2}$ (13 wt% vinyl acetate) [6,10,36]; 41.76 $J^{1/2}$ $cm^{-3/2}$ (14 wt% vinyl acetate) [36] δ_h 38.91–46.44 $J^{1/2}$ $cm^{-3/2}$ (14 wt%vinyl acetate) [36] 32.64–55.65 $J^{1/2}$ $cm^{-3/2}$ (14 wt% vinyl acetate, moderate solvent); [36] 0 $J^{1/2}$ $cm^{-3/2}$ (14 wt% vinyl acetate, strong solvent); 38.91–46.44 $J^{1/2}$ $cm^{-3/2}$ (12 wt% vinyl acetate, poor solvent); [36] 32.64–55.23 $J^{1/2}$ $cm^{-3/2}$ (12 wt% vinyl acetate, moderate solvent); [36] 0 $J^{1/2}$ $cm^{-3/2}$ (12 wt% vinyl acetate, strong solvent) [36]
Plasticisers: Vinyl acetate comonomer acts as an internal (permanent) plasticiser, it cannot be lost or extracted, and will not migrate; [1,11] comonomer has softening effect on copolymerisation with vinyl chloride; internal plasticisation means that less additional plasticiser is needed than for pure PVC. Other plasticisers include dioctyl and dibutyl phthalates, dibutyl cellosolve phthalate, cellosolve ricinoleates, glyceryl esters, tricresyl phosphate, camphor and triacetin [37]
Solvents/Non-solvents: Sol. THF, cyclohexanone, Me_2CO, methyl ethyl ketone, methyl isobutyl ketone, benzene, toluene, methylene chloride, esters (general). Insol. alcohols, hydrocarbons, Me_2CO (<5 wt% vinyl acetate) [13]

Transport Properties:

Transport Properties General: Viscosity is dependent on vinyl acetate content, concentration of soln., plus presence of other additives, e.g. plasticisers
Polymer Solutions Dilute: Viscosity 200–5000 cP (25% soln) [15]. Solution viscosity (15% solids in methyl ethyl ketone/toluene (1/1), 25°) 16 cP ("medium/low" MW, 12–13 wt% vinyl acetate); [33] 36 cP ("medium" MW, 13–16 wt% vinyl acetate); [33] 57 cP ("medium" MW, 14–15 wt% vinyl acetate); [33] 82 cP ("medium/high" MW, approx. 10 wt% vinyl acetate); [33] 175 cP (M_n 22000, 14 wt% vinyl acetate, 25% solids, methyl ethyl ketone/toluene (1/2); 200 cP (MW 27000, 14 wt% vinyl acetate, 20% solids, methyl ethyl ketone/toluene (1/1); 250 cP (MW 44000, 10 wt% vinyl acetate, 15% solids, methyl ethyl ketone/toluene (2/1); 350 cP (MW 12000, 12 wt% vinyl acetate, 30% solids, methyl ethyl ketone/toluene (1/2) [20]
Polymer Melts: η_{inh} 0.28 (M_n 12000, 12 wt% vinyl acetate); [18] 0.4 (M_n 22000, 14 wt% vinyl acetate); [18] 0.5 (M_n 27000, 14 wt% vinyl acetate) [18]
Permeability of Gases: Diffusion coefficients for a range of gases have been reported [37]
Permeability of Liquids: Water absorption as a function of vinyl acetate content has been reported, related to morphology of copolymers; absorption increases with increasing acetate content (cf. reduction in crystallinity) [28]
Permeability and Diffusion General: Permeability of O_2 and iron salts through membranes has been studied; permeability reduced when TiO_2 used as filler; found that mechanical degradation increases, hence anticorrosive props. diminish use. [22]
Water Content: Water retention of fibres approx. 12%; [13] moisture regain of fibres, approx. 0.1% (65% relative humidity) [13]
Water Absorption:

No.	Value	Note
1	0.23 %	50h, 3 wt% vinyl acetate [28]
2	0.27 %	50h, 10 wt% vinyl acetate [28]
3	0.3 %	50h, 17 wt% vinyl acetate [28]
4	0.07–0.1 %	24h, 25°, $\frac{1}{8}$" thick [37]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	51.2 cm^3 mm/(m^2 day atm)	7.8 × 10^{-11} cm^2 (s cm Hg)$^{-1}$, 25°, 75 wt% vinyl acetate [37]
2	O_2	23.6 cm^3 mm/(m^2 day atm)	3.6 × 10^{-11} cm^2 (s cm Hg)$^{-1}$, 25°, 50 wt% vinyl acetate [37]
3	O_2	7.87 cm^3 mm/(m^2 day atm)	1.2 × 10^{-11} cm^2 (s cm Hg)$^{-1}$, 25°, 20 wt% vinyl acetate [37]
4	He	55.8 cm^3 mm/(m^2 day atm)	8.5 × 10^{-11} cm^2 (s cmHg)$^{-1}$, 25°, 40 wt% vinyl acetate [37]
5	H_2	60.4 cm^3 mm/(m^2 day atm)	9.2 × 10^{-11} cm^2 (s cmHg)$^{-1}$, 25°, 40 wt% vinyl acetate [37]
6	N_2	3.94 cm^3 mm/(m^2 day atm)	6 × 10^{-12} (s cmHg)$^{-1}$, 25°, 40 wt% vinyl acetate [37]
7	CO_2	105 cm^3 mm/(m^2 day atm)	1.06 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 25°, 40 wt% vinyl acetate [37]

Mechanical Properties:

Mechanical Properties General: Wet strength of fibres is almost the same as air-dry strength [13]

Tensile (Young's) Modulus:

No.	Value	Note
1	2353–4168 MPa	240–425 kgf mm^{-2}, plastics [13]
2	3432–4412 MPa	approx. 350–450 kgf mm^{-2}, fibres, 30–40 gf den^{-1} [13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	41.4–48.3 MPa	[37]	
2	51.9–58.8 MPa	5.3–6 kgf mm^{-2}, plasticised [13]	200–450%
3	245–294 MPa	25–30 kgf mm^{-2}, fibres containing filler, 2.5 gf den^{-} [13]	20–30%
4	83.4 MPa	8.5 kgf mm^{-2}, staple, 0.7 gf den^{-1} [13]	100%

Flexural Strength at Break:

No.	Value	Note
1	83.4 MPa	8.5 kgf mm^{-2} [13]

Mechanical Properties Miscellaneous: Elastic recovery 70–90% (continuous filament, 1–2% extension); 30% (approx., continuous filament, >5% extension); 10% (staple, >5% extension); 5–10% (staple, >10% extension) [13]
Hardness: Brinell hardness: 15 (approx., 25 kg load, 2.5 mm ball) (unplasticised material); softened by plasticisers and increasing vinyl acetate content [13]
Izod Notch:

No.	Value	Notch	Note
1	26.68–53.37 J/m	Y	0.5–1 ft lb in^{-1} [13]

Electrical Properties:

Electrical Properties General: Dielectric constant increased by presence of plasticisers [13]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3–3.5	50 Hz-1 MHz	[13]
2	3.2–3.3	60 Hz	[37]
3	3.1–3.2	1 kHz	[37]
4	3–3.1	1 MHz	[37]

Dielectric Strength:

No.	Value	Note
1	55 $kV.mm^{-1}$	unplasticised [13]
2	16–24 $kV.mm^{-1}$	plasticised [13]
3	16.7 $kV.mm^{-1}$	425 V mil^{-1}, short time, $\frac{1}{8}$" thick [37]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.01–0.02	50 Hz-1 MHz	[13]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.525–1.535	average values; 5–10% vinyl acetate [3]
2	1.52–1.55	20° [13,37]
3	1.53	fibres [13]

Transmission and Spectra: Ir spectral data for copolymers, unplasticised and containing plasticiser (tricresyl phosphate), have been reported; presence of plasticiser has little effect on carbonyl peak. [25] X-ray photoelectron spectroscopy has been used to examine the surfaces of copolymers moulded against metal substrates [34]
Total Internal Reflection: Birefringence nil [13]

Polymer Stability:

Thermal Stability General: Thermal analysis of coating materials has been reported. [27] Thermal stability is less than each of comonomers; [2] minimum stability occurs for compositions containing 40–50 mol% vinyl acetate. [2,5] Dependent on content of internal unsaturated groups and blocks of polyconjugated double bonds; independent of MW and total number of double bonds; stability reduced when terpolymers formed [17]
Decomposition Details: Unplasticised material decomposes above 150°. [13] Bulk degradation studies using thermal volatilisation analysis have been reported; evolution of AcOH and hydrogen chloride with relative proportions remaining equivalent to copolymer composition; measurements made over ambient-500°. [2,5] Corresponding experiments carried out in tritolyl phosphate plasticised solns. at 180° under isothermic degradation conditions; similar behaviour to bulk polymer exhibited; minimum stability occurs for compositions containing 30–40 mol% vinyl acetate; [4,5] uv spectroscopy used to examine development of conjugation along polymer chain; longer sequences found (at given extent of degradation for copolymers containing 20–30 mol% vinyl acetate. [4] Other thermal degradation studies have been reported, both for bulk polymer [9] and in solution (DMF). [24] At 153°, both dehydrochlorination and elimination of the comonomer units occurs (analysis by using ir and Raman spectroscopy); comonomer units randomly distributed in small amounts and break up 'zipper' dehydrochlorination reaction of PVC homopolymer; [9] conjugated polyenes formed which are significantly longer than average PVC block length, by elimination of vinyl acetate moieties [24]
Flammability: Is self-extinguishing [37]
Environmental Stress: Resistance to uv irradiation reduced on addition of comonomer; approx. in proportion to vinyl acetate content. [16] Darkens on prolonged exposure to sunlight; [37] less stable to light than PVC homopolymer. Low water absorption results in excellent dimensional stability under all kinds of weather conditions [37]
Chemical Stability: Virtually unaffected by most chemical reagents. Displays excellent resistance to acids, alcohols, alkalis and oils of all kinds; swollen by aromatic hydrocarbons; poor resistance to aq. ammonia, ketones, esters, aldehydes etc.; decomposed by alcoholic alkalis and hot oxidising acids. [13,37] Chemical degradation studies using potassium-*tert*-butoxide/DMF have been reported: essentially complete dehydrochlorination occurs, plus hydrolysis to vinyl alcohol; latter groups remain intact and block any extension of conjugated polyene sequences; ir and Raman spectroscopy show only short polyene sequences to be formed [24]
Hydrolytic Stability: Displays excellent resistance to water and salt solns.

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical emulsion polymerisation of mixture of comonomers; typical initiators include peroxides (benzoyl, cyclohexanone and hydroxyheptyl), AIBN (often with UV light) and tri-*n*-butyl boron [7,8,13]
Applications: Flooring, records, sheet, film, packaging. In general, finds applications for products where better melt flow and fusion is required than is easily achievable with homopolymer, such as pipes, fittings, coatings and films

Poly(vinyl chloride-*co*-vinyl-acetate), Carboxylated P-585

R = poly (carboxylic acid) containing side chain

Synonyms: *Carboxylated VC/VA. Carboxylated PVC/PVAc. Poly(vinyl chloride-co-vinyl acetate), carboxyl-modified. Carboxylated vinyl chloride-vinyl acetate copolymer. Carboxyl-modified vinyl chloride-vinyl acetate copolymer. ' COOH containing ' vinyl chloride-vinyl acetate copolymer*
Related Polymers: Poly(vinyl chloride-*co*vinyl acetate), PVC copolymers, Poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid), Poly(vinyl chloride-*co*-vinyl acetate), hydroxylated
Monomers: Vinyl chloride, Vinyl acetate
Material class: Gums and resins, Copolymers
Polymer Type: PVC, polyvinyl acetatepolyvinylspolyhaloolefins
CAS Number:

CAS Reg. No.	Note
39423-34-2	aq. soln.

Molecular Formula: $[(C_2H_3Cl).(C_4H_6O_2).(C_2H_4O).(C_3H_3O_2R)]_n$
Molecular Weight: M_n 4000–23000 (polycarboxylated side-chain copolymers)
Identification: Hydroxyl equivalent weight 740 (polycarboxylated-side-chain copolymer, M_n 4000); 1000 (polycarboxylated-side-chain copolymer, M_n 23000) [7]. Hydroxyl content 2.3% (polycarboxylated-side-chain copolymer, M_n 4000); 1.7% (polycarboxylated-side-chain copolymer, M_n 23000) [7]. Acid number 75 (polycarboxylated-side-chain copolymer, M_n 4000–23000) [7]
Miscellaneous: Presence of COOH group improves adhesion when used in coatings applications (particularly to metals) and improves solubility in relatively weak solvent systems. A specific example is poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid), which is most well studied carboxylated form. Structure and props. of series of copolymers with polycarboxylate side chains have been reported [7]; hydroxyl groups randomly distributed on backbone; side chains become extremely hydrophobic in form of amine salts; waterborne vinyl dispersions have been formulated for use as inks and paints [7] presence of hydroxyl and carboxyl side-groups imparts improved adhesion to many plastic substrates and provides sites for optional cross-linking [7]. Has environmental and health aspects, dispersions of polycarboxylated-side-chain copolymers in aq. systems used for waterborne ink and paint formulations; reductions in volatile organic content during handling and drying operations [7]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26 g/cm^3	polycarboxylated-side-chain copolymer; M_n 4000 [7]
2	d 1.32 g/cm^3	polycarboxylated-side-chain copolymer; M_n 23000 [7]

Glass-Transition Temperature:

No.	Value	Note
1	67°C	polycarboxylated-side-chain copolymer; M_n 4000 [7]
2	81°C	polycarboxylated-side-chain copolymer; M_n 23000 [7]

Transport Properties:

Polymer Solutions Dilute: Viscosity 2000 cP (polycarboxylated-side-chain copolymers, M_n 4000, aq. dispersion, 31% solids) [7]; 1900 cP (polycarboxylated-side-chain copolymers, M_n 23000, aq. dispersion, 36% solids) [7]

Mechanical Properties:

Mechanical Properties General: Low MW material is relatively brittle; however, displays excellent combination of toughness, adhesion and hardness in formulated thermoplastic systems (e.g. in inks); toughness, e.g. impact strength, increases with both MW and cross-linking [7]

Polymer Stability:

Polymer Stability General: Waterborne dispersions of polycarboxylate-side-chain copolymers (pH 5–9) display good shelf lives and freeze/thaw stability: typically, can be stored for e.g. 4 weeks at 50° and at least 1 year at 20° [7]
Chemical Stability: Good solvent and chemical resistance shown by amino-cured films of polycarboxylated-side-chain copolymers [7]

Applications/Commercial Products:

Trade name	Details	Supplier
Cevian A678	aq. solution	Diacel Chem. Ind.
Ucar AW 100	low MW aq. dispersion	Union Carbide Corporation
Ucar AW 850	high MW aq. dispersion	Union Carbide Corporation

Poly(vinyl chloride-*co*-vinyl acetate), Epoxidised P-586

Synonyms: *Epoxidised VC|VA. Epoxidised PVC|PVAc. Poly(vinyl chloride-co-vinyl acetate), epoxy-modified. Epoxidised vinyl chloride-vinyl acetate copolymer. Epoxy-modified vinyl chloride-vinyl acetate copolymer*
Related Polymers: Poly(vinyl chloride-*co*-vinyl acetate), PVC copolymers, Poly(vinyl chloride-*co*-vinyl acetate), hydroxylated, Poly(vinyl chloride-*co*-vinyl acetate-*co*-(2-hydroxypropyl acetate)
Monomers: Vinyl chloride, Vinyl acetate
Material class: Gums and resins, Copolymers
Polymer Type: PVC, polyvinyl acetatepolyhaloolefins

Molecular Weight: 15000 (82% vinyl chloride, 9% vinyl acetate 9% epoxy-containing monomer)
General Information: Epoxy-modified copolymers can crosslink to carboxyl-containing polymers after stoving, thus improving toughness and solvent resistance. Solns. in methyl ethyl ketone/toluene (3/2) (40% solids) commercially available; used , often in conjunction with solns. of acid-modified (carboxylated) terpolymers such as poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid), to produce high-solid baked coatings, having very good adhesion to metal, hardness, and gloss [5]

Transport Properties:

Polymer Solutions Dilute: Viscosity 1000 cP (vinyl resin soln. in methyl ethyl ketone/toluene (3:2); 40% solids, 82% vinyl chloride, 9% vinyl acetate, 9% epoxy-containing monomer) [1]

Applications/Commercial Products:

Trade name	Details	Supplier
Ucar VERR-40	vinyl resin soln. 40% solids in methyl ethyl ketone/toluene (3/2)	Union Carbide Corporation

Poly(vinyl chloride-*co*-vinyl acetate), Hydroxylated P-587

Synonyms: *Hydroxylated VC|VA. Poly(vinyl chloride-co-vinyl acetate), hydroxy-modified. Hydroxylated vinyl chloride-vinyl acetate copolymer. Hydroxy-modified vinyl chloride-vinyl acetate copolymer. ' OH-containing' vinyl chloride-vinyl acetate copolymer*

Related Polymers: Poly(vinyl chloride-*co*-vinyl acetate), PVC copolymers, Poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol), Poly(vinyl chloride-*co*-vinyl acetate-*co*-(2-hydroxypropyl acrylate)
Monomers: Vinyl chloride, Vinyl acetate
Material class: Gums and resins, Copolymers
Polymer Type: PVC, polyvinyl acetatepolyhaloolefins
CAS Number:

CAS Reg. No.	Note
25822-51-9	17% hydroxy functionality

Molecular Weight: MW 3500–33000 (soln. vinyl resins containing hydroxyalkyl acrylates)
General Information: General class: examples include terpolymers containing poly (vinyl alcohol), poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol) and various hydroxyalkyl acrylates, such as 2-hydroxypropyl acrylate, Poly (vinyl chloride-*co*-vinyl acetate-*co*-(2-hydroxypropyl acrylate))
Miscellaneous: Modified copolymers display improved compatibility with other film-forming resins; in addition, they can be cured by cross-linking with isocyanates or melamine-formaldehyde resins. Solutions in methyl ethyl ketone, methyl ethyl ketone/toluene and isopropyl acetate (20–74% solids) commercially available; used for coatings [6]. Terpolymers often used blended with polyurethanes, e.g. in applications in magnetic recording media

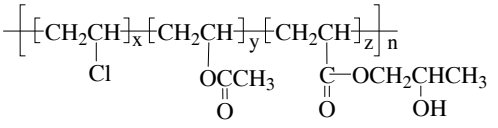
Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.36–1.37 g/cm^3	81% vinyl chloride, 4% vinyl acetate, 15% hydroxyalkyl acrylate [6]
2	d 1.32 g/cm^3	67% vinyl chloride, 11% vinyl acetate, 22% hydroxyalkyl acrylate [6]
3	d 1.32 g/cm^3	60% vinyl chloride 32% vinyl acetate, 8% hydroxyalkyl acrylate [6]
4	d 1.27 g/cm^3	58% vinyl chloride 10% vinyl acetate, 32% hydroxyalkyl acrylate [6]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. THF. Insol. MeOH

Transport Properties:
Polymer Solutions Dilute: Viscosity (terpolymers containing hydroxyalkyl acrylates): 171–1000 cP (20–50% solids, in methyl ethyl ketone/toluene) [6]; 1100 cP (74% solids, methyl ethyl ketone) [6]; 1500 cP (40% solids, isopropyl acetate) [6]

Optical Properties:
Transmission and Spectra: Ir spectrum shows broad OH signal at 3400 cm^{-1} (copolymer with 17% hydroxyl functionality [1]



Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by partial hydrolysis of poly(vinyl chloride-*co*-vinyl acetate) using NaOH in MeOH [1] or by copolymerisation of poly(vinyl chloride-*co*-vinyl acetate) with hydroxyl-containing monomers in a free radical polymerisation process
Applications: Applications as components of binder resins, e.g. for use in magnetic recording media; formed by reactions of isocyanates with OH groups of copolymers, magnetic particles wetted, also used in abrasive tapes for polishing magnetic (tape) heads. Additional applications include components of waterproof fillers for decorative building boards and in the preparation of membranes for ion-selective electrodes

Trade name	Details	Supplier
Ucar	VAGC, VAGF, VROH, VYES, VYES-4, VYNC, VP-200; solns. of resins in isopropyl acetate, methyl ethyl ketone or methyl ethyl ketone/toluene mixts	Union Carbide Corporation

Poly(vinyl chloride-*co*-vinyl acetate-*co*-2-hydroxypropyl acrylate) P-588

Synonyms: *Poly(vinyl chloride-co-vinyl acetate-co-(2-hydroxypropyl propenoate). Poly(chloroethene-co-ethenyl acetate-co-(2-hydroxypropyl-2-propenoate)). Poly(chloroethene-co-ethenyl acetate-co-(β-hydroxypropyl-2-propenoate)). Poly(vinyl chloride-co-vinyl acetate-co-(β-hydroxypropylacrylate)*
Related Polymers: Polyvinyl chloride, Poly(vinyl chloride-*co*-vinyl acetate), PVC copolymers, Poly(vinyl chloride-*co*-vinyl acetate), hydroxylated, Poly(vinyl chloride-*co*-vinyl acetate), epoxidised
Monomers: Vinyl chloride, Vinyl acetate, 2-Hydroxypropyl acrylate
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, polyvinyl acetateacrylic terpolymerspolyhaloolefins
CAS Number:

CAS Reg. No.	Note
41618-91-1	
123814-61-9	graft copolymer
114237-66-0	phosphate, P_2O_5

Molecular Formula: $[(C_2H_3Cl).(C_4H_6O_2).(C_6H_{10}O_3)]_n$
Fragments: C_2H_3Cl $C_4H_6O_2$ $C_6H_{10}O_3$
Molecular Weight: M_n 5500-3000 (research grade), M_n 10000-12000 (commercial material)
General Information: Is available in research quantities
Identification: Vinyl chloride content 58–81%; vinyl acetate 4–34%; hydroxypropyl acrylate 8–22%: commercial materials usually contain 80–81 wt% vinyl chloride 4–5% vinyl acetate, 15% acrylate [7,12]. Hydroxyl number 99–59 (22–15 wt% acrylate; M_n 5500–33000) [12]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.35 g/cm^3	80% vinyl chloride, 5% vinyl acetate, 15% acrylate [7]
2	d 1.2 g/cm^3	estimated: 58% vinyl chloride, 34% vinyl acetate, 8% acrylate [7]

Glass-Transition Temperature:

No.	Value	Note
1	63°C	80% vinyl chloride, 5% vinyl acetate, 15% acrylate, M_n 10000; 58% vinyl chloride, 34% vinyl acetate, 8% acrylate, M_n 12000 [7],
2	65–70°C	M_n 15000–33000, 81% vinyl chloride, 4% vinyl acetate, 15% acrylate [12]
3	53°C	M_n 5500, 67% vinyl chloride, 11% vinyl acetate, 22% acrylate [12]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. cyclohexane [2]

Transport Properties:

Polymer Solutions Dilute: η 0.15–0.56 (M_n 5500–33000) [12]; 0.222 (52% vinyl chloride, 30% vinyl acetate, 18% acrylate) [2]; 0.34 (59% vinyl chloride, 32.1% vinyl acetate, 8.9% acrylate) [5]

Polymer Stability:

Stability Miscellaneous: Devolatilisation in environmental and health studies has been reported [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical initiated (diisopropyl peroxydicarbonate) polymerisation of co-monomer mixt. in Me_2CO at 73° (41–69 psig) [2]. Coatings compositions prepared by reaction with neopentyl glycol diacrylate, and cured by photocrosslinking using Hg or Ar irradiation [2]; thermosetting coating compositions have also been reported [3,4,6]

Applications: Major applications as coatings, layers and binders: coating compositions for wood (radiation curable); binders for magnetic recording media (e.g. tapes) cured with diisocyanates; various thermosetting coating compositions, furniture polishes and lacquers (with nitrocellulose); as polyurethane prepolymers for high-strength mouldings. Graft copolymers used in production of sheet and foam laminates. Phosphate (containing P_2O_5) derivative used in compositions for magnetic recording media

Trade name	Details	Supplier
Standard samples	M_n 5500–33000; 22–15 wt% acrylate	Aldrich

Poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid) P-589

Synonyms: *Poly(chloroethene-co-(ethenyl acetate)-co-((Z)-2-butenedioic acid)). 'Carboxylated' vinyl chloride-vinyl acetate copolymers. 'Carboxyl-modified' vinyl chloride-vinyl acetate copolymers. 'Acid-modified' vinyl chloride-vinyl acetate copolymers*

Related Polymers: PVC copolymers, Carboxylated poly(vinyl chloride-*co*-vinyl acetate)

Material class: Thermoplastic, Copolymers

Polymer Type: polyvinyls, polyhaloolefins

CAS Number:

CAS Reg. No.
9005-09-8

Molecular Weight: M_n 15000–27000; M_n 25400; MW 61900 (86% vinyl chloride, 13% vinyl acetate, 1% maleic acid)

Identification: Typical compositions: 79–88% vinyl chloride; 11.8–18.9% vinyl acetate; 0.8–2.5% maleic acid: most generally used copolymers contain 86% vinyl chloride, 13% vinyl acetate and 1% maleic acid (acid number 10, 83% vinyl chloride, 16% vinyl acetate and 1% maleic acid (acid number 10), and 81% vinyl chloride, 17% vinyl acetate and 2% maleic acid (acid number 19) [10]

Miscellaneous: Specific example of carboxylated vinyl chloride-vinyl acetate copolymer. Addition of maleic acid improves air-dry adhesion to metals, paper and other substrates; important in coating and adhesive applications; often used in conjunction with cross-linking systems such as epoxidised vinyl chloride-vinyl acetate copolymers. [9] Sometimes referred to as maleic anhydride terpolymer, as anhydride used in synthesis as third comonomer. Comparative study of polydispersity for terpolymers prepared by both solution and suspension-polymerisation techniques has been carried out; similar values found for polydispersity, 1.80–1.94. [28] United States Food and Drug Administration have published data on maximum levels of vinyl chloride monomer that may be tolerated in terpolymers used for food-contact applications (Federal Food, Drug and Cosmetic Act); levels of 5–50 ppb reported, depending on polymer composition and use [31] may be determined by gc [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.34–1.35 g/cm^3	[11]

Glass-Transition Temperature:

No.	Value	Note
1	70–74°C	2-1 wt % maleic acid [10]

Transition Temperature General: Thermal analysis of terpolymer coating materials (films and lacquers) has been reported [6]

Surface Properties & Solubility:

Solubility Properties General: Solubility characteristics and coating properties (in connection with use as coatings) have been reported [12]

Cohesive Energy Density Solubility Parameters: Solubility parameters **δ** 41.8 $J^{1/2}$ $cm^{-3/2}$; δ_h 44.35–46.44 $J^{1/2}$ $cm^{-3/2}$ (poor solvent).[3] 32.64–50.63 $J^{1/2}$ $cm^{-3/2}$ (moderate solvent) [3], 0 (poor solvent) [3]

Solvents/Non-solvents: Sol. THF [7], 2-butanone [8], (some) ketones, esters, chlorinated hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons [9]. Solubility in weak solvent systems improved by increasing carboxyl groups. V. sol. ketone/aromatic solvent mixtures [9]

Surface and Interfacial Properties General: 2.1–2.5% maleic acid content used in adhesives [9]

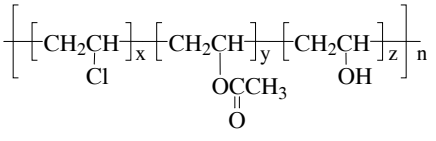
Mechanical Properties:

Friction Abrasion and Resistance: Adhesive strengths of terpolymer coating formulations have been reported; with respect to MW, polarity and flexibility of polymer chains [32]

Polymer Stability:

Environmental Stress: Effect of environment on adhesion to steel of various paint formulations containing terpolymer has been reported; water environments have most disruptive effect [23]
Stability Miscellaneous: Sterilisation by uv radiation or H_2O_2 of heat sealable packaging material formulations (for pharmaceutical and food products) reduces seam (tear) strength [35]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by free-radical-initiated copolymerisation of vinyl chloride/vinyl acetate/maleic anhydride mixtures
Applications: Major applications as coatings and adhesives; solutions in methyl ethyl ketone/toluene (25/75 and 50/50) containing 20–30% solids are used either alone or in combination with other resins e.g. cross-linking systems such as epoxidised vinyl chloride-vinyl acetate copolymers for coatings systems. Coatings consisting of interpenetrating networks of terpolymers with various urethanes have also been reported. Applications include wetting binders for magnetic and optical recording media; heat-sealable packaging films for pharmaceutical and food products; plastisol compositions for sealing (welded) joints and sound-insulation coatings; heat-transferable and chemical and abrasion-resistant labels and coatings for glass and metals; preparation of membranes for ion-selective electrodes; food contact applications; release agents; leather susbstitutes (e.g. footwear); inks for thermal-transfer printing; primers for metal surfaces; anticorrosive sheet steel (e.g. for cans); binders and fire-resistant coatings for textiles; fluoroelastomer film compositions; modifiers for polymer fillers; electrophotographic coatings; microlithography/photoresists (e.g in highly sensitive negative electron-beam resist compositions); waterproof coating materials for building applications (e.g. on concretes); in blends with heparinised urethane rubbers for medical applications such as catheters. Used as anti-corrosive paint and varnish

Poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol) P-590

Synonyms: *Poly(chloroethene-co-ethenyl acetate-co-ethenol). 'Hydroxyl-modified' vinyl chloride-vinyl acetate copolymers. 'Hydroxylated' vinyl chloride-vinyl acetate copolymers. Hydrolysed vinyl chloride-vinyl acetate copolymers*
Related Polymers: Polyvinyl chloride, Poly(vinyl chloride-*co*-vinyl acetate), PVC copolymers, Hydroxylated Poly(vinyl chloride-*co*-vinyl acetate)
Monomers: Vinyl alcohol, Vinyl acetate, Vinyl chloride
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, polyvinyl acetatepolyvinyl alcohol
CAS Number:

CAS Reg. No.
25086-48-0
51990-36-4

Molecular Formula: $[(C_2H_3Cl).(C_2H_4O).(C_4H_6O_2)]_n$
Molecular Weight: M_n 22000–27000; M_n 32900. MW 69500 (91.5% vinyl chloride, 3% vinyl acetate, 5.5% vinyl alcohol)
Additives: Plasticisers (phthalates, phosphates)
Morphology: Thin films cast from isobutyl methyl ketone have

completely amorph. struct. (from electron microscopic and electron diffraction studies) [15]; ir spectroscopic studies and temp. dependence investigations indicate the presence of intermolecular hydrogen bonding [18]

Identification: Typical composition: 90–91.5% vinyl chloride; 3–4% vinyl acetate; 5.5–6% vinyl alcohol: most generally used copolymers contain 90% vinyl chloride, 4% vinyl acetate, 6% vinyl alcohol (hydroxyl number, 76). A headspace gas-chromatographic method, for the routine determination of low-level (ppb) amounts of residual vinyl chloride in various vinyl chloride terpolymer systems, has been reported [24]; rapid method reported for identifying small particles of terpolymer by using light microscopy and dispersion staining techniques [40]

Miscellaneous: Specific example of hydrolysed vinyl chloride-vinyl acetate copolymer. Hydrolysed copolymers have increased adhesion to organic substrates, compatibility with wide range of modifying resins and reactive sites for cross-linking and modification; cross-linking is possible of OH groups by reaction with amino resins (urea-formaldehyde or melamine-formaldehyde) or isocyanates. Presence of OH groups also improves compatibility with e.g. nitrocellulose and alkyd resins in surface-coating formulations. Toxicological studies of terpolymer dust have been reported: shows no skin resorption and fibrogenic props.; recommended max. permissible concentration in working environment 10 mg m^{-3} [39]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.39 g/cm^3	[1,2]

Glass-Transition Temperature:

No.	Value	Note
1	76–77°C	
2	78.1°C	TMA, 91% vinyl chloride, 3% vinyl acetate, 6% vinyl alcohol [19]
3	81°C	differential scanning calorimetry, 91% vinyl chloride, 3% vinyl acetate, 6% vinyl alcohol [18]
4	82.5°C	calc., 91% vinyl chloride, 3% vinyl acetate, 6% vinyl alcohol [18]

Transition Temperature General: Thermal analysis of terpolymer coating materials (films and lacquers) has been reported [11]

Surface Properties & Solubility:

Solubility Properties General: Solubility reduces with increasing MW [14]. Solubility characteristics and coating props. (in connection with use as coatings) have been reported [22]

Cohesive Energy Density Solubility Parameters: Solubility parameter δ 42.47 $J^{1/2}$ $cm^{-3/2}$ [3]; δ_h 44.35–46.44 $J^{1/2}$ $cm^{-3/2}$ (poor solvent) [3]; 32.64–41.42 $J^{1/2}$ $cm^{-3/2}$ (moderate solvent) ; 0 (strong solvent) [3]

Solvents/Non-solvents: Sol. THF [13], (some) ketones, esters and chlorinated hydrocarbons [14], isobutyl methyl ketone

Transport Properties:

Polymer Solutions Dilute: Hydrodynamic props. (viscosity parameters, α and k, etc) have been reported for both dilute and conc. solns [5]. Viscosity 350–400 cP (20–25%, methyl ethyl ketone/toluene, Ucar) [2]; 17–87 cP (15% solns. methyl ethyl ketone/toluene) [14]. Comprehensive study of rheology of terpolymer solns. in methyl ethyl ketone and dichloroethane has been reported. Displays an inverse dependence of intrinsic viscosity on critical concentration [26]

Polymer Melts: Inherent viscosity η_{inh} 0.44–0.53

Permeability and Diffusion General: Effects of type and content of different plasticisers, e.g. phthalates and phosphates, on permeability and diffusion of (artificial) seawater on terpolymer (91 wt% vinyl chloride, 3 wt% vinyl acetate, 6 wt% vinyl alcohol) have been reported [17]. Water absorption of terpolymer (91% vinyl chloride, 3% vinyl acetate, 6% vinyl alcohol) greater than that of poly(vinyl chloride-*co*-vinyl acetate) (3–17% vinyl acetate); indications of hydrogen-bonding in terpolymer, and effect of amorph. struct. [15]

Mechanical Properties:

Mechanical Properties Miscellaneous: Thermomechanical spectra have been reported, including systems cross-linked with diisocyanates, effect of OH content and degree of cross-linking, on T_g [38]

Electrical Properties:

Static Electrification: Low frequency dielectric relaxation, relative permittivity (ϵ') and loss (ϵ'') have been reported [29,30] for terpolymer (91% vinyl chloride, 3% vinyl acetate, 6% vinyl alcohol). Strong α and weak β relaxations are observed

Optical Properties:

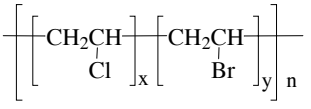
Transmission and Spectra: Ir spectral data: temp. dependence for plasticised and unplasticised terpolymer has been reported [18,34,35]. XPES have been reported [37]

Polymer Stability:

Thermal Stability General: Thermal dehydrochlorination studies, including effects of accelerated uv-ageing, have been reported [7]. Thermal stability is reduced with respect to poly(vinyl chloride-*co*-vinyl acetate, possibly due to formation of conjugated double bonds [33,36]

Decomposition Details: Degradation involves dehydrochlorination and formation of conjugated polyene, initiated at several sites in polymer unzipping reaction

Applications/Commercial Products:



Trade name	Details	Supplier

Poly(vinyl chloride-*co*-vinyl bromide) P-591

Synonyms: *Vinyl chloride-vinyl bromide copolymer. Poly(chloroethene-co-bromoethene). VC/VB copolymer*
Related Polymers: Poly(vinyl chloride), unplasticised, PVC copolymers
Monomers: Vinyl chloride, Vinyl bromide
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, polyhaloolefins
CAS Number:

CAS Reg. No.
30875-00-4

Molecular Formula: $[(C_2H_3Cl)_x(C_2H_3Br)_y]_n$
Molecular Weight: MW 30000–32400 (AIBN/uv, 25°, 7.6–1.7% vinyl bromide), 40500 (AIBN/uv, -30°, 6.8% vinyl bromide), 63900–148400 (degree of polymerisation 510–1190, suspension polymerisation, cyclohexyl percarbonate initiator, 40°, 13.87–0.49 wt% bromine)
General Information: Presence of vinyl bromide as comonomer increases copolymer's flame-retardant props. Has been used as model for PVC homopolymer with chain irregularities and variable tacticities (latter by ir) [6,9,10]; comonomer vinyl bromide content <10% [6,10]. Have relatively low MW
Tacticity: Tacticity decreases with increase in vinyl bromide content. [10] Analysis of tacticity and sequence distribution facilitated by reductive debromination, thus eliminating ionisation interferences; approximate Bernoullian statistics exhibited for copolymerisation reactions [1,2]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. 1,2,4-trichlorobenzene (100°) [1]; DMF [3]. Insol. MeOH, H_2O [3]

Transport Properties:
Polymer Solutions Dilute: [η] 8.0–26.5 (THF, 25°, soln. polymerisation; cyclohexyl percarbonate initiator, 40°, increases with increasing vinyl chloride content). [3] [η] 73.2–138.8 (THF, 25°, suspension polymerisation; cyclohexyl percarbonate initiator, 40°, increases with increasing vinyl chloride content) [3]

Optical Properties:
Transmission and Spectra: High-resolution H-1 nmr and C-13 nmr spectral data have been reported. [1,2] Ir spectral data have been reported [6]

Polymer Stability:
Thermal Stability General: Used as model for investigations of thermal dehydrochlorination reaction of PVC homopolymer. [3,9,10,11]
Decomposition Details: Rate of decomposition at 180° greater than for PVC; lower activation energy of hydrogen halide elimination. Thermal elimination of hydrogen chloride starts from comonomer unit (in N_2 atmosphere); first step in decomposition requires sequence of at least two neighbouring comonomer units. [11] Ozonolysis studies at 0–20° on suspension polymerised copolymers (1.32 and 12.45 mol.% vinyl bromide) have been reported. Ionic degradation with LiCl and LiBr also examined; polymer degrades by autooxidation at 0–70°; used in determination of internal double bond content of PVC homopolymer. It is reported that suspension polymerised PVC contains 0.05 double bonds for each 1000 vinyl chloride units; presence of Bu_2S during ozonolysis protects double bonds. [9] Dehydrobromination reaction is not selective; isolated double bonds not produced even at low temps. [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by bulk [1,6,10], solution (dichloroethane) [3], suspension [3] or emulsion [7,8] polymerisation of comonomers. Free radical initiators are used, e.g. AIBN (60°) [1], AIBN + uv radiation (-30 to 25°) [6,10], cyclohexyl percarbonate (40°) [3] or γ-irradiation (0°) [1]
Applications: Has applications due to fireproofing characteristics that include its compositions with poly(vinyl alcohol), e.g. transparent fireproof films (30% vinyl bromide content, emulsion polymerised) and other fire-resistant films, fibres and coatings; component of paddings in fire-retardant blend compositions for fireproofing textiles, cotton/polyester blends and 50/50 polyester/cotton wovens [8]; emulsions with amides and phosphonium salts; flame-resistant finish durable up to 50 washing cycles, with no yellowing during curing

Poly(vinyl chloride-*co*-vinylidene chloride) P-592

Synonyms: *Vinyl chloride-vinylidene chloride copolymer. High-vinylidene copolymer. Poly(vinylidene chloride) copolymer. VDC/VC. Poly(1,1-dichloroethene-co-1-chloroethene)*
Related Polymers: Polyvinyl chloride, unplasticised, Poly(vinylidene chloride), PVC copolymers
Monomers: Vinyl chloride, Vinylidene chloride
Material class: Thermoplastic, Copolymers
Polymer Type: PVC, polyvinylidene chloridepolyhaloolefins
CAS Number:

CAS Reg. No.
9011-06-7

Molecular Formula: $[(C_2H_3Cl).(C_2H_2Cl_2)]_n$
Fragments: C_2H_3Cl $C_2H_2Cl_2$
Molecular Weight: MW 200000 (emulsion copolymers); MW 44250 (degree of polymerisation 200, 38 wt.% vinyl chloride); MW 28530 (degree of polymerisation 130, 68 wt.% vinyl chloride); MW 29340 (degree of polymerisation 150, 76% vinyl chloride); MW 43190 (degree of polymerisation 200, 95% vinyl chloride, free-radical (AlBN) initiated suspension polymerisation)
Additives: Stabilisers (chemical; light), plasticisers, antioxidants
General Information: Has improved permeability compared to PVC. Although it has many valuable props., e.g. resistance to solvents and low gas permeability, PVDC not used to any great extent on its own, owing to difficulties in fabrication and processing; high-vinylidene copolymers used - typically contain 10–15% vinyl chloride as comonomer. In addition, copolymers are available, at other end of range, containing approx. 95% vinyl chloride. Terpolymers (e.g. vinylidene chloride/vinyl chloride/acrylonitrile (85/13/2) are also available commercially
Morphology: High-vinylidene copolymers prepared as aq. dispersions are usually amorph. but can become crystalline when converted to films [2]. Cold drawing leads to highly oriented (highly crystalline) material, e.g. films and fibres [2]. X-ray diffraction studies show morphology of PVDC homopolymer retained in copolymers (0.4–95% vinyl chloride) [5,6]; crystallinity 20–34% (40–90% vinyl chloride, cold drawn and annealed fibres) [5,6]; SAXS studies on cold drawn fibres indicate microstructure of fringe-micelle type, with little folded-chain-lamellar struct. [5,7]. PVDC homopolymer has higher degree of crystallinity (lamellar particles); structural regularity is reduced as vinyl chloride content is increased, until at vinyl chloride $\geq$30%, copolymer becomes amorph. (spherical particles) [5,9]
Miscellaneous: Fibres have characteristic pale straw colour [12]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.69 g/cm^3	granules, 200–260 μm [1]
2	d 1.6 g/cm^3	approx., flexible film [4]
3	d 1.65–1.72 g/cm^3	typical range, monofilament [5]

Melting Temperature:

No.	Value	Note
1	163°C	granules, 200–260 μm [1]
2	164°C	powder [1]
3	135°C	10 wt.% vinyl chloride [13]
4	183–192°C	vinyl chloride mole fraction 0.44–0.095, cold drawn and annealed fibres [5,6]

Glass-Transition Temperature:

No.	Value	Note
1	-17°C	[13]

Transition Temperature General: T_g varies with copolymer composition; can be approximated using a modified Gordon-Taylor equation [5,10]. High-vinylidene copolymers have lower T_m values than PVDC homopolymer [11]
Vicat Softening Point:

No.	Value	Note
1	115–140°C	typical range, monofilament [5]

Transition Temperature:

No.	Value	Note	Type
1	77°C	intermittant, typical value, monofilament [5]	heat resistance temp.
2	100°C	continuous, shrinks, typical value, monofilament [5]	heat resistance temp.

Surface Properties & Solubility:

Solubility Properties General: Modified forms of PVC (e.g. 95 wt% vinyl chloride) have greater solubility than PVC homopolymer; solubility increases with increasing vinyl chloride content [2]; copolymers, in particular those of low crystallinity, are much more soluble in common organic solvents at room temp. than PVDC homopolymer [11]
Plasticisers: Alkyl esters of adipic, sebacic and citric acids (e.g. acetyltributyl citrate); dioctyl phthalate; polymeric plasticisers, e.g. poly(ethylene-*co*-vinyl acetate) and polyurethane rubbers. Most of common PVC plasticisers can be used, although compatibility with high-vinylidene copolymers is sometimes poor [5]
Solvents/Non-solvents: Sol. THF (vinylidene chloride:vinyl chloride (90:10)) [2], ketone/aromatic hydrocarbon mixtures (vinylidene chloride:vinyl chloride (85:15)) [2], ketones (low vinylidene chloride content materials) [2]
Wettability/Surface Energy and Interfacial Tension: Critical contact angle 39–40° (15 wt% vinyl chloride, 25°) [5,8]. Contact angle 80° (H_2O), 31° (methylene iodide), 0° (hexadecane, 25°, 15 wt% vinyl chloride) [5,8]

Transport Properties:

Transport Properties General: High vinylidene copolymers are highly impermeable to most gases and vapours; transmission increases as vinylidene chloride content is reduced, and with increasing temp. Vinylidene chloride polymers more impermeable to wider range of gases and liquids than many other polymers due to a combination of high density and high crystallinity [11]; permeabilities increased by presence of plasticisers [11]
Polymer Solutions Dilute: [η] (after gel permeation chromatography, in THF) 0.23 dl g^{-1} (38 wt% vinyl chloride); 0.44 dl g^{-1} (68 wt% vinyl chloride); 0.5 dl g^{-1} (76 wt% vinyl chloride); 0.875 dl g^{-1} (95 wt% vinyl chloride) [16]
Polymer Melts: Melt viscosity 5300 P (175°, 100 s^{-1}, granules, 200–260 μm) [1]; 9100 P (185°, 100 s^{-1}, powder) [1]
Permeability of Gases: 0.015 Barrer, (20°, 40 wt% vinyl chloride) [17]
Permeability of Liquids: [H_2O] 1.38–7.38 $\times$ 10^{13} cm^3 cm (cm^2 s Pa)$^{-1}$ (30°, 0.5–7.2 wt.% acetyltributyl citrate plasticiser; vinylidene chloride/vinyl chloride (88/12), (no relative humidity variation effects of any significance, but permeability increases markedly with temp. between 30° and 45° [3]

Water Absorption:

No.	Value	Note
1	0.1 %	27h, max., typical value, 0.01 in diameter filament, [5]

Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	0.33 cm^3 mm/(m^2 day atm)	0.005×10^{-10} cm^2 $(s\ cmHg)^{-1}$ [2]
2	[N_2]	0.06 cm^3 mm/(m^2 day atm)	0.0009×10^{-10} cm^2 $(s\ cmHg)^{-1}$ [2>
3	[CO_2]	1.97 cm^3 mm/(m^2 day atm)	0.03×10^{-10} cm^2 $(s\ cmHg)^{-1}$ [2]
4	[H_2O]	0.03 cm^3 mm/(m^2 day atm)	0.0004×10^{-10} g $(cm\ s\ cmHg)^{-1}$ [2] (typical values, high vinylidene copolymers);
5	[N_2]	0.08 cm^3 mm/(m^2 day atm)	0.0012 Barrer, (25°, moulded sheets, low to moderate crystallinity ($<50\%$)
6	[CO_2]	0.19 cm^3 mm/(m^2 day atm)	0.003 Barrer, (20°, 15 wt% vinyl chloride) [17]
7	[CO_2]	0.46 cm^3 mm/(m^2 day atm)	0.007 Barrer, (20°, 30 wt% vinyl chloride) [17]
8	[CO_2]	0.98 cm^3 mm/(m^2 day atm)	0.015 Barrer, (20°, 40 wt% vinyl chloride) [17]

Mechanical Properties:

Mechanical Properties General: Copolymers are non-linear viscoelastic materials; mechanical props. are very dependent on sample (thermal) history and morphology [5]. Presence of vinyl chloride units in high-vinylidene copolymers results in lowering of dynamic modulus (reduction in crystallinity); corresponding rise in T_g; softening effect observed at room temp. accompanied by increased brittleness at lower temps.; 2–10% plasticiser added to avoid this [11]. Increase in tensile strength with crystallinity, with corresponding falls in toughness and elongation; orientation improves all of these props. [11]

Tensile (Young's) Modulus:

No.	Value	Note
1	350–400 MPa	10–15 wt% vinyl chloride, 25 μm film [13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	235–330 MPa	[11,14]	33.1–16.2%
2	>70 MPa	min., flexible film [4]	
3	275 MPa	40 kpsi, typical value, monofilament [5]	15–25%

Flexural Strength at Break:

No.	Value	Note
1	103–117 MPa	15–17 kpsi, typical range, monofilament [5]

Mechanical Properties Miscellaneous: Yield 23 $m^2\ kg^{-1}$ (high-vinylidene copolymer, 10–15 wt.% vinyl chloride, 25 μm film) [13]. Shrinkage 2–60% (possible range from typical filament; dependent on formulation and after-treatment) [5].Tensile strength 1.4–1.7 kN m^{-1} (35–25% extension, high vinylidene copolymer, 25 μm film) [13]
Hardness: Vickers diamond pyramid (136°) 16.7 (3 × 100 g, 3 × 500 g; moulded discs, 15 wt.% vinyl chloride) [8]
Friction Abrasion and Resistance: High-vinylidene copolymers display good abrasion resistance; μ_{stat} (polymer/polymer) 0.49; μ_{dyn} (polymer/steel sphere) 0.46 (15 wt.% vinyl chloride) [5,8]

Optical Properties:

Transmission and Spectra: Crystalline materials show strong doublet at 1046 and 1071 cm^{-1}, plus signals in CCl stretching region (500–700 cm^{-1}) [5]

Polymer Stability:

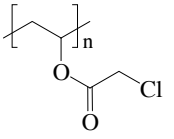
Polymer Stability General: In melt-processing of high-vinylidene copolymers, great care must be taken to avoid degradation caused, for example, by overheating or contact with metals, such as Fe, Cu, steel etc.
Thermal Stability General: High-vinylidene copolymers have greater stability than PVDC homopolymers cf. greater stability of CCl bond on vinyl chloride unit (secondary halides less reactive than tertiary halides) [5]
Upper Use Temperature:

No.	Value	Note
1	75–95°C	intermittently, high-vinylidene copolymers [2]

Decomposition Details: Thermal decomposition occurs above 150° and involves a two-stage dehydrochlorination reaction; rate of latter falls progressively with increasing vinyl chloride content (cf. change in morphology) [5]. Slow (overall) degradation rate observed [11]. Hydrogen chloride is product of decomposition, and is itself a catalyst for further decomposition; stabilisers (e.g. alkaline-earth and heavy metal oxide phosphites) which absorb or combine with evolved HCl are used [11]
Flammability: High-vinylidene copolymers are flame-resistant [2]; self-extinguishing [5]
Environmental Stress: Fibres are resistant to light [12]
Biological Stability: Resistant to bacterial and insect attack (fibres) [12]
Stability Miscellaneous: High-energy irradiation, e.g. γ-rays, causes copolymers to undergo cross-linking (PVC units) and chain scission [11]; behaviour dependent on morphology and composition [11,15]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by conventional free-radical copolymerisation of mixture of comonomers [18]; initiators used include potassium peroxysulfates, organic peroxides, peroxycarbonates, azo compounds, H_2O_2, organic hydroperoxides, peroxyborates etc.; redox pairs often used. Emulsion and suspension polymerisation are preferred industrial processes; continuous addition process employed to ensure constant composition. Emulsion polymerisation - resulting latex is often used directly, plus various stabilising additives, as coating vehicle for application to specific substrates. Suspension polymerisation used for producing moulding and extrusion resins: fabrication by injection, compression and transfer moulding techniques. Extrusion is main fabrication technique for filaments, films, rods, tubing or pipe. Manufacture of filaments: stretching produces orientation in single direction; highly crystalline materials. Oriented films produced in similar fashion. Fibres can also be produced by melt-spinning and then stretching. Low-density, fine-celled foams made by extrusion in presence of blowing agent. Copolymerisation can also be achieved by ionic initiation (Ziegler catalysis)



Applications: Used in the manufacture of fibres and films. Modified forms of PVC (approx. 95% vinyl chloride) are used for mouldings and in lacquers and impregnating compositions. Typical applications include unplasticised calendered sheets, mouldings, extruded films for packaging, viscosity-reducing polymer in pastes (suspension polymerisation); coatings and finishes (emulsion polymerisation). High-vinylidene copolymers are useful for films with high durability and chemical resistance, and as films and coatings with low gas and water vapour permeability. Major applications are adhesion coatings for paper and board; packaging of food products; pipes for chemical processing equipment; upholstery, seat covers, fibres, bristles, latex coatings. Such barrier applications utilise copolymer films with 10–15% vinyl chloride content. Fibres (Saran); high-vinylidene copolymers; both staple fibres and filament yarns produced, latter in both monofilament and multifilament forms; applications in upholstery, filter cloths and fishnets. Applications due to excellent chemical resistance, barrier props. and extended service life. Moulded parts as gas filters, valves, pipe fittings, containers, chemical processing equipment. Extruded monofilaments are widely used in textile field, e.g. furniture and automobile upholstery; drapery fabric; outdoor furniture; filter cloths. Biaxially oriented extruded films used in packaging, transparent barriers and shrink film for food products. Multilayer films and sheets, e.g. with HDPE, used for perishable food packaging and rigid barrier containers. Lacquer resins used as coatings for films, board and paper; interior coatings for fuel storage tanks; packaging of foodstuffs; binders for magnetic (audio, video and computer) tapes. Applications due to flame-suppression props., e.g. in fibres. Miscellaneous uses include rubber-modified products and blends; improved toughness and other mech. props.

Trade name	Details	Supplier
Breon	CS 100/30, 202	BP Chemicals
Cryovac		WR Grace
Daran	CR 6795H	WR Grace
Geon	222, 652, 650 X17	Aku-Goodrich
Ixan	SGA 1	Solvay
Kurehalon	AO, SOA	Kureha Chemical Industry Co.
Saran	Films and fibres, B and HB series; high-vinylidene copolymers include 506, 683, 746, 872, 925	Dow
Saran	Film	Ashley Polymers

Poly(vinyl chloroacetate) P-593

Synonyms: *Poly(ethenyl chloroacetate). Poly[(chloroacetoxy)ethylene]*
Related Polymers: Poly(vinyl fluoroacetate)
Monomers: Vinyl chloroacetate
Material class: Thermoplastic
Polymer Type: polyvinyl acetate
CAS Number:

CAS Reg. No.
24991-33-1

Molecular Formula: $(C_4H_5ClO_2)_n$
Fragments: $C_4H_5ClO_2$
Molecular Weight: Typically MW 153000, M_n 57000

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.45 g/cm^3	amorph.

Glass-Transition Temperature:

No.	Value	Note
1	23°C	[1,2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, EtOAc, chlorobenzene, pyridine, dioxane, cyclohexanone. Insol. saturated hydrocarbons. Swollen by Me_2CO

Transport Properties:

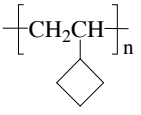
Polymer Solutions Dilute: [η] 0.28–0.83 (2-butanone) [3]; 0.25–0.49 (Me_2CO, 20°) [4]

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	24.73	60 Hz	70° [6]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5131	20°
2	1.504–1.512	30°



Transmission and Spectra: X-ray [5] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical polymerisation of vinyl chloroacetate
Applications: Lacquer resin, adhesive, electrophotographic binder

Poly(vinyl cycloheptane) P-595

Synonyms: *Poly(ethenylcycloheptane). Poly(1-cycloheptyl-1,2-ethanediyl)*
Monomers: Vinylcycloheptane
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
66906-09-0	
30847-54-2	isotactic

Molecular Formula: $(C_9H_{16})_n$
Fragments: C_9H_{16}
Morphology: Tetragonal, a 2.34–2.35, b 2.34–2.35, c 0.65, helix 4_1 [1]

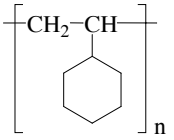
Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.926 g/cm^3	[1]

Melting Temperature:

No.	Value	Note
1	>300°C	min. [2]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. C_6H_6 [2]. Insol. Me_2CO, Et_2O [2]



Transport Properties:
Polymer Solutions Dilute: [η] 0.39 dl g^{-1} (C_6H_6, 30°) [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-$Al(^iBu)_3$ in heptane at 72° [2]

Poly(vinyl cyclohexane) P-596

Synonyms: *PVCH. Hydrogenated polystyrene. Poly(cyclohexylethylene). Poly(ethenylcyclohexane). Poly(1-cyclohexyl-1,2-ethanediyl)*
Monomers: Vinylcyclohexane
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
25498-06-0	atactic
26951-20-2	isotactic
123880-54-6	syndiotactic

Molecular Formula: $(C_8H_{14})_n$
Fragments: C_8H_{14}
General Information: Fine, white powder [3]
Tacticity: Atactic, isotactic and syndiotactic forms known
Morphology: Tetragonal, a 2.19, b 2.19, c 0.65, helix 4_1 [4]; tetragonal, a 2.176, b 2.176, c 0.650, helix 4_1 [5]; form I tetragonal, a 2.199, b 2.199, c 0.643, helix 4_1 [6]; form II tetragonal, a 2.048, b 2.048, c 4.458, helix 24_7 [6]; triclinic, a 1.16, b 0.78, c 0.66 or 1.32, **α** 92±5°, **β** 108±5°, **γ** 98±5° [7]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.9467 g/cm^3	[8]
2	d^{90} 0.9272 g/cm^3	[8]
3	d 0.9475 g/cm^3	[6]
4	d 0.945 g/cm^3	[7]
5	d 0.94 g/cm^3	[31]

Volumetric Properties General: α_v values have been reported [9]
Equation of State: Thermodynamic functions have been measured (0–400K) [68]
Thermodynamic Properties General: Activation energy of polymerisation 21.8 kJmol^{-1} (5.2 kcalmol^{-1}) [10], 52.3 kJmol^{-1} (12.5 kcalmol^{-1}) [11]. Heat of combustion has been reported [68]. Cp values have been reported [12,13,14,68]
Latent Heat Crystallization: Equlibrium thermodynamic props. of formation have been reported [12,68]. Thermodynamic props. of melting have been reported [68]
Melting Temperature:

No.	Value	Note
1	280–285°C	[10]
2	300°C	[15]
3	305°C	[16]
4	320–325°C	[3,17,18,19]
5	340°C	[20]
6	365°C	[6]
7	370–375°C	[2,22,23]
8	382°C	[24]
9	383°C	[25]
10	351°C	(syndiotactic) [1]

Glass-Transition Temperature:

No.	Value	Note
1	90°C	[23,26]
2	118–128.3°C	[8,24]
3	120°C	[27,67]
4	135°C	[28]
5	80°C	atactic [12]
6	127–150°C	atactic [21]
7	138°C	atactic [29]
8	127°C	isotactic [29]
9	133°C	isotactic [21]
10	88°C	head-head [29]

Transition Temperature General: Additional Tg values have been reported [68]
Deflection Temperature:

No.	Value	Note
1	142.5°C	1.84 MPa (264 psi), ASTM D648) [31]

Vicat Softening Point:

No.	Value	Note
1	140°C	[30]

Transition Temperature:

No.	Value	Note	Type
1	405°C	Equilibrium melting point (isotactic) [12]	
2	-130°C	[27,67]	**β**
3	200°C	Softening range [32]	
4	95°C	Softening point [15]	
5	28°C	Polymer melt temp. [16]	
6	-90°C	Relaxation temp. (183K) [36]	
7	223°C	High temp. transition [24]	

Surface Properties & Solubility:

Solubility Properties General: Solvent-polymer interaction parameter 0.463–0.468 (toluene, 37°) [8]
Cohesive Energy Density Solubility Parameters: (CED 285 Jcm^{-3} (0.000285 J^{-3}); **δ** 16.9 J$^{1/2}$cm$^{3/2}$ [28]. Energy of molecular cohesion [9] has been reported
Solvents/Non-solvents: Sol. toluene, C_6H_6, cyclohexane, carbon disulfide, tetrahydronaphthalene; [3,7,18,22] $CHCl_3$ [33, 34]; trichloroethylene [34]; boiling *p*-xylene, boiling chlorobenzene, boiling trichlorobenzene, boiling methylcyclohexane, boiling

ethylbenzene, boiling decahydronaphthalene, boiling *o*-dichlorobenzene [10]. Mod. sol. xylene, decahydronaphthalene [3,18]; *n*-heptane, nonane [10]. Insol. Me_2CO [22]; butanone [10,33]; dioxane [33]; Et_2O [7]; nitrobenzene, CH_2Cl_2 [10]. Atactic, sol. hexane, heptane, cyclohexane, decahydronaphthalene, C_6H_6, toluene, xylene, chlorobenzene, bromobenzene, $CHCl_3$, CCl_4 1,2-dichloroethylene-*cis*, 1,2-dichloroethylene-*trans*, THF [35]. Atactic, insol. dioxane, diisopropylether, Et_2O, MeOH, EtOH, propanol, 2-propanol, cyclohexanol, benzyl alcohol, MeOAc, EtOAc, methyl propionate, Me_2CO, butanone, 2-pentanone, 2-heptanone, 3-methyl-2-heptanone [35]. THF is a theta solvent [33]

Transport Properties:

Polymer Solutions Dilute: Other T_θ values have been reported [37]. $[\eta]_{inh}$ 1.05 dl g^{-1} (decahydronaphthalene, 135°) [32]. $[\eta]_{inh}$ 2.4 dl g^{-1} (trichloroethylene) [34]. $[\eta]_{sp}$ 0.61 dl g^{-1} (cyclohexane) [31]. $[\eta]$ 0.36 dl g^{-1} (C_6H_6, 30°, atactic) [29]. $[\eta]$ 0.85 dl g-*1* (tetrahydronaphthalene, 90°, isotactic) [29]. $[\eta]$ 0.38 dl g^{-1} (C_6H_6, 30°, head-head) [29]. Other $[\eta]$ values have been measured for various solvents [3,10,15,18,19,20,21,22,31,33,36,37]

Mechanical Properties:

Mechanical Properties General: Thermomechanical prop. curves have been reported [18,24]. Mech. props. have been reported [38]. Dynamic mech. props. have been reported [36]

Tensile Strength Break:

No.	Value	Note
1	16.67–19.61 MPa	170–200 kgm cm^{-2} [39]
2	26.9 MPa	3900 psi, 25° [31]
3	13.1 MPa	1900 psi, 60° [31]
4	10.3 MPa	1500 psi, 80° [31]
5	9.7 MPa	1400 psi, 100° [31]
6	8.3 MPa	1200 psi, 120° [31]

Flexural Strength at Break:

No.	Value	Note
1	19.61–29.42 MPa	200–300 kg cm^{-2} [39]

Elastic Modulus:

No.	Value	Note
1	2900 MPa	[28]

Complex Moduli: Dynamic tensile storage modulus and loss modulus (110Hz, -150–180°, atactic) [21], (110Hz, -160–320°, isotactic) [21], (-180–230°) have been reported [27]

Impact Strength: Impact strength 5–8 kg cm cm^{-2} [39]. Dynstat impact strength 2.9 kg cm cm^{-2} ($\frac{1}{2}$" unnotched) [31]

Viscoelastic Behaviour: Viscoelastic behaviour [40,41] has been reported

Mechanical Properties Miscellaneous: Critical strain 0.35% [28]

Hardness: Rockwell R125.5 [31]

Electrical Properties:

Electrical Properties General: Specific volume electrical resistance (180–160°, 50–1000000Hz) [42]. Dielectric constant of atactic and isotactic forms has been reported. [43] Other dissipation factor values have been reported [42,43]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.1–2.4	50–1000000Hz	-160–220° [20]
2	2.56		[31]

Static Electrification: Conductivity has been reported [43]. Dielectric permeability coefficient -0.2% (glass phase); -0.6% (100° approx.) [42]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0006		up to 200° [19]
2	0.0005–0.0008	50 Hz-1 MHz	-10–220° [20]

Optical Properties:

Transmission and Spectra: Ir [3,5,11,18,21,22,25,29,32,36,44,45], H-1 nmr [29,32], C-13 nmr [46,47], esr [48,49,50], epr (20°, 160°) [24] and photoelectron [51] spectral data have been reported. Light transmission 88% (450 nm), 90% (550 nm), 91% (600 nm) [31]

Molar Refraction: dn/dC 0.131 cm^3 g^{-1} (THF, 25°), 0.17 cm^3 (hexane, 25°), 0.101 cm^3 g^{-1} (cyclohexane, 25°) [33]

Polymer Stability:

Decomposition Details: Decomposition temp., T_{dec} [39], 280–530° [7,24,39,60], 368° (atactic) [29], 379° (isotactic) [2,29], 400° (syndiotactic) [2], 366° (head-head) [29]. Weight loss 0.02–0.17% (100°) [8], 0.71–0.93% (150°) [8]. 10% (320°) [24], 50% (390°) [24], 50% (369°) [61]. Temp.-weight loss curves have been reported [12,39,62]. Thermal degradation has been reported [60,62,63,64,65,66]. Activation energy of decomposition 236.6 $kJmol^{-1}$ (56.5 kcal mol^{-1}, 390–420°, argon) [60]. Activation energy of decomposition 184.2 $kJmol^{-1}$ (44 kcal mol^{-1}, atactic), 138.2 $kJmol^{-1}$ (33 $kcalmol^{-1}$, isotactic), 184.2 $kJmol^{-1}$ (44 $kcalmol^{-1}$, head-head) [29]. Other values for activation energy of decomposition have been reported [61,62]

Environmental Stress: Effects of antioxidants [39,54,55], ozonolysis [48,49,50,56,57,58], and oxidative thermal degradation [55,59,60] have been reported. Oxidation onset 220° (approx.) [24], 240° (approx.) [60], 260° (approx.) [19] and ozonolysis degradation kinetics have been reported [53]. Activation energy of oxidation 20.5 $kJmol^{-1}$ (4.9 $kcalmol^{-1}$) [39]. Activation energy of oxidation 129.8 $kJmol^{-1}$ (approx.) (31 $kcalmol^{-1}$ (approx.), 240–320°, air) [60]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts [47,52], such as $TiCl_3$-$AlMe_3$ in toluene at 50°, or by hydrogenation of polystyrene [21,47]

Poly(vinyl cyclopentane) P-597

Synonyms: *PVCP. Cyclopentane-ethenyl homopolymer. Poly(ethenylcyclopentane). Poly(1-cyclopentyl-1,2-ethanediyl)*
Related Polymers: Poly(vinylcyclopropane)
Monomers: Vinylcyclopentane
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
30229-22-2	
30847-53-1	isotactic

Molecular Formula: $(C_7H_{12})_n$
Fragments: C_7H_{12}
Morphology: Form I tetragonal, a 2.014, b 2.014, c 0.650, helix 4_1 [1]; form II tetragonal, a 2.011, b 2.011, c 1.95, helix 12_3 [1]; form III tetragonal, a 3.73, b 3.73, c 1.98, helix 10_3 [1]; triclinic, a 1.05, b 0.74, c 0.66, α 92 $\pm$ 5°, β 108 $\pm$ 5°, γ 99 $\pm$ 5° [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.965 g/cm^3	[3]
2	d 0.95 g/cm^3	form III [1]

Melting Temperature:

No.	Value	Note
1	270°C	[7]
2	292°C	[5]

Glass-Transition Temperature:

No.	Value	Note
1	70°C	[2,8]
2	75°C	[6,7]

Transition Temperature:

No.	Value	Note	Type
1	-140°C	[2,8]	Relaxation temp.

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. C_6H_6 [4], $CHCl_3$ [4], trichloroethylene [4]. Slightly sol. pentane [5]. Insol. Et_2O [4,6].

Transport Properties:
Polymer Solutions Dilute: [η] 0.56 dl g^{-1} [3]

Mechanical Properties:
Mechanical Properties General: Variation of dynamic loss modulus with temp. has been reported in graphical form [2]

Optical Properties:
Transmission and Spectra: Ir [3,5] and H-1 nmr [5] spectral data have been reported

Polymer Stability:
Thermal Stability General: Decomposition temp. 260° (min.) [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. using Ziegler-Natta catalysts such as $TiCl_4$-$AlBu_3$ in heptane at 68° [2,3,5]

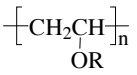
Poly(vinyl difluoroacetate) P-599

Synonyms: *Poly[(difluoroacetoxy)ethylene]. Poly(ethenyl difluoroacetate)*
Monomers: Vinyl difluoroacetate
Material class: Thermoplastic
Polymer Type: polyvinyl acetate
CAS Number:



CAS Reg. No.
105596-75-6

Molecular Formula: $(C_4H_4F_2O_2)_n$
Fragments: $C_4H_4F_2O_2$
General Information: Reported to have similar props. to poly(vinyl trifluoroacetate)

Bibliographic References

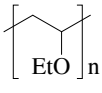
[1] *U.S. Pat.,* 1948, 2 436 144

Poly(vinyl ethers) P-600

where R = Me, Et, etc

Synonyms: *Poly(vinyl alkyl ethers). Poly(alkyl vinyl ethers)*
Related Polymers: Poly(vinyl methyl ether-*co*-maleic anhydride), Poly(vinyl methyl ether), Poly(vinyl octadecyl ether), Poly(vinyl propyl ether), Poly(vinyl hexyl ether), Poly(vinyl methyl ether-*co*-maleic acid)
Monomers: For vinyl ether derivatives
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
General Information: The physical props. of polymers based upon alkyl vinyl ethers depend upon MW, the alkyl group, polymerisation initiator, stereospecificity and crystallinity. Materials range from viscous liqs., through to sticky liqs., rubbery or brittle solids. Long alkyl chains prod. low MW waxy materials. Copolymers with maleic anhydride are the most significant commercial class of vinyl ether copolymers. Methyl vinyl ether-maleic anhydride copolymers dominate the commercial market [1,2]

Applications/Commercial Products:



Processing & Manufacturing Routes: Homopolymers prod. by cationic initiation with Friedel-Crafts catalysts. Copolymers prod. by free radical initiated copolymerisation. Vinyl ether polymerisation rates decrease rapidly with solvent polarity [3]. Many initiator systems have been reported to give stereoregular homopolymers [4,5]
Applications: Adhesives, surface coatings, lubricants, greases, elastomers, moulding compounds, fibres, films. Also used as plasticisers. Waxy materials are used as polishing and waxing agents

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.000242 K^{-1}	T > -33° [17,19]	L
2	0.000101 K^{-1}	-90 < T < -33°	L
3	8.9×10^{-5} K^{-1}	-178° < T < -90° [17,19]	L
4	4.9×10^{-5} K^{-1}	T < -178°	L

Thermodynamic Properties General: Thermodynamic props. have been reported [18,26]
Latent Heat Crystallization: ΔH_f 9.39 kJ mol^{-1} (2240 cal mol^{-1}) [7]. ΔS_f 0.015 kJ mol^{-1} (3.5 cal mol^{-1}) [7]
Melting Temperature:

No.	Value	Note
1	86°C	[1,27]

Glass-Transition Temperature:

No.	Value	Note
1	-33°C	[26]
2	-43°C	[4]

Transition Temperature General: T_{gg}(1) -90° [17]. T_{gg}(2) -222° [17]
Vicat Softening Point:

No.	Value	Note
1	57–68°C	[16]

Transition Temperature:

No.	Value	Note	Type
1	-23°C	[4]	Inflection temp.
2	-21°C	[4]	Inflection temp.
3	-20°C	[4]	Low temp. stiffening
4	-10°C	[4]	Low temp. stiffening

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: δ 31.59 $J^{1/2}$ $cm^{-3/2}$ (7.54 $cal^{1/2}$ $cm^{-3/2}$) [4], 38.21 $J^{1/2}$ $cm^{-3/2}$ (9.12 $cal^{1/2}$ $cm^{-3/2}$) [29]. Other solubility parameters have been reported [29]
Solvents/Non-solvents: Sol. CH_2Cl_2, $CHCl_3$, EtOH, MeOH [8], C_6H_6, Et_2O, Me_2CO, vinyl alcohol [15]. Insol. H_2O [8], MeOH, heptane, hexane, ethylene glycol, Et_2O

Transport Properties:
Polymer Solutions Dilute: [η] 1.45 dl g^{-1} [16]. Absolute viscosity 0.8015 centipoise. η_{inh} 1.9 dl g^{-1} [4]

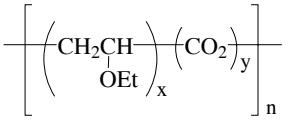
Mechanical Properties:
Hardness: Shore A15 [16], A20 (24h) [30]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.454	30° [4,5]
2	1.452	20° [15]
3	1.3761	20° [16]

Transmission and Spectra: Nmr [21,25] and ir [31] spectral data have been reported
Molar Refraction: Molar refraction 20.53 [4]

Polymer Stability:
Polymer Stability General: Oxidatively degraded by air
Stability Miscellaneous: Stability to γ-irradiation has been reported 0.36 G scissions $(100\ eV)^{-1}$ [18]



Applications/Commercial Products:
Processing & Manufacturing Routes: Stereoregular polymerisation takes place in toluene with ferric oxide as initiator at -20° giving approx. 97% conversion [6,7]. The atactic form may be obtained by using heterogeneous aluminium sulfate-sulfuric acid as catalyst [9]. A considerable number of catalysts and synthetic routes have been developed and studied. Catalysts include hydrosilicates [10], inorganic acids [11], ferric sulfate [12] (which gives high MW stereoregular polymers), and a variety of organic peroxides [13]. Low MW polymers can be prepared by the use of zeolites [14]. Ionic polymerisations [15], and cationic polymerisations initiated by antimonate salts [21,23,24] have been developed along with the use of Grignard reagents [20] and photopolymerisation techniques [22]
Applications: Used as a plasticiser for cellulose nitrate and cellulose resin lacquers, as a base for pressure-sensitive adhesives in films and tapes, especially in surgical applications. Also used for non-irritating surgical casts requiring moisture permeability and to impart dry-film flexibility and increased viscosity of photochemical resist-coating compositions

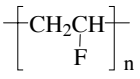
Poly(vinyl ethyl ether-*co*-carbon dioxide) P-602

Related Polymers: Poly(vinyl ethers)
Monomers: Ethyl vinyl ether, Carbon dioxide
Material class: Thermoplastic, Copolymers
Polymer Type: polyester, polyvinyls
CAS Number:

CAS Reg. No.
55993-87-8

Molecular Formula: $[(C_4H_8O).(CO_2)]_n$
Fragments: C_4H_8O CO_2



Optical Properties:
Transmission and Spectra: Ir spectral data have been reported [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by cationic polymerisation with Lewis Acid catalyst

Bibliographic References

Poly(vinyl fluoride) P-603

Synonyms: *PVF. Vinyl fluoride polymer. Poly(fluoroethene)*
Monomers: Vinyl fluoride
Material class: Thermoplastic
Polymer Type: PVF, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.
24981-14-4

Molecular Formula: $(C_2H_3F)_n$
Fragments: C_2H_3F
Molecular Weight: M_n 76000–234000, MS 143000–654000, MS $\cong$ MW
Additives: Pigments, stabilisers, flame retardants, plasticisers.
Tacticity: Commercial material is usually atactic
Morphology: Polyvinyl fluoride is a semicrystalline polymer with a planar zig-zag chain configuration. Amount of crystallinity will depend on the polymerisation method

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.38–1.57 g/cm^3	[5]
2	d 1.45 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5×10^{-5} K^{-1}	30 min., air [5]	L
2	9×10^{-5} K^{-1}	[3]	L

Thermodynamic Properties General: ΔH 120–240 kJ mol^{-1} (upper T_g value); ΔH 160 kJ mol^{-1} (lower T_g value) [5]
Thermal Conductivity:

No.	Value	Note
1	0.14 W/mK	-30 [5]
2	0.17 W/mK	60° [5]

Melting Temperature:

No.	Value	Note
1	197–235°C	dependent on degree of crystallinity [1,15]

Glass-Transition Temperature:

No.	Value	Note
1	40–45°C	(upper value) relaxation in the amorph. region under restraint by crystallinity [5]
2	-20°C	(lower value) relaxation in the amorph. region essentially free from restraint
3	40–50°C	(upper value) relaxation in the amorph. region under restraint by crystallinity [8,9,10,11]
4	-20–-15°C	(lower value) relaxation in the amorph. region, essentially free from restraint [7]

Transition Temperature General: T_m increases with decreasing polymerisation temp. and with increasing degree of crystallinity [15]
Deflection Temperature:

No.	Value	Note
1	121°C	0.45 Mpa
2	82°C	1.8 MPa [3]

Transition Temperature:

No.	Value	Note	Type
1	-70°C	[3]	Minimum service temp.
2	-80°C	[1]	Short chain relaxation in the amorph. region
3	150°C	[1]	Premelting intracrystalline relaxation

Surface Properties & Solubility:

Solubility Properties General: Low solubility in all solvents below 100°. Solubility may be increased by addition of 0.1% 2-propanol as modifier. δ 38.9 J cm^{-3} (9.3 cal cm^{-3}, $CHCl_3$, 23°); 53.2 J cm^{-3} (12.7 cal cm^{-3}, EtOH, 23°); 41.4 J cm^{-3} (9.9 cal^{-3}, Me_2CO, 23°) [12]
Cohesive Energy Density Solubility Parameters: δ 50.2–50.7 J$^{1/2}$ cm$^{-3/2}$ (12.0–12.1 cal$^{1/2}$ cm$^{-3/2}$) [1]
Solvents/Non-solvents: Slightly sol. DMF, dimethyl acetamide, γ-butyrolactone, propylene carbonate (above 100°) [1]

Transport Properties:

Transport Properties General: Has good barrier props.
Permeability of Gases: [CO_2] 1.7, [He] 22.9, [H_2] 8.9, [N_2] 0.04, [O_2] 0.5 cm^3 (m^2 day kPa)$^{-1}$ (98 kPa, 23.5°, ASTM D1434) [5]
Permeability and Diffusion General: Vapour permeability g (m^2 day kPa)$^{-1}$, 23.5°), AcOH 10, Me_2CO 2400, C_6H_6 22, CCl_4 12, EtOAc 240, hexane 13 [5], H_2O 40–50 g (m^2 d)$^{-1}$ (7 kPa, 39.5°, ASTM E96-58T)
Water Absorption:

No.	Value	Note
1	>0.5 %	min., 23° [5]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1700–2600 MPa	23°, ASTM D882 Method A [5]

Flexural Modulus:

No.	Value	Note
1	1400 MPa	1.4 GN m^{-2} [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	48–120 MPa	23°, ASTM D882 Method A [5]	100% elongation min.

Tensile Strength Yield:

No.	Value	Elongation	Note
1	33–41 MPa	100% elongation min.	23°, ASTM D882 Method A [5]

Impact Strength: Impact strength 10–22 kJ m^{-1} (DuPont pneumatic tester) [5]
Mechanical Properties Miscellaneous: Ultimate elongation 115–250% (ASTM D882 Method A, 100% min., 23°) [5]. Tear strength 4.6–39 kJ m^{-1}, (Elmendorf propagated) [5]. Tear strength 174–239 kJ m^{-1}, (ASTM 1004 initial value). Bursting strength, 131–482 kPa (Mullen, ASTM D774) [5]
Hardness: Shore D80 [3]
Friction Abrasion and Resistance: Good abrasion resistance [3]. Coefficient of friction 0.15–0.3 (film/metal, Instron)
Izod Notch:

No.	Value	Notch	Note
1	1800 J/m	Y	[3]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	8.5–9.9	1 kHz	23°, ASTM D150 [5]

Dielectric Strength:

No.	Value	Note
1	130 kV.mm^{-1}	ASTM D150 [5]
2	20 kV.mm^{-1}	
3	140 kV.mm^{-1}	[3]

Strong Field Phenomena General: Corona endurance 40 V μm^{-1} (60 Hz, ASTM D2275) [5]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	1.6	1 MHz	ASTM D150 [3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.46	30°, ASTM D542 [5]

Transmission and Spectra: Transparent to radiation in the uv, visible and near ir regions of the solar spectrum, transmitting over 90% of the radiation at 350–2000 nm. It absorbs radiation of 7000–12000 nm [1]. Other details of transmission and spectra have been reported [14]

Polymer Stability:

Polymer Stability General: Has excellent weatherability and strength over a wide range of temps.
Upper Use Temperature:

No.	Value	Note
1	107–175°C	[5]
2	105–120°C	ASTM D150 [3]
3	105–120°C	[3]

Decomposition Details: Degradation in air is a two step process with loss of hydrogen fluoride followed by backbone cleavage at 350 and 450° respectively. Char also forms which resists further degradation until 650° [1]. The main products of pyrolysis and non-flaming oxidative degradation at 450° are hydrogen fluoride and methane [13]

Flammability: Self ignition temp. 390° (ASTM D1929) [5]. Limiting oxygen index 22.6% [1]
Chemical Stability: Inert to a wide variety of chemicals, corrosive and staining agents [1]
Stability Miscellaneous: Relatively unstable at processing temps.

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation requires high pressure and high temp. The use of Ziegler-Natta catalysts lowers polymerisation temp. and pressure. Bulk, suspension and emulsion techniques may be used. Thin film may be produced by extrusion and dispersion. The polymer may be applied to substrates using dispersion or powder coating
Applications: PVF finds wide use as protective or decorative coatings, either as preformed film in a laminating step, or from dispersion. Uses include highway sound barriers, automobile trim, aircraft cabin interiors, solar panel covers, greenhouses, bags for insulating mats and release sheets in plastics processing.

Trade name	Supplier
Dalvor	Diamond Shamrock
Tedlar PVF film	DuPont

Poly(vinyl fluoroacetate) P-604

Synonyms: *Poly[(fluoroacetoxy)ethylene]*
Monomers: Vinyl fluoroacetate
Material class: Thermoplastic
Polymer Type: polyvinyl acetate
Molecular Formula: $(C_4H_5FO_2)_n$
Fragments: $C_4H_5FO_2$
General Information: Reported to have similar props. to poly(vinyl trifluoroacetate)

Bibliographic References

[1] *U.S. Pat.,* 1948, 2 436 144

Poly(vinyl formal) P-605

Synonyms: *PVF*
Related Polymers: Polyvinyl butyral, Polyvinyl acetal, Polyvinyl alcohol
Monomers: Vinyl acetate, Formaldehyde
Material class: Thermoplastic
Polymer Type: polyvinyl acetate, polyvinyls
CAS Number:

CAS Reg. No.
9003-33-2

Molecular Formula: $[(C_5H_8O_2)_x(C_2H_4O)_y(C_4H_6O_2)_z]$
Fragments: $C_5H_8O_2$ C_2H_4O $C_4H_6O_2$
Molecular Weight: 15000–45000
Additives: Antioxidants improve thermal stability
General Information: Props. of resin depend on MW and degree of acetalisation. Manufacturing process yields a terpolymer struct. [2]. May contain up to 10–20% acetate and 5–10% hydroxyl groups. Statistical degree of acetalisation is 87% (approx.) [3]. Hydroxyl content is independent of reaction time and temp. Increased polyvinyl acetate content contributes to softer resins, lower heat distortion temp. and reduced tensile and impact strength
Tacticity: Atactic, isotactic and syndiotactic forms known, related to the tacticity of starting material, polyvinyl acetate. Isotactic polymer chains undergo acetalisation more rapidly than syndiotactic portions [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.2 g/cm^3	[5]

Glass-Transition Temperature:

No.	Value	Note
1	103–113°C	ASTM D1043, Formvor [6]

Transition Temperature General: MW change little influences thermal props. Increasing polyvinyl acetate content lowers distortion temp. [6]
Deflection Temperature:

No.	Value	Note
1	88–93°C	Formvor 7/95 [5]
2	50–60°C	7% OH, 40–50% acetate [5]

Vicat Softening Point:

No.	Value
1	140–170°C

Surface Properties & Solubility:

Solubility Properties General: Compatible with phenolic and epoxy resins
Plasticisers: Plasticisers include phthalates, phosphates and adipate esters
Solvents/Non-solvents: Sol. THF, phenol, dimethylacetamide, DMSO, *N*-methyl pyrrolidone. Formvor 7/95 (5% OH, 15% PVA): sol. AcOH, aniline, $CHCl_3$, dioxane, pyridine, tetrachloroethane, nitropropane, furfural, DMF; insol. Me_2CO, EtOH, MeOH, cyclohexanone, EtOAc, hydrocarbons, methyl cellosolve, 2-butanone [3]. Formvor 12/85 (5% OH, 22–30% PVA): sol. AcOH, aniline, $CHCl_3$, cyclohexanone, tetrachloroethane, dioxane, isophorone, nitropropane, methyl cellosolve, pyridine, DMF; insol. MeOH, EtOH, Me_2CO, hydrocarbons, EtOAc, 2-butanone [3]. Increasing polyvinyl acetate content increases solubility in less polar solvents; increasing free hydroxyl content increases H_2O solubility

Transport Properties:

Polymer Solutions Dilute: Soln. viscosity 500–600 cP (MW 26000–34000, 22–30% PVA, 5% OH), 100–200 cP (MW 10000–15000, 9–13% PVA, 5–6% OH), 300–500 cP (MW 16000–20000, 9–13% PVA, 5–6% OH) [6], 40–60 cP (20°, dichloroethane) [5]. Viscosity increases with increasing MW and increasing poly(vinyl acetate) content
Water Absorption:

No.	Value	Note
1	1 %	24h, 22–30% PVA, 5% OH [5]
2	1.2 %	24h, 9–13% PVA, 5% OH [5]

Mechanical Properties:

Mechanical Properties General: Strength, rigidity, elongation and impact strength decrease with increasing polyvinyl acetate content [5]
Tensile Strength Break:

No.	Value	Note	Elongation
1	68.9–75.8 MPa	10–11 kpsi, ASTM D638, Formvor [5]	7–50%

Elastic Modulus:

No.	Value	Note
1	2413–4136 MPa	350–600 kpsi, ASTM D1043, Formvor [5]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	59–66 MPa	7%	ASTM D638, Formvor [6]

Flexural Strength Yield:

No.	Value	Note
1	115–124 MPa	ASTM D790, Formvor [6]

Hardness: Rockwell M150-M155 (ASTM D785) [6], E65-E75 (ASTM D785, Formvor) [6]
Friction Abrasion and Resistance: Has good abrasion resistance
Izod Notch:

No.	Value	Notch	Note
1	70 J/m	Y	ASTM D256, Formvor [6]
2	3202 J/m	N	600 ft lb in^{-1}, ASTM D256 [5]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.2–3.4	50 Hz	ASTM D150, Formvor [6]
2	3–3.3	1 kHz	ASTM D150, Formvor [6]
3	2.8–3.1	1 MHz	ASTM D150, Formvor [6]

Dielectric Strength:

No.	Value	Note
1	12–13 kV.mm^{-1}	short-time, ASTM D149, Formvor [6]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0081–0.0087	50 Hz	ASTM D150, Formvor [6]
2	0.01	1 kHz	ASTM D150, Formvor [6]
3	0.021	1 MHz	ASTM D150, Formvor [6]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5	25° [5]

Transmission and Spectra: Ir [4,8] and H-1 nmr [7,8] spectral data have been reported
Volume Properties/Surface Properties: Colourless

Polymer Stability:

Polymer Stability General: High degree of acetalisation implies good thermal stability
Thermal Stability General: Stable up to 320° in N_2. Polymer darkens to deep brown colour at elevated temp.
Decomposition Details: Decomposition in air occurs via oxidative cleavage of acetal ring producing formaldehyde [10]
Flammability: Fl. p. 370° (min.)
Chemical Stability: Has good resistance to oils and hydrocarbons
Hydrolytic Stability: Stable to base, but sensitive to oxidation in base. Hydrolysed by strong acid

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. [11] by *in situ* hydrolysis of poly(vinyl acetate) in AcOH by sulfuric acid with formaldehyde at 65–90°. Polymer is produced after neutralisation. MW depends on MW of starting acetate, and composition is determined by quantities of AcOH, H_2O and formaldehyde added. Also produced by acid catalysed acetalisations of poly(vinyl alcohol)
Applications: Primarily used as oil resistant coating for electrical wires in combination with phenolic resins. Also used as an adhesive, surface coating agent, binder in alkali batteries and in rocket casings

Poly(vinyl formate) P-606

Synonyms: *Poly(ethenyl formate). PVF. PVFO*
Monomers: Vinyl formate
Material class: Thermoplastic
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
25567-89-9	homopolymer
27101-53-7	syndiotactic

Molecular Formula: $(C_3H_4O_2)_n$
Fragments: $C_3H_4O_2$
Tacticity: Syndiotactic and isotactic forms are known as well as a stereoblock form
Morphology: Rhombohedral, a 15.9Å, b 15.9Å, c 6.55Å [5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{30} 1.34 g/cm^3	[5]

Thermodynamic Properties General: ΔH_{act} for polymerisation has been reported [4]
Glass-Transition Temperature:

No.	Value	Note
1	30.5°C	[5]
2	37°C	60% syndiotactic [1]
3	33°C	50% syndiotactic [1]

Transition Temperature General: T_g varies considerably with polymerisation temp. [5] and the extent of syndiotacticity [1,5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, H_2O, dioxane [11] and Me_2CO [12]. Syndiotactic [5] sol. acetonitrile. Isotactic sol. formic acid, DMSO [5]. Isotactic insol. acetonitrile, methyl formate [5]

Optical Properties:

Refractive Index:

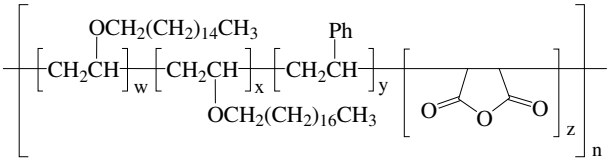
No.	Value	Note
1	1.4757	20° [1]

Transmission and Spectra: Visible absorption [11] and nmr spectral data have been reported [6]. Important characteristic ir band at 1026 cm^{-1} in the syndiotactic [5] and stereoblock forms [9]. This band is absent from the isotactic ir spectrum

Polymer Stability:

Environmental Stress: Frost resistant but may coagulate if aq. phase freezes [3]
Biological Stability: Unprotected emulsions susceptible to attack from microorganisms [3]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by radical polymerisation of vinyl formate using typical peroxide initiators [2,3,10]. May be stabilised with anionic or non-ionic emulsifiers or water-sol.

protective colloids. Syndiotactic propagation is achieved using AIBN [4] or triethylboron catalyst [6,8]. Final polymerisation result is very dependent upon polymerisation medium [5,7]
Applications: Major applications in the area of coatings

Poly(vinylidene chloride) P-610

$$-\left[CH_2CCl_2\right]_n-$$

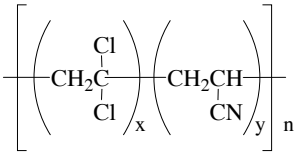
Synonyms: *Poly(1,1-dichloroethene). Poly(1,1-dichloroethylene). PVDC. PVdC*
Related Polymers: Poly(vinyl chloride-*co*-vinylidene chloride, Poly(vinylidene chloride-*co*-acrylonitrile), Poly(vinylidene chloride-*co*-butadiene-*co*-co styrene, Vinylidene chloride copolymers
Monomers: Vinylidene chloride
Material class: Thermoplastic
Polymer Type: polyvinylidene chloride
CAS Number:

CAS Reg. No.
9002-85-1
98846-23-2

Molecular Formula: $(C_2H_2Cl_2)_n$
Fragments: $C_2H_2Cl_2$
Molecular Weight: Mw 9100–126000 Mv 8500–117000
Additives: Heat and light stabilisers acid-acceptor type e.g. amines, phenyl glycidyl ether, certain organometallics plasticisers, dyes pigments lubricants
General Information: Due to its high thermal instability, the homopolymer has little commercial importance. Principal applications are with copolymers
Morphology: Hard, tough, translucent to transparent material sometimes faintly yellow in colour [8] Stereoregular polymer [9, 28] Symmetrical molecular structure result in high crystallinity [27]
Identification: Cl present (Ca 70%), N, P, S absent [8] Colour tests darkens when left for some days in contact with conc. NH4OH [8] brown/black colour with pyridine/methanolic KOH soln [6] brown/black ppt with pyridine/methanolic NaOH soln (c.f. PVC homopolymer . Where brown/ black colouration is initially observed, followed by slow formalin of brown precipitate [6], immersion in morpholine causes both sample and liquid to blacken within a few hours [6, 8] latter two methods allow identification of PVDC even in presence of PVC

Polymer Stability:

Thermal Stability General: Displays low thermal stability [7], may darken an lose strength (especially in presence Cu, Fe, etc); deterioration not serious with properly compounded materials [8]. Min. use temp. 0° (film) [7]
Upper Use Temperature:



No.	Value	Note
1	143°C	approx. commercial film [7]

Decomposition Details: TGA Studies show some decomposition beginning at 140° [6]; decomposition occurs as a result of dehydrochlorination reaction [8], formation of conjugated unsaturated units gives yellow or brown. Coloration (particularly under alkaline conditions) [8]. Decomp. temp. 210–225 [7], 200° (film) [8], 250° (cryst.)
Flammability: Flammability rating V0 (commercial vinyl-based resin) [28]. Excellent fire-resistance props. as a consequence of high chlorine content [9]; does not readily burn, self-extinguishing [7,8]; softens, melts, leaves swollen carbonaceous residue [8]
Environmental Stress: Displays poor resistance to sunlight and uv-irradiation; darkens on exposure [7,8] and may lose strength [8]
Chemical Stability: Swollen by oxygen-containing liquids, e.g. dioxane, cyclohexanone, dimethylformamide and some chlorination hydrocarbons [8]; relatively unaffected by hydrocarbons (mineral oils), alcohols, phenols, many common organic solvents, moderately concentrated acids and alkalis, except ammonia and strong amines) [8]; exceptional resistance to water [8]. Chemical resistance is reduced with increases in temp. [8] decomposed by prolonged contact with ammonia, strong amines and related compounds [8]; darkening observed, some yellowing observed in presence of other alkalis [8]; attacked by chlorine, and slowly by cocentrated sulfuric acid [8], copper and iron catalyse decomposition of polymer [8]
Biological Stability: Unaffected by bacteria, fungi and insects [8]
Stability Miscellaneous: High chlorine content can lead to rapid degradation at normal process temps.; risk of splitting off of chlorine during processing, thus only non-ferrous materials should be allowed to come into contact with melt [8,27]; however, compromise/balance must be made, as high crystallinity necessitates use of high tool temps. [27]

Poly(vinylidene chloride-*co*-acrylonitrile) P-611

Synonyms: *Poly (1,1-dichloroethene-co-2-propenenitrile). Poly(vinylidene chloride-co-vinyl cyanide)*
Related Polymers: Vinylidene chloride copolymers, Poly acrylonitrile
CAS Number:

CAS Reg. No.	Note
9010-76-8	
124322-63-0	block copolymer

Fragments: C_2H_3Cl C_3H_3N
Additives: Anti-blocking agents (films, coatings)
General Information: Copolymers usually contain 5–15% acrylonitrile. Copolymers are more easily processed than the homopolymer. Copolymer exhibits excellent barrier props.
Morphology: Unperturbed chain dimension parameters derived from viscosity/molecular weight data; A = 0.664 a.u., Af = 0.313 a.u; steric factor (A/AP), 2.12; copolymers with low AN content used as model to make comparisons with polyvinyl chloride homopolymer; results indicate that latter has more extended chain, as a consequence of increased hindering potential about C-C bond through addition of second Cl atom [1] Modacrylic fibres contain 35–84% acrylonitrile content; flame-proof ; good resistance to sunlight, water acids and alkalis; cheaper than materials containing higher proportions of acrylonitrile, although not resistant to org.solvents, soften at lower temps and have slightly lower strengths [10]
Miscellaneous: The terms polymer and copolymer are used interchangeably with regard to Poly(vinylidene chloride) copolymers; and care must be take to avoid ambiguities

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.34 g/cm^3	modacrylic fibre [10]

Transition Temperature General: Modacrylic fibres soften at lower temps than other commercial products containing higher proportions of acrylonitrile; readily shrink unless stabilised [10]

Transport Properties:
Transport Properties General: Display excellent barrier props
Polymer Solutions Dilute: Viscosity/molecular weight relationship study of copolymer samples η 0.177–0.568 dl g^{-1} (MW 31300–189800; M_n 27600–139700, 9wt% acrylonitrile, TMF) Mark-Howink relationships, and unperturbed chain dimensions have been reported [1]
Permeability of Gases: Gas permeability increases with acrylonitrile content and decreasing crystallininity
Water Absorption:

No.	Value	Note
1	0.5–1 %	65% relative humidity [10]

Mechanical Properties:
Mechanical Properties General: Modacrylic fibres have lower strengths than other commercial products containing higher proportoons of acrylonitrile [10]
Friction Abrasion and Resistance: Coefficient of friction/μstat (polymer/poymer) 0.8; μdyn (polymer/steel sphere) 0.65 [4]

Optical Properties:
Transmission and Spectra: IR spectrum of copolymer containing 20% acrylonitrile has been reported [7, 10] Characteristic absorption at 2240 cm^{-1}

Polymer Stability:
Flammability: Modacrylic fibres are flame-proof [10]
Environmental Stress: Resistant to sunlight (modacrylic fibres) [10]
Chemical Stability: Modacrylic fibres resistant to water; moderately resistant to acids and cold alkalis; attacked by hot alkalis; fibres swollen by some org. solvs. [10]
Hydrolytic Stability:

Poly(vinylidene fluoride) P-612

Synonyms: *PVDF. Vinylidene fluoride polymer. Poly(1,1-difluoroethene). PVF$_2$. PVdF*
Related Polymers: Poly(vinylidene fluoride-*co*-hexafluoroisobutylene), Poly(vinylidene fluoride-*co*-hexafluoropropylene, Poly(vinylidene fluoride-*co*-tetrafluoroethylene)
Monomers: Vinylidene fluoride
Material class: Thermoplastic
Polymer Type: PVDF, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.
24937-79-9

Molecular Formula: $(C_2H_2F_2)_n$
Fragments: $C_2H_2F_2$
Additives: Carbon, carbon fibre
General Information: Partially crystalline polymer containing 59.4% w/w fluorine and 3% hydrogen. Typical commercial material contains 3.5–6 mol% of head-to-head and tail-to-tail units
Morphology: PVdF crystallises in three different forms: Form I (β), form II (α) and form III (γ). Form I is monoclinic with a trans-gauche-trans-gauche (TGTG) conformn.; form II is orthorhombic with a trans-trans (TT) or planar zig-zag conformn., and form III is monoclinic with planar zig-zag TT conformn. The most commonly available are the polar form I and the electrically inactive form II. Commercial bulk polymer usually consists of form II. For high degrees of electrical activity, a significant amount of form I crystalline material is necessary. The degree of electrical activity will depend on the polarity, i.e. the degree to which the dipoles can be made parallel to one another. A common method of achieving this is to apply a high potential across oriented sheet
Miscellaneous: PVdF is an electronically-active polymer, the piezoelectric and pyroelectric responses of PVdF rival those of ceramics. (PVdF is known as a ferroelectric material)

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.75–1.8 g/cm^3	ASTM D792 [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9×10^{-5}–0.00012 K^{-1}	ASTM D696 [2]	L

Latent Heat Crystallization: Heat of fusion 29.5 kJ mol^{-1} (46.1 kJ kg^{m1}) [5]. ΔS 74.7 J K^{-1} mol^{-1} (17°) [8]. ΔH 111.7 kJ mol^{-1} (17°) [8]. ΔG 104.9 kJ mol^{-1} (17°)
Thermal Conductivity:

No.	Value	Note
1	0.1–0.13 W/mK	[3]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.255–1.425 kJ/kg.C	[5]	P
2	1.217 kJ/kg.C	77.9 J K^{-1} mol^{-1}, -3° [8]	P

Melting Temperature:

No.	Value	Note

Glass-Transition Temperature:

No.	Value	Note
1	-40°C	[3]

Deflection Temperature:

No.	Value	Note
1	150°C	0.455 MPa [2]
2	100°C	1.82 MPa [2]

Brittleness Temperature:

No.	Value	Note
1	-64–-62°C	ASTM D746 [3]

Surface Properties & Solubility:

Solubility Properties General: Has good compatibility with a range of oxygen containing polymers [2]
Solvents/Non-solvents: Sol. dimethylacetamide, DMF, hexamethyl phosphoramide and DMSO [5]. Some highly polar solvents such as ketones and ethers are absorbed

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	5–180 g/10 min	265°, ASTM D1238 [2]

Volatile Loss and Diffusion of Polymers: Thermogravimetric weight loss 0.5% (1h, 300°) [2]
Water Absorption:

No.	Value	Note
1	0.03–0.06 %	ASTM D570 [5]

Mechanical Properties:

Mechanical Properties General: Has excellent mech. props., with good impact strength and excellent ability to withstand fatigue crack propagation. Tensile strengths up to 290 MPa can be achieved by orientation [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	1200–1600 MPa	ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	1200–1800 MPa	ASTM D790 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	30–60 MPa	25° [2]	25–500%
2	20–30 MPa	100°, ASTM D638 [2]	300–600%

Flexural Strength at Break:

No.	Value	Note
1	55–75 MPa	ASTM D790 [2]

Compressive Modulus:

No.	Value	Note
1	1000–1400 MPa	ASTM D695 [2]

Poisson's Ratio:

No.	Value	Note
1	0.383	Kynar 730

Tensile Strength Yield:

No.	Value	Note
1	30–60 MPa	25° [2]
2	20–40 MPa	25°

Compressive Strength:

No.	Value	Note
1	55–100 MPa	ASTM D695

Mechanical Properties Miscellaneous: Tear strength 250–320 N mm^{-1} (40 μm thick, oriented film, machine direction), 160–200 N mm^{-1} (25 μm thick, oriented film, machine direction), 170–245 N mm^{-1} (9 μm thick, oriented film, machine direction) [1]
Hardness: Durometer D70-D80 (ASTM D2240) [2]. Shore R110 [6]
Friction Abrasion and Resistance: Tabor abrasion 7.0–10 mg $(1000 \text{ cycles})^{-1}$ (Wheel CS-17, 1 kg) [3]; 17.6 mg $(1000 \text{ cycles})^{-1}$ (Wheel CS-17, 0.5 kg) [4]. Sand abrasion 4 m^3 mm^{-1} (ASTM D968) [3]

Izod Notch:

No.	Value	Notch	Note
1	75–235 J/m	Y	25°, ASTM D256 [4]
2	700–2300 J/m	N	25°, ASTM D256 [4]

Electrical Properties:

Electrical Properties General: Exhibits ferroelectric behaviour after alignment of crystal dipoles in an electric field. This makes PVdF a very useful material in piezoelectric and pyroelectric applications

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	8.4–13.5	60 Hz	ASTM D150 [2]
2	7.4–13.2	1 kHz	ASTM D150 [2]
3	6–7.6	1 MHz	ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	10.23–37.4 kV.mm^{-1}	260–950 V mil^{-1}, ASTM D149 [5]

Arc Resistance:

No.	Value	Note
1	50–60s	ASTM D495 [2]

Complex Permittivity and Electroactive Polymers: Pyroelectric coefficient 24–28 μC m^{-2} K^{-1} [1]; 27–40 μC m^{-2} K^{-1} [2,5]. Piezoelectric coefficient d_{31} 21–28, d_{32} 2.3, d_{33} -32 [2]. Piezoelectric coefficient g^{31} 0.12–0.14, g^{32} 0.18–0.022 Vm N^{-1} [1]. Piezoelectric strain constant 20–50 pm V^{-1} [3]. Piezoelectric stress constant (pressure) 0.23 V m^{-1} Pa^{-1} [3]. Piezoelectric constants, d 20 × 10^{-12} mV^{-1}, e 6 × 10^{-2} N Vm^{-1}, g 0.174 Vm N^{-1}, h 530000000 Vm^{-1} [9]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.012–0.019	60 Hz	ASTM D150
2	0.013–0.019	1 kHz	ASTM D150
3	0.15–0.22	1 MHz	ASTM D150

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.41–1.42	25°, ASTM D542 [2]

Transmission and Spectra: Exhibits high transmittance (80–90%) at 100 μm thickness in the visible region of the electromagnetic spectrum making it suitable for solar applications

Volume Properties/Surface Properties: Clarity transparent to translucent [6]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	148°C	[6]
2	150–190°C	

Decomposition Details: The predominant method of thermal degradation is dehydrofluorination. The second major product is trifluorobenzene, which is prod. by chain scission and cyclisation. The onset of rapid thermal degradation occurs at 390°. After a weight loss of 70%, the charred PVdF is stabilised and no further gaseous evolution occurs [2]

Flammability: Flammability rating V0 (UL 94). Limiting oxygen index 43% (ASTM D2863, Kynar 730) [5]

Environmental Stress: Has superb weathering characteristics, with no deterioration of mech. props. after years of outdoor exposure [2]

Chemical Stability: Resistant to most inorganic and organic chemicals at room temp. It is, however, especially sensitive to attack from amines [5]

Stability Miscellaneous: Has exceptional resistance to γ-radiation [2]. At 100 Mrad there is essentially no loss in tensile strength

Applications/Commercial Products:

Processing & Manufacturing Routes: Free radical suspension, emulsion or soln. polymerisation. Processed by extrusion or injection moulding

Mould Shrinkage (%):

No.	Value	Note
1	2.5–3%	[6]

Applications: Long lasting metal finishes, wire and cable insulation, fluid handling systems, packaging, chemical processing equipment. Transducers, ultrasonics, hydrophones, loudspeakers, headphones, microphones and pressure sensors

Poly(vinylidene fluoride-*co*-chloro trifluoroethylene) P-613

Synonyms: *Poly(1,1-difluoroethene-co-chlorotrifluoroethene). PVDF-co-PCTFE*
Related Polymers: Poly(vinylidene fluoride)
Monomers: Vinylidene fluoride, Chlorotrifluoroethylene
Material class: Thermoplastic, Copolymers, Synthetic Elastomers
Polymer Type: PVDF, PCTFEfluorocarbon (polymers)
CAS Number:

CAS Reg. No.	Note
9010-75-7	
123236-28-2	graft

Molecular Formula: $[(C_2H_2F_2)_x(C_2ClF_3)_y]_n$
Fragments: $C_2H_2F_2$ C_2ClF_3
Molecular Weight: MW 750000–1000000; MW 840000; M_n 480000; MW 75000; M_n 29000 (23–28 mol% vinylidene fluoride); MW 447000 (vinylidene fluoride:CTFE 1:30); MW 322000 (vinylidene fluoride:CTFE 1:12); MW 996000 (vinylidene fluoride:CTFE 1:9); MW 279000 (vinylidene fluoride:CTFE 2:1) MW 416000 (vinylidene fluoride:CTFE 4:1); MW 75700 (commercial resin, 22 wt% CTFE); M_n 29400 (commercial resin, 22 wt% CTFE)
Additives: Plasticisers/softeners; vulcanising (cross-linking) agents; thermal stabilisers ('Gossypol', phenyl ketone derivatives, hydroquinone derivatives, $CaCl_2$, methyl cellulose); fillers (silica, silicates, carbon blacks, Cu powder); modifiers (low MW chlorofluorocarbons); anti-oxidants (phenyl ketone derivatives); anti-caking agents (polyolefins, alkaline earth salts); processing aids; release agents and colours (occasionally)
General Information: Are speciality, high-performance fluorocarbon copolymers available either as thermoplastics (containing less than 15 mol% CTFE and known as 'flexible PVDF') or as fluoroelastomers, which are commercially available as 30/70 and 50/50 CTFE/vinylidene fluoride compositions (most commonly used/well known); fluoroelastomers are usually tough transparent to translucent gums [36,37]. Copolymers containing low amounts of vinylidene fluoride have excellent optical, electrical, chemical, thermal and mechanical props. They find uses where good moisture barrier and optical transparency props. are needed: such props. are dependent on morphology [31]. Physical and mechanical props., compounding, processing and applications have been reviewed [36,37]
Tacticity: Atactic fluorine rubber [6]
Morphology: Has a hexagonal struct. (helical arrangement) (3 mol% vinylidene fluoride) [41]. Copolymer containing 25–70 mol% vinylidene fluoride is amorph. [41]. Cryst. struct. of 95 wt% vinylidene fluoride copolymer before and after poling has been reported [46,52]. Monoclinic, a 0.496, b 0.965, c, 0.462 [46,52]; these dimensions are v. close to those of PVDF α-form, plus very small amount of PVDF β-form [46,52]. There is little change in struct. after poling although ir spectral data reveal decrease in α-phase component and increase in β-form component [46,52]. Positron annihilation studies of the microdefect struct. have been reported [30]. Structural assignments of chemical shifts in F-19 high-resolution (338.7 MHz) nmr spectra have been correlated with 5-carbon (pentad) sequences in copolymer backbone [8,29]. Methods to monitor crystallinity of copolymers containing 0.72–3.4 wt% vinylidene fluoride have been reported; degree of crystallinity (films), 51–16% (from dsc), 64–11% (from xrd), 77–13% (from density measurements) [31]. Morphology of block copolymers consists of hard (PVF) and soft segments [48]. Copolymers containing 96–97 mol% CTFE have a crystalline struct. (hexagonal, helical arrangement). Increasing vinylidene fluoride content 25–70 mol% gives amorph. materials [41]. Amorph. fluoroelastomer has globular struct; same struct. both in films and bulk. It is resistant to corrosive liqs., milling, and unchanged by vulcanisation and is altered only by high pressure [42]. Ms studies of microstruct. reveal comonomers linked by intermediate $-CH_2CFCl-$ and $-CF_2CF_2-$ units [45]. Far ir measurements have been used to investigate degree of ordering/chain conform.; order reduced by increasing amounts of CTFE [13]. X-ray measurements show struct. is similar to that of PVDF (Form II) [13]. Typical commercially available copolymer, e.g. CTFE:VDF (75:25) is partially crystalline. The extent of crystallinity depends on thermal history. Annealing at temps. $T_g < T < T_m$ (also under strain) produces slow crystallisation resulting in a rather low ultimate degree of crystallinity, as randomly distributed ribbon-like lamellae. Thermal and mechanical (tensile) behaviour following annealing have also been reported [15]. The crystallisation rate is also dependent on processing history; DSC studies have revealed 'memory effect' in some copolymer systems [34]. X-ray diffraction anal. of semicrystalline polymer shows unusually large crystallites (less than 500Å) depending on processing conditions; apparent crystallite size can be regarded as measure of crystalline perfection [16]. Molecular motions of copolymer have been investigated by esr spectroscopy and fluorescence polarisation experiments [55]. Motions of graft (VDF on CTFE) copolymer have been studied by pulsed pmr spectroscopy; the struct. consists of a ribbon-like (mobile) component and a crystalline (immobile) component; motions correlate with mechanical props. [33]. Commercial elastomer is amorph. at temps. down to -40°, but partially crystallises at 300% elongation [58]. Small amounts of CTFE reduce crystallinity of polyvinylidene fluoride. Greater than 30 mol% vinylidene fluoride can be incorporated into helical struct. of CTFE homopolymer before crystallinity and struct. are significantly affected. 50/50 Compositions have a fair amount of disorder along chain direction and are of random struct. with low degree of alternation, head-to-head, head-to-tail [51]
Identification: Fluorine determined by burning in presence of urethane rubber, PE and $NaNO_3$, using distilled water as absorbing soln.; fluoride ions in solns. containing urotropin (pH 5–5.2) are titrated with $La(NO_3)_3$ soln., using a fluoride-selective electrode [18]. Controlled pyrolysis- electron impact mass spectrometry has been reported as diagnostic method for identifying commercial material [54]. Atom ion emission- ms anal. for qualitative and quantitative evaluation has the particular advantages of high accuracy, efficiency and the need for only small sample sizes [39]. H-1 nmr and C-13 nmr spectroscopy is used for identification/anal. of impurities in copolymer resin and its lacquers: F-19 nmr is used to identify impurities and emulsifiers (e.g. perfluorodecanoates) from polymerisation process [57]. Anal. of esca data gives compositional results to within 2% of those obtained from elemental anal. [43]. CTFE content in copolymers can be monitored by the intensity of the 840 cm^{-1} band in the vibrational (ir) spectrum; intensity decreases with increasing CTFE content [56]
Miscellaneous: Graft copolymers are available [23,24,26] e.g. with PVDF, vinylidene fluoride grafted on to copolymer [23]. Block copolymers have been reported [48]. Blends of copolymer with PTFE, EPDM, ethylene-propylene copolymers, natural rubber, 'reclaimed' rubber, EPR, PVC, ethylene-norbornene (rubber), acrylic polymers and rubbers, graft fluoropolymers and (oligomeric) PE have been reported

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2–2.04 g/cm^3	commercial resin, 25 wt% vinylidene fluoride [60]
2	d 2.09–2.12 g/cm^3	3 mol% vinylidene fluoride, higher crystallinity, hexagonal (helical) arrangement [41]
3	d 2.02 g/cm^3	25 mol% vinylidene fluoride, amorph. [41]

4	d 1.85 g/cm^3	50 mol% vinylidene fluoride, amorph. [41]
5	d 1.85 g/cm^3	70 mol% vinylidene fluoride, amorph. [41]
6	d 1.85 g/cm^3	68 wt% CTFE, commercial elastomers [37,58]
7	d 2.093–2.144 g/cm^3	3.84–0.72 wt% vinylidene fluoride [31]

Volumetric Properties General: C_P 26–100 J mol^{-1} K^{-1}, -193°- 67°, 70 wt% vinylidene fluoride; 28–107 J mol^{-1} K^{-1}, -193°-67°, 56 wt% vinylidene fluoride [38]
Thermodynamic Properties General: Thermal conductivity increases with increasing temp.; no change is observed at temps. greater than T_g [21]
Melting Temperature:

No.	Value	Note
1	197°C	approx., 3–4 mol% vinylidene fluoride, high crystallinity, hexagonal (helical) arrangement [41]
2	92–164°C	85–99 mol% vinylidene fluoride [47]
3	186–215°C	3.84–0.72 wt% vinylidene fluoride [31]

Glass-Transition Temperature:

No.	Value	Note
1	52°C	approx., 3–4 mol% vinylidene fluoride, high crystallinity, hexagonal (helical) arrangement [41]
2	0°C	50 mol% vinylidene fluoride, amorph. [41]
3	-15°C	70 mol% vinylidene fluoride, amorph. [41]
4	-44–-26°C	99–85 mol% vinylidene fluoride [47]
5	-13°C	amorph., 70 wt% vinylidene fluoride [49,55]
6	28°C	25 wt% vinylidene fluoride [15]
7	-2°C	amorph., 50 wt% vinylidene fluoride [49,55]
8	-18°C	unknown composition [30]
9	20–40°C	VDF:CTFE 1:3 [9]

Transition Temperature General: Transition temps. are dependent on thermal and mechanical history of sample [49]
Brittleness Temperature:

No.	Value	Note
1	-40°C	25 wt% CTFE, commercial vulcanisate [37]

Surface Properties & Solubility:

Plasticisers: Fluorodiethers, fluorosiloxanes, chlorofluorocarbons, fluoroelastomers. Use of (oligo)fluorosiloxane liqs. (5–7 phr) leads to products with high strength, good heat resistance, and improved processability [19]. Addition of fluorinated species (optimal conc. 50 parts) such as $H(CF_2)_nCH_2O$-$CH_2OCH_2(CF_2)_nH$ (where n=4 or 6; n=6 most effective) gives products displaying reduced stress at 100% elongation, high breaking elongation and high cold resistance (to -50°) [17]. Fluoroacrylate polymers and cyanoethyl ethers also used
Solvents/Non-solvents: Sol. certain ketones and esters [37]; THF (22 wt% CTFE, commercial resin) [25]. Insol. MeCN, MeOH; (22 wt% CTFE, commercial resin). 50/50 Copolymer sol. DMF [10,53]

Transport Properties:

Transport Properties General: Rheological props. and their dependence on MW and MW distribution have been reported. Melt index displays inverse correlation to high MW component [20]. Rheological behaviour (entanglement network and segmental mobility) and its effect on electrification has been reported [6]. Commercial vulcanisate has low water absorption props. [58]
Polymer Solutions Dilute: Intrinsic viscosity and Mark-Houwink constants of vinylidene fluoride:CTFE (1:4) copolymer in EtOAc at 25° have been reported; 0.0004–0.0005 poise (graft copolymer with vinylidene fluoride) [33]; melt viscosity 0.45–0.55 cSt (commercial resin, 25 wt% vinylidene fluoride) [60]. Mooney viscosity 127 (170°, commercial elastomer, 68% CTFE) [37]. Mooney viscosity of elastomer depends on MW amd MW distribution [20]
Permeability of Liquids: Permeability to solns. of hydrochloric acid has been reported. The lowest permeabilities are found for copolymers with highest T_g values [12]Has low permeability to moisture [9]
Gas Permeability:

No.	Gas	Value	Note
1	[O_2]	1.313 cm^3 mm/(m^2 day atm)	0.02×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 97% CTFE [14]
2	[N_2]	0.657 cm^3 mm/(m^2 day atm)	0.01×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 97% CTFE [14]

8	[CO_2]	177.29 cm^3 mm/(m^2 day atm)	2.7×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 68% CTFE [14]
9	[O_2]	61.07 cm^3 mm/(m^2 day atm)	0.93×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 50% CTFE [14]
10	[CO_2]	262.66 cm^3 mm/(m^2 day atm)	4.0×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 50% CTFE [14]
11	[O_2]	2.76–37.43 cm^3 mm/(m^2 day atm)	$0.042–0.57 \times 10^{-10}$ cm^2 (s cm Hg)$^{-1}$, 25°, 25% CTFE [14]
12	[N_2]	0.79–0.98 cm^3 mm/(m^2 day atm)	$0.012–0.015 \times 10^{-10}$ cm^2 (s cm Hg)$^{-1}$, 25°, 25% CTFE [14]
13	[CO_2]	6.3–15.76 cm^3 mm/(m^2 day atm)	$0.096–0.24 \times 10^{-10}$ cm^2 (s cm Hg)$^{-1}$, 25°, 25% CTFE [14]
14	[H_2]	308.63 cm^3 mm/(m^2 day atm)	4.7×10^{-10} cm^2 (s cm Hg)$^{-1}$, 33°, 20% CTFE [14]
15	[He]	22.33 cm^3 mm/(m^2 day atm)	0.34×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 20% CTFE [14]
16	[CH_4]	0.55 cm^3 mm/(m^2 day atm)	0.0084×10^{-10} cm^2 (s cm Hg)$^{-1}$, 25°, 20% CTFE [14]

Mechanical Properties:

Mechanical Properties General: Tensile strength (and corresponding elongation) increases with increasing MW [20]. Tensile

strength increases with decrease in temp. from 20° to -253°, and then shows a further increase from -253° to -268.8°. Breaking elongation decreases with decreasing temp. The presence of fillers gives increased tensile strength at room temp., with lower strengths recorded at lower temps [40]. Compounding with carbon black lends reinforcement by breaking down the original globular struct. Mechanical props. of filled rubber vulcanisates improve with increasing filler/rubber interface area; effects of moisture also reported [62]. Tensile behaviour following annealing has been reported for commercially available (75% CTFE) copolymer [15]. Elasticity and good tensile strength are attributable to the presence of CH_2 units in normally rigid highly fluorinated chain [58]

Tensile Strength Break:

No.	Value	Note	Elongation
1	28–30 MPa	graft copolymer with vinylidene fluoride [33]	520–563%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	10.3–20.7 MPa	250–350%	1500–3000 psi, commercial resin, 25% vinylidene fluoride [60]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2.1–5.5 MPa	25 wt% CTFE, commercial vulcanisate [37]	100% modulus

Impact Strength: Impact experiments on thin layers of copolymers with thin layers of intermediate explosives (e.g. PETN and other aminotetryls) have been reported [3]. The copolymer has a sensitising effect on the explosive. Dynamic compression experiments carried out at 500–1000 MPa are related to ignition behaviour by impact [3]

Viscoelastic Behaviour: Viscoelastic props. have been reported. Temp. dependence of both filled and unfilled vulcanisates appears to be determined by stress-relaxation process [35]

Mechanical Properties Miscellaneous: Copolymer exhibits changes in its mechanical behaviour upon storage at room temp. (or at temps. just above) which can lead to problems with respect to end-use applications [15]. Compression set 40% at 200° (70h) [Method B], (25 wt% CTFE, commercial vulcanisate) [37]. Shear storage modulus, relaxation strength and loss tangent have been reported. Mechanical props. vary with degree of crystallinity which is of relevance to applications as sensitisers for explosives, e.g. PETN [15]. Mechanical relaxation spectra have been reported for copolymers containing 30–97 mol% CTFE for isochronal measurements at 3.5–110 Hz as function of temp. (-90° to highest temp. before onset of flow) [41]

Hardness: Shore D64 (commercial resin, 25% vinylidene fluoride) [60]. Durometer 53–85 (25 wt% CTFE, commercial vulcanisate) [37]

Failure Properties General: Failure appears to be determined by stress-relaxation process; maximum tensile strength (and elongation) occurs at -22°, with maximum at 120°. The strength of filled copolymer is up to twice as that of unfilled copolymer [35]

Friction Abrasion and Resistance: Rubber vulcanisates filled with Cu powder show a reduction in friction coefficient of 20–60% and 2–6 fold increase in wear resistance [44]

Izod Notch:

No.	Notch	Break	Note
1	Y	N	commercial resin, 25% vinylidene fluoride [60]

Electrical Properties:

Electrical Properties General: Tracking erosion and arc resistance have been reported [4]

Complex Permittivity and Electroactive Polymers: Electrical conductivity of soln.-grown thin films of copolymer (50% fluoride) as a function of temp. and field has been reported. Current is strongly temp. dependent. Richardson-Schottky effect suggested as dominant mechanism of conduction at high fields [53]. Substantial piezoelectric activity is observed on poling a copolymer film (5% CTFE). Near ir spectral anal. shows increase in β-phase (with corresponding decrease in γ-phase) on poling, although x-ray structural anal. shows no change on poling; α-phase of PVDF predominates, plus small amount of β-phase [46,52]. Electrical characteristics (dielectric props., charge distribution, charge-transport props.) and related potential applications of thin films in combination with silicon in FET structures have been reported [10]

Static Electrification: Static electrification study of copolymer extruded above T_g through metal and dielectric ducts has been reported; negatively charged surfaces are produced [6]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.416	commercial resin, 25 wt% vinylidene fluoride [60]
2	1.62	91 wt% vinylidene fluoride [13]

Transmission and Spectra: Nmr spectral data of graft copolymer (with vinylidene fluoride) have been reported [33]. Esr spectral data have been reported [55]. Mass [45], fluorescence [55], F-19 nmr [51] spectral data have been reported [51]. Near (400–4000 cm^{-1})- and far (50–500 cm^{-1}) ir spectral data of copolymer containing 95 wt% vinylidene fluoride have been reported [13,46,52]

Total Internal Reflection: Mechanical stretching results in highly dichroic material (highly anisotropic) [13]

Polymer Stability:

Polymer Stability General: As T_g of copolymers is close to ambient temp., both physical ageing and annealing effects can occur during its end use [9]

Thermal Stability General: Vulcanisate is thermally stable up to approx. 125° [58]. Heat resistance has been reported [37]. Thermal anal. of semicrystalline polymer has been reported [15]

Upper Use Temperature:

No.	Value	Note
1	175°C	25 wt% CTFE, commercial vulcanisate [37]

Decomposition Details: Pyrolysis of the copolymer causes depolymerisation, with elimination of HF, and chain cleavage accompanied by H-transfer. Major pyrolysis products are CF_2CH_2, CF_2CFCl, C_3F_5Cl, HCl, $C_3F_5H_2^{\oplus}$, $C_3F_4H_2Cl^{\oplus}$, $C_5F_6H^{\oplus}$, plus various allylic ions [7]. Hydrogen halide gases are liberated above 230°. Mechanism of decomposition has been reported [54]. Presence of stabiliser ('Gossipol', 15%) increases degradation induction period and reduces weight loss. Degradation reactions and mechanisms for various copolymers compositions have been reported [28]; decomposition products include CO_2, CTFE, VDF, C_3F_5Cl, HF and HCl [28]. Chain unzipping is the predominant mechanistic route [28] Decomposition is promoted by presence of chlorine in copolymer chain [28]. Themal degradation proceeds via free-radical mechanism and is a single stage process, starting at approx. 400° for pure elastomer. Decomposition temp. is greatly reduced for compounds, but increases again on vulcanisation, although it is still lower than that of the pure elastomer. Degradation rates and activation energies have also been reported [5]. Thermal degradation of a range of copolymers produces the constituent comonomers plus some hydrogen chloride which results from elimination reactions

involving adjoining -CF_2CFCl- and -CH_2CF_2- units in the backbone [32].

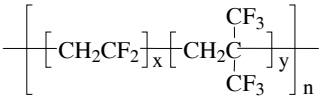
Flammability: Elastomers cured with hexamethylenediamine carbamate or bisphenol A have oxygen indices 48–60%. Is non-flammable [58,60]. Flammability rating V0 (UL94) [36]. Fire resistance is greatly increased by introduction of chlorine into the copolymer macromolecule. Oxygen index 52% (11 wt% CTFE); 85% (33 wt% CTFE); 88% (50 wt% CTFE); 97% (80 wt% CTFE); 100% (approx., 86 wt% CTFE) [11]

Chemical Stability: Vulcanisate is completely destroyed by contact with potassium hydroxide (specific gravity 1.4) at 90° [61]. Unaffected by hexane; quite stable in aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, alcohols and primary aromatic amines. Swollen by ketones, carboxylic acids, ethers, esters, tertiary amines and DMF [50]. Resists oxidising acids [37,58,59] 90% H_2O_2, O_2 and petroleum products [58]. Displays good general resistance to most chemicals [9]. Coatings show satisfactory resistance to acids and bases [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Usually synth. by aq. emulsion polymerisation of comonomer mixture using potassium or ammonium persulfate as free-radical initiator [32,37,51], or by use of redox system with or without chain-transfer agents (e.g. CCl_4, alkyl esters or halogen salts) [37]. Graft copolymers with vinylidene fluoride synth. by reaction of vinylidene fluoride, CTFE and unsaturated peroxide (e.g. CH_2CHCH_2OCOOO-*tert*-butyl) at low temps.; the intermediate (base) polymer, containing peroxide side chains, is heated to give required polymer [33]. Polymer has a saturated backbone and therefore cannot be vulcanised in conventional sense. It can, however, be cross-linked by use of poly(isocyanates), polyamines or organic peroxides to form elastomeric materials [58, 59]. 'Vulcanisation' can also be achieved using γ-irradiation. Formulation/compounding/processing [59] with various additives can be carried out on 2-roll rubber mill at 77–88° [37]. Films (e.g. containing 5% CTFE) are prepared by chill-roll extrusion process [46,52]. Resin (e.g. containing 70 mol% CTFE) can be moulded into thin, clear sheets that are flexible and stress-free at ambient temps. [60]

Applications: Used in lacquers, paints, putties, propellants, lubricants, adhesives, acid-proofing compounds, laminates; as corrosion-resistant coatings and radiation-protective coatings. A major application is as coatings (elastomeric polymeric binder) for plastic-bonded explosives and propellants, e.g. with PETN and other aminotetryls (sensitiser), and 1,3,5-triamino-2,4,6-trinitrobenzene (TATB) (sensitiser). Also used in gaskets, oil seals, high-barrier films and membranes, and in fibres (with other fluoropolymers). Has wide range of applications in optics and electronics, including moisture-resistant and weather-resistant coatings (insulators) for electrical braid, wire, cable and harnesses, fibre optics, piezoelectric components, electrets, microcircuitry, LCD devices, cathodes and batteries, thin films for FETS (with Si) [10] and in electrophotographic and photothermographic imaging systems. Other applications include ion-exchange membranes, HPLC column packings (with aminopropyl silica) [25] and in dentistry. Block copolymers are used in optical device materials. Graft copolymers are used as leather substitutes, owing to their resistance to stains, chemicals and weathering, as laminated sheets and in flexible layers for various pharmaceutical applications. Copolymer films containing 0.5–3.5 wt% vinylidene fluoride find applications where good moisture-barrier and optical transparency props. are required



Trade name	Details	Supplier
Aclar	22 (96 wt% CTFE), 22A, 22S, 33C. Non-exclusive also used to refer to other PCTFE materials	Allied Chemical
Kel-F	5 wt% CTFE; thin (20μ) films	Solvay
Kel-F	various grades 25–97 wt% CTFE non-exclusive; also used to refer to other VDF and CTFE polymer materials	3M Industrial Chemical Products
P994	Fluorine rubber	Atochem Polymers
SKF-32	fluorine rubber	
Voltalef	3700 (30 wt% CTFE) and 5500 (50 wt% CTFE), amorph., copolymers; non-exclusive; also used to refer to other PCTFE and rubber materials	Atochem Polymers

Poly(vinylidene fluoride-*co*-hexafluoro isobutylene) P-614

Synonyms: *Poly(vinylidene fluoride-co-hexafluoroisobutene). Poly(HFIB/VF_2). Poly(1,1-difluoroethene-co-(3,3,3-trifluoro-2-(trifluoromethyl)-1-propene)). PVDF/HFIB. Poly(vinylidene fluoride-co-hexafluoro(γ-butylene)*
Related Polymers: Poly(vinylidene fluoride)
Monomers: Vinylidene fluoride, Hexafluoroisobutylene
Material class: Thermoplastic, Copolymers
Polymer Type: PVDF, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.
34149-71-8

Molecular Formula: $[(C_2H_2F_2).(C_4H_2F_6)]_n$
Fragments: $C_2H_2F_2$ $C_4H_2F_6$

Additives: Phosphites, bis(carboxylates) of bis(hydroxylalkyl), oxamides; salts and/or oxides of divalent metals, including ZnO, CaO as stabilisers
General Information: Fluorocarbon copolymer exhibiting many of the desirable props. of PTFE but with additional advantage that it is melt processable and film forming [4].The polymer has the same crystalline melting point as PTFE but a much lower density. The copolymer may be injection moulded at approx. 380°. Commercial material is available as a 50:50 mixt. and is hard, rigid and highly crystalline, displaying good resistance to chemicals, good electrical props., anti-stick characteristics, and is non-flammable [4]. Reviews of the synth., processing, applications and physical props. have been reported [1,3]
Morphology: Orthorhombic; a 1.064, b 1.837, c 0.783 [2]; helix 2_1, with approx. *trans-trans-gauche-gauche-* backbone dihedral angle sequence. Severe intrachain steric crowding gives a rigid chain, with some backbone bond angles being highly extended [2]. Ir and Raman spectroscopy show head-to-tail struct., ie. $C(CF_3)_2CH_2CF_2\ CH_2)_n$. Evaluation of CH_2 bending region supports such a conclusion. There is more than one monomer per repeat unit [7]
Miscellaneous: MW values have not been reported, partly due to non-solubility of copolymer in organic solvents [7,8]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.88 g/cm^3	50/50 copolymer [1,2,3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
0	4.7×10^{-5} K^{-1}	149–204° [1]	l
1	3.7×10^{-5} K^{-1}	-45–24° [1]	l

Melting Temperature:

No.	Value	Note
1	327°C	50/50 copolymer [2,3,7,9]
2	326°C	[6]
3	303°C	64% VDF [15]

Glass-Transition Temperature:

No.	Value	Note
1	84–98°C	[6]

Transition Temperature General: Melting point increases with increasing isobutylene content [15], T_g of high MW material difficult to measure by DSC [10]. Copolymer does not display any reversible crystalline (relaxation) transition temp. [5,6,11]
Deflection Temperature:

No.	Value	Note
1	220°C	1.82 MPa [2,3,7]
2	220°C	1.89 MPa [1]

Transition Temperature:

No.	Value	Note	Type
1	132°C	approx. [10]	T_α
2	-68°C	approx. [10]	T_β

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. all common organic solvents [7,10]; swollen by EtOAc [8]
Surface and Interfacial Properties General: Has low surface energy [20] and tension [8,24]
Surface Tension:

No.	Value	Note
1	19.3 mN/m	19.3 dyne cm^{-1} [2,3]

Transport Properties:

Transport Properties General: A study of the effect of metal oxide stabilisers on melt flow index values has been reported [9,14]
Melt Flow Index:

No.	Value	Note
1	3.07 g/10 min	no stabilisers
2	1.04 g/10 min	1.5 wt% ZnO, extrusion at 345° [9]
3	1.31 g/10 min	CaO, extrusion [14]
4	1–3 g/10 min	ASTM D2116 [2,3]
5	0.8 g/10 min	powder, 5 kg load [7]
6	13 g/10 min	film, after compression, 2.16 kg load, moulding at 350° [7]
7	15 g/10 min	350°, 2.16 kg load [8]
8	0.042 g/10 min	no stabilisers
9	0.005 g/10 min	stabilised [9,14]
10	9 g/10 min	345°, 2.16 kg load [5]

Permeability and Diffusion General: Permeability to water vapour is approx. 4 times lower than that of PTFE. The copolymer has one of the lowest known values of water vapour permeability [1]

Mechanical Properties:

Mechanical Properties General: Displays high moduli and low creep even at temps. above 150° [20]. Its mechanical props. e.g. tensile strength and modulus are superior to those of PTFE, particularly at elevated temps. [1,2]. Its impact strength is inferior to that of PTFE [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	3792 MPa	550 kpsi [2,3]
2	3800 MPa	380 N mm^{-2}, 23° [1,2,3]
3	758 MPa	110 kpsi [2,3]
4	690 MPa	690 N mm^{-2}, 200° [1,2,3]

Flexural Modulus:

No.	Value	Note
1	4481 MPa	650 kpsi, 23° [2,3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	37.9 MPa	5.5 kpsi [2,3]	
2	38 MPa	38 N mm^{-2} [1]	2%, 23° [1,2,3]
3	20.7 MPa	3000 psi [2,3]	
4	21 MPa	21 N mm^{-2}	200%, 200° [1,2,3]
5	15.8 MPa	2300 psi [2,3]	
6	16 MPa	16 N mm^{-2}	220%, 300° [1,2,3]

Flexural Strength at Break:

No.	Value	Note
1	36.5 MPa	5300 psi, 23° [2,3]

Impact Strength: Impact strength 0.4 ft lb in^{-1}, notched, 23° [2,3]
Mechanical Properties Miscellaneous: Dielectric and dynamic mechanical relaxation studies have been reported [10]
Hardness: Rockwell R111 [2,3]. Pencil hardness 8H (coatings containing metal oxides) [16]. R116 (surface) [1]
Fracture Mechanical Properties: Creep strain 1.4% (1hr, 100°, 2 kpsi); strain 1.7% (after 150h) [2,3]
Friction Abrasion and Resistance: Displays anti-stick, non-wetting characteristics, and good abrasion and scratch resistance [1,4]. Shows good adhesion to metal substrates [4] and unprimed metals [16]

Electrical Properties:

Electrical Properties General: Has good electrical props.[4,15], low electrical loss props. [12] and high electrical resistance [8]

Optical Properties:

Transmission and Spectra: Ir and Raman [7,8]; epr [12] H-1 nmr, and F-19 nmr [7,10] spectral data have been reported
Total Internal Reflection: Birefringent, pseudosphenilitic struct. revealed by polarised light microscopy studies [10]. Film drawn at 300° to only 200% elongation displays high degree of dichroism [8]
Volume Properties/Surface Properties: Colour yellow-brown (unstabilised extrudate); grey (ZnO stabilised) [9]

Polymer Stability:

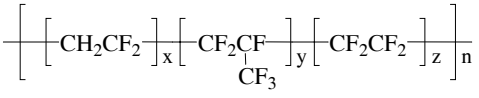
Thermal Stability General: Has good thermal stability [15]
Upper Use Temperature:

No.	Value	Note
1	288°C	[4]
2	280°C	[1,2,3]

Decomposition Details: Weight loss of 50/50 copolymer in N_2 0.03%, 0.22% and 53% at 350°, 400° and 500°, respectively [15]
Flammability: Non-flammmable [4]. Has high oxygen index [20]
Chemical Stability: Has good resistance to chemicals (in general) [1,4,8,15,20]. Inert to strong bases, halogens and metal salt solns. [1]. Shows slight weight gain in ketones and esters [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by free-radical suspension or emulsion polymerisation of mixture of comonomers under pressure [1]. Typical initiators include trichloroacetyl peroxide [12,15], trifluoroacetyl peroxide [12], *tert*-butyl acetyl peroxide [12] and di-sec-butyl peroxydicarbamate [12]. Processed by compression moulding at 350°, injection moulding at 370–380°, or powding coating by fluidised bed, electrostatic spray or plasma spray techniques [1]
Applications: Aplications where superior mechanical props. (particularly at elevated temps.) are required in mouldings, coatings, cellular and porous plastic materials. Aqueous dispersions are used to produce organosols. Other uses include mould release agents, non-stick coatings for industrial rolls, cookware, chemical process equipment, fuel cells, dust precipitators industrial fabrics. Often used in blends with other polymers; examples include porous films; non-wetting, flexible coatings, bearing seals, components with high compressive strength (with PTFE); sliding parts (with PEEK); components with good non-stick props.,



low-friction coefficients and good abrasion resistance (with polyimides). Potential application as sorbent in chromatography

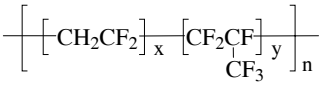
Poly(vinylidene fluoride-*co*-hexafluoro propene-*co*-tetrafluoroethylene) P-615

Synonyms: *Vinylidene fluoride-hexafluoropropylene-tetrafluoroethylene terpolymer. Fluoroelastomer. Fluorine-containing rubber*
Related Polymers: Polyvinylidene fluoride, Polytetrafluoroethylene, Fluoroelastomers, Poly(vinylidene fluoride-*co*-hexafluoropropylene)
Monomers: Tetrafluoroethylene, Vinylidene fluoride, Hexafluoropropene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: PVDF, PTFEfluorocarbon (polymers)
CAS Number:

CAS Reg. No.
25190-89-0

Molecular Formula: $[(C_2H_2F_2).(C_3F_6).(C_2F_4)]_n$
Fragments: $C_2H_2F_2$ C_3F_6 C_2F_4



Additives: Magnesium oxide, calcium hydroxide, fillers, carbon black, cross-linking agents, accelerators, process aids
Miscellaneous: The terpolymer has better resistance to swelling in oils, bettter long term heat resistance and better resistance to chemical degradation than vinylidene fluoride/hexafluoropropylene copolymers

Applications/Commercial Products:

Processing & Manufacturing Routes: Typically prepared by high pressure, free radical, aq. emulsion polymerisation. Polymer is processed further using typical rubber compounding techniques such as milling

Trade name	Supplier
Fluorel	3M Industrial Chemical Products

Poly(vinylidene fluoride-*co*-hexafluoro propylene) P-616

Synonyms: *Vinylidene fluoride-hexafluoropropylene copolymer. FKA Synthetic Rubber. Poly(1,1-difluoroethene-co-1,1,2,3,3,3-hexafluoro-1-propene). Perfluoropropene-PVDF copolymer. Poly(vinylidene fluoride-co-perfluoropropylene). PVdF-HFP copolymer. Fluoroelastomer. Fluorine containing rubber*
Related Polymers: Polyvinylidene fluoride, Poly(vinylidene fluoride-*co*-hexafluoropropylene-*co*-tetrafluoroethylene)
Monomers: Vinylidene fluoride, Hexafluoropropene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: PVDF, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.	Note
9011-17-0	
107221-31-8	block

Molecular Formula: $[(C_2H_2F_2).(C_3F_6)]_n$
Fragments: $C_2H_2F_2$ C_3F_6
Additives: Magnesium oxide, calcium hydroxide, fillers, carbon black, cross-linking agents, accelerators, process aids. Cure agents include diamines, bisphenols and peroxides [1,2,4]
General Information: Several versions of this copolymer have been commercialised. Props. may be elastomeric depending on the mol% of hexafluoropropylene. Typical values are in the region of 30–40 mol%
Miscellaneous: The copolymer is generally used as an elastomer after vulcanisation. Typical fluorine contents of elastomers are 68–69%

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.8 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	-9.5°C	TGA, unvulcanised [2]
2	-22°C	vulcanisate [4]

Brittleness Temperature:

No.	Value	Note
1	-50–-18°C	ASTM D746, dependent on formulation [1]

Transition Temperature:

No.	Value	Note	Type
1	-84°C	unvulcanised [1]	T_β

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 8.7 $J^{1/2}$ $cm^{-3/2}$ [3]
Solvents/Non-solvents: Sol. 2-butanone, other ketones and esters. (Raw elastomer (non-cross-linked)). The cross-linked material is swollen by compatible solvents. Degree of swelling depends on the formulation and the extent of cross-links [2,3]

Transport Properties:

Transport Properties General: Very low gas permeability
Polymer Solutions Dilute: Mooney viscosity 30–120 (100°, ML 1+10, ASTM D1646) [1,4]; 74 (100°, ML 1+4, ASTM D1646) [2]
Polymer Melts: Mooney scorch, min. viscosity 42 (121°), time to a 10 unit rise 26 min. (Viton A, DuPont) [4]

Mechanical Properties:

Mechanical Properties General: The exact values depend on the formulation and compounding of the elastomer
Tensile Strength Break:

No.	Value	Note	Elongation
1	8.96–18.62 MPa	[1]	100–500%
2	14.4 MPa	moulding compound [1]	265%
3	15 MPa	O-ring compound [1]	200%

Miscellaneous Moduli:

No.	Value	Note
1	2.07–15.17 MPa	100% Modulus [1]

Viscoelastic Behaviour: Compression set 9–16% (70h, 25°); 10–30% (70h, 200°), 50–70% (1000h, 200°) (ASTM D395, Method B for 5 mm O-ring) [1]. Compression set 20% (70h, 200°, ASTM D395, Method B, 1.27 cm disk, moulding compound) [1]. Compression set 15% (70h, 200°, ASTM D395, Method B, O-ring) [1]
Hardness: Shore A50-A95 [1]. Shore A74 (moulding compound) [1]. Shore A75 (O-ring compound) [1]
Friction Abrasion and Resistance: Abrasion resistance is good and is satisfactory for most uses [1]

Polymer Stability:

Polymer Stability General: Has excellent resistance to a range of fuels and oils, and good resistance to solvents, acids and alkalis
Thermal Stability General: Has good thermal stability 50% of the initial tensile strength is retained after 1 year at 205° [1]
Upper Use Temperature:

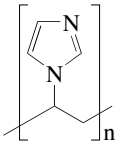
No.	Value	Note
1	315°C	
2	230°C	3000h
3	260°C	1000h
4	285°C	240h
5	315°C	48h [5]

Decomposition Details: Thermal degradation temp. 400–550° [1]
Flammability: Self extinguishing or non-burning [1]
Environmental Stress: Has excellent resistance to ozone and weathering. Sample unaffected after 200h exposure to 150 ppm ozone [1]
Chemical Stability: Low volume change after exposure to various solvents has been reported [2,4]
Stability Miscellaneous: Has fair to good resistance to radiation

Applications/Commercial Products:

Processing & Manufacturing Routes: Typically prepared by high pressure, free radical, aq. emulsion polymerisation. Polymer is processed further using typical rubber compounding techniques such as milling. Additives such as cross-linking agents are added at this stage. The material can be processed using compression, transfer and injection moulding, as well as extrusion. Material is vulcanised in press cure and post cure stages. Typical curing temps. are in the ranges 175–205° press cure and 204–260° post cure (16–24h)
Mould Shrinkage (%):

No.	Value
1	2.6–3.2%



Applications: Components for ground transportation including, engine oil seals and fuel system components such as hoses, O-rings and drive train seals. Also used for industrial hydraulic and pneumatic applications

Poly(*N*-vinylimidazole) P-617

Synonyms: *1-Ethenyl-1H-imidazole homopolymer. PVI*
Monomers: 1-Vinylimidazole
Material class: Thermoplastic
CAS Number:

CAS Reg. No.
25232-42-2

Molecular Formula: $(C_5H_6N_2)n$
Fragments: $C_5H_6N_2$
General Information: Weakly basic polymer which forms complexes with a wide range of metal ions such as Cu^{2+}, Ag^{+}, Co^{2+}, Cd^{2+}, Zn^{2+} and Pb^{2+} [1,2,3]. It also forms interpolymer complexes with polyacrylic acid and other hydroxy-containing polymers [4] and with silicic acid [5]. Prod. as white powder or hygroscopic solid.
Tacticity: The effect of temperature and nature of polymerisation medium on tacticity of the polymer has been studied [6].

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	340–374°C	[8]

Glass-Transition Temperature:

No.	Value	Note
1	109–167°C	Different values of T_g for different samples [4,7]. Doping with iodine and complexation with copper increases T_g [9]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. water, MeOH, EtOH, isopropanol, butanol [10], DMF [4]. Insol. THF [4]. Water is a theta solvent for the polymer [10]

Electrical Properties:

Electrical Properties General: Polymer alone is insulator (conductivity less than 10^{-10} S cm^{-1}). On doping with iodine, conductivity increases to 10^{-7} S cm^{-1}. Quaternisation with methyl iodide and iodine doping increases conductivity to 10^{-4} S cm^{-1} [9].

Optical Properties:

Optical Properties General: UV absorption bands with λ_{max} in region of 205 and 245nm reported [2]
Transmission and Spectra: Pmr [6,11,12], cmr [6], ftir [5,7,9,12,13], Raman [13] and UV [2] spectral data have been reported.

Polymer Stability:

Thermal Stability General: Gradual weight loss (23%) on heating to 330°C then rapid decomposition [8].

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by free-radical solution or bulk polymerisation of *N*-vinylimidazole. A common solvent is benzene [1,7,10], although other solvents such as absolute EtOH have been used [4,6]. The free-radical initiator used is normally azobisisobutyronitrile (AIBN) [1,4,6,7,8,10].
Applications: Possible applications for extraction of metal ions from different media. Has been used as anticorrosion agent for copper at high temperatures [14].

Poly(vinyl isobutyl ether-*co*-monoethyl maleate) P-618

Synonyms: *Poly(vinyl 2-methyl propane ether-co-monoethyl maleate)*
Related Polymers: General information
Monomers: Vinyl isobutyl ether, Maleic anhydride
Material class: Thermoplastic, Copolymers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
36572-31-3

Molecular Formula: $[(C_6H_{12}O).(C_6H_6O_4)]_n$
Fragments: $C_6H_{12}O$ $C_6H_6O_4$

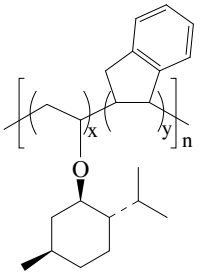
Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by dissolving poly(-isobutyl vinyl ether-*co*maleic anhydride) in ethanol. Poly(isobutyl vinyl ether-*co*-maleic anhydride) formed by free-radical initiated copolymerisation
Applications: Application as an aerosal hairspray resin

Poly(vinyl isobutyl ether-*co*-vinyl chloride) P-619

Synonyms: *Poly(vinyl-2-methyl propane ether-co-vinyl chloride)*
Related Polymers: General information
Monomers: Vinyl isobutyl ether, Vinyl chloride
Material class: Synthetic Elastomers, Copolymers
Polymer Type: PVC, polyvinyls
CAS Number:

CAS Reg. No.
25154-85-2



Molecular Formula: $[(C_6H_{12}O).(C_2H_3Cl)]_n$
Fragments: $C_6H_{12}O$ C_2H_3Cl

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by free-radical initiated copolymerisation e.g. AIBN, benzoyl peroxide
Applications: Used in marine paints, electrostatic image-developing powders i.e. toner, binding resin, adhesive tape for joining and sealing PVC single-ply roofing membranes

Trade name	Supplier
Caroflex MP-45	BASF

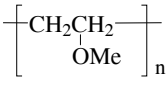
Poly(vinyl *l*-menthyl ether-*co*-indene) P-620

Synonyms: *Poly[(5-methyl-2-(1-methylethyl)cyclohexyloxyethene-co-indene)*
Related Polymers: Poly(vinyl ethers)
Monomers: Vinyl *l*-menthyl ether, Indene, Levomenthol
Material class: Thermoplastic
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
69860-91-9

Molecular Formula: $[(C_{12}H_{22}O).(C_9H_8)]_n$
Fragments: $C_{12}H_{22}O$ C_9H_8

Volumetric & Calorimetric Properties:
Melting Temperature:



No.	Value	Note
1	158–169°C	[1]

Optical Properties:
Transmission and Spectra: Uv and ir spectral data have been reported [1]
Total Internal Reflection: $[\alpha]_D^{25}$ -3.4–26.1 (C_6H_6) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by asymmetric induction radical copolymerisation with AIBN at 50°

Poly(vinyl methyl ether) P-621

Synonyms: *Poly(methyl vinyl ether). PVME. Poly(methoxyethene)*
Related Polymers: Poly(vinyl ethers), Poly(vinyl methyl ether-*co*-maleic anhydride)
Monomers: Methyl vinyl ether
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
9003-09-2	homopolymer
27082-59-3	isotactic

Molecular Formula: $(C_3H_6O)_n$
Fragments: C_3H_6O
Additives: Antioxidants generally added
General Information: The polymer can vary from a viscous, readily water-sol. liq. to a stiff rubber depending on MW. Compatible with aq. solns.
Tacticity: Isotactic form known

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d^{27} 1.037 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00047 K^{-1}	[2,3]	l

Equation of State: Tait, [4] Dee-Walsh, [5] van der Waals, [13] and Sanchez-Lacombe equation of state information has been reported [14]
Thermodynamic Properties General: ΔC_p 0.533 J g^{-1} K^{-1}. Specific heat capacity expressions have been reported [6]
Latent Heat Crystallization: ΔH_m 13.64 kJ mol^{-1}, ΔS_m 14.7 J mol^{-1} K^{-1} [10]. E_a 7.54 kJ mol^{-1} (1.8 kcal mol^{-1}) [11]. ΔH_a 31.5–38.5 [3]. ΔH_c -30.5 kJ g^{-1} (specific heat of combustion) [12]
Specific Heat Capacity:

No.	Value	Note	Type
1	2.53 kJ/kg.C	320–420K [9]	P

Melting Temperature:

No.	Value	Note
1	147°C	[7]
2	144°C	Crystalline form [19,31]

Glass-Transition Temperature:

No.	Value	Note

2	-22°C	[3]
3	-13°C	[1,19]

Vicat Softening Point:

No.	Value	Note
1	55–70°C	[8]

Transition Temperature:

No.	Value	Note	Type
1	-20°C	[1]	Inflection temp.
2	-10°C	[1]	Low temp. stiffening
3	-31°C	[1]	Low temp. stiffening

Surface Properties & Solubility:
Solubility Properties General: Compatible with chlorinated rubber [27]; also with poly *p*-(2-hydroxyhexafluoroisopropyl)styrene-*co*-styrene [21]; novolac resin [22]; phenoxy resin [29]; polystyrene [20,25,26,27,28,29,33]; polyvinylpropionate [30]; polyvinylbutanoate [30] and the poly(hydroxyether) of Bisphenol A [23]

Cohesive Energy Density Solubility Parameters: δ 37.78 $J^{1/2}$ $cm^{-3/2}$ (8.13 $cal^{1/2}$ $cm^{-3/2}$) [2]; 33.27 $J^{1/2}$ $cm^{-3/2}$ (7.94 $cal^{1/2}$ $cm^{-3/2}$) [1]
Solvents/Non-solvents: Sol. EtOAc, Me_2CO, cold H_2O, MeOH, C_6H_6, CH_2Cl_2, $CHCl_3$, EtOH [30,34]. Insol. hexane, heptane, decane, ethylene glycol, Et_2O, hot H_2O. Polymer absorbs solvents to a greater or lesser degree depending on solubility [15]
Wettability/Surface Energy and Interfacial Tension: γ_s 0.00029 mN m^{-1} (29 dyn cm^{-1})

Transport Properties:

Polymer Solutions Dilute: [η] 1.4 dl g^{-1} [2]; 1.8 dl g^{-1} [1]. Viscosity constant K, 76000 ml g^{-1} (30°, light scattering) [2]. η_{sp} 0.47 dl g^{-1}
Permeability of Gases: Permeability of gases such as Ar and He has been reported [2]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	82.73 MPa	12000 psi, 10 mil film [15]
2	56.53 MPa	8200 psi, 23°, 10 mil film, 25% H_2O absorbed [15]
3	158.6 MPa	23000 psi, 23°, 10 mil film, oriented [15]

Tensile Strength Break:

No.	Value	Note	Elongation
1	20.68 MPa	3000 psi, 23°, 10 mil film [15]	450%
2	59.98 MPa	8700 psi, 23°, 10 mil film, oriented [15]	46%
3	8.96 MPa	1300 psi, 33°, 10 mil film, 23°, 25% H_2O absorbed [15]	180%
4	18.99 MPa	2754 psi [16]	370%
5	1.01 MPa	146 psi [16]	525%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	0.68 MPa	525%	98 psi [16]
2	9.24 MPa	370%	1340 psi [16]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2.6 MPa	2600000 dyn cm^{-2} [17]	Plateau modulus

Mechanical Properties Miscellaneous: Steady state compliance 3×10^{-5} MPa (3×10^{-6} dyn cm^{-2}) [17]
Hardness: Shore A70 [8]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.47	30° [1]

Transmission and Spectra: Ir spectral data have been reported [18]
Molar Refraction: Molar refractivity 15.54 [1]

Polymer Stability:

Polymer Stability General: Exposure to oxygen, heat and light can lead to chain cleavage, cross-linking and oxidation [30,34]
Decomposition Details: Decomposition occurs by a free-radical pathway [34]
Flammability: Fl. p. 22° (Tagliabue open cup)
Chemical Stability: Stability to γ-radiation has been reported 0.31 G scissions $(100\ eV)^{-1}$[11]
Hydrolytic Stability: Very resistant to hydrol. [34]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by bulk or soln. polymerisation with a Lewis acid catalyst such as BF_3 or $AlCl_3$. May also be prepared by etherification of polyvinyl alcohol. Isotactic form synth. by using aluminium sulfate/sulfuric acid initiator in toluene
Applications: Rubber plasticiser and tackifier, raw material for adhesives and paints, heat sensitiser. Used for pressure sensitive adhesives for tapes and labels. Promotes adhesion on glass and metal. Also used to treat reverse osmosis membranes; to impart dry-film flexibility and to increase viscosity of photochemical-resist coatings

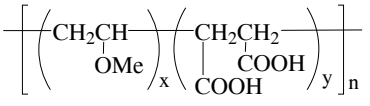
Poly(vinyl methyl ether-*co*-disodium maleate) P-622

Synonyms: *Poly(vinyl methyl ether-co-disodium 1,3-propenoate). Poly(disodium (Z)-2-butenedioate-co-methoxyethene). Poly(-methoxyethene-co-disodium (Z)-2-butenedioate)*
Related Polymers: Poly(vinyl ethers), Poly(vinyl methyl ether-*co*-maleic acid, Poly(vinyl methyl ether-*co*-maleic anhydride
Monomers: Methyl vinyl ether, Maleic anhydride
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyvinyls
CAS Number:



CAS Reg. No.
9019-25-4

Molecular Formula: $[(C_3H_6O).(C_4H_2O_4Na_2)]_n$
Fragments: C_3H_6O $C_4H_2O_4Na_2$

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by cation exchange of free acid derived from the hydrol. of PVM-MA. PVM-MA formed by free radical copolymerisation using AIBN or benzoyl peroxide initiators
Applications: Phosphate replacement in detergents

54018-18-7	monobutyl ester
62386-95-2	calcium, sodium salt
133222-53-4	calcium, strontium salt
133222-51-2	calcium, zinc salt
133222-52-3	calcium, zinc, sodium salt

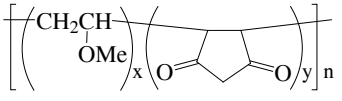
Molecular Formula: $[(C_3H_6O).(C_4H_2O_2)]_n$
Fragments: C_3H_6O $C_4H_2O_2$

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: Molar volume V_r 36.4 cm^3 mol^{-1} [3]
Glass-Transition Temperature:

No.	Value	Note
1	144°C	[1]

Transport Properties:
Polymer Solutions Dilute: [η] 1.56 dl g^{-1} (25°, sodium salt) [2]

Electrical Properties:
Complex Permittivity and Electroactive Polymers: Soln. dielectric props. have been reported [4]



Optical Properties:
Transmission and Spectra: Ir spectral data have been reported [1,2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by hydrolysis of PVM-MA. PVM-MA formed by free-radical initiated copolymerisation e.g. AIBN, benzoyl peroxide
Applications: Thickener, protective colloid, inhibitor of tartar and antibacterial agent in toothpastes

Poly(vinyl methyl ether-*co*-maleic anhydride) P-624

Synonyms: *PVM-MA. Methyl vinyl ether-maleic anhydride copolymer. Poly(2,5-furandione-co-methoxyethene). Poly(methoxyethene-co-2,5-furandione)*
Related Polymers: Poly(vinyl ethers), Poly(vinyl methyl ether-*co*-butenedioic acid)
Monomers: Vinyl methyl ether, Maleic anhydride
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyvinyls

CAS Number:

CAS Reg. No.	Note
9011-16-9	
52229-50-2	alternating

Molecular Formula: $[(C_3H_6O).(C_4H_4O_3)]_n$
Fragments: C_3H_6O $C_4H_4O_3$
Additives: Water sol. uv absorbers and antioxidants such as thiourea may be added to Gantrez
General Information: Copolymers of maleic anhydride are the most significant commercial class of vinyl ether copolymers and the methyl vinyl ether copolymer is by far the most dominant

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	153°C	[1,3]
2	133°C	[2]

Transport Properties:
Polymer Solutions Dilute: η_{inh} 2.43 dl g^{-1} (0.5% in DMF, 30°) [1]

Optical Properties:
Transmission and Spectra: H-1 nmr spectral data have been reported [1]

Polymer Stability:
Chemical Stability: Preferentially degrades rather than cross-links upon exposure to γ-radiation resulting in greatly reduced viscosity

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical initiated polymerisation
Applications: Raw material for adhesives, coatings and pharmaceuticals. FDA approved for food packaging adhesives

Poly(vinyl propionate) P-631

Synonyms: *PVPr. Poly(propionyloxyethylene)*
Monomers: Vinyl propionate
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
25035-84-1

Molecular Formula: $(C_5H_8O_2)_n$
Fragments: $C_5H_8O_2$

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: ΔH_p -86.5 kJ mol^{-1}(-20.6 kcal mol^{-1}) [8]
Glass-Transition Temperature:

No.	Value	Note
1	10°C	[1]

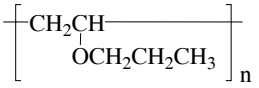
Surface Properties & Solubility:
Solubility Properties General: Miscible with poly(vinyl methyl ether) [3] and poly(ethyl acrylate) [11]. Limited miscibility with poly(vinyl acetate-*co*-ethylene) and poly(vinyl acetate-*co*-stearate) [6]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.4665	20° [2]

Polymer Stability:
Decomposition Details: Photodegradation leads mainly to the formation of propanoic acid (70%) and propanol (19%). Small volatiles account for the mass balance [7]
Environmental Stress: Frost resistant but may coagulate if aq. phase freezes [5]
Chemical Stability: More stable towards alkalis than polyvinyl acetate [5]
Biological Stability: Emulsions may be prone to attack from microorganisms unless protected frequently [5]
Stability Miscellaneous: Photodegradable by the action of a mercury lamp in vacuum at 20° [7]

Applications/Commercial Products:
Processing & Manufacturing Routes: Manufactured by emulsion polymerisation of vinyl propionate using typical peroxide initiators [5]. May be stabilised with water-sol. protective colloids, anionic emulsifiers or non-ionic emulsifiers. Poly vinyl propionate may be prepared by radical polymerisation [4] using AIBN [9] or in the presence of lithium [10]. Polymerisation giving polymer beads from a monomer suspension has been reported [16], as have a number of catalysts [12,13,14,15], some of which are used for poly(vinyl benzoate) manufacture [12,13]
Applications: Main applications include emulsion paints, coatings and adhesives. Used in anti-noise coatings, chewing gum bases, as a concrete additive and in soil stabilisation. Also used as glass fibre sizing material and in binders for non-woven fabrics, pigment printing pastes, as coatings for food and the undersides of carpets, cheese rinds and paper, and as a fibrous leather substitute



Trade name	Supplier
Propiofan	BASF

Poly(vinyl propyl ether) P-632

Synonyms: *Poly(propyl vinyl ether). Poly(propoxyethene). PVPr*
Related Polymers: Poly(vinyl ethers)
Monomers: Propyl vinyl ether
Material class: Synthetic Elastomers
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.	Note
25585-50-6	homopolymer
28209-42-9	isotactic

Molecular Formula: $(C_5H_{10}O)_n$
Fragments: $C_5H_{10}O$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.9368 g/cm^3	[4]

Melting Temperature:

No.	Value	Note
1	76°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	-49°C	[3,5]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ cohesive energy 37.54 J$^{1/2}$ cm$^{-3/2}$ (8.96 J$^{1/2}$ cm$^{-3/2}$) [2]
Solvents/Non-solvents: Sol. $CHCl_3$, Et_2O, C_6H_6, propanol. Insol. heptane, Me_2CO [1]

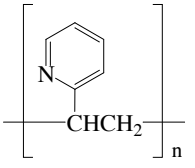
Transport Properties:

Polymer Solutions Dilute: Absolute viscosity (0.8010 centipoise) [2] has been reported [4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.4528	[4]



Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by cationic polymerisation with Friedel-Crafts catalysts (BF_3, $AlCl_3$, $SnCl_4$). May also be prepared in good yield by using ferric chloride catalyst [4]. The isotactic form can be obtained by using ferric sulfate catalyst [6]
Applications: Used as a diesel fuel additive to reduce particulates

146666-38-8	2-ethenyl-2,2-d_2 pyridine isotactic homopolymer
91499-22-8	homopolymer ion(1-), lithium
27476-03-5	dimer
53125-47-6	homopolymer ion(1-), sodium

Molecular Formula: $(C_7H_7N)_n$
Fragments: C_7H_7N
Molecular Weight: MV 400000 (isotactic, organo hafnium catalyst)
Tacticity: Isotactic and syndiotactic forms known
Morphology: Threefold helix, hexagonal unit cell a=b 15.49Å, c 6.56Å (fibre axis) [3,17], space group $P3_1$ or $P3_2$ [17]
Miscellaneous: Side reactions occur during the preparation and handling (e.g. in soln.) of polymers of 2-vinylpyridine [6]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Heat of fusion per unit

volume values have been reported [3]. Thermal expansion coefficient values have been reported [27]

Melting Temperature:

No.	Value	Note
1	212.5°C	isotactic [3]

Glass-Transition Temperature:

No.	Value	Note
1	84°C	isotactic [5]

Transition Temperature General: Up to three melting endotherms can be present [3]. Other T_g values have been reported [4,24]

Surface Properties & Solubility:

Solubility Properties General: Acts as an electron donor due to pyridine nitrogen of polymer and hence is more sol. in acidic solvents

Cohesive Energy Density Solubility Parameters: Solubility parameter 21.26 $J^{1/2}$ $cm^{-3/2}$ (approx., 10.4 $cal^{1/2}$ $cm^{-3/2}$) [10]. Other solubility parameter values have been reported [10]

Solvents/Non-solvents: Sol. MeOH, ethylene glycol, nitroethane, EtOH aq., $CHCl_3$, heptanol, 2-butanol, pentanol, butanol, propanol, pyridine [3,10,29]. Insol. hexane, H_2O [10,29], DMF, THF, 2-propanol, chlorobenzene, C_6H_6 [29], dioxane, 2-butanone and CH_2Cl_2 [29]

Surface Tension:

No.	Value	Note
1	39.5 mN/m	[3]
2	3.2 mN/m	perpendicular to direction of growing crystal [3]
3	34–36.2 mN/m	varies with MW [14]

Transport Properties:

Polymer Solutions Dilute: Various calculated viscosity values and Mark-Houwink parameters have been reported for pyridine [31], $CHCl_3$/EtOH [36,38], MeOH [11,31], DMF [11], C_6H_6 [11] and dioxane [11]. Critical miscibility temps. of soln. have been calculated from Flory-Fox [12] and Kurata-Stockmayer equations [12]

Permeability and Diffusion General: Diffusion of C_6H_6, CH_2Cl_2, MeOH, H_2O vapours has been reported; [29] C_6H_6 and CH_2Cl_2 vapours behave in a non-Fickian manner [29]

Mechanical Properties:

Mechanical Properties General: Sound velocity 11.1 kHz [32]. Variation of damping factor vs. temp. has been reported [32]

Electrical Properties:

Electrical Properties General: Electrical behaviour of P2VP has been studied [28]. Activation energy for conduction 1.23 eV [28]. Conductivity doped with iodine σ 10^{-4} Ω^{-1} cm^{-1} (M_n 40000) [32]

Surface/Volume Resistance:

No.	Value	Note	Type
1	1×10^{15} Ω.cm	conductivity value [32]	S

Optical Properties:

Optical Properties General: Molecular optical anisotropy has been reported [34,35]

Transmission and Spectra: Ir [1,5,16], x-ray [16,17], H-1 nmr [13,21,22], C-13 nmr [13], epr [19,24], ms [2,8,25,26], uv [1], xps [18], esca [19], EELS [15], Auger [7], carbon core 1s electron spectrum [15], and laser desorption spectral data [8] have been reported

Polymer Stability:

Decomposition Details: Decomposition by depolymerisation occurs at 396° leaving no char [2]. Complexation with copper(*II*) chloride lowers decomposition temp. to 320° and leaves 26–41% by wt. of char [2]. Activation energy of decomposition 250 kJ mol^{-1} (60 kcal mol^{-1})

Environmental Stress: Irradiation at wavelengths above 300 nm produces vinyl pyridinyl radicals [9]

Stability Miscellaneous: Laser desorption degrades polymer to give 2-vinylpyridine monomer [8]. γ-Irradiation causes cross-linking [19,20]. P2VP is 5–9 times less stable to ionising radiation than styrene

Poly(2-vinylpyridine)-borane complex P-634

Synonyms: *Poly(2-ethenylpyridine-co-borane)*
Related Polymers: Poly(2-vinylpyridine)
Monomers: 2-Vinylpyridine
Material class: Copolymers
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.
72514-01-3

Molecular Formula: $[(C_7H_7N).BH_3]_n$
Fragments: C_7H_7N BH_3

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. THF, C_6H_6, hexane [1]. Swells in refluxing C_6H_6

Applications/Commercial Products:

Supplier
Aldrich

Poly(vinylpyrrolidinone-*co*-(2-dimethyl aminoethyl)methacrylate) P-635

Synonyms: *Poly(1-ethenyl-2-pyrrolidinone-co-2-(dimethylamino)ethyl-2-methyl-2-propenoate). PVP-dimethylaminoethyl methacrylate copolymer. PVP-DMAEMA. (DAM-VP) copolymer*
Related Polymers: Poly *N*-vinylpyrrolidone
Monomers: *N*-Vinylpyrrolidinone, 2-Dimethylaminoethyl methacrylate
Material class: Copolymers
Polymer Type: acrylic, polyvinyls
CAS Number:

CAS Reg. No.	Note
30581-59-0	
172284-56-9	graft copolymer
53633-54-8	
55008-57-6	
99716-87-7	

Molecular Formula: $[(C_6H_9NO).(C_8H_{15}NO_2)]_n$
Fragments: C_6H_9NO $C_8H_{15}NO_2$
Tacticity: Tacticity has been examined by nmr [2]

Surface Properties & Solubility:

Solubility Properties General: Molal compressibility and molal volume of the copolymer in MeOH, dioxane and water have been reported [4]
Solvents/Non-solvents: Sol. DMF [2,6], tetramethylene sulfone [2], EtOH [3] (copolymer), MeOH (copolymer) [4], dioxane (copolymer) [4], H_2O (copolymer (insol. when quarternised with C12 or C16 octyl bromides) [2]) [4], 2-propanol, *n*-butanol, 2-butanol [6], glycerine [6], propylene glycol [6], benzyl alcohol [6]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity of quarternised polymer in a pH 7 buffer, and Mark-Houwink constants have been reported [1]. Rheological props. of quarternised PVPDMAEMA in aq. solns. have been studied [2]. Second viral coefficient (A_2), intrinsic viscosity and the Huggins parameter have been investigated for copolymers and quarternised copolymers [3]

Optical Properties:

Transmission and Spectra: Ir (copolymer) [2,4] and H-1 nmr (copolymer) [3,4] spectral data have been reported

Applications/Commercial Products:

Trade name	Details	Supplier
Copolymer 845		International Speciality Products
Copolymer 937	film forming resin	International Speciality Products
Copolymer 958	ethyl alcohol	International Speciality Products
Gafquat	quarternised product	International Speciality Products

Poly(vinylpyrrolidinone)-iodine complex P-636

Synonyms: *PVP-I. Povidone-iodine*
Monomers: *N*-Vinylpyrrolidinone
Polymer Type: polyvinyls
CAS Number:

CAS Reg. No.
25655-41-8
30849-75-3

Molecular Formula: $[(C_6H_9NO).I_2]_n$
Fragments: C_6H_9NO I_2
Additives: Iodine
General Information: Povidone-iodine is an antibacterial, antiviral, antiseptic and an antifungal agent. These props. are due to the 10–12% iodine in the complex

Surface Properties & Solubility:

Solvents/Non-solvents: V. sol. H_2O [1]. Sol. EtOH [1], $CHCl_3$. Spar. sol. Et_2 [1], Me_2CO, C_6H_6, CCl_4 [1]

Optical Properties:
Transmission and Spectra: Uv [1], x-ray [2] and ir [3] spectral data have been reported

Molecular Formula: $[(C_6H_9NO).(C_4H_6O_2)]_n$
Fragments: C_6H_9NO $C_4H_6O_2$

Volumetric & Calorimetric Properties:
Density:

No.	Value
1	d 0.91 g/cm^3

Glass-Transition Temperature:

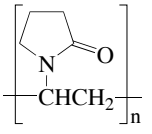
No.	Value	Note
1	55°C	10% vinyl acetate [2]
2	40°C	35% vinyl acetate [2]

Surface Properties & Solubility:
Internal Pressure Heat Solution and Miscellaneous: Enthalpy of soln. of PVP-VA (60% VA) in water at various pressures has been reported [4]. ΔH° -73.9 cal mol^{-1} (1 atm.) [4]. ΔH -38.3 cal mol^{-1} (2000 atm.). The volume changes on dissolution of the same copolymer in water at various temps. has also been reported [4]. ΔV increases with temp. increase
Solvents/Non-solvents: Sol. Me_2CO [4], H_2O [4,7], EtOH [7], 2-propanol [7]. Insol. naphtha

Transport Properties:
Polymer Solutions Dilute: Viscosities of copolymers (initiated by radiation) are reported in DMF [2], EtOH, H_2O [7]. Surface pressure versus vinyl acetate subphase area, in soln., has been examined [3]

Optical Properties:
Transmission and Spectra: H-1 nmr [5] and ir [5] spectral data have been reported

Polymer Stability:
Thermal Stability General: Pyrolysed products have been identified [2]
Decomposition Details: Decomposition temp. at 60% weight loss for radiation polymerised copolymer 432° (10% vinyl acetate) [2], 435° (35% vinyl acetate)



Applications/Commercial Products:

Poly(*N*-vinyl-2-pyrrolidone) P-638

Synonyms: *PVP. PNVP. Polyvidone. Poly(1-ethenyl-2-pyrrolidinone). Poly(VPD). PVPyr. Poly[1-(2-oxo-1-pyrrolidinyl)ethylene]. PVPD*
Monomers: *N*-Vinylpyrrolidinone
Material class: Thermoplastic
Polymer Type: polyvinyls

CAS Number:

CAS Reg. No.	Note
9003-39-8	homopolymer
89231-03-8	isotactic
41227-10-5	dimer

Molecular Formula: $(C_6H_9NO)_n$
Fragments: C_6H_9NO
General Information: A water soluble white hygroscopic powder [33]. Cast films are dry, very hard and clear (may have slight yellow coloration). [33] The polymer is insol. in water when cross-linked
Miscellaneous: Also obtainable as an aq. soln. [33]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	25° [35]

Thermodynamic Properties General: Thermodynamic props. for a range of aq. solns. have been reported [27]. Relationship of specific heat capacity with temp. has been reported [26,27]. Molar volume 31.1 cm^3 mol^{-1} (calc.) [17]
Glass-Transition Temperature:

No.	Value	Note
1	175°C	[8]

Transition Temperature General: Transition temp. varies with water content of bulk polymer [18,37]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density parameters have been reported [17]
Solvents/Non-solvents: Very sol. H_2O [8]. Solubility in H_2O limited by viscosity of soln. [9,33,34,37]. Sol. alcohols, e.g. MeOH, EtOH, cyclohexanol, phenol, 1,3-butanediol [8], organic acids, AcOH, CH_2Cl_2, $CHCl_3$, amines, Freons, aniline, diethanolamine, butylamine, morpholine. Insol. EtOAc, hydrocarbons, C_6H_6, petrol, hexane, Et_2O, CCl_4, Me_2CO, THF [8]

Transport Properties:

Transport Properties General: Melt viscosity is impractically high [33]. Decomposition occurs before onset of flow [8]
Polymer Solutions Dilute: Viscosity values calc. from Stockmayer-Fixman-Burchard equation parameters have been reported [3,23,31,33]. Adiabatic compressibility of aq. solns. and ultrasonic velocity have been reported [28]. Dielectric response function is of the Kohlrausch type in aq. soln. [15], and behaviour and constants have been reported [36]. Heats of soln. -16.62 kJ mol^{-1} (-3.97 kcal mol^{-1}, H_2O) [20]; -8.37 kJ mol^{-1} (-2 kcal mol^{-1}, $CHCl_3$). Theta temp. 130° (H_2O) [6]. Hydrodynamic parameters, temp. coefficient of intrinsic viscosity have been reported [16]
Permeability of Gases: Diffusion coefficients vary with the thickness of polymer film and relative humidity [24]. Permeation coefficient [O_2] 31×10^{10} cm^2 s^{-1} [24]
Water Content: Absorbance 0.5 mol H_2O per monomer unit. Equilib. water content is 33% (approx.) of relative humidity. [33] Moisture sorption capability of thin films has been reported [44]
Water Absorption:

No.	Value	Note
1	18 %	50% relative humidity [33]
2	8 %	28% relative humidity [33]
3	57 %	89% relative humidity

Mechanical Properties:

Mechanical Properties General: Apparent plasticity 0.0369 cm N^{-1} (62% relative humidity) [13]. Adhesive force f_{50} 0.01–0.0001 N (40–80% relative humidity) [13]

Electrical Properties:

Electrical Properties General: Dielectric behaviour of various aq. solns. has been reported [30]. Poole-Frenkel type conduction mechanisms have been reported [5]. Conductivity of unannealed films decreases during annealing cycles [5]
Surface/Volume Resistance:

No.	Value	Note	Type
1	2.56×10^{15} Ω.cm	conductivity value, room temp., annealed film [5]	S
2	0.00145×10^{15} Ω.cm	conductivity value, unannealed film [5]	S

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.53	25° [35]

Transmission and Spectra: H-1 nmr [2,37], C-13 nmr [2,37], ir [8,19,37,38], ms [10,11], Raman [12,25], ESCA [21] and uv [38] spectral data have been reported
Molar Refraction: Refractive index parameters from the Sellmeyer dispersion [32] equation and at various T_m [28] values have been reported

Polymer Stability:

Polymer Stability General: Cross-linking occurs at 150° [33]
Thermal Stability General: Weight loss below 100° due to loss of absorbed moisture [1]
Decomposition Details: Decomposition studies have been reported [1]
Environmental Stress: Aq. solns. degrade on exposure to ozone [23]
Chemical Stability: Conc. nitric acid causes an increase in viscosity of solns. and formation of a gel. Precipitation from soln. occurs with strong caustic solns. [33]. Treatment with ammonium peroxydisulfate and heating at 90° causes cross-linking [33]. Exposure to light in presence of diazo compds. or oxidising agents can cause gel formation [33]
Biological Stability: Solns. are stable if protected from mould [33]
Stability Miscellaneous: Ultrasound causes decomposition in aq. soln., yielding CO, CO_2, CH_2O, CH_3CHO, CH_4, C_2H_4, C_2H_6 [3]. These products are attributed to pyrolysis rather than hydrodynamic shear forces [3]. Rate of ultrasonic decomposition 4×10^{-5} M min^{-1} [3]. Ultrasonic degradation rate 0.032 min^{-1} [7]. PVP degrades under high speed stirring (30000 rpm) in aq. soln. [22]

Poly(*N*-vinylpyrrolidone-*co*-acrylic acid) P-639

Synonyms: *Poly(1-ethenyl-2-pyrrolidinone-co-2-propenoic acid)*
Related Polymers: Poly(*N*-vinylpyrrolidone)
Monomers: *N*-Vinylpyrrolidinone, Acrylic acid
Material class: Copolymers
Polymer Type: acrylic, polyvinyls
CAS Number:

CAS Reg. No.	Note
28062-44-4	
127383-17-9	graft
153990-36-4	sodium salt
150198-94-0	
53608-09-6	
102685-02-9	

Molecular Formula: $[(C_6H_9NO).(C_3H_4O_2)]_n$
Fragments: C_6H_9NO $C_3H_4O_2$
General Information: White free flowing powders (Acrylidone R) [6]. Copolymer is a weak acid [6]. Increasing the pH of soln. causes the polymer chains to extend due to electrostatic repulsions, thus altering the rheological props. [6]. The copolymer is amphiphilic due to pyrrolidone and carboxylic groups [6]
Morphology: Crystallinity is due to interpolymer adduct, by hydrogen bonding, between vinylpyrrolidinone and acrylic acid [2]
Miscellaneous: The copolymer contains dissociated ionogenic groups [3]

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	116–185°C	varies with MW and composition [1,6]

Surface Properties & Solubility:

Solubility Properties General: Molal compressibility and molal volume of the copolymer in MeOH and water have been reported [8]
Solvents/Non-solvents: Sol. *N*-ethyl-2-pyrrolidinone, *m*-pyrrole, *N*-cyclohexyl-2-pyrrolidinone, glycerol, ethylene glycol, propylene glycol, 1,4-butanediol, DMF, DMSO, dimethyl acetamide, EtOH/H_2O, *N*-methyl-2-pyrrolidinone [6], alkali solns. Insol. butyrolactone, toluene, heptane, xylene, $CHCl_3$, CH_2Cl_2, CCl_4, EtOAc,

MeOH, EtOH, isopropanol, butanol, propanol, Me_2CO, 2-butanone, H_2O
Wettability/Surface Energy and Interfacial Tension: Surface tension values have been reported [6]

Transport Properties:
Polymer Solutions Dilute: Reduced viscosity varies according to neutralisation of the ionogenic macromolecule [3]. Viscosimetric titration [3]. Viscosity of copolymer, partially neutralised and fully neutralised copolymer have been reported [6]. Potentiometric titration of copolymer follows the Henderson-Hasselbach equation [7]. Viscosimetric titration of copolymer has been performed [7], the curves are typical for ionogenic polymers [7] and some constants have been determined [7]
Water Content: Depends on MW and composition ratio 5–14% water content [1,6] (0–100% acrylic acid). Water resistance is enhanced if unneutralised copolymer is cast from 2-propanol/H_2O or from ammonium neutralised solns. [6]. Water resistance is also enhanced by cross-linking with ammonium zirconium carbonate or methylated melamine formaldehyde [6]

Mechanical Properties:
Mechanical Properties General: Flexibility can be increased by treatment with plasticisers (e.g. dioctyl phthalate, glycerine or polyethyleneglycol) [6]

Optical Properties:
Transmission and Spectra: X-ray [2], C-13 nmr [4], ir [8] and H-1 nmr [8] spectral data have been reported

Polymer Stability:
Polymer Stability General: Copolymer is precipitated from soln. by strong acids or divalent and trivalent salt solns. [6]
Thermal Stability General: Thermally decomposes by dehydration and decarboxylation releasing H_2O and CO_2 respectively [5]. Copolymer is approx. 4 times as slow in releasing H_2O compared to polyacrylic acid at 200° [5]. The copolymer decarboxylates more readily than polyacrylic acid homopolymer [5]
Stability Miscellaneous: Compatibility in soln. with various resins and gums, and inorganic salts has been reported [6]

Applications/Commercial Products:

Related Polymers: Poly *N*-vinylpyrrolidone
Monomers: Styrene, *N*-Vinylpyrrolidinone
Material class: Copolymers
Polymer Type: polystyrene, polyvinyls
CAS Number:

CAS Reg. No.	Note
25086-29-7	
116219-50-2	block copolymer
123924-78-7	graft

Molecular Formula: $[(C_8H_8).(C_6H_9NO)]_n$
Fragments: C_8H_8 C_6H_9NO
General Information: Copolymer (Antara) is tough and clear [5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. *N*-methylpyrrolidone [1], C_6H_6 [4], dichloroethane [4], $CHCl_3$ [4], benzyl alcohol [4], acetylacetone [4], DMF/2-propanol (9:1) [4], dioxane [2]. Insol. H_2O, cyclohexane (hot); cyclohexane-heptane [2]

Transport Properties:

Polymer Solutions Dilute: Soln. props. (intrinsic viscosity, second viral coefficient A_2, average radius of gyration of the polymer coils $(R^{-2})^{1/2}$) in C_6H_6 and dichloroethane for various ratios of polystyrene and overall MW have been reported. Intrinsic viscosity and second viral coefficient have been determined in $CHCl_3$, DMF, dioxane and the temp. dependance of the intrinsic viscosity has been reported [2]
Permeability of Liquids: Flow rate of water through polymer versus time has been reported [5] (antara). Permeate flux of ultrafiltration membrane has been reported [1] (100000 $cm^3\ m^{-2}\ h^{-1}$)
Water Absorption:

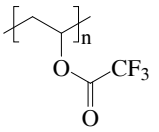
No.	Value	Note
1	9 %	antara [5]

Mechanical Properties:

Mechanical Properties General: Bursting strength of ultrafiltration membrane (styrene grafted onto PVP) has a maximum of approx. 5.5 kPa (85% w/w grafted styrene) [1]. The bursting pressure also depends on the strength of the casting soln. (ideally >6% polymer) [1]

Optical Properties:

Transmission and Spectra: SEM data have been reported [1]



Applications/Commercial Products:

Solvents/Non-solvents: Sol. Me_2CO, pyridine, cyclohexanone, butyl acetate, diethylenetriamine [1], isobutyl methyl ketone, *n*-propyl methyl ketone, isopropyl methyl ketone, 2-butanone [4]. Spar. sol. methyl formate, methyl acetate, methyl propionate, methyl *n*-butyrate [4]. Insol. C_6H_6, hexane, MeOH, γ-butyrolactone, $CHCl_3$, formic acid [1], nonane, octane, heptane, hexane, pentane, vinyl trifluoroacetate [4]

Transport Properties:

Polymer Solutions Dilute: [η] 1.15–1.31 [1]

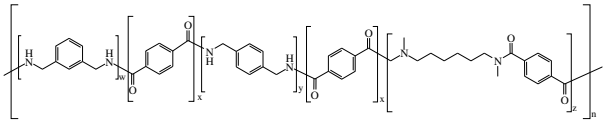
Mechanical Properties:

Mechanical Properties Miscellaneous: Tenacity 0.8 g den^{-1} (7%) [3]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.383	[1]
2	1.375	[2]

Transmission and Spectra: Ir [1], H-1 nmr [6] and x-ray [1,7] spectral data have been reported
Total Internal Reflection: Optical birefringence -0.0015 [3]



Polymer Stability:
Flammability: Non flammable
Hydrolytic Stability: Hydrolyses quickly to poly(vinyl alcohol) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by free radical polymerisation of vinyl trifluoroacetate

Poly(*m*-xylenediamine-*co*-*p*-xylenediamine-*co*-trimethylhexamethylene terephthalamide-*co*-terephthalic acid) P-643

Synonyms: *Poly(m-xylylenediamine-co-wp-xylylenediamine-co-nylon 6(3)T-co-terephthalic acid. MXD/PXD/6(3)T//T*
Related Polymers: Nylon 6(3)T
Monomers: *m*-Xylenediamine, *p*-Xylenediamine, Terephthalic acid
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
Molecular Formula: $[(C_8H_{10}N_2).(C_{17}H_{26}N_2O_2).(C_8H_4O_2)]_n$
Fragments: $C_8H_{10}N_2$ $C_{17}H_{26}N_2O_2$ $C_8H_4O_2$
Molecular Weight: 15000–40000
General Information: Is amorph.

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	150°C	7.5–15% *m*/*p*-xylylenediamine

Deflection Temperature:

No.	Value	Note
1	150–180°C	7.5–15% *m*/*p*-xylylenediamine

Vicat Softening Point:

No.	Value	Note
1	156–159°C	[1]

Surface Properties & Solubility:
Plasticisers: *p*-Toluenesulfonamide
Solvents/Non-solvents: Sol. sulfuric acid, formic acid, dimethylacetamide, *N*-methylpyrrolidone (containing 1–2% boric acid)

Mechanical Properties:
Flexural Modulus:

No.	Value	Note
1	2500–3000 MPa	20°, 7.5–15% *m*/*p*-xylylenediamine [1]

Tensile Strength Break:

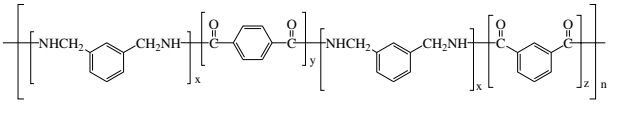
No.	Value	Note
1	91–93 MPa	20°, 7.5–15% *m*/*p*-xylylenediamine [1]

Impact Strength: Falling weight impact strength 50 J (min., 2mm disc, 0% failure rate, 7.5–15% *m*/*p*-xylylenediamine
Hardness: Rockwell R130 (7.5–15% *m*/*p*-xylylenediamine)

Electrical Properties:
Electrical Properties General: Has very good electrical insulation props., particularly when dry

Polymer Stability:
Upper Use Temperature:

No.	Value	Note
1	110°C	
2	150°C	500 h



Decomposition Details: Volatilisation of the diamines occurs at above 300°
Flammability: Limiting oxygen index 25% (approx.)
Environmental Stress: Ageing in air above 80° causes yellowing
Chemical Stability: Injection moulded polymer is resistant to C_6H_6, paraffin, oil, CCl_4; slightly cracked by petroleum ether, aq. alkali, hydrochloric acid, sulfuric acid and salt soln. Severe cracking caused by Me_2CO, lower alcohols, THF and brake fluid. Is resistant to most aliphatic and aromatic hydrocarboons.
Hydrolytic Stability: Is resistant to boiling H_2O for over 500h

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymer containing up to 80 mol% terephthalic acid is synth. by aq. melt polymerisation of nylon, *m* and *p*-xylylenediamine and terephthalic acid salts at up to 275° for 3h
Applications: Potential applications due to excellent impact toughness and general performance. Uses have not been investigated commercially

Poly(*m*-xylylene adipamide) P-645
Synonyms: *Nylon MXD-6. Poly(m-xylylene diamine-co-adipic acid). Poly(iminomethylene-1,3-phenylenemethyleneimino(1,6-dioxo-1,6-hexanediyl)]. Poly(meta-xylylene adipamide)*
Related Polymers: Poly(meta-xylylene adipamide), 50% Glass fibre filled
Monomers: Hexanedioic acid, 1,3-Bis(aminomethyl)benzene
Material class: Thermoplastic
Polymer Type: aromatic polyamides
CAS Number:

CAS Reg. No.
25805-74-7

Molecular Formula: $C_{16}H_{18}N_2O_2$
Fragments: $C_{16}H_{18}N_2O_2$
Additives: Normally sold with 30% glass fibre reinforcement to improve thermal and mech. props.
General Information: A semi-crystalline semi-aromatic nylon. The pure polymer has a very high resistance to gas and water vapour permeation. Glass reinforced polymer maintains remarkably high stiffness and strength up to near its melting point and compares favourably in mech. and thermal props. with wholly aromatic liq. cryst. polyesters, PEEK, Kevlar etc. Coefficients of linear expansion are comparable to those of many metals and alloys

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.22 g/cm^3	amorph. [6]
2	d 1.22–1.25 g/cm^3	crystalline [6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.1 × 10^{-5} K^{-1}	ASTM D696	L

Melting Temperature:

No.	Value	Note
1	243°C	[2,3]
2	245°C	[6]
3	236°C	

Glass-Transition Temperature:

No.	Value	Note
1	95°C	[5]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. strong acids, e.g. H_2SO_4, formic acid, and polar solvents such as DMF and *N*-methylpyrrolidone

Transport Properties:
Permeability of Gases: Maintains excellent oxygen impermeability under very moist conditions
Water Content: 4.0% (saturated) [2,3]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.03 cm^3 mm/(m^2 day atm)	0.5 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 0% relative humidity, ASTM D3982-81 [4]
2	O_2	0.06 cm^3 mm/(m^2 day atm)	0.9 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 100% relative humidity, ASTM D3982-81 [4]

Mechanical Properties:
Mechanical Properties General: The unreinforced polyamide does not have a particularly useful range of physical props. and is used as an engineering polymer only when reinforced with glass fibre. However, limited quantities of unfilled material are sold into the barrier market where the excellent oxygen impermeability of MXD-6 is utilised by blending with main stream barrier polymers to enhance performance. Tenacity 0.26–0.44 N tex^{-1} [3]

Polymer Stability:
Polymer Stability General: Poor dimensional stability above 75° unless reinforced with glass fibre
Thermal Stability General: Similar to other semi-aromatic nylons. Stiffness and creep resistance drop dramatically above T_g. Susceptible to oxidation above 80°
Upper Use Temperature:

No.	Value	Note
1	75–80°C	[1]

Flammability: Limiting oxygen index 25% (ASTM D2863)

Chemical Stability: Resistant to aliphatic and aromatic hydrocarbons, chlorinated solvents, ketones, esters, ethers. Attacked by these solvents above 60°. Resistant to many aq. salt or weak base solns. Degraded by strong mineral acids, oxidising agents and bases
Hydrolytic Stability: Sensitive to aq. chloride solns. and strong acid solns.

Applications/Commercial Products:

Processing & Manufacturing Routes: Believed to be manufactured from the MXD-6 salt in an autoclave under pressure in temp. range 200–300° to prepolymer, followed by final conversion in a thin film extrusion process. Up to 50% of 3 mm glass fibre, treated with e.g. silane to give better adhesion to the polymer, may be incorporated in a separate extrusion blending stage. Similarly, grades containing up to 50% inorganic filler are prod. by extrusion blending
Mould Shrinkage (%):

No.	Value	Note
1	0.1–0.5%	direction of flow [1]

Applications: Used as a barrier material. High price dictates its use, in blending with other nylons to increase oxygen impermeability. Used in multi-extruded layers for packaging. Filled material used in engineering components such as pulleys, shafts and gears

Polymer Stability:

Thermal Stability General: Processed at temps. up to 280°. Thermally stable up to 300° in N_2
Upper Use Temperature:

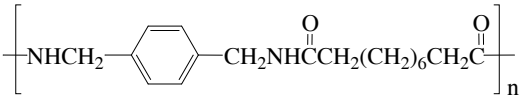
No.	Value	Note
1	138°C	[1]

Flammability: Limiting oxygen index 25% (ASTM D2863). Flammability rating HB (3.2 mm, UL 94)
Chemical Stability: Unaffected up to 60° by aliphatic and aromatic hydrocarbons, chlorinated solvents, ketones, esters, ethers. Also resistant to many aq. salts and weak bases. Resistant to engine oil at 120° for 2000h and gasoline at 40°. Degraded by strong mineral acids, oxidising agents and bases
Hydrolytic Stability: Sensitive to aq. chloride solns. and strong acid solns.

Applications/Commercial Products:

Processing & Manufacturing Routes: Glass fibre is incorporated into resin in melt extrusion process
Mould Shrinkage (%):

No.	Value	Note
1	0.44%	ASTM D955



Applications: Glass reinforced grades are suitable for injection moulding with a 'hot' mould to allow gradually cooling crystallisation which imparts vacuum property benefits. It replaces metals in many applications due to low coefficient of expansion, high stiffness and heat distortion temp. Examples of use include continuous use at 120°, fishing reels, bell housings for cars, one shot mouldings of frames e.g. chart recorders, nails, scraber vice for precision engineering. Other uses include electronics (connectors, housings and boxes for video recorder lids, tape recorder cases etc.); electrotechnology (bases for equipment, circuit breakers, electrical induction etc.); domestic electrical appliances (parts for electric can openers, irons, vacuum cleaner motors, refrigerator hinges, sewing machines etc.); mechanical applications (gear wheels, axles, housings, vices, nails, air pumps for soldering irons, cable clamps, display shelving); motor vehicles (petrol pumps, oil filter bodies, parcel shelf supports, rear mirror adjusters, window opening mechanisms, door handles etc.)

PPP-OR11 P-648

Synonyms: *PPP(EO)$_3$. Poly[2,5-bis[2-[2-(2-methoxyethoxy)ethoxy]ethoxy][1,1′-biphenyl]-4,4′-diyl]*
Material class: Thermoplastic
CAS Number:

CAS Reg. No.
187754-90-1

Molecular Formula: $(C_{26}H_{36}O_8)n$
Fragments: $C_{26}H_{36}O_8$
General Information: Soluble poly(*p*-phenylene) polymer with photoluminescent and electroluminescent properties.
Morphology: Layers of parallel main chains are separated by side chains that are mostly crystalline [1,2].

Volumetric & Calorimetric Properties:
Transition Temperature General: The endothermic transition between 18 and 65°C corresponds to side chain melting. Above 120°C there is a broad endotherm due to polymer backbone melting with a sharp peak at 216°C, which is probably due to melting of the high molecular-weight fraction [2].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$ and chlorinated hydrocarbons; sparingly sol. THF [1,2].

Electrical Properties:
Electrical Properties General: Polymer film exhibits electroluminescence in the blue region with λ_{max} in region of 420nm [4,5]. Oxidative degradation can cause a fairly rapid shift to the green region in LED devices, although blue emission is stable in light-emitting electrochemical cells [5]. When combined with lanthanide complexes, in particular ytterbium tetraphenylporphyrin [4] and β-diketonate complexes [6], the blue emission is quenched and Förster energy transfer to the Yb complex takes place with sharp emission at 977nm in the near-IR region [4,6,7]. The wavelength of emission can be tuned with the use of other lanthanide complexes, for example, with erbium emission is at 1570nm [7]. Turn-on voltage for LED devices is *ca*. 4v [4].

Optical Properties:
Optical Properties General: For polymer film, uv absorption band exhibited with λ_{max} *ca*. 365nm and photoluminescence band with λ_{max} *ca*. 415nm [3,4]. For polymer solutions, the absorption and photoluminescence bands occur at slightly shorter wavelength [4].
Transmission and Spectra: In addition to the UV and photoluminescence [3,4,5,8] and electroluminescence [4,5,7,8] spectral data, the electron diffraction spectrum [2] has been reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Suzuki coupling of the oligo(ethylene oxide) derivative 2,5-dibromo-1,4-bis[2-[2-(2-methoxyethoxy)ethoxy]ethoxy]benzene and bis(1,3-propanediyl) 1,4-benzenediboronate [1].
Applications: Potential application for organic light-emitting diodes, particularly near-infrared devices in blends with lanthanide compounds.

Propylene-ethylene copolymer P-649

Synonyms: *Propylene copolymer. Polypropylene impact copolymer. Polypropylene copolymer. Poly(1-propene-co-ethene). Poly(1-propene-block-ethene)*
Related Polymers: More general information on polypropylene, More general information on polypropylene copolymers, Ethylene-propylene elastomers (EPM, EPDM), Polypropylene-isotactic, Polypropylene-atactic, Ethylene-propylene-butylene terpolymer, Polyethylene, Blends of polypropylene and polyethylene
Monomers: Propylene, Ethylene
Material class: Thermoplastic, Copolymers
Polymer Type: polyethylene, polypropylene
CAS Number:

CAS Reg. No.	Note
9010-79-1	
106565-43-9	block

Molecular Formula: $[(C_3H_6).(C_2H_4)]_n$
Fragments: C_3H_6 C_2H_4
Molecular Weight: MW 3000–1000000. $M_w/M_n \leq 50$. MZ/MW ≤ 20. MV/MW ≥ 0.85
General Information: Propylene with up to about 10% ethene (actual amount depends on the process) polymerises to a random copolymer with improved elongation and toughness compared to polypropylene. The effect is similar to, but more efficient than, an increase in the atactic to isotactic ratio. At higher ethylene levels up to about 40%, *block* copolymer is formed, comprising blocks of highly isotactic polypropylene bonded to blocks of random ethylene-propylene copolymer. Still higher ethylene levels give ethylene-propylene elastomers
Miscellaneous: Polypropylene, impact copolymer is a term often used to describe the low ($<10\%$) ethylene copolymer. Propylene-ethylene copolymers with very small percentages of ethylene ($<10\%$) may be referred to as ethylene-propylene random copolymer or as copolymer polypropylene which in general is discussed under Polypropylene. Propylene/ethylene copolymer reactivity ratios of r_1 0.620; r_2 0.32 have been measured [6]

Surface Properties & Solubility:
Internal Pressure Heat Solution and Miscellaneous: Heats of mixing at infinite dilution have been reported for ethylene: propylene (33:67) ratio in a range of aliphatic solvents [1]

Transport Properties:

Permeability of Gases: Permeability of gases [He] 1.93 × 10^{-7}; [Ne] 4.89 × 10^{-7}; [Ar] 46.7 × 10^{-7}; [N_2] 167 × 10^{-7} cm^2 (s Pa)$^{-1}$ [4,5]

Mechanical Properties:

Mechanical Properties General: Mech. props. have been reported [2,3]. At low ethylene content, the material is normally referred to as polypropylene copolymer

Propylene oxide elastomers P-650

Synonyms: *Synthetic elastomers - polyether. 1,2-Epoxypropane elastomers*

Related Polymers: Other polymers of propylene oxide, Propylene oxide, allyl glycidyl ether copolymer (GPO), Propylene oxide, allyl glycidyl ether, epichlorohydrin terpolymer (GPCO), Propylene-ethylene copolymers, Polypropylene-rubber blends
Material class: Synthetic Elastomers
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
25104-27-2	GPO
25213-15-4	GPCO

Additives: Reinforcing fillers (e.g. carbon black, silica or alumina); non-reinforcing fillers; stabilisers/antioxidants (especially nickel dibutyldithiocarbamate for air and ozone resistance and 2-mercaptobenzimidazole for heat resistance). Plasticisers may be added if the elastomer is highly filled or for softening or viscosity requirements. Ether and/or esters are suitable, hydrocarbon and peroxidised plasticisers are not suitable
General Information: Because of its low cost, propylene oxide is an attractive monomer to include in polyether elastomers. The homopolymer is not readily vulcanised and so has not been commercialised. The copolymers GPO and GPCO however are used as an alternative to natural rubber where the improvements in high and low temp. resistance and in resistance to air and ozone are required

Proteins P-651

Synonyms: *Polypeptides. Peptides*
Related Polymers: Casein (protein), Collagen (protein), Gelatin (protein), Silk (protein), Wool (protein), Poly(L-alanine) fibre, Poly(γ-methyl L-glutamate) fibre

PTFE P-652

Synonyms: *Polytetrafluoroethylene. Teflon. Polytetrafluoroethene*
Related Polymers: Poly(tetrafluoroethylene-*co*-hexafluoropropylene), Poly(tetrafluoroethylene-*co*-ethylene), Poly(tetrafluoroethylene-*co*-perfluoropropyl vinyl ether), Polytetrafluoroethylene Bronze filled, Polytetrafluoroethylene Glass fibre filled, Polytetrafluoroethylene Graphite filled
Monomers: Tetrafluoroethylene
Material class: Thermoplastic
Polymer Type: PTFE, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.
9002-84-0

Molecular Formula: $(C_2F_4)_n$
Fragments: C_2F_4
Molecular Weight: MW 400000–9000000
Additives: Cadmium compounds, iron oxides, ultramarines, glass, asbestos, alumina, silica and lithia, graphite, titanium dioxide, bronze
Morphology: Virgin PTFE has a crystallinity of approx. 92–98% with chains containing little branching. The fluorine atoms are 'too large' to allow a planar zig-zag struct., therefore chains are rigid

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2.18 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00012 K^{-1}	23–60°, ASTM D696 [1,5]	L

Latent Heat Crystallization: Heat of formation 813 kJ mol^{-1}. Heat of fusion 8.2 kJ mol^{-1} (82 kJ kg^{-1}). Entropy of melting 477 J K^{-1} mol^{-1} [6]

Thermal Conductivity:

No.	Value	Note
1	0.24 W/mK	4.6 mm thickness, Cenco fitch [1]

Melting Temperature:

No.	Value	Note
1	327°C	[3]
2	342°C	

Glass-Transition Temperature:

No.	Value	Note
1	127°C	[3]

Deflection Temperature:

No.	Value	Note
1	120°C	0.45 MPa [3]
2	132°C	0.455 MPa [6]
3	60°C	1.82 MPa, ASTM D648 [6]

Brittleness Temperature:

No.	Value	Note
1	-269°C	PTFE remains ductile in compression [2]

Transition Temperature:

No.	Value	Type
1	79°C	1st order
2	30°C	1st order, cryst. disordering
3	80–110°C	1st order, stress relaxation
4	-110–-73°C	2nd order, amorph. region
5	-30°C	2nd order, amorph. region >

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. high boiling perfluorocarbons e.g. perfluorokerosene at 350° [4]. Insol. almost all industrial solvents and chemicals at room temp.

Surface and Interfacial Properties General: Has very low surface friction

Wettability/Surface Energy and Interfacial Tension: Critical surface tension, γ_c, 18.5 mN m^{-1}. The coefficients of static and dynamic friction are numerically equal to wet ice on wet ice [4]

Transport Properties:

Polymer Melts: Viscosity 10 GPa (380°). Critical shear rate for melt fracture 0.0001 s^{-1} (380°) [6]

Permeability of Gases: Permeability constants [CO_2] 0.93 $\times$ 10^{15} mol m^{-1} s^{-1} Pa^{-1}; [N_2] 0.18 $\times$ 10^{15}; [He] 2.47 $\times$ 10^{15}; [HCl] <0.01 $\times$ 10^{15}. Other permeability constants have been reported [12]

Permeability and Diffusion General: Permeability to vapours at 23° [acetophenone] 8.61 g m^{-2} d^{-1}, [C_6H_6] 5.54 g m^{-2} d^{-1}, [CCl_4] 0.92 g m^{-2} d^{-1}, [EtOH] 1.99 g m^{-2} d^{-1}, [HCl (20%)] <0.15 g m^{-2} d^{-1}, [piperidine] 1.08 g m^{-2} d^{-1}, [Skydrol hydraulic fluid] 0.92 g m^{-2} d^{-1}, [NaOH (50%)] 0.0008 g m^{-2} d^{-1}, [H_2SO_4] 0.0008 g m^{-2} d^{-1} (ASTM 96-35T at vapour pressure for 25.4 μm film thickness) [7]

Water Absorption:

No.	Value	Note
1	0.005 %	ASTM D570 [2]

Mechanical Properties:

Mechanical Properties General: PTFE is a tough, non-resilient material with moderate tensile strength [1,2]

Tensile (Young's) Modulus:

No.	Value	Note
1	340 MPa	23°, ASTM D638 [9]

Flexural Modulus:

No.	Value	Note
1	350–630 MPa	23°, ASTM D747, granular material [1]
2	280–630 MPa	fine powder [9]

Elastic Modulus:

No.	Value	Note
1	410–550 MPa	tensile elastic modulus [3]

Poisson's Ratio:

No.	Value	Note
1	0.46	Teflon, DuPont

Tensile Strength Yield:

No.	Value	Note
1	7–28 MPa	23°, ASTM D638, granular material [1]
2	17.5–24.5 MPa	fine powder

Compressive Strength:

No.	Value	Note
1	4.2 MPa	23°, 1% deformation, ASTM D695, Compressive stress
2	7 MPa	23°, 1% offset, Compressive stress

Miscellaneous Moduli:

No.	Value	Note	Type
1	186 MPa	100h, 0.6895 MPa, 23°, ASTM D695 [9]	Compressive creep modulus

Mechanical Properties Miscellaneous: Elongation 100–200% (23°, granular) [1,30], 300–600% (23°, fine powder), 350% (ASTM D638). Deformation under load 2.4% (6.86 MPa, 24h, 26°), 15% (13.72 MPa, 24h, 26°) [1]. Creep modulus 2 kN m^{-1} [5]

Hardness: Durometer D50–D65 (ASTM D1706) [1]

Friction Abrasion and Resistance: Static coefficient of friction with

polished steel 0.05–0.08 [1]. Wear factor 3000 × 10^{-17} Pa^{-1} [8]
Izod Notch:

No.	Value	Notch	Note
1	106 J/m	N	2 ft lb in^{-1}, 23°, ASTM D256 [2]
2	160 J/m	N	[15]

Electrical Properties:

Electrical Properties General: Has excellent electrical insulating props.
Surface/Volume Resistance:

No.	Value	Note	Type
1	$>10 \times 10^{15}$ Ω.cm	min., 100% relative humidity [1,10]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.1	60 Hz-2 GHz	ASTM D150 [10]

Dielectric Strength:

No.	Value	Note
1	23.6 $kV.mm^{-1}$	short time, 2 mm thick [1]
2	55 $kV.mm^{-1}$	1397 V mil^{-1}, Hostaflon

Arc Resistance:

No.	Value	Note
1	>300s	min., ASTM D495 [1,10]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0003	60 Hz-2 GHz	ASTM D150 [1,10]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.35	ASTM D542 [3]

Volume Properties/Surface Properties: Clarity opaque [1,4]

Polymer Stability:

Polymer Stability General: Has excellent stability to heat
Thermal Stability General: PTFE degrades to monomer under vacuum. Degradation begins at 440°, peaks at 540° and continues until 590° [1]
Upper Use Temperature:

No.	Value	Note
1	230–260°C	[3]
2	260°C	intermittent
3	230–260°C	continuous [3]
4	500°C	gaskets in totally enclosed system

Decomposition Details: Fine powder degrades more readily than granular material. At temp. 232–371° degradation ranges from 0.0001–0.03% per hour [1]
Flammability: Non-flammable
Environmental Stress: Exceptional weathering resistance. Samples exposed in Florida for 10 years showed little change in physical props. [2]
Chemical Stability: Chemically inert to almost all industrial chemicals and solvents. It will react with molten alkali metals, fluorine, strong fluorinating agents and sodium hydroxide above 300°. The surface can be etched by solns. of sodium naphthalenide or sodium in liq. ammonia [1,3]
Hydrolytic Stability: Resistant to aq. solns. [2]
Biological Stability: Has excellent resistance to fungi and bacteria [3]
Stability Miscellaneous: Degraded by high energy radiation. Exposure to a dose of 70 Mrad halves the tensile strength. [2] Degradation due to uv radiation has been reported [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by suspension polymerisation, which produces a granular resin. Emulsion polymerisation produces a fine dispersion. Processed by pre-forming the powder, sintering and then cooling. Commonly machined and coined. Specialist extrusion with sintering zone. Used for impregnation of fabrics
Applications: Seals, tapes, gaskets, valves, pump parts and laboratory equipment

Pullulan P-660

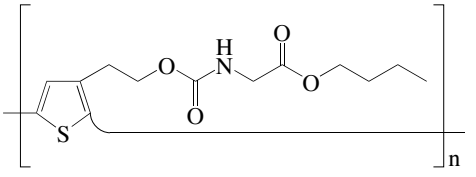
Related Polymers: Cellulose I, Cellulose II
Monomers: Glucose
Material class: Polysaccharides
Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9057-02-7

Molecular Formula: $(C_6H_{10}O_5)_n$
Fragments: $C_6H_{10}O_5$
Molecular Weight: MW 15000–810000. MW 200000 (commercial material)
General Information: Polysaccharide extracted from the fungus *Aureobasidium pullulans*. Contains repeating triads of 1-4,1-4 and 1-6-linked α-D-glucose monomers. The dried product is a water-sol. powder, which can be formed into films, fibres or compression mouldings

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: Heat of combustion 2705.4 kJ mol^{-1} (16.7 kJ g^{-1}) [1]

Transport Properties:
Permeability and Diffusion General: Films $\leq$0.01 mm thick are impermeable to O_2 and grease [2]



Optical Properties:
Total Internal Reflection: $[\alpha]_D$ +180–190° (H_2O) [1]

Applications/Commercial Products:

Trade name	Supplier
Pollulan	Hayashibara

PURET P-661

Synonyms: *Poly[2-(3-thienyl)ethanol-n-butoxycarbonylmethylurethane]. N-[[2-(3-Thienyl)ethoxy]carbonyl]glycine butyl ester homopolymer*
Material class: Thermoplastic
Polymer Type: polythiophene
CAS Number:

CAS Reg. No.
182691-54-9

Molecular Formula: $(C_{13}H_{17}NO_4S)n$
Fragments: $C_{13}H_{17}NO_4S$
General Information: Urethane-substituted polythiophene with electroluminescent properties and good solubility in a range of organic solvents.
Morphology: Amorphous polymer structure according to x-ray diffraction studies [1]. Polymer has a non-planar coil-like structure with inter- and intramolecular hydrogen bonding [2].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	18°C	[1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. $CHCl_3$, THF, dioxan, toluene, DMF, *N*-methylpyrrolidone, DMSO, trifluoroacetic acid [1,3].

Electrical Properties:

Electrical Properties General: Conductivity of films doped with I_2 or $FeCl_3$ of the order of 1 S cm^{-1} [1]. Polymer exhibits electroluminescence in single-layer LED devices with emission of orange-red light with λ_{max} in the region of 600nm [3,4]. Electroluminescence intensity is enhanced by the addition of europium or ruthenium complexes [5]. On doping with the laser dye DCM there is increase in EL intensity and voltage tunable emission, with a red shift on increasing the voltage [6]. Addition of tris(8-hydroxyquinoline)aluminium causes a red shift in EL emission [7]. On increasing the temperature there is a blue shift in EL emission and an increase in intensity [2].

Optical Properties:

Optical Properties General: Uv absorption band occurs with λ_{max} in the region of 465–480nm [1,4] for film and 420–430nm for solutions in various solvents [1]. The optical band gap is *ca*. 2eV [4,5]. Photoluminescence with emission of orange-red light occurs with λ_{max} in the region of 570–600nm [1,4,5]. Increasing the temperature causes a blue shift in the uv absorption band [8] and in photoluminescence with an increase in intensity [2].
Transmission and Spectra: Pmr [1], ftir [1], uv and photoluminescence [1,2,4,5,8], electroluminescence [2,3,4,5,6,7], xps [3,8] and ups [8] spectral data have been reported.

Polymer Stability:

Thermal Stability General: Polymer is stable up to 220°C in nitrogen [1]. The side chain decomposes in the region 200–300°C, while the backbone is stable above 400°C [8].
Stability Miscellaneous: Polymer backbone decomposes slowly at r.t on exposure to light at wavelength 397nm [8].

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by polymerisation of the monomer (2-(3-thienyl)ethanol *n*-butoxycarbonylmethylurethane) with $FeCl_3$ in $CHCl_3$ [1,3]. Films can be obtained by solution casting [1].
Applications:

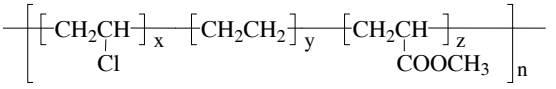
PVC copolymers P-662



Synonyms: *Poly(vinyl chloride) copolymers*
Related Polymers: PVC, Vinyl chloride-acrylonitrile copolymer, Vinylidene chloride-vinyl chloride copolymer, Vinyl chloride-propylene copolymer, Vinyl chloride-chlorotrifluoroethylene copolymer, Cinyl chloride-ethylene copolymer, Polyvinyl chloride, unplasticised, Poly(vinyl chloride-*co*-vinyl acetate), Poly(vinyl chloride-*co*-vinyl acetate), epoxidised, Poly(vinyl chloride-*co*-vinyl acetate), carboxylated, Poly(vinyl chloride-*co*-vinyl acetate-*co*-vinyl alcohol), Poly(vinyl chloride-*co*-vinyl acetate-*co*-2-hydroxypropyl acrylate), Poly(vinyl chloride-*co*-vinyl acetate-*co*-maleic acid), Poly(vinyl chloride-*co*-acrylonitrile), Poly(vinyl chloride-*co*-chlorotrifluoroethylene), Poly(vinyl chloride-*co*-ethylene), Poly(-vinyl chloride-*co*-propylene), Poly(vinyl chloride-*co*-*N*-cyclohexylmaleimide), Poly(vinyl chloride-*co*-vinylidene chloride), Poly(vinyl chloride-*co*-vinyl bromide)

General Information: The presence of a significant amount of comonomer leads, in general, to the following; processing temp. is reduced; reduction in T_g; decrease in heat stability; reduction in softening temp.; reduction in temp. of deflection under load; hardness is decreased; extensibility is increased [1]. Copolymers are also more readily soluble, in general, than homopolymer [1]

PVC, EVA filled P-663

Synonyms: *Polyvinyl chloride, Ethylene-vinyl acetate copolymer filled. Poly(chloroethene-co-ethene-co-ethenyl acetate). VC/EVA. Vinyl chloride-ethylene-vinyl acetate terpolymer. PVC-EVA. Ethylene-vinyl acetate-vinyl chloride graft copolymer. Grafted VC/EVA copolymer. EVA/VC graft copolymer*
Related Polymers: Poly(vinyl chloride), unplasticised, Poly(vinyl chloride-*co*-vinyl acetate), Poly(vinyl chloride-*co*-ethylene), Poly(-ethylene-*co*-vinyl acetate), PVC copolymers
Material class: Thermoplastic, Synthetic Elastomers, Copolymers, Composites
Polymer Type: polyethylene, PVCpoly(vinyl acetate)polyhaloolefins
CAS Number:

CAS Reg. No.	Note
25085-46-5	(terpolymer)
24937-78-8	
55599-81-0	

Molecular Formula: $[(C_2H_3Cl).(C_2H_4).(C_4H_6O_2)]_n$
Molecular Weight: MW 250000 (approx., main chain terpolymer). K-value: 67 (high-impact graft copolymer, 88% vinyl chloride); 78–79 (high-impact graft copolymer, 50% vinyl chloride
Additives: Stabilisers (organotin compounds, Ba/Cd soaps, Ca/Zn compounds, Pb compounds); co-stabilisers (phosphites); lubricants; plasticisers; blowing-agents; pigments; fillers
General Information: Both main-chain co(ter)polymers and graft copolymers are available; for latter, most usual form is where vinyl chloride is grafted onto ethylene-vinyl acetate backbone, [18] although other forms have been described, e.g. grafting of ethylene to vinyl chloride-vinyl acetate backbone. [29] Graft copolymer displays interesting combination of physical props., i.e. plastic rigidity (PVC component) and toughness of a saturated rubber (ethylene-vinyl acetate rubber component); [27] finds most important application as an impact modifier, e.g. for PVC homopolymer mouldings; typical composition 27.5/22.5/50 (ethylene/vinyl acetate/vinyl chloride) with 50–70% EVA, can act as plasticiser or processing aid (e.g. lubricant) for (U)PVC homopolymer; vinyl chloride component promotes excellent compatibility with PVC resins; graft copolymer can act as solid plasticiser of exceptionally high permanence, in amounts as high as 80 phr; [5, 31] graft copolymers more expensive, in general, than main-chain copolymers [13]
Morphology: Electron microscopy studies of graft copolymers[21,27] with varying EVA content (5,20,50%) reveal that EVA phase forms network structure which separates PVC matrix into particles (approx. 0.5μ diameter; 5% EVA); mesh of network decreases and thread becomes thicker with increasing EVA content; 50% EVA sample can be best described as EVA matrix containing dispersed PVC particles, i.e. an EVA rubber 'filled' with PVC particles; such a structure helps to explain improved impact strength and flow properties (cf. rigid PVC homopolymer); network of EVA phase containing PVC particles undergoes phase inversion when subjected to high temp., pressure and shear; such phenomena generally applicable to most 'impact' grade PVC-2 phase systems; reduction in impact resistance observed after such treatment. [17] Weight fraction of grafted chains for solution-grafted copolymer (75% MeOH) is greater than that of

bulk-grafted (electron-irradiated) material for equivalent grafted monomer contents [24]
Identification: Pyrolysis-gas chromatography has been used for simple and rapid identification/analysis of terpolymer [14]
Miscellaneous: Anionic and non-ionic latex systems (52% solids), terpolymer emulsions (52% solids) and terpolymer dispersions (approx. 50% solids) are commercially available. [32] Properties and uses of graft copolymers have been reviewed [3,12]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.13 g/cm^3	graft copolymer
2	d 1.38 g/cm^3	engineered terpolymer [32]
3	d 0.56–0.69 g/cm^3	bulk density, graft copolymer [32]
4	d 0.88 g/cm^3	8.8 lb gal^{-1}, terpolymer anionic latex system component [32]
5	d 0.91 g/cm^3	9.1 lb gal^{-1}, terpolymer emulsion system component [32]
6	d 1.17–1.18 g/cm^3	high-impact graft copolymer, 50% vinyl chloride [17]
7	d 1.4 g/cm^3	high-impact graft copolymer, 95% vinyl chloride [17]
8	d 1.35 g/cm^3	high-impact graft copolymer, 88% vinyl chloride [17]

Transition Temperature General: Variation of Vicat softening point (to VDE 302) as a function of admixture content (5–20% ethylene-vinyl acetate) has been reported [18]
Deflection Temperature:

No.	Value	Note
1	82°C	1 kg load, Vicat, DIN 53 460, 10 pbw, [4,31] 70°
2	70°C	5 kg load, Vicat, DIN 53460, 10 pbw [4,31]
3	85°C	1 kg load, Vicat, DIN 53460, 15 pbw [4,31]
4	69°C	5 kg load, Vicat, DIN 53460, 15 pbw [4,31]

Vicat Softening Point:

No.	Value	Note
1	81°C	min., Vicat/B, high-impact PVC formulation [32]
2	76–82°C	high-impact graft copolymer, 95% vinyl chloride [17]
3	76°C	min., high-impact graft copolymer, 94% vinyl chloride [17]

Brittleness Temperature:

No.	Value	Note
1	-55°C	high-impact graft copolymer, 50% vinyl chloride [17]

Surface Properties & Solubility:

Plasticisers: Phthalate esters, e.g. ethyl hexyl and di-n-butyl phthalates. VC/EVA graft copolymers (containing 50–70% EVA) themselves can act as plasticisers for (U)PVC compositions; excellent compatibility with PVC resins; low extractability, volatility and migration; true ('internal') plasticiser; high concentrations possible ($\leq$ 80 phr), and high degree of resistance to biodegradation [5,31]
Solvents/Non-solvents: Graft copolymers sol. cyclohexane

Transport Properties:

Transport Properties General: Flow properties of graft copolymer considerably improved (cf. rigid PVC homopolymer); can be understood by considering network struct. of rubber phase in plastic matrix, as revealed by electron microscopy studies; EVA phase (possibly partially contaminated with PVC) serves as lubricant at high temps., while acting as binder for PVC phases at room temp.; [27] high melt flow displayed by graft copolymer; [32] melt flow index of solution-grafted copolymer lower than that of bulk-grafted form [24]
Polymer Solutions Dilute: η_{rel} 2.26 (high-impact graft copolymer, 88% vinyl chloride, cyclohexanone (1%, 25°), K-value 67) [17]
Polymer Solutions Concentrated : Viscosity 50–12 000 mPa s (terpolymer dispersions, 50% solids); [32] 100–600 cps (self-crosslinking anionic terpolymer system, 52% solids); [32] 100–500 cps (anionic terpolymer latex system, 52% solids); [32] 100–500 cps, (terpolymer emulsion system, 52% solids) [32]
Polymer Melts: $\eta_{intrinsic}$ 153 cm^3 g^{-1} (high-impact graft copolymer, 50% vinyl chloride, K-value 79) [17]

Mechanical Properties:

Mechanical Properties General: Changes from a semirigid PVC to a soft PVC on increasing EVA content of graft copolymer; mechanical props. of latter form comparable to those of plasticised PVC. [27] Comparative study of mechanical properties of bulk (electron irradiation at 0° and 20°) and soln. (75% MeOH) grafted copolymers has been reported: yield strength increases with increasing graft content for both forms; yield strength for electron-irradiated graft copolymer prepared at 20° is greater than that of material produced at 0° for equivalent graft contents [24]. Mech. props. of a range of EVA/PVC systems have been reported [18]

Tensile (Young's) Modulus:

No.	Value	Note
1	2500 MPa	high-impact graft copolymer, 95% vinyl chloride [17]

Flexural Modulus:

No.	Value	Note
1	2400 MPa	high-impact graft copolymer, 95% vinyl chloride [17]
2	2500 MPa	high-impact graft copolymer, 94% vinyl chloride [17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	12.75 MPa	1850 psi, engineered terpolymer [32]	250%
2	4.5 MPa	terpolymer dispersion material [32]	550–700%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	45 MPa	$<$5% elongation	min., high-impact PVC formulation, 94% vinyl chloride [17,32]
2	14.5 MPa	250% elongation	high-impact graft copolymer, 50% vinyl chloride [17]
3	37 MPa	60% elongation	high-impact graft copolymer, 95% vinyl chloride [17]

Flexural Strength Yield:

No.	Value	Note
1	80 MPa	high-impact graft copolymer, 95% vinyl chloride [17]

Impact Strength: Impact strength of graft copolymer is greatly improved cf. rigid PVC homopolymer, e.g. by factor of 10 for 5% EVA content. [27] The notched Charpy impact strength (DIN 53 453, 23° and -36°) of unplasticised PVC, containing EVA/VC copolymer as modifier increases with increasing modifier content. Comparative study of impact strengths of bulk (electron irradiation at 0° and 20°) and soln. (75% MeOH) grafted copolymers has been reported: reduction with increasing graft for bulk-grafted material, while increases with increasing content for solution-grafted product; in former case, impact strength for material prepared at 0° greater than that of material prepared at 20° for equivalent graft contents. [24] Notched impact tensile strength 170 kJ m^{-2} (high-impact graft copolymer, 94–95% vinyl chloride). [17] Maximum impact strength of graft copolymers is achieved with EVA rubbers having 45% vinyl acetate content.[18] Impact strengths 40 kJ m^{-2} (high-impact graft copolymer, 95% vinyl chloride); [17] 50 kJ m^{-2} (high-impact graft copolymer, 92% vinyl chloride); [17] higher concentrations of EVA rubber give no further improvement; [17] reduced to low levels (e.g. 10–15 kJ m^{-2}) when subjected to conditions of high temp., pressure and shear (e.g. in roll-compounding mill); related to phase inversion of structure [17]
Hardness: Shore A90 (10 s, engineered terpolymer) [32]; Shore D78 (high-impact PVC formulation, graft copolymers, 94–95% vinyl chloride) [17,32]
Friction Abrasion and Resistance: Engineered terpolymer has good abrasion props.; [32] good abrasion resistance displayed by terpolymer latex component [32]
Charpy:

No.	Value	Notch	Note
1	640	y	23°, 90% PVC, 10% EVA/VC copolymer [4,31]
2	820	y	23°, 85% PVC, 15% EVA/VC copolymer [4,31]
3	480	y	-36°, 90% PVC, 10% EVA/VC copolymer [4,31]
4	490	y	-36°, 85% PVC, 15% EVA/VC copolymer [4,31]
5	20	y	min., 23°, high-impact graft copolymer, 95% vinyl chloride [17]
6	8	y	min., 23°, high-impact graft copolymer, 94% vinyl chloride [17]
7	30	y	min., 23°, high-impact graft copolymer, 94% vinyl chloride [17]
8	5	y	min., 0°, high-impact graft copolymer, 94% vinyl chloride [17]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3	1 MHz	high-impact graft copolymer, 95% vinyl chloride [17]

Dielectric Strength:

No.	Value	Note
1	43 $kV.mm^{-1}$	high-impact graft copolymer, 50% vinyl chloride [17]
2	28 $kV.mm^{-1}$	high-impact graft copolymer, 95% vinyl chloride [17]

Static Electrification: Thermodielectric loss measurements (using DTA) have been reported for graft copolymer; contour maps produced show similar shapes to those obtained for incompatible polymer mixtures (blends) (cf. two distinct polymer phases of graft copolymer) [26]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0185	1 MHz	high-impact graft copolymer, 95% vinyl chloride [17]

Optical Properties:

Transmission and Spectra: Wide-line nmr spectral data of graft copolymers have been reported: comparative studies with blends of PVC and EVA used to examine phase separation [28]

Polymer Stability:

Polymer Stability General: Study of effect of heat and light on degradation processes and structural changes has been reported: presence of pigments in addition to impact-modifier; surface examination by electron microscopy shows degradation by escaping pigment; high pigment concentrations lead to low weather resistance [23]
Thermal Stability General: Engineered terpolymer displays good resistance to high temps. [32]; graft copolymer (high-impact form, 88% vinyl chloride) displays good thermal stability at elevated temps. [17]. Good stability at normal extrusion temps. (100 min.), [19] compared to PVC. Other thermal stability studies have been reported [29]
Decomposition Details: Pyrolysis-gas chromatography studies show production of dimers and trimers on pyrolysis [14]. Raman spectroscopy has been used to evaluate polyene sequences in heat-treated graft copolymers (50% vinyl chloride content) over range 60–145°; engineered terpolymer shows low HCl generation on heating [25,32]
Flammability: Engineered terpolymer has low flammability and low smoke generation; [32] terpolymer (anionic) latex component exhibits flame retardancy props. [32] Limiting oxygen index 23.5% (high-impact graft copolymer, 50% vinyl chloride) [17]
Environmental Stress: Engineered terpolymer displays good weathering props. [30,31,32,34]
Chemical Stability: Terpolymer emulsion component shows good resistance to alkalis; [32] terpolymer displays greater resistance to alkalis than vinyl chloride-vinyl acetate copolymers, [34]
Hydrolytic Stability: Has good resistance to water [32]
Biological Stability: Has high degree of resistance to biodegradation [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Main-chain terpolymers synth. by emulsion or suspension polymerisation of mixture of comonomers; free-radical initiators used include peroxydicarbonates, [20] alkali peroxydisulfates, [33] organic hydroperoxides [33] and lauroyl peroxide; [28] typical emulsion polymerisation involves treating a mixture of vinyl chloride-vinyl acetate (1:9) at 68–70° with ethylene (17–20 atm., excess pressure) (vinyl chloride:ethylene 1:2–3:1) using $K_2S_2O_8$ as initiator. [8] Graft

copolymers typically made by grafting PVC chains onto ethylene-*co*-vinyl acetate backbone by suspension polymerisation of EVA rubber dissolved in vinyl chloride monomer. [27,30] Graft copolymers usually suspension-grade materials; [18] grafting can be carried out in bulk (e.g. by electron irradiation at 0–20°) or in soln. (e.g. 75% MeOH); [24] typical synthesis involves grafting of 0.2–2 parts of vinyl chloride to 1 part of EVA copolymer (containing 15–75% ethylene) below 80°. [15] Some graft copolymers used immediately for thermoplastic processing, while others serve as mixing components for achieving certain props. in formulations, e.g. impact-modification, plasticisation, lubrication, etc.; [18,30] processed by injection moulding or extrusion [30]
Applications: Terpolymer emulsions (water-based dispersions/ pressure-polymer emulsions) used as components of various adhesives, paints, textiles, paper and board coatings, wallpapers and binder formulations. Uses include adhesives for bonding plastics, foam, tiles, flooring, walls; binders for pigments, fillers and mortar, textured finishes, thermal insulation systems, fabrics (non-woven, fire-resistant), glass fibre, textile auxiliaries, and wipes, cover stock and medical surgical applications; house and masonry emulsion paints; surface coatings and finishing agents (paper and paperboard), foam-forming (fire-resistant) applications for use as electrical insulators; high strength cements with improved waterproofing props., chemical resistance and mechanical strength; shoe-sole formulations and other leather substitutes (often in blends with PVC); flexible foams, with improved processability and mechanical strength. Graft copolymer (extruded material) has major application as profiles, either on its own or in compositions (blends), with UPVC in window frames ($\leq$ 10% grafted polymer); impact-modifier, offering good combination of impact resistance and tensile strength, with good weatherability (at low temps.): extruded or injection moulded products used for rigid pipes (drainpipes), roof guttering, profiles for benches and fences, light panels, road-sign posts, panels for facade cladding, ventilation systems, chemical plant, waste, gas and drainage pipes and cable conduit, thermoforming sheet, fittings, covers, bottles and containers. Graft copolymers containing high concentrations of EVA behave as internally (permanently) plasticised materials; used for plasticiser-free sheet roofing or artificial leather; also used as processing aids for PVC, as lubricants

Resorcinol formaldehyde resins R-1

Synonyms: *Resorcinol resins. 1,3-Benzenediol resins. RF resins*
Related Polymers: Phenolic Resins
Monomers: Resorcinol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Weight: MW 400 (uncured)
General Information: In resorcinol OH groups activate the 2,4 and 6 ring positions. The effect of this activation is that the resin system will cure at much lower temps. than for phenol formaldehyde resins. Resorcinol is a relatively high-cost phenol and hence is only used in high-value applications where its cold setting props. are significant. Resorcinol can be co-condensed with phenol to form a range of resorcinol phenol formaldehyde (RPF) resins which are more reactive than simple PF resins. This is significant when designing cold-curing adhesives, and is the usual commercial practice

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d1.364 g/cm^3	uncured [2]

Melting Temperature:

No.	Value	Note
1	70–105°C	uncured, dependent on synth. [1]

Vicat Softening Point:

No.	Value	Note
1	89–125°C	uncured, dependent on synth. [1]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 6.68 J$^{1/2}$ cm$^{-3/2}$ (10.66 cal $^{1/2}$ cm$^{-3/2}$, uncured) [2]
Solvents/Non-solvents: Uncured sol. Me_2CO, 2-butanone, EtOAc, EtOH; insol. petroleum, C_6H_6, turpentine, toluene, CCl_4, $CHCl_3$ [1]

Transport Properties:

Polymer Solutions Dilute: Viscosity of resins for laminated wood beams 60–160 mPa s (20°, 53–54% solids RF30); 3000–8000 mPa s (20°, 58–59%, solids, WATEX-1410, 1400)

Mechanical Properties:

Miscellaneous Moduli:

No.	Value	Note	Type
1	1000 MPa	10^{10} dyne cm^{-2}, 20–150°, cured [5]	Storage modulus

Optical Properties:

Transmission and Spectra: C-13 nmr spectral data have been reported [3,4]
Volume Properties/Surface Properties: Colour 7–10 (Gardner scale, uncured, dependent on synth.) [1]

Polymer Stability:

Chemical Stability: Uncured resin is incompatible with linseed oil, tung oil and castor oil. By altering conditions of synth., uncured resin can be compatible with double-boiled linseed oil [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. in a manner analogous to that of phenol-formaldehyde resins i.e. reaction of resorcinol with aq. formaldehyde in the presence of an acid (e.g. oxalic acid) catalyst. The reaction rate of resorcinol with formaldehyde is considerably higher than that of phenol. Phenolic resins prepared with some resorcinol as comonomer have greater reactivity. Resorcinol formaldehyde adhesives are curable at room temp. and at neutral pH. They require the addition of a curing agent and solid paraformaldehyde is often used. Resorcinol formaldehyde adhesives confer greater moisture resistance in outdoor structural applications
Applications: Structural wood bonding methods have been used to construct loadbearing structs. for both indoor and outdoor applications, e.g. boat building. Resorcinol or resorcinol-formaldehyde prepolymers can be used as accelerating compounds for curing phenolic resins. The addition of 3–10% permits shorter curing cycles in particle board and grinding wheel production. Resorcinol formaldehyde resins are curable under neutral conditions enabling the adhesives to be used with acid-sensitive systems such as fibre-reduced cement. Shaped refractory products can be made using resorcinol resins by a cold-mixing technique. Resorcinol formaldehyde resoles are used as tyre-cord adhesives and as high performance binders for wood composites

Trade name	Details	Supplier

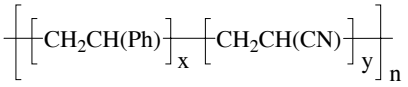
Resorcinol resins, Wood applications R-2

Related Polymers: Resorcinol Formaldehyde Resin
Monomers: Resorcinol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
General Information: In resorcinol -OH groups activate the 2,4 and 6 ring positions. The effect of this activation is that the resin system will cure at much lower temps. than for phenol formaldehyde resins

Applications/Commercial Products:

Processing & Manufacturing Routes: Bonded wood beams (88%) are used with resin (2%) and 10% moisture. Resorcinol resin adhesives with curing agents (paraformaldehyde) are curable at ambient temps. (>15°) and are used where enhanced mositure resistance is required
Applications: Structural wood bonding methods have been used to construct loadbearing structs. for both indoor and outdoor applications, e.g. boat building



Trade name	Details	Supplier
Aerodux	resorcinol resins	Dyno
Dynosol	resorcinol resins	Dyno
RF-10	RPF resin for laminated wood	Neste
RF-30L	RPF resin for laminated wood	Neste

Rubber hydrochloride R-3

Related Polymers: Natural rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
Additives: Plasticisers: dibutylphthalate, tritolyl phosphate
General Information: Hydrohalogenated rubber

SAN

S-1

Synonyms: *Styrene-acrylonitrile copolymer. Poly(styrene-co-acrylonitrile) copolymer. ANS. Poly(2-propenenitrile-co-ethenylbenzene)*
Related Polymers: SAN, general purpose, SAN, injection moulding unfilled, SAN, injection moulding glass fibre filled, SAN, extrusion unfilled, SAN, glass reinforced, SAN, flame retardant injection moulding glass fibre filled, SAN, blow moulding, Polyacrylonitrile, Polystyrene
Monomers: Styrene, Acrylonitrile
Material class: Thermoplastic, Copolymers
Polymer Type: styrene-acrylonitrile (SAN), acrylonitrile and copolymers
CAS Number:

CAS Reg. No.	Note
9003-54-7	
106209-33-0	alternating
107440-17-5	block copolymer
110902-08-4	graft copolymer

Molecular Formula: $(C_8H_8)_x(C_3H_3N)_y$
Fragments: C_8H_8 C_3H_3N
General Information: SAN resins are rigid, hard and transparent. A typical composition is 76% styrene and 24% acrylonitrile [14]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.07–1.08 g/cm^3	[14]

Equation of State: Equation of state information [35,36] for the alternating copolymer [37] has been reported
Thermodynamic Properties General: Heat capacity as a function of temp. (10–240°) has been reported [39]. Heat of combustion has been reported [40]
Glass-Transition Temperature:

No.	Value	Note
1	127°C	[30]
2	104°C	amorph. [38]

Transition Temperature General: T_g varies non-linearly with acrylonitrile content, with a maxima at 50% wt. acrylonitrile [10]
Deflection Temperature:

No.	Value	Note
1	72°C	5.5% wt. acrylonitrile [10]
2	88°C	27% wt. acrylonitrile [10]
3	101–104°C	1.8 MPa, 264 psi [14]

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(*N*-vinyl-2-pyrrolidone), poly (*N*-methyl-*N*-vinylacetamide) and poly(*N,N*-dimethylacrylamide) provided the acrylonitrile content of SAN exceeds 62% [1]. Miscible with bisphenol A carbonate cyclic oligomers [2]
Cohesive Energy Density Solubility Parameters: Solubility parameters have been reported [22,23]
Solvents/Non-solvents: Softened and swollen by toluene. Unaffected by immersion in 2-propanol, petrol, motor oil, hexane, detergent or chlorine bleach [47]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	1.6 g/10 min	10 min, 220°, ASTM D1238 [11]

Polymer Solutions Dilute: η 0.68 (25°, C_6H_6) (alternating; styrene:acrylonitrile 1:2) [3]; η 0.75 dl g^{-1} (30°, 2-butanone, 26% wt. acrylonitrile) [5]. Dilute soln. props. have been reported [17,27]
Polymer Melts: Relationship between limiting viscosity and MW, and calculation of the Flory constant, K_θ, have been reported [6]. Limiting viscosity number decreases with increasing temp. [7]. The viscosity of polymer melts at high shear rate has been reported [11]
Permeability of Gases: Permeability to oxygen [19] and water vapour [19,20] has been reported
Water Content: Water content data have been reported [29]

Mechanical Properties:

Mechanical Properties General: Mechanical props. are dependent on the acrylonitrile content

Tensile (Young's) Modulus:

No.	Value	Note
1	0.0033–0.0038 MPa	0.475–0.56 psi [14]

Tensile Strength Break:

No.	Value	Note	Elongation
1	68.9–75.8 MPa	10–11 kpsi [14]	2–3%
2	42.27 MPa	5.5% wt. acrylonitrile [10]	1.6%
3	72.47 MPa	27% wt. acrylonitrile [10]	3.2%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	39.2 MPa	1.8%	400 kg cm^{-2}, 40° [4,6]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2059.4 MPa	21000 kg cm^{-2}, 23°, 10000h [46]	creep modulus

Impact Strength: Impact strength 26.6 J m^{-1} (notched, 5.5% wt. acrylonitrile), 27.1 J m^{-1} (27% wt. acrylonitrile) [10]; 13.7 J m^{-1} (0.4–0.6 ft lb in^{-1}). Charpy impact strength behaviour has been reported [18].
Viscoelastic Behaviour: The dynamic viscoelastic behaviour of SAN random copolymers has been reported [15]. Dynamic viscoelastic props. are dependent on the method of synth. [30]
Mechanical Properties Miscellaneous: Critical shear rate for injection moulding has been reported [28]
Fracture Mechanical Properties: SAN resins with acrylonitrile content of 25, 30 and 51.2% have greater fatigue fracture resistance than unmodified polystyrene. Fatigue resistance of resins increases with increasing acrylonitrile content up to a max. of 30% [13]

Optical Properties:

Optical Properties General: 30% Styrene content in the polymer film leads to a deterioration in optical props. [41]. The relationship between refractive index and struct. has been reported [45]
Transmission and Spectra: Ir [42,43] and C-13 nmr [44] spectral data have been reported

Polymer Stability:

Thermal Stability General: Deteriorates with increasing acrylonitrile content [9]
Decomposition Details: Initial temp. of weight loss (alternating copolymer) 323° [3]. Activation energy of decomposition 142 kJ mol^{-1} [3]. Max. rate of decomposition occurs at 425° with NH_3 and HCN among the major products [8]. Weight loss is smaller when heating occurs in a N_2 rather than air environment, with the least amount of degradation occurring in the presence of 0.15–0.5% moisture [12]. Pyrolysis at 500° under N_2 produces HCN, acetonitrile, acrylonitrile, styrene and toluene among the products. The amount of HCN is proportional to the acrylonitrile content [34]
Flammability: Ignition temp. 542° [4]. Ignition limiting oxygen indices 16.9 (550°), 5.4 (600°), 4.5 (650°) [4]
Environmental Stress: Outdoor exposure reduces impact strength by 75% and bending strength by 50% after 1 year [21]. Other weathering data have been reported [25]
Chemical Stability: SAN resins are resistant to non-oxidising acids, aliphatic hydrocarbons, alkalis, except KOH, vegetable oils, foodstuffs and detergents. Attacked by aromatic and chlorinated hydrocarbons, esters and ketones [14]
Biological Stability: Biodegradation details have been reported [26]
Stability Miscellaneous: γ-Irradiation causes embrittlement and degradation of phys. props. [24]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. comly. by emulsion, suspension or continuous bulk polymerisation [9,14]. The latter method is preferred for applications requiring high optical quality and gives better colour and haze [9]. Bulk polymerisation in toluene or acetonitrile can show a penultimate unit effect [31]. May also be synth. by free radical polymerisation using a $ZnCl_2$ catalyst without initiator in soln. at 40° [32]. Processed by injection moulding, blow moulding, extrusion, thermoforming and casting [9]. The mechanism of the $ZnCl_2$-catalysed polymerisation has been reported [33]
Applications: Has applications in household appliances and goods - washing machine parts, refrigerator shelves, blenders, mixers, food trays, bottles and as bristle in brooms and brushes; in the automotive industry (batteries, lenses, interior trim)

SAN, Glass reinforced S-6

Related Polymers: SAN
Monomers: Styrene, Acrylonitrile
Material class: Composites, Copolymers
Polymer Type: styrene-acrylonitrile (SAN), acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
9003-54-7

General Information: Glass fibre content is usually 20% or 40%

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.22–1.4 g/cm^3	20% filled [1]

Volumetric Properties General: Thermal expansion coefficient has been reported [7]
Transition Temperature General: Heat deflection temp. has been reported [5]
Deflection Temperature:

No.	Value	Note
1	99–110°C	264 psi, 20% filled [1]

Mechanical Properties:

Mechanical Properties General: Addition of glass fibre improves toughness, modulus and hardness [1]. Studies on the tensile modulus of Acrylafil have been reported [2]. Props. of 20% filled material have been reported [4]. Tensile modulus 1.45 GN m^{-2} [7]

Tensile (Young's) Modulus:

No.	Value	Note
1	0.008–0.012 MPa	1.2–1.7 psi, 20% filled [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	73.8 MPa	10.7–12 kpsi	1.4–1.9%
2	82.7 MPa	20% glass fibre [1]	

Poisson's Ratio:

No.	Value	Note
1	0.36	105.6° [7]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	39.2 MPa	0.6%	40°, 400 kg cm^{-2} [6]

Miscellaneous Moduli:

No.	Value	Note	Type
1	7355 MPa	75000 kg cm^{-2}, 23°, 10000h [6]	creep modulus

Izod Notch:

No.	Value	Notch	Note
1	86.1–103.1 J/m	Y	2.5–3 ft lb in^{-1} [1]

Polymer Stability:

Flammability: A 0.125" sample cont. long fibres passes the UL 484 test whereas a 0.065" sample fails [8]. UL 94 self-extinguishing (0.25" bar) [8]
Chemical Stability: Chemical resistance and hydrolytic stability are improved by the addition of glass fibre [3]

Applications/Commercial Products:

Trade name	Details	Supplier
Acrylafil		Fiberfil
SN	Various GF series	Compounding Technology

Applications/Commercial Products:

Trade name	Supplier
C-Flex R	Concept
Kraton	Shell Chemicals

Silicone acrylate S-10

Related Polymers: PDMS fluid

Material class: Synthetic Elastomers

Polymer Type: silicones

Molecular Formula: $[C_2H_6OSi]_n$

Fragments: C_2H_6OSi

Molecular Weight: MW 5000–25000

General Information: End groups are readily cross-linked by uv radiation in the presence of photoinitiatiors and the absence of oxygen

Transport Properties:

Polymer Melts: Viscosity values have been reported 10 Poise (25°, before cross-linking) [3]

Mechanical Properties:

Mechanical Properties General: Has good elastomeric props.

Applications/Commercial Products:

Processing & Manufacturing Routes: Acrylate groups can be attached to silicones in various ways. A major route involves reaction of polydimethylsiloxane, bearing terminal SiH groups, with 3-chloro-1-propene. The product is treated with acrylic acid to give the acrylate end group polysiloxane [1,2,3,4]

Applications: Rapid cure makes silicone acrylate commercially valuable for release coatings on paper and film. Has applications in fibre optics

Trade name	Supplier
Photomer 7020	Harcros
Tego Silicone Acrylate	Goldschmidt AG

Silicone epoxy copolymer S-11

Synonyms: *Epoxysilicone copolymer*
Related Polymers: Polysiloxanes, Epoxy resins
Monomers: Dichlorodimethylsilane, Epichlorohydrin, Diphenylolpropane
Material class: Gums and resins
Molecular Formula: $[(C_2H_6OSi).(C_{18}H_{20}O_3)]_n$
Fragments: C_2H_6OSi $C_{18}H_{20}O_3$
General Information: The struct. is very complex; the structural unit illustrated is a simplified version

Surface Properties & Solubility:
Surface and Interfacial Properties General: Good adhesive props., particularly to copper [1,3]

Electrical Properties:
Electrical Properties General: Has good insulating props. [2]

Polymer Stability:
Polymer Stability General: Greater resistance to chemicals than polysiloxanes. Usable at higher temps. than epoxy resins [1,2]
Thermal Stability General: Usable above 200° [1,2]
Environmental Stress: Highly weather resistant [1,2]
Chemical Stability: Resistant to most chemicals and solvents; decomposed by conc. acids [2]
Hydrolytic Stability: SiOC bonds are susceptible to hydrolysis at elevated temps. [1]
Recyclability: Not recyclable

Applications/Commercial Products:
Processing & Manufacturing Routes: Polydimethylsiloxane with reactive end groups is mixed with epoxy resin, which is obtained by the condensation of epichlorohydrin and diphenylolpropane. Under moderate heating co-condensation occurs. Resin can be cured at room temp. [1,3,4]
Applications: Can be used for tough resistant coatings and varnishes used particularly to coat metals

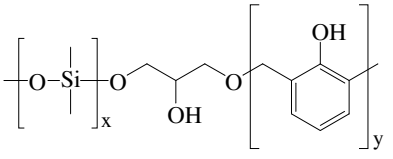
Silicone phenol formaldehyde copolymer S-12

Synonyms: *Silicone phenolic resin copolymer. Phenolic resin silicone copolymer*
Related Polymers: Polysiloxanes, Phenolic resins
Monomers: Dichlorodimethylsilane, Formaldehyde, Phenol
Material class: Gums and resins
Molecular Formula: $[(C_2H_6OSi).(C_7H_6O)]_n$
Fragments: C_2H_6OSi C_7H_6O
General Information: The struct. is very complex. The structural unit illustrated is a simplified version

Electrical Properties:
Electrical Properties General: Has good insulating props. [1]



Polymer Stability:
Thermal Stability General: Usable above 200° [1,2]
Environmental Stress: Strongly resistant to weathering and exposure [1,2,3]
Chemical Stability: Decomposed by conc. oxidising acids and hot alkalis [1]
Hydrolytic Stability: SiOC bonds are susceptible to hydrolysis at elevated temps. [1,2]
Recyclability: Not recyclable

Applications/Commercial Products:
Processing & Manufacturing Routes: Polydimethylsiloxane with reactive end groups is heated with glycerol under dehydrating conditions. The product is mixed with phenol formaldehyde resin in an organic solvent and heated under dehydrating conditions [2,3]
Applications: Used as a varnish where resistance to weathering is important

Silicone polycarbinol copolymer S-13

Synonyms: *Silicone polyallyl alcohol copolymer*
Related Polymers: PDMS fluid
Monomers: Dichlorodimethylsilane, Allyl alcohol
Material class: Fluids
Polymer Type: silicones
Molecular Formula: $[(C_2H_6OSi).(C(_5+_3m)H(_{12}+_6m)O(_2+m)Si)]_n$
Fragments: C_2H_6OSi $C(_5+_3m)H(_{12}+_6m)O(_2+m)Si$
Molecular Weight: M_n 1000–20000

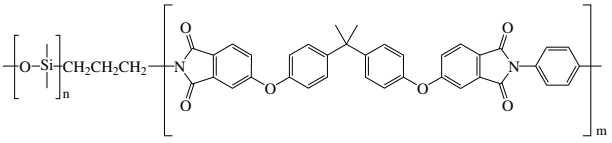
Volumetric & Calorimetric Properties:
Transition Temperature:

No.	Value	Note	Type
1	-62°C	-80°F [1,2]	Pour point

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons [1,2]

Transport Properties:
Polymer Melts: Viscosity 2–5 St [1,2]

Polymer Stability:
Polymer Stability General: SiC bonds make this a relatively stable copolymer
Flammability: Fl. p. 120° (250°F) [1,2]
Hydrolytic Stability: Stable to H_2O at room temp.; hydrolysed by steam [4]
Recyclability: Not recyclable



Applications/Commercial Products:
Processing & Manufacturing Routes: Polydimethylsiloxane is heated with allyl alcohol and peroxide [3,5]
Applications: Surfactant for organic systems and urethanes

Silicone polyetherimide copolymer S-14

Synonyms: *Polyetherimide silicone copolymer*
Related Polymers: Polysiloxanes
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyimide, polysilanes
Molecular Formula: $[(C_2H_6OSi).(C_{37}H_{24}N_2O_6)]_n$
Fragments: C_2H_6OSi $C_{37}H_{24}N_2O_6$

Volumetric & Calorimetric Properties:

Deflection Temperature:

No.	Value	Note
1	200°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, esters, H_2O [1,2]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	37 MPa	5500 psi [4]	47%

Electrical Properties:

Electrical Properties General: Has excellent insulating props. [3]

Optical Properties:

Transmission and Spectra: Low light transmission [1]

Polymer Stability:

Polymer Stability General: Highly resistant to heat, chemicals and flames [1,3]
Thermal Stability General: Usable up to 200° [1]
Upper Use Temperature:

No.	Value	Note
1	200°C	[1]

Flammability: Flame retardant [1,2]
Environmental Stress: Highly resistant to weathering [1,2]
Chemical Stability: Unaffected by aliphatic, aromatic and chlorinated hydrocarbons or by esters [1,2,3]
Hydrolytic Stability: High hydrolytic stability [1,2]
Recyclability: Non-recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Polydimethylsiloxane with aminoalkyl end groups is treated with polyetherimide formed by reaction of a bis(ether anhydride) with diaminobenzene [1,2,3]
Applications: Used for wire and cable manufacture where fire resistance is important

Silicone resin, Glass filled S-15

Synonyms: *Silicone resin, Glass reinforced*
Related Polymers: Methyl silicone resin, Methyl phenyl silicone resin
Monomers: Trichloromethylsilane, Trichlorophenylsilane, Dichlorodimethylsilane, Dichloromethylphenylsilane
Material class: Gums and resins, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.	Note
159011-85-5	methyl silicone
159968-66-8	methyl phenyl silicone

Molecular Formula: $[(C_2H_6OSi)(C_7H_8OSi)]_n$
Fragments: C_2H_6OSi C_7H_8OSi
Additives: Glass fibre used as filler to increase toughness and mechanical strength

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.85 g/cm^3	[4,6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7.5×10^{-5} K^{-1}	laminate [1]	L
2	4×10^{-5} K^{-1}	glass filled [4,6]	L

Thermal Conductivity:

No.	Value	Note
1	0.21 W/mK	0.0005 cal (cm s °C)$^{-1}$, laminate [1]
2	0.45 W/mK	0.0011 cal (cm s °C)$^{-1}$, glass filled [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.05 kJ/kg.C	0.25 Btu lb^{-1}°F^{-1}, laminate [1]	P

Deflection Temperature:

No.	Value	Note
1	260°C	[6]
2	300°C	570°F [1,3]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.3%	laminate
2	0.07%	glass filled [1]

Mechanical Properties:

Mechanical Properties General: Silicone resin laminates are much stiffer than glass fibre filled resins

Tensile (Young's) Modulus:

No.	Value	Note
1	15000 MPa	2200 kpsi, laminate [1]

Flexural Modulus:

No.	Value	Note
1	9000 MPa	13500 kpsi, glass filled [4]
2	18000 MPa	2700 kpsi, laminate [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	28 MPa	4000 psi, glass filled [1,4]	
2	200 MPa	30000 psi, laminate [1]	1.5%

Flexural Strength at Break:

No.	Value	Note
1	62 MPa	9000 psi, glass filled [1,4]
2	240 MPa	35000 psi, laminate [1]

Compressive Strength:

No.	Value	Note
1	82MPa	12000 psi, glass filled [1,4]
2	100MPa	15000 psi, laminate [1]

Hardness: Rockwell M70–M90 [4]
Izod Notch:

No.	Value	Notch	Note
1	16–550 J/m	N	0.3–10 ft lb in^{-1}, glass filled [1,4]
2	270–1360 J/m	N	5–25 ft lb in^{-1}, laminate [1]

Electrical Properties:

Electrical Properties General: Good insulating props.
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.9	[2,3,6]

Dielectric Strength:

No.	Value	Note
1	14 $kV.mm^{-1}$	340 V mil^{-1}, $\frac{1}{8}$" thick) [1]

Arc Resistance:

No.	Value	Note
1	200–300s	[3,4]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002		glass filled [2,3,4]
2	0.005	1 kHz	laminate [1]
3	0.00015	1 MHz	laminate

Polymer Stability:

Polymer Stability General: Stable over a wide temp. range
Thermal Stability General: Usable from -100–250° [1,2,3]
Upper Use Temperature:

No.	Value
1	250°C

Flammability: Non-burning [4]
Environmental Stress: Outstanding weather resistance. Unaffected by sunlight or water; excellent radiation resistance [3,5]
Chemical Stability: Attacked by strong acids; unaffected by alkali or weak acid. Degraded by chlorinated hydrocarbons, aromatic hydrocarbons, ketones and esters. Alcohols and aliphatic hydrocarbons have little effect [3,5]
Hydrolytic Stability: Fully stable to cold water; poor resistance to steam [5]
Biological Stability: Non-biodegradable [2]
Recyclability: Not recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Silicone resin is prepared as [2,4] for methyl silicone resin or methyl phenyl silicone resin. It is mixed with glass fibre and partially cured, then moulded and given a final cure. Glass filler can be regularly distributed as sheets, rather than randomly in fibres, to prod. silicone resin glass laminates
Mould Shrinkage (%):

No.	Value	Note
0	0.003%	[6]

Applications: Used as tough heat resistant moulding compound and laminate particularly in the electrical and electronics industry. Valuable in environments where large temp. variations are encountered

Trade name	Supplier
SC	Bacon

Silicone resin, Room temperature vulcanising S-16

Synonyms: *Flexible silicone resin. Silicone encapsulant*
Related Polymers: Methylsilicone resin, Methylphenylsilicone resins
Monomers: Trichloromethylsilane, Trichlorophenylsilane, Dichlorodimethylsilane, Dichloromethylphenylsilane
Material class: Gums and resins, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.	Note
159011-85-5	methyl silicone
159968-66-8	methyl phenyl silicone

Molecular Formula: $[(C_2H_6OSi)(C_7H_8OSi)]_n$
Fragments: C_2H_6OSi C_7H_8OSi

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.23 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0009 K^{-1}	[2]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal (cm s °C)$^{-1}$ [2]

Transition Temperature:

No.	Value	Note	Type
1	-80°C	approx. [2]	Stiffening temp.

Transport Properties:

Polymer Melts: Viscosity values for the pre-cure resin have been reported 1000 Poise [3]
Water Absorption:

No.	Value	Note
1	0.1%	[2]

Mechanical Properties:

Mechanical Properties General: Mech. props. are similar to room temp. vulcanised methyl silicone rubber. Resins remain flexible down to low temps. unlike unmodified low functionality soft resins
Tensile Strength Break:

No.	Value	Note	Elongation
1	3.4 MPa	490 psi [1,3]	180%

Hardness: Shore A22–A70 [1,2]
Fracture Mechanical Properties: Tear strength 0.3–1.7 J cm^{-2} (15–100 ppi) [2]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9	[1,2,3]

Dielectric Strength:

No.	Value	Note
1	22 kV.mm^{-1}	550 V mil^{-1} [2]

Arc Resistance:

No.	Value	Note
1	115–130s	[2]

Dissipation (Power) Factor:

No.	Value	Note
1	0.007	[1,2]

Polymer Stability:

Polymer Stability General: Stable material which is particularly valuable in high temp., high humidity conditions
Thermal Stability General: Usable from -100–250° [4]
Upper Use Temperature:

No.	Value
1	250°C

Flammability: Self-extinguishing [2]
Environmental Stress: Outstanding weather resistance. Unaffected by sunlight or water. Excellent resistance to radiation, electrical fields and currents [4]
Chemical Stability: Attacked by strong acids; unaffected by alkali or weak acid. Degraded by chlorinated hydrocarbons, aromatic hydrocarbons, ketones and esters. Alcohols and aliphatic hydrocarbons have little effect [1,4]
Hydrolytic Stability: Fully stable to cold water; poor resistance to steam [2,4]
Biological Stability: Non-biodegradable
Recyclability: Not recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Silicone resin is prepared as [4,5] methyl silicone resin or (methyl phenyl silicone resin) and the free silanol groups are modified by reaction with a diorganobisacyloxysilane. The resulting resin can be cured at room temp. by an organotrisacyloxysilane in the presence of atmospheric moisture
Mould Shrinkage (%):

No.	Value	Note
1	0.15%	[2]

Applications: Used as sealant encapsulant and adhesive particularly in the electrical and electronics industry

Silicone rubber, Conductive S-17

Synonyms: *Conductive silicone rubber*
Related Polymers: Pre-crue gum, More general information
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
9016-00-6	
63394-02-5	elastomer

Molecular Formula: $(C_2H_6OSi)_n$
Fragments: C_2H_6OSi
Additives: Carbon block used as a filler to prod. an electrically conducting elastomer

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	4.8 MPa	700 psi [2]	200%

Hardness: Shore A60 [2]
Fracture Mechanical Properties: Tear strength 1 J cm^{-2} (60 ppi) [2]

Electrical Properties:

Electrical Properties General: Is electrically conducting. Volume resistivity 5 Ω cm [1,2]

Optical Properties:

Volume Properties/Surface Properties: Colour black, owing to presence of carbon filler

Applications/Commercial Products:

Processing & Manufacturing Routes: The gum is prepared as in polydimethylsiloxane gum. Organic peroxide (typically benzoyl peroxide) is used at 1–2 parts per 100 rubber to ease the gum to an elastomer at 110–200°, under pressure typically for less than an hour. It is often post cured for several hours at 200–250°
Applications: Used in [1,2,3] electrical and electronic industry as antistatic material and for low amperage electric contacts

Silicone rubber, Glass fibre filled S-18

Synonyms: *Silicone elastomer, Glass fibre filled. Dimethylsiloxane rubber, Glass fibre filled. Poly[oxy(dimethylsilylene)]*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Polydimethylsiloxane gum
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
63394-02-5	elastomer
31900-57-9	PDMS

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi
Additives: 10–46% Glass fibre

Mechanical Properties:

Mechanical Properties General: Very high tear strength; silicone rubber elongation at break 10% (max) [1]
Hardness: Shore A70–A80 [1]
Fracture Mechanical Properties: Tear strength 5 J cm^{-2} (300 ppi) [1]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	500 V mil^{-1} [1]

Dissipation (Power) Factor:

No.	Value	Note
1	0.04	[2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Organic peroxide, typically benzoyl peroxide, is used at 1–2 parts per 100 rubber to cure the gum to an elastomer. The rubber is cured at 110–200°, under pressure, typically for less than an hour. Post cured often for several hours at temps. of 200–250°
Applications: Used as solid rubber where high tear strength is essential. Used as flexible insulating material in the electrical industry

Silk S-19

$(Gly.Ala.Gly.Ala.Gly.Ser)_n$

Synonyms: *Fibroin*
Related Polymers: Proteins
Monomers: Amino acids
Material class: Proteins and polynucleotides
Molecular Weight: 350000, 370000 (subunits of 170000 and 25000). 60000–150000 (regenerated)
General Information: Complex natural fibre secreted by the silkworm *Bombyx mori*, related insects and some spiders. Highly orientated crystalline fibre forming antiparallel pleated sheet struct. [3,4]. Has poor thermoplasticity [5]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.31 g/cm^3	[1]
2	d 1.3 g/cm^3	[5]

Thermal Conductivity:

No.	Value	Note
1	0.092 W/mK	0.00022 cal (cm s °C)$^{-1}$ [1]

Surface Properties & Solubility:
Solubility Properties General: Amphoteric, absorbing acids and alkalis. Isoelectric point in H_2O pH 5 [2]
Solvents/Non-solvents: Sol. sulfuric acid, sodium hypochlorite. Insol. AcOH, Me_2CO, DMF, hydrochloric acid

Transport Properties:
Water Absorption:

No.	Value	Note
1	10%	20°, 60% relative humidity [2], 18.7% swelling in diameter
2	11%	[1,5]

Mechanical Properties:
Mechanical Properties General: Tenacity 0.34–0.39 N tex^{-1} (20% elongation) [5]

Tensile (Young's) Modulus:

No.	Value	Note
1	9800 MPa	1000 kg mm^{-2} [1]

Impact Strength: Impact strength 1300000000 erg cm^{-3} [1]
Friction Abrasion and Resistance: Elongation (standard conditions) 18–25% (15–60% wet) [2]

Electrical Properties:
Electrical Properties General: Has high electrical resistance. It is electrostatic when dry [2]

Optical Properties:
Refractive Index:

No.	Value	Note
1	0.06	[1]

Polymer Stability:
Decomposition Details: Decomposes above 150°. Weight loss occurs above 175°, with charring at 250° [2]
Flammability: Combustible but self-extinguishing [1]
Environmental Stress: Slowly yellows upon exposure to light. Degrades rapidly in sunlight [2]
Chemical Stability: Discoloured by oxidants [2]. Stable to strong alkali (16–18% sodium hydroxide at low temp.) [2]

Silly putty S-20

Synonyms: *Bouncing putty*
Related Polymers: PDMS fluid
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
31900-57-9	PDMS

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi
Molecular Weight: MW 1000–10000
Additives: Fillers are often incorporated to produce desired mech. props.
General Information: Contains (SiOBOSi) linkages

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. esters, ethers, ketones, alcohols, chlorinated hydrocarbons, aromatic hydrocarbons. Slightly sol. H_2O, aliphatic hydrocarbons [4]

Mechanical Properties:
Mechanical Properties General: The incorporation of boron atoms into a linear dimethylpolysiloxane allows temporary cross-linking between chains. In the short term the putty behaves as a cross-linked rubber but in the long term as a fluid gum. Behaves as very viscous fluid on storage in a vessel but shows elastic rebound on hard surfaces, brittleness on sudden impact and plastic flow under moderate tension
Viscoelastic Behaviour: 80% Rebound from sharp impact [3,5]

Polymer Stability:
Polymer Stability General: Not particularly stable
Chemical Stability: Dissolved by Me_2CO, alcohols and Et_2O [4]. Swollen by chlorinated or aromatic hydrocarbons
Hydrolytic Stability: Slowly disintegrated by H_2O [4]
Recyclability: Not recyclable

Applications/Commercial Products:
Processing & Manufacturing Routes: Silicone fluid prepared as in PDMS fluid. The fluid is heated with boric oxide and ferric chloride for some hours at 150–250°
Applications: Used as a novelty toy, as core for golf balls and as an exerciser for weak arm muscles

SIS S-21

Synonyms: *Poly(styrene-block-isoprene-block-styrene). SIS polymer. Poly(ethenylbenzene-block-2-methyl-1,3-butadiene-block-Ethenylebenzene). Styrene-isoprene-styrene triblock copolymers*
Related Polymers: Styrene-isoprene copolymers, Styrene-isoprene star block copolymers
Monomers: Styrene, Isoprene
Material class: Copolymers, Thermoplastic, Natural elastomers
Polymer Type: polydienes, polybutadienepolystyrene

CAS Number:

CAS Reg. No.	Note
25038-32-8	
105729-79-1	block

Additives: Carbon fibre
General Information: Is probably the most important styrene-isoprene copolymer
Morphology: Contains a varying number of phases depending on MW and composition [3]. Lamellae, spherical and cylindrical microdomains have been identified for copolymers of different compositions. A mobile polystyrene-polyisoprene junction point has been identified by dielectric spectroscopy; the associated chain dynamics have been reported [4,8,9]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.92 g/cm^3	14% styrene [1]

Melting Temperature:

No.	Value	Note
1	153°C	[10]

Glass-Transition Temperature:

No.	Value	Note
1	-47–-37°C	[1]
2	-90.5–-62.5°C	dependent on composition [3]

Transition Temperature General: There may be one, two or three glass-transition temps. depending on the composition [3]
Transition Temperature:

No.	Value	Note	Type
1	220°C	14.3% styrene, total MW 140000 [2,7,8]	Order-disorder transition
2	180°C	13% styrene, total MW 113800 [4,7,8]	Order-disorder transition
3	90°C	30% styrene, total MW 39000 [4,7,8]	Order-disorder transition
4	105°C	52% styrene, total MW 27700 [4,7,8]	Order-disorder transition
5	166°C	13% styrene, total MW 149000 [4,7,8]	Order-disorder transition

Transport Properties:

Polymer Solutions Concentrated : In an isoprene-selective solvent (tetradecane) solns. show rubbery, plastic and viscous behaviour at low, intermediate and high temps. Homogeneous mixing of styrene and isoprene blocks occurs in the viscous region but in the rubbery and plastic regions styrene blocks are segregated to form spherical domains and the isoprene blocks have either loop or bridge conformns. [5]
Polymer Melts: Melt elasticity is independent of temp. and total MW for copolymers in the disordered state with constant block length ratio. The melt viscosity, however, is dependent on both total MW and block length ratio. In the ordered state props. would depend on the morphological state of the microdomains [4]

Mechanical Properties:

Mechanical Properties General: At similar compositions the lower MWs tend to give better tensile resistance. At similar MWs tensile strength increases with polyisoprene content. Optimum shear strength is found with MWs of 30000–50000 and a polyisoprene content of 20–40%. Shear strength can be improved by chemical modification, e.g. by reaction with small amounts of maleic anhydride [9]
Tensile Strength Break:

No.	Value	Note	Elongation
1	15.7 MPa	14% styrene [1]	167%
2	12.2–12.4 MPa	14% styrene, 5 phr carbon fibre [1]	2025–2100%
3	10.8–11.7 MPa	14% styrene, 10 phr carbon fibre [1]	2025–2100%
4	4.4–4.6 MPa	14% styrene, 20 phr carbon fibre [1]	1860–1880%

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.25 MPa	14% styrene [1]	10% Modulus
2	0.25 MPa	14% styrene, 5 phr carbon fibre [1]	10% Modulus
3	0.35–0.51 MPa	14% styrene, 10 phr carbon fibre [1]	10% Modulus
4	0.59–0.62 MPa	14% styrene, 20 phr carbon fibre [1]	10% Modulus
5	0.38 MPa	14% styrene [1]	25% Modulus
6	0.41 MPa	14% styrene, 5 phr carbon fibre [1]	25% Modulus
7	0.6–0.67 MPa	14% styrene, 10 phr carbon fibre [1]	25% Modulus
8	0.1–1.15 MPa	14% styrene, 20 phr carbon fibre [1]	25% Modulus
9	0.5 MPa	14% styrene [1]	50% Modulus
10	0.51–0.52 MPa	14% styrene, 5 phr carbon fibre [1]	50% Modulus
11	0.7–0.75 MPa	14% styrene, 10 phr carbon fibre [1]	50% Modulus
12	1.02–1.1 MPa	14% styrene, 20 phr carbon fibre [1]	50% Modulus

Viscoelastic Behaviour: The ratio of loops to bridges of the polyisoprene midblock is a major factor influencing the viscoelastic props. Viscoelastic props. can be very sensitive to the presence of styrene-isoprene diblocks and homopolymer. The effects of added diblock and homopolymer on the props. of a copolymer with spherical domain morphology have been reported [6,9]
Hardness: Shore A30 (14% styrene); A33 (14% styrene; 5 phr carbon fibre); A35 (14% styrene, 10 phr carbon fibre), A37 (14% styrene, 20 phr carbon fibre) [1]
Failure Properties General: Tear strength 28.2 N mm^{-1} (14% styrene), 20.30–21.6 N mm^{-1} (14% styrene, 5 phr carbon fibre), 19.90–20.6 N mm^{-1} (14% styrene, 10 phr carbon fibre), 15.00–6.2 N mm^{-1} (14% styrene, 20 phr carbon fibre) [1]. The failure props. of adhesives containing triblock copolymers have been reported [9]

Optical Properties:

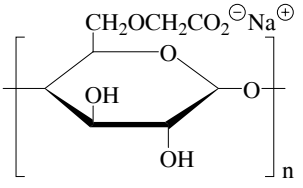
Transmission and Spectra: Ir spectral data have been reported [2]

Polymer Stability:

Polymer Stability General: Ageing tests show that oxidation of surface molecules initially occurs slowly when stored at 95°. After

approx. 90 min., however, oxidation proceeds much more rapidly; the MW distribution shifts to low values and there is a significant loss of mech. props. During degradation the surface energy of the polymer changes from nonpolar to polar [2]

Applications/Commercial Products:



Processing & Manufacturing Routes: May be synth. using a three-stage anionic polymerisation in C_6H_6 at 45° using *n*-butyl lithium as initiator [3]
Applications: Used in adhesives, and as reinforcing agents

9000-11-7	carboxymethyl cellulose
9004-32-4	

Molecular Formula: $(C_8H_{11}O_7Na)_n$
Fragments: $C_8H_{11}O_7Na$
Molecular Weight: MW 90000–700000 (typically 200 to 1000 'monomer' units)
General Information: Degree of substitution 0.65–1.45 [4]; sodium content 7.0–12.0% [4]

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.067 g/cm^3
2	d 0.55–1 g/cm^3

Volumetric Properties General: Film density 1.59 g m^{-1} [2,3]
Melting Temperature:

No.	Value	Note
1	>300°C	min. [1]

Transition Temperature:

No.	Value	Note	Type
1	227°C	[2,3]	Browning
2	252°C	[2,3]	Charring

Surface Properties & Solubility:

Plasticisers: 10–30% glycerol (film) [4]. Diglycerol, 2-methyl-2-nitro-1,3-propanediol, propylene glycol [4], ethanolamines, ethylene glycol, glycerol alphamonomethyl ether, glycerol monochlorohydrin, 2,3-butylene glycol, 1,2,6-hexanetriol
Solvents/Non-solvents: Sol. H_2O; sl. sol. EtOH, Me_2CO; insol. organic solvents [4]
Surface Tension:

No.	Value	Note
1	71000 mN/m	1% soln. [3]

Transport Properties:

Water Content: 8.0% (max., commercial product) [2,3]; 26–32% (80% relative humidity, 25°) [4]

Mechanical Properties:

Viscoelastic Behaviour: Viscosity ranges 1000–4500 mPa s (1%, 25°); 25–3100 mPa s (2%, 25°) [4]

Electrical Properties:

Complex Permittivity and Electroactive Polymers: Zeta potential 3.4 mV (multilayer in $10^{-4}N$ KCl) [5]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.515	film [2,3]
2	1.3355	25°, 2% soln. [2,3]

Polymer Stability:

Chemical Stability: Maximum stability occurs between pH 7–9

Applications/Commercial Products:

Processing & Manufacturing Routes: Alkali cellulose (the complexes obtained by treating cellulose with aq. sodium hydroxide) is treated with sodium chloroacetate in alcoholic solvent
Applications: Food applications as an emulsifier; to control ice cryst. growth; a protein stabiliser; texture modifier; thickener and rapid solubiliser. Used in personal care products as a thickener; stabiliser and viscosity regulator; in pharmaceuticals, tablet disintegrant, as a binder, viscosifier and emulsifier. Also used in adhesives; paints; paper coatings; textile sizing; drilling muds; films and detergents

Spandex fibres S-23

Related Polymers: Polyurethanes General information
Monomers: Ethylenediamine, 1,4-Butanediol, 3,4-Diisocyanatotoluene, 2,6-Diisocyanatotoluene, 4,4′-Diphenylmethane diisocyanate, 2,4-Diisocyanatotoluene
Material class: Fibres and Films
Polymer Type: polyurethane
General Information: Spandex (FTC) is the generic name given to synthetic elastomeric fibres that contain at least 85% of segmented polyurethane. The term elastane (ISO) is most common in Europe. May be used to replace natural rubber thread in many applications. Fibres are lightweight, and have high tensile and tear strength and excellent abrasion resistance. Melt or soln. spun fibres of a wide variety of denier sizes are available

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1 g/cm^3	[1]

Melting Temperature:

No.	Value	Note
1	250°C	[1]

Transition Temperature General: Sticking temp. 175° [1]

Mechanical Properties:

Mechanical Properties General: Tenacity 0.7g den^{-1} 550% elongation [1]

Polymer Stability:

Thermal Stability General: Yellows and degrades above 150° [1]. Stable to a wide range of chemicals including dry-cleaning fluids, soaps, detergents, oils, perspiration, acids and alkalis [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Usually prepared by a two-stage process using an isocyanate terminated prepolymer that is chain extended with a low MW diol, diamine or hydrazine. Several methods of spinning: dry spinning from soln., reaction spinning, wet spinning, hot-melt extrusion. The most important process at present is dry spinning from DMF soln. Lycra (DuPont) and Dorlastan (Bayer) are made by this process. Lycra is the first and most sucessful spandex fibre [2] and is based on poly(oxytetramethylene)glycol reacted with excess diisocyanate, HMDI and chain extended in soln. with aliphatic diamines. Dorlastan is based on MDI with soft segment consisting of hydrophobic polyester chains derived from adipic acid and aliphatic glycols e.g.1,6-hexanediol. Much work has been done on melt-spinning to avoid the use of expensive solvents and solvent recovery but this process is commercially less important than dry-spinning because of limitations on elastomer melting point
Applications: Spandex fibres have established a substantial and competitive market in the clothing industry replacing natural rubber threads. They can be produced as fine yarns and have better resistance to oxidation, sunlight and dry cleaning fluids than natural rubber threads and may be dyed using acid, basic or disperse dyes. Inferior to natural rubber in stress retention and some grades are less resistant to hot detergent wash treatment. Degraded by solns. of bleach and chlorine but generally satisfactory in low chlorine levels. Used in supportive clothing (belts, girdles, corsets, brassieres, garters, surgical stockings). In swimwear, cycling shirts, cycling shorts and various sportswear applications. Other uses in upholstery and carpets

Starch S-24

Synonyms: *Amylum. Polyamylose*
Related Polymers: Amylose, Amylopectin

Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9005-84-9

Molecular Formula: $(C_6H_{10}O_5)_n$
Fragments: $C_6H_{10}O_5$
General Information: Starch is a polysaccharide polymer found in seeds and tubers of many plants. It comprises two related components: **Amylose**, a mainly linear polymer of (1→4)-α-D-glucose comprising 200–2000 glucose residues, and Amylopectin, a branched polymer of (1→4)-α-D-glucose, containing both 1–4 and 1–6 bonds, in which each branch may contain 20–30 sugar residues. The degree of polymerisation can be up to ten times greater than for amylose [1]. Starch forms into granules with diameter range 2–150μm. Typical values are 20–22μm in wheat seeds and 25–50μm in potato tubers. Differences in the ratio of the two polymers and the size of granules, sometimes rather small, lead to changes in props. that are important in processing and performance. The amylose component is usually found as a linear polymer, though occasional branching is found in samples from some sources. Amylose usually comprises 18–28% of the mixt. in starch, though in some seeds it appears to make up *ca*. 85% of the total. In parallel with starch, amylose has been identified in four forms, A, B, C and V, though detailed conformational information is scarce. Polymer chains appear to have a left-handed helical struct., containing six glucose residues per turn [3]. This struct. accounts for the ability of amylose to absorb water (up to 10%) and to form clathrates with a wide range of molecules. Complexation with butanol is important in its isolation and purification. In soln. amylose is thought to form random coils, consisting of helical sections separated by disordered areas of the polymer [4]. Amylopectin is one of the largest natural polymers, its MW range is variously quoted in the range 1000000–500000000, depending on the source [5,6]. Branches occur at every tenth-twelfth glucose residue, usually by reaction at C-6, though C-3 bonds are also found. Each side-chain comprises 20–30 glucose residues, which may also be non-linear. Thus the struct. of amylopectin is variable and complex
Morphology: Granules generally contain crystalline regions which make up 25–45% of the total. X-ray data suggest four types of macromolecular arrangements are possible. Types A and B are found in cereals and tubers respectively. Type C is present in smooth peas and some beans, while type V is generated when starch is precipitated from soln. Samples high in type A material may contain only 10–15% crystalline materials [2]

Polymer Stability:

Polymer Stability General: Moderately explosive when exposed to flame

Styrene butadiene radial block copolymers S-27

Synonyms: *Branched butadiene-styrene block copolymers. Radial teleblock butadiene-styrene copolymers. Radial multichain styrene-butadiene block copolymer. Star styrene butadiene block copolymers. Star-branched butadiene-styrene block copolymers*
Related Polymers: Styrene butadiene block copolymers
Monomers: Styrene, 1,3-Butadiene
Material class: Copolymers, Thermoplastic
Polymer Type: polybutadiene, polystyrene
CAS Number:

CAS Reg. No.
9003-55-8
106107-54-4
61789-96-9

Molecular Formula: $[(C_8H_8).(C_4H_6)]_n$
Molecular Weight: MW 190 000 (20% styrene); M_n 150 000 (20% styrene); MW 115000–136000 (30% styrene, trichain); MW 182 000 (30% styrene, tetrachain); MW 115 000 (40% styrene, trichain); MW 182000 (40% styrene, tetrachain); MW 77000–216000 (30% wt% styrene; trichain; terminating in butadiene blocks); MW 63000–155000 (30 wt% styrene; trichain; terminating in butadiene blocks); MW 135000–177000 (30 wt% styrene; trichain; terminating in styrene blocks); MW 111000–139000 (30 wt% styrene; trichain; terminating in styrene blocks); MW 156000–173000 (30 wt% styrene; tetrachain; terminating in styrene blocks); M_n 127000–148000 (30 wt% styrene; tetrachain; terminating in styrene blocks)
Additives: Fillers (carbon black, clay, silica, whitings); resins (polymers, e.g. polythene or polystyrene or other polymers (as blends); TiO_2; stearic acid; thermal stabilisers (e.g. zinc dibutyl dithiocarbamate); antioxidants (phenolic based, e.g. phenyl-2-naphthylamine); pigments; light (uv) stabilisers (e.g. benzotriazoles and benzophenones)
General Information: May be represented by general formula $(SB)_n$ where n = 3 (trichain (Y-shaped) molecule) or n = 4 (tetrachain (X-shaped) molecule) [8]; radial copolymers uniquely combine effects of long-chain branching with aggregation phenomenon of terminal block polystyrene-containing materials [8] Radial block copolymers belong to class of 'themoplastic elastomers', i.e. they combine various desirable props. of thermoplastic and elastomeric materials without the need for vulcanisation [8,10]. They possess high coefficients of friction and good flexibility at low temps.
Morphology: Polystyrene segments associate with one another to form microdomains which effectively cross-link molecules into network struct. [6] Reinforcement of rubbery segments in this way leads to high tensile strengths [10]
Miscellaneous: Reviews describing the physical and mech. props., processing and compounding, and applications of radial block copolymers have been reported [8,10]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.92–0.94 g/cm^3	30 wt% styrene [16]
2	d 0.94–0.95 g/cm^3	30–40 wt% styrene [10]

Glass-Transition Temperature:

No.	Value	Note
1	-87°C	lower, 30% styrene [8]
2	110°C	higher, 30% styrene [8]
3	-92°C	lower, 40% styrene [8]
4	102°C	upper, 40% styrene [8]

Transition Temperature General: Incompatability of blocks causes raw polymers to exhibit distinct T_g values for each segment [6,10]. Such block copolymers can have T_g values well below those of corresponding random copolymers, e.g. systems containing 40% styrene [10]

Surface Properties & Solubility:

Solubility Properties General: Can be blended with both elastomers and thermoplastics (e.g. polystyrene, polythene, polybutadiene, polyurethanes, neoprene, EPDM) to give combinations of props. desirable in specific applications [4,5,6]
Plasticisers: Naphthenic oil, paraffin oil
Solvents/Non-solvents: Sol. toluene [5,6], THF [5], cyclohexane [12], hexane [6] Insol. isopropanol [12]; EtOH [14] Generally block copolymers are sol. in solvents in which corresponding homopolymers are insoluble. This is a consequence of block struct and 'non-permanence' of network struct, which lead to unique solubility characteristics [6]
Wettability/Surface Energy and Interfacial Tension: Adhesive props. of various formulations containing radial block copolymers have been reported [5,6,7]. The reduction in viscosity with an increase in radiality (n = 2–4, linear to tetrachain) [5], and the effects of this parameter, MW and copolymer composition on shear resistance and adhesion and tack have been reported [1,4]. Shear resistance increases as a function of radiality [5,6] while tack shows little change [1]. Tack of formulations as a function of styrene content has been reported [6,7]. Peel strength 2.1–4.6 lb in^{-1} (15–40 wt% styrene, ASTM D 1000) [6,7,8]. Shear adhesion 0.03–4.5 h (to failure, 15–40 wt% styrene, 90°, slippage of sample bonded vertically to stainless steel) [6,7]. Tack, peel strength and shear adhesion as functions of MW, degree of branching and monomer distribution in blocks have been reported [6,7,8]

Transport Properties:

Transport Properties General: Block copolymers behave as thermorheologically complex materials [11]. Radial block copolymers display markedly different viscosity props to those of linear analogues [5,12]. Rheological behaviour is dominated by their two-phase domain struct., which persists in the melt, i.e. at temps. T_g (polystyrene domains) [12]. Viscous flow is significantly affected by long-chain branching [15]
Melt Flow Index:

No.	Value	Note
1	<1 g/10 min	max., commercial materials; 30% styrene [16]
2	30 g/10 min	commercial material; 44% styrene; plasticised [16]
3	2–4 g/10 min	180°, 5 kg; 40% styrene, MW 150 000 [8]

Polymer Solutions Dilute: Solution viscosity measurements (17% soln. in toluene/ naptha at 25°) of comparable block copolymer systems show a reduction in viscosity with increasing radiality (n = 2–4, linear to tetrachain) (e.g. for copolymer containing 30% styrene) [5] Viscosity [12] 0.73–1.66 dl g^{-1} (THF, 25°, 30% styrene, trichain, terminating in butadiene blocks); 0.99–1.49 dl g^{-1} (THF, 25°, 30% styrene, trichain, terminating in styrene blocks); 1.13–1.14 dl g^{-1} (THF, 25°, 30% styrene, tetrachain, terminating in styrene blocks) $[\eta]_{inh}$ 1.27–1.01 dl g^{-1} (toluene, 15–40 wt% styrene) [6,7]. The effect of MW degree of branching and monomer distribution in blocks on inherent viscosity has also been reported [6,7] Other viscosity data have been reported [16]

Polymer Melts: Mooney viscosity of comparable block copolymer systems decreases with increasing radiality (n = 2–4, linear to tetrachain) [5]. Corresponding effects are also observed in measurements of melt flow (e.g. for copolymers containing 30% styrene) [5]. At constant MW, the viscosity of a polymer terminating in S block is the greatest regardless of branching. Mooney viscosity has been reported as a function of styrene content [6,7,8]

Mechanical Properties:

Mechanical Properties General: Thermoplastic elastomers possess high coefficients of friction and good flexibility at low temps.: depending on MW and styrene content, block copolymers can exhibit relatively high tensile strength [6], which increases with styrene content and MW [8,10]. Tensile strength decreases with increasing temp.; may become low as softening point is approached [8,10]

Tensile Strength Break:

No.	Value	Note	Elongation
1	4.5–27.5 MPa	4000–650 psi, 26–60°, MW 130 000 [4]	
2	12.4–26.2 MPa	3800–1800 psi, 26–60° MW 250 000 [4]	
3	1.72–27.6 MPa	250–4000 psi, 30% styrene [16]	600–820%
4	9.2–10.7 MPa	1330–1500 psi, 30–46% styrene, plasticised, commercial material [16]	1100–1200%
5	11.7–33.8 MPa	1700–4900 psi, 15–40 wt% styrene [6,7]	
6	19.3–27.6 MPa	2800–4000 psi, 30–40 wt% styrene [8]	700–750%

Miscellaneous Moduli:

No.	Value	Note	Type
1	19.3–27.6 MPa	2800–4000 psi, 30–40 wt% styrene [8]	300% modulus

Viscoelastic Behaviour: Viscoelastic behaviour is governed by the length of the terminal block and not by MW [12]

Mechanical Properties Miscellaneous: Tensile strength as a function of styrene content, MW, degree of branching and monomer distribution in blocks has been reported [6,7]

Hardness: Shore A increases with increasing styrene content [10]; Shore A61–A75 (30% styrene, commercial material) [16]; A46–A82 (30–40% styrene, commercial material, plasticised) [16]; Shore A42–A98 25°, 10–50 wt% styrene) [10]. Copolymers can display a wide range in hardness values [8,10]. Shore A80–A92 (30–40% styrene) [10]. Hardness decreases with increasing temp; may become low as softening point is reached [10]

Friction Abrasion and Resistance: Resistance to abrasion and cracking improves with increasing MW [8,10]

Polymer Stability:

Thermal Stability General: An increase in temp. causes loss of tensile strength thereby limiting serviceable use at higher temps. [8,10]

Environmental Stress: Presence of unsaturated polybutadiene block renders copolymers susceptible to attack by ozone; resistance can be improved by compounding techniques [10]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by addition of butadiene to styrene and butyl lithium initiator in cyclohexane at 70°; polymerisation is allowed to proceed for approx. 30 min., and then a coupling agent is added, e.g. PCl_3 for trichain (n = 3) or $SiCl_4$ for tetrachain (n = 4). The reaction is terminated after a further 30 min. by the addition of isopropanol [12]. Many variations on this general route have been reported [13,14,15]. Thermoplastic-elastomeric nature allows processing using conventional equipment for both thermoplastics and rubbers, e.g. injection moulding, compression moulding and extrusion [8,10]. Deposition from solvents is also used to form products

Applications: As an elastomeric component of pressure-sensitive adhesives; as an asphalt modifier (to give optinum high-temp. performance); in contact cements and hot melts. There is a wide range of elastomeric applications including use in shoe soles and heels, hose and tubing, toys, cove bases, mats, weatherstrip and in various extruded goods and moulded parts. Used in blends with other rubbers and plastics to modify props. Examples include addition in small quantities to improve impact strength/resistance in plastics or green strength in rubbers. Blending with other rubbers e.g. with EPDM, can also give improved resistance to ozone, etc [10]

Related Polymers: Polybutadiene, Styrene-butadiene copolymers, Polystyrene, High-*trans*-styrene butadiene rubber
Monomers: Styrene, 1,3-Butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene, polystyrene
CAS Number:

CAS Reg. No.
9003-55-8

Additives: Vulcanised by sulfur. Fillers include carbon black and extender oil. Mineral fillers such as alumina and lead silicate
General Information: Usually contains 25% styrene to 75% butadiene. Styrene and butadiene may be randomly dispersed mixts. or blocks or grafts. Does not break down on mastication. Synthetic polymer is more uniform in quality than natural rubber, and contains less contaminants
Morphology: Amorph.: variation of catalyst alters diene microstructure. Does not crystallise at high strain unlike natural rubber

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.933 g/cm^3	unvulcanised [1]
2	d 0.98 g/cm^3	pure gum vulcanisate
3	d 1.15 g/cm^3	vulcanisate, 50 phv carbon black [2]
4	d 0.94 g/cm^3	pure gum vulcanisate [25]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00066 K^{-1}	unvulcanised [1]	V
2	0.00066 K^{-1}	pure gum vulcanisate [2,3]	V

Thermodynamic Properties General: Variation of thermodynamic props. with concentration of vulcanising sulfur and carbon black has been reported. [139,140] Thermal conductivity and coefficient of thermal expansion values have been reported for a range of SBR/butyl rubber blends [69,110]
Thermal Conductivity:

No.	Value	Note
1	0.19–0.25 W/mK	pure gum vulcanisate [7,8]
2	0.3 W/mK	vulcanisate, 50 phv carbon black [8]
3	0.246 W/mK	pure gum vulcanisate [69]
4	0.19 W/mK	SBR/BR blend (50/50) pure gum vulcanisate [69]

Thermal Diffusivity: 9×10^{-8} m^2 s^{-1} (pure gum vulcanisate) [9]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.89 kJ/kg.C	unvulcanised [5]	P
2	1.83 kJ/kg.C	pure gum vulcanisate [6]	P
3	1.5 kJ/kg.C	vulcanisate, 50 phv carbon black [6]	P

Glass-Transition Temperature:

No.	Value	Note
1	-108–-54°C	SBR/butyl rubber blends [89]
2	-64–-59°C	unvulcanised [1]
3	-52°C	pure gum vulcanisate [4]
4	-52°C	vulcanisate, 50 phv carbon black [4]

Transition Temperature General: T_g increases with increasing styrene content [25] and variation with hydrocarbon content has been reported. [110] Random emulsion polymerisation is reported to produce single T_g value [78,111]. Blends of SBR with butyl rubber before vulcanisation give two distinct T_gs for the separate components and only one T_g after vulcanisation [89]
Brittleness Temperature:

No.	Value	Note
1	-60°C	vulcanisate, carbon black filled [25]

Surface Properties & Solubility:

Solubility Properties General: The compatibility of SBR with other tyre elastomers, with and without carbon black, cured and uncured has been investigated by DTA [112]. The miscibility of SBR with other tyre elastomers has been investigated by examining the morphology of blends after curing. Immiscible with butyl rubber, chlorobutyl rubber, EPDH and CR. Miscibility with natural rubber, and polybutadiene is borderline [119]
Cohesive Energy Density Solubility Parameters: Solubility parameter δ 17.39 J$^{1/2}$ cm$^{-3/2}$ (butadiene:styrene 85:15) [33]
Plasticisers: The effectiveness of pitch as a plasticiser for SBR and blends compared with oil has been reported. The 300% modulus for pitch, 5.6 Mpa, is higher than for oil, 2.6 Mpa, and elongation is similar (800–900%) but there is more heat build up for pitch [99]
Solvents/Non-solvents: The feasibility of using supercritical fluids to extract extender oil, organic acids and antioxidants from SBR has been reported [137]. Unvulcanised sol. hydrocarbon solvents
Surface and Interfacial Properties General: The distribution of carbon black between phases in blends of SBR with natural rubber and polybutadiene has been characterised [42,46]
Surface Tension:

No.	Value	Note
1	31.3 mN/m	PTFE mould, pure gum vulcanisate, 23% styrene [40]
2	35.6 mN/m	PET mould, pure gum vulcanisate, 23% styrene [40]
3	39.6 mN/m	stainless-steel mould, pure gum vulcanisate, 23% styrene [40]
4	33 mN/m	critical surface tension spreading [73]

Transport Properties:

Polymer Solutions Dilute: θ temp. 21° (2-pentanone, M_n 150000–860000, butadiene:styrene 76:24) [31]. 21° (octane, M_n 40000–800000, butadiene:styrene 75:25) [32]. Viscosity is affected by

amount of carbon black and MW [90]. Effect of shear rate, temp. and blend ratio on rheological props. of polymer lattices has been reported [55,143]. The distribution of carbon black between phases and effect of vulcanisation in NR/SBR blends has been determined [51,57].

Polymer Melts: Extensional viscosity data have been reported for SBR melt with 30–80 phv carbon black [74,75]. The effect of carbon black type and loading on the extensional viscosity of SBR melt and also the effect of other fillers - clay, calcium carbonate and silica - have been investigated [75]. The viscosity of SBR melt with different levels of silica and carbon black has been measured at shear rates from 3 to 3000 s^{-1} [98]. Mark-Houwink constants K 0.0525 ml g^{-1}, a 0.66 (C_6H_6, 25°) [34]; 0.0316 ml g^{-1}, a 0.7 (cyclohexane, 30°) [35]; 0.00525 ml g^{-1}, a 0.66 (toluene, 25°) [36]

Permeability of Gases: Permeability of gases increases with increasing temp. [157]. Relative gas permeabilities 1.09 (He/CH_4, 23°); 2.71 (O_2:N_2; 23–25°); 1.91 (H_2:CH_4); 5.9 (CO_2:CH_4) [30]. More gas permeable than polybutadiene. Diffusion coefficients of a range of hydrocarbons have been reported for a range of temp. and vulcanisation conditions [110,116,124,147,148,150,153]

Gas Permeability:

No.	Gas	Value	Note
1	air	34.8 cm^3 mm/(m^2 day atm)	24° [157]
2	air	2048 cm^3 mm/(m^2 day atm)	66° [157]
3	air	4346 cm^3 mm/(m^2 day atm)	94° [157]

Mechanical Properties:

Mechanical Properties General: Gum vulcanisates have low mech. strength, vastly improved using carbon black fillers [59,72,88,113,125,133]. Has been used as an additive in oriented fibres [104]. Other values for tensile strength have been reported [84,86] including blends with other elastomers [77]. Does not crystallise under high strain, unlike natural rubber, so mechanical props. are adversely affected

Tensile (Young's) Modulus:

No.	Value	Note
1	1–2 MPa	pure gum vulcanisate [37]
2	14–19 MPa	vulcanisate, 50 phv carbon black [37]
3	1.6 MPa	pure gum vulcanisate [4,16]
4	3–6 MPa	vulcanisate, 50 phv carbon black [15]

Tensile Strength Break:

No.	Value	Note	Elongation
1	16–23 MPa	carbon black filled; SBR/BR blends [88]	
2	24–28 MPa	carbon black filled [82]	415–500%
3	7 MPa	pure gum vulcanisate [26]	600%
4	14 MPa	vulcanisate, carbon black filled [26]	600%
5	1.4–3 MPa	pure gum vulcanisate [14,15,25,37]	400–600%
6	17–28 MPa	vulcanisate, 50 phv carbon black [14,15]	400–600%
7	14–24 MPa	vulcanisate, 50 phv carbon black [25,37]	300–700%

Elastic Modulus:

No.	Value	Note
1	1890 MPa	unvulcanised [11]
2	1960 MPa	vulcanised [11]
3	2500 MPa	vulcanised, 50 phv carbon black [11]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.53 MPa	pure gum vulcanisate [4]	shear modulus
2	2 MPa	vulcanisate, 50 phv carbon black [17]	shear modulus

Complex Moduli: In-phase shear modulus, G′, out-of-phase shear modulus, G″, and tan δ have been measured over a wide range of amplitude for SBR gum and vulcanisate and for blends with other elastomers [93]. Complex dynamic shear modulus for unvulcanised SBR [18,19,20], pure gum vulcanisate [18,19,22,23] and vulcanisate with 50 phv carbon black [2,17,19] has been reported. Dynamic mechanical props. have been reported for carbon black and other filled systems [55,62,70,81,82,100,101,102,114,115]. Effect of cross-linking on dynamic mechanical props. has been reported [92]. Storage modulus and loss modulus values have been reported [19,20,22,60,114]. log G′ 5.82 (log Pa) (unvulcanised) [20]; 6.94 (log Pa) (vulcanisate, 50 phv carbon black) [19]; log G″ 4.94 (log Pa) (unvulcanised) [20]; 6.28 (log Pa) (vulcanisate, 50 phv carbon black) [19]. Storage modulus is increased on addition of octadecylamine diluent; hydrocarbons have little effect [130]

Viscoelastic Behaviour: Constants in Williams-Landel-Ferry equation for temperature shift factor for viscous flow have been reported [19,56]. Dynamic elastic and loss moduli, and tan δ have been reported for cured SBR with different types of carbon black from 0.01 to 10 Hz [50]. Resilience [77] 65% (pure gum vulcanisate) [15,24,158]; 40% (vulcanisate, 50 phv carbon black) [24]; 45–61% (carbon black filled) [88]. Effects of microstructure and styrene content on rebound values have been reported [111]. Tack data have been reported [29]. Heat build up occurs readily. Values of 53–66° have been reported for a range of filled polymers [47,88]. Creep behaviour of carbon-filled polymer is characterised by temp. jump experiments [82]. Viscoelastic props. are affected by particle size and loading of carbon black fillers [83]. Creep activation energy increases with increase in carbon filler 54 kJ mol^{-1} (unfilled); 167 kJ mol^{-1} (80 phv carbon black) [61]. Extrudate swell [121,125] is dependent on volume fraction of carbon black, but not on shear rate, wall slip [149] or rubber-carbon network [121]. Green strength [44] 1.7 kN m^{-1}; tack 1.56 kN m^{-1} [72]. Peel strength 1.2–1.5 kN m^{-1} (bonded to UHMWPE) [43]

Mechanical Properties Miscellaneous: Longitudinal bulk wave velocity 1485 m s^{-1} (pure gum vulcanisate); 1510 m s^{-1} (vulcanisate, 50 phv carbon black) [12]. Longitudinal strip velocity 73 m s^{-1} (pure gum vulcanisate) [13]; 161 m s^{-1} (vulcanisate, 50 phv carbon black) [12]. Compressibility 530/TPa (unvulcanised) [11]; 510/TPa (pure gum vulcanisate) [12]; 400/TPa (vulcanisate, 50 phv carbon black) [11]. Retraction after extrusion has been reported [72]

Hardness: Shore A40–A100 (vulcanisate, carbon black filled) [25]; A40–A90 [26]; A65–A71 (carbon black filled) [82]. Other hardness values have been reported [111]

Failure Properties General: Crack growth [80] is slower in vacuum than in air, but these effects are less marked under high loads and tearing rates [45,47,108]. Threshold tear strength [77,127,128] 60 J m^{-2} (Young's modulus 2.25) [63]. Tearing energy [76,77,111] 10–26 kJ m^{-2} (carbon filled); 26–100 kJm^{-2} (SBR elastomer blends) [88].

Friction Abrasion and Resistance: Coefficient of friction [57] 0.6–1.5 [54], 2 [40], 2.2 [40], 2.3 [40]; values increase when moulded against surfaces with increasing surface energy. Carbon black filled grades [136] have lower values [94,135]. Skid resistance has been reported for wet ice [53] and correlated to phase behaviour [103,111]. Has better abrasion resistance and resistance to tearing

[56] but lower resilience (causing heat build-up) [27] than natural rubber. Abradability is affected by amount of carbon black and other fillers [41,49,105,151,155]. Wear by metal is much higher in nitrogen than in air [79]

Electrical Properties:

Electrical Properties General: Volume resistivity 10^5 Ω cm (pure gum vulcanisate) [25]. Electrical props. of mica filled [52,151], carbon black filled [48,141,152] and sulfur vulcanised [139] polymer have been reported

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.5	1 kHz	unvulcanised [10]
2	3	1 kHz	pure gum vulcanisate [10]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0009	unvulcanised [10]
2	0.0009	pure gum vulcanisate [10]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5345	unvulcanised [1]
2	1.5368	[112]

Transmission and Spectra: Nmr spectral data have been reported [66,91]. Sequence distribution [71,117] has been reported and H-1 nmr magic angle spinning spectral data indicate loosely and tightly bound monomer segments on the carbon black surface [132]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	110°C	vulcanisate, carbon black filled [14,25]
2	90°C	[26]

Decomposition Details: Weight loss occurs at 442–449° (23–40% styrene) and 261–309° (23–40% styrene) [25]. Volatilisation reported to occur at 330–440° [87]. Decomposition onset 350–390° (N_2, gum) [93]. Carbon black filler has no effect on pyrolysis

Flammability: Limiting oxygen index 16.9% (foam) [38]; 18.5%; 24% (53 wt.% alumina trihydrate) [95]. Smoke evolution has been reported [87]; addition of $CaCO_3$ reduces soot emissions by up to 60% [95]. Flammability rating 3.9 (Matel) [107]; 1.8 (Mil 417) [107]

Environmental Stress: Vulcanisate tears more rapidly in air than in vacuum, and tearing is increased by thiophenol, probably due to prevention of broken chain radicals recombining [47]. Electron irradiation in air liberates H_2, and methane (87%) plus higher mass products [67]. Has good resistance to oxidation and γ-radiation [122,125]; oxygen is reponsible for stress relaxation between 75–115° [97]. Oxidative hardening also has been reported [100]. Carbon black filled vulcanisate has poor ozone resistance; the rate of crack propagation has been reported [109]. Ageing at 70° has been reported [28]. Fate of airborne particles has been reported [65,142]

Chemical Stability: Has poor resistance to gasoline, oil and hydrocarbons [2,26,64]

Biological Stability: Has been monitored for mutagenic props. [44]

Recyclability: Pyrolysis kinetics have been reported; potential for energy recovery from scrap [126]

Applications/Commercial Products:

Processing & Manufacturing Routes: Originally produced by emulsion polymerisation of styrene and butadiene at 50° - hot rubber; also produced at 5° - cold rubber. Broader MW distribution obtained from hot rubber process, more suitable for adhesives. 'Cold' product has more *trans* isomer (72%). May also be produced by solution polymerisation using anionic catalysis, with more control over molecular structure. Suitable initiators determine microstructure, and monomer concentration controls distribution of monomer segments

Applications: Main application is in tyre tread, also used for conveyor belts. Not used in thick sections due to excessive heat generation. Other applications include electrical sheathing, rollers, moulded and extruded articles. May also be blended with natural rubber and other elastomers

Trade name	Details	Supplier
Ameripol Synpol 1009		Ameripol Synpol
Buna Hüls EM		Hüls AG

Styrene butadiene rubber, High-*trans* S-29

Synonyms: *Poly(styrene-co-1,3-butadiene), high-trans. High trans styrene butadiene rubber. High trans SBR*
Related Polymers: Styrene butadiene rubber, Polystyrene, Polybutadiene, ABS, SBS, Styrene butadiene copolymers
Monomers: Styrene, 1,3-Butadiene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polydienes, polystyrene
CAS Number:

CAS Reg. No.
9003-55-8

Molecular Formula: $[(C_8H_8)_x(C_4H_6)_y]_n$
Additives: Carbon black
General Information: High *trans* polymer contains greater than 80% *trans* butadiene segments with respect to *cis* segments

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	-11°C	76% 1,4 *trans* [1]
2	30°C	88% 1,4 *trans* [1]

Transition Temperature General: T_m increases with increasing *trans* content

Mechanical Properties:

Mechanical Properties General: Carbon black-filled vulcanisates show high levels of abrasion resistance and resistance to oxidation and crack initiation and when blended with natural rubber, show remarkably low rates of crack growth with high green strength and tack strength

Tensile (Young's) Modulus:

No.	Value	Note
1	1.3 MPa	100% elongation [1]
2	5 MPa	300% elongation [1]

Tensile Strength Break:

No.	Value	Note
1	16.4 MPa	[1]

Mechanical Properties Miscellaneous: The green strength of high *trans* SBR has been reported as the variation of stress with elongation for different levels of *trans* content. [1] Stress relaxation of vulcanisates with carbon black has been measured for high *trans* SBR and compared with soln. SBR and natural rubber [1]
Failure Properties General: Fatigue life has been reported for different degrees of elongation and compared with natural rubber. [1] Tack strength 0.29 MPa (uncured); green strength 2 MPa (uncured) [1]
Friction Abrasion and Resistance: Pico abrasion index for high *trans* SBR in tyre tread vulcanisate 194

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by soln. polymerisation using anionic catalysts

Styrene-isoprene block copolymers S-30

Synonyms: *Styrene-isoprene diblock copolymers. Poly(styrene-block-isoprene). Poly(ethenylbenzene-block-2-methyl-1,3-butadiene)*
Related Polymers: Styrene-isoprene copolymers, SIS, Styrene-isoprene star block copolymers
Monomers: Styrene, Isoprene
Material class: Copolymers
Polymer Type: polyolefins, polydienespolybutadienepolystyrenes-tyrenes
CAS Number:

CAS Reg. No.	Note
25038-32-8	
105729-79-1	block

General Information: The props. of these polymers can vary greatly; for example, SIS triblock copolymers at room temp. have many props. associated with vulcanised rubbers whereas the diblock copolymers are weak materials. Perhaps the most important group commercially are the SIS copolymers
Morphology: Diblock copolymers undergo several phase transitions. These transitions are listed together with transition temp. and any other information for diblock copolymers with varying compositions given in parentheses: lamellae to disordered 250° (42.3% isoprene, M_n 30300) or 239° (40.7% isoprene, M_n 30800); hexagonally perforated layers to bicontinuous cubic (Ia3d) 167° (39.3% isoprene, M_n 31500) or 175° (37.6% isoprene, M_n 31800); bicontinuous cubic (Ia3d) to disordered (39.3% isoprene, M_n 31500) or 234° (37.6% isoprene, M_n 31800); hexagonally packed cylinders to bicontinuous cubic (Ia3d) 182° (35.9% isoprene, M_n 33800); bicontinuous cubic (Ia3d) to disordered 245° (35.9% isoprene, M_n 33800); hexagonally packed cylinders to disordered 285° (33.1% isoprene, M_n 36800). [7] Lamellar spacing remains essentially constant up to 180–200°. Above this temp. the lamellar thickness increases significantly and irreversibly. Linear multiblock copolymers $(SI)_n$ exhibit lamellar morphologies in which the

microdomain periodicity decreases with *n*. [7,10] Morphology of ideal and tapered block copolymers has been reported [4]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	180–200°C	lamellar, MW 25000–100000 [7]

Glass-Transition Temperature:

No.	Value	Note
1	15°C	ideal block, 51% styrene, M_n 97000 [4]
2	39–40°C	tapered block, 47–48% styrene, M_n 43000–36000 [4]
3	82.5–97.7°C	diblock, varying MW and composition [8]
4	-44–40°C	tetrablock, varying composition [2]

Transition Temperature General: T_g increases with increasing M_n [8]. The order-disorder transition temp. of a multiblock copolymer is lower than that of the corresponding diblock copolymer of the same composition and total MW. The order-disorder transition temp. for tapered block copolymers is lower than that of ideal block copolymers [2,4,7,10,17]

Transition Temperature:

No.	Value	Note	Type
1	50°C	approx., diblock, MW 45000, varying styrene content [2,4]	Order-disorder transition
2	230–285°C	diblock [7]	Order-disorder transition
3	111°C	asymmetric diblock, 13% styrene, MW 62600 [17]	Order-disorder transition
4	159°C	asymmetric diblock, 13.5% styrene, MW 78400 [17]	Order-disorder transition
5	200°C	asymmetric diblock, 13.1% styrene, MW 90600 [17]	Order-disorder transition
6	<25°C	max., tetrablock, MW 45000, varying styrene content [2,4]	Order-disorder transition

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, THF, toluene, cyclohexane, methyl cyclohexane, decalin [3,5]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.4 dl g^{-1} (THF, diblock, MW 117000), 1.61 dl g^{-1} (toluene, 33 wt% styrene, MW 293000), 1.4 dl g^{-1} (toluene, 59 wt% styrene, MW, 189000), 0.69 dl g^{-1} (isobutyl methyl ketone, 33 wt% styrene, MW 263000), 0.6 dl g^{-1} (isobutyl methyl ketone, 78 wt% styrene, MW 263000), 1.41 dl g^{-1} (cyclohexane 33 wt% styrene, MW 268000), 0.86 dl g^{-1} (cyclohexane, 78 wt% styrene, MW 269200), 0.29 dl g^{-1} (cyclohexane, tapered long blocks, MW 47800), 0.44dl g^{-1} (cyclohexane, tapered short blocks, MW 62500). [1,3] Theta temps. [1] 44° (butanone), -88° (toluene, MW 256000), -80° (toluene, MW 221000), -93° (toluene, MW 259000), -81° (cyclohexane, MW 256000), -24° (cyclohexane, MW 221000), 6° (cyclohexane, MW 259000). Second virial coefficients have been reported [1]

Polymer Melts: The use of large amplitude oscillatory shear to induce lamellae alignment in diblock copolymer melts has been reported. Lamellae orient parallel to the shearing surfaces at high frequency or low temp. and perpendicular at low frequency/high temp. Mixed parallel and perpendicular morphologies have been identified at intermediate temps. [14,15]

Permeability of Gases: The sorption/desorption of toluene vapour has been used to study the order-disorder transition of the diblock copolymer [16]

Permeability and Diffusion General: Self-diffusion coefficients have been reported for tetrablock copolymers over a range of temps. Self-diffusion coefficient increases with isoprene content and becomes more temp. dependent as the styrene content increases [2]

Mechanical Properties:

Mechanical Properties General: For $(AB)_n$ block copolymers the yield stress and elastic modulus increase with *n*. [11] The optimum shear strength of SI copolymers occurs at approx. 50% polyisoprene. Star copolymers may have higher shear strengths than triblock copolymers of the same MW range; exceptions occur at the extremes of polyisoprene content. In the case of the star copolymers it is the MW of the branches rather than the total number of branches which exerts the greater influence on shear strength [18]

Viscoelastic Behaviour: The viscoelastic props. of tetrablock copolymers of varying compositions and Willams-Landel-Fleming parameters have been reported [2]

Electrical Properties:

Electrical Properties General: Block copolymers can be made electrically conductive by doping with iodine [9]

Optical Properties:

Optical Properties General: The variation of refractive index increment with composition for various block copolymers in several solvents has been reported; a linear relationship independent of chain struct. is found [3]

Transmission and Spectra: Diblock copolymers with MW greater than 1000000 are visibly coloured above a critical concentration in C_6H_6. The critical concentration decreases as MW increases; e.g. critical concentration for MW 470000 is approx. 10% weight and the soln. is blue. Optical props. of these polymers are related to the size of the domains present as a result of phase separation [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Block copolymers with varying block lengths and sequence can be prepared using anionic living polymerisation. It is necessary to exclude water, oxygen or any impurity which may react with the active propagating species. The different copolymers are produced by varying the solvents, initiators and polar modifiers. Sequential living anionic polymerisation has also been used to prepare $(SI)_n$ copolymers with varying styrene content [2,3,10,12]

Applications: Used in pressure-sensitive adhesives, and as reinforcing agents

Trade name	Details	Supplier
SI(11-10)	diblock	Pressure Chemical Co.

Styrene-isoprene copolymers S-31

Synonyms: *Poly(styrene-co-isoprene). Poly(ethenylbenzene-co-2-methyl-1,3-butadiene). Poly(vinylbenzene-co-2-methyl-1,3-butadiene)*
Related Polymers: Styrene-isoprene star block copolymers, Styrene-isoprene block copolymers, SIS
Monomers: Styrene, 2-Methyl-1,3-butadiene
Material class: Copolymers
Polymer Type: styrenes
CAS Number:

CAS Reg. No.
25038-32-8

Molecular Formula: $[(C_8H_8)_x(C_5H_8)_y]_n$
Fragments: C_8H_8 C_5H_8
General Information: Styrene and isoprene may copolymerise to give a variety of products including random, diblock, triblock and star copolymers. The props. of these polymers can vary greatly; e.g. SIS tribock copolymers, at room temp., have many props., associated with vulcanised rubbers whereas the dibock copolymers are weak materials. Perhaps the most important group commercially are the SIS copolymers.

Transport Properties:
Polymer Solutions Dilute: Intrinsic viscosity 0.56 dl g^{-1} (THF, random copolymer, MW 75200, 0.56 dl g^{-1} (cyclohexane, random copolymer, MW 83000)

Styrene-isoprene star block copolymers S-32
Synonyms: *Styrene-isoprene radial block copolymers. Poly(ethenylbenzene-block-2-methyl-1,3-butadiene)*
Related Polymers: Styrene-isoprene copolymers, SIS, Styrene-isoprene block copolymers
Monomers: Styrene, 2-Methyl-1,3-butadiene
Material class: Copolymers
Polymer Type: polydienes, polybutadienepolystyrene
CAS Number:

CAS Reg. No.	Note
25038-32-8	
105729-79-1	block

General Information: There are several types of styrene/isoprene star copolymers: $(AB)_n$, A_nB_n, A_mB_n and gradient-modulus stars
Morphology: Morphology of these polymers has been extensively investigated. Body-centred cubic, a mixture of body-centred and face-centred cubic and face-centred cubic structs. have been reported for $(AB)_n$ stars depending on the concentration. The microphase-separated structs. of stars with diblock arms have been reported. [1,2,5,6] Polystyrene outer blocks in the arms may exist in the form of spheres, cylinders, lamellae or a double-diamond struct. The morphology may depend on the number of arms, the amount of polystyrene in the arm, and the MW of polystyrene. The microphase-separated morphologies of several types of miktoarm polymers has been reported: e.g. morphology is lamellar for star type A_2B (55 wt% styrene, total M_n 70400) or for star type A_3B (57 wt% styrene, total M_n 104000) [9]

Volumetric & Calorimetric Properties:
Transition Temperature:

No.	Value	Note	Type
1	112°C	$(AB)_n$ star, 44% styrene, 4 arms, polystyrene MW 6300 [2,10]	lamellar/disorder
2	155°C	$(AB)_n$ star, 29% styrene, 4 arms, polystyrene MW 7000 [3,12]	PS spheres/disorder
3	97°C	A_3B star, 41% styrene, total M_n 77200 [2,10]	PS cylinder/disorder
4	88°C	A_3B star, 50% styrene, total M_n 73000 [2,10]	PS cylinder/disorder

Transport Properties:
Polymer Solutions Dilute: The micellisation behaviour of miktoarm polymers in comparison to that of linear diblock copolymers has been reported [11]. Studies on the dilute soln. props. of gradient-modulus stars show that they behave as soft rather than hard spheres and that they form unimolecular micelles [12]. Intrinsic viscosity 2.29 dl g^{-1} (toluene, 35°, 3-miktoarm $PS(PI)_2$, 32% styrene, MW 25500), 2.38 dl g^{-1} (dioxane, 26.5°, 3-miktoarm $PS(PI)_2$, 32% styrene, MW 25500), 1.83 dl g^{-1} (cyclohexane, 34.5°, 3-miktoarm $PS(PI)_2$, 32% styrene, MW 25500), 4.83–11.19 d lg^{-1} (dioxane, 26.5°, 16-miktoarm $(PS)_8(PI)_8$, 48–41% styrene, MW 330000–894000) [4,11]. Huggins and second virial coefficients have been reported [13]

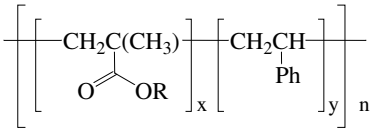
Mechanical Properties:
Mechanical Properties General: Tensile and shear strengths of star copolymers are higher than those of linear block copolymers. The MW of the branches has a greater influence on the strength of the polymer than the total MW. The lowest strengths are found at the extremes of polyisoprene content [13]
Tensile Strength Break:

No.	Value	Note
1	0.5–1.5 MPa	4–17 triblock arms, MW 220000–780000 [13]

Fracture Mechanical Properties: Shear strength 0.9–13.4 MPa (4–17 triblock arms, MW 220000–780000) [13]

Optical Properties:
Transmission and Spectra: H-1 nmr and C-13 nmr spectral data have been reported [3]

Applications/Commercial Products:
Processing & Manufacturing Routes: $(AB)_n$ Star polymers are prepared by cross-linking poly(styrene-*block*-isoprene) diblocks with divinylbenzene or chlorosilanes [5]. Copolymers with two polystyrene arms are two polyisoprene arms (A_2B_2) have been synth. by various routes. [7,8] The synth. of various miktoarm copolymers by anionic polymerisation has been reported [4,9,11]. Gradient-modulus star copolymers are prepared by anionic copolymerisation of tapered block copolymer monoanions with divinylbenzene [12]



Applications: Used in adhesives

107493-06-1	alternating copolymer
107391-68-4	block copolymer
27136-15-8	MMA-*co*-butyl acrylate-*co*-styrene

Morphology: Copolymers with the same composition have the same microstruct. regardless of the solvent used in their preparation [1]. Comb-like graft copolymers can be made with short polystyrene sidechains [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.09 g/cm^3	MMA-*co*-styrene, injection-moulding grade [3]
2	d 1.16 g/cm^3	MMA-*co*-styrene, extrusion grade [3]
3	d^{100} 0.974 g/cm^3	hexyl methacrylate-*co*-styrene, 26 mol% styrene [4]
4	d^{100} 0.984 g/cm^3	hexyl methacrylate-*co*-styrene, 41 mol% styrene [4]
5	d^{25} 1.022 g/cm^3	hexyl methacrylate-*co*-styrene, 26 mol% styrene [4]
6	d^{25} 1.031 g/cm^3	hexyl methacrylate-*co*-styrene, 41 mol% stryrene [4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6×10^{-5}–8×10^{-5} K^{-1}	MMA-*co*-styrene, ASTM D696 [5]	L

Thermodynamic Properties General: The heat capacities of alternating, statistical and diblock copolymers are additive irrespective of sequence length distribution. The glass-transition temp., however, is dependent on sequence length distribution as well as tacticity and composition [6]
Thermal Conductivity:

No.	Value	Note
1	0.189 W/mK	0.0004–0.0005 cal (s cm °C)$^{-1}$, MMA-*co*-styrene, ASTM C177 [5]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.42 kJ/kg.C	0.34 cal (g°C)$^{-1}$, MMA-*co*-styrene [5]	P

Glass-Transition Temperature:

No.	Value	Note
1	111.5°C	MMA-*co*-styrene, statistical copolymer, 29.4% styrene, MW 447000 [6]
2	102.5°C	MMA-*co*-styrene, statistical copolymer, 55.3% styrene, MW 137000 [6]
3	101.1°C	MMA-*co*-styrene, statistical copolymer, 70.3% styrene, MW 270000 [6]
4	97.1°C	MMA-*co*-styrene, alternating copolymer, 50.4% styrene, MW 233000 [6]

5	94.5°C	MMA-*co*-styrene, alternating copolymer, 49.0% styrene, MW 186000 [6]
6	101.8°C	MMA-*co*-styrene, diblock copolymer, 47.0% styrene, MW 828000 [6]
7	173°C	MMA-*co*-styrene, diblock copolymer, 47% styrene, MW 828000 [6]
8	78°C	ethyl methacrylate-*co*-styrene, statistical copolymer, 52.6% styrene [8,9]
9	75°C	ethyl methacrylate-*co*-styrene, alternating copolymer, 50.2% styrene [8,9]
10	43°C	butyl methacrylate-*co*-styrene, alternating copolymer, 47.4% and 52.1% styrene [8,9]
11	65°C	isobutyl methacrylate-*co*-styrene [9]
12	4°C	hexyl methacrylate-*co*-styrene, 26 mol% styrene [4]
13	14°C	hexyl methacrylate-*co*-styrene, 41 mol% styrene [4]
14	-1°C	octyl methacrylate-*co*-styrene, alternating copolymer, 51.4% styrene [8]
15	-21–77°C	octyl methacrylate-*co*-styrene, statistical copolymer, 15.6–92.1% styrene [8]

Transition Temperature General: T_g at the surface of a diblock copolymer is much lower than that of the bulk copolymer. T_g decreases as depth decreases. MW dependence of T_g is more pronounced than in the bulk sample [7]. T_g varies with styrene content [8]

Deflection Temperature:

No.	Value	Note
1	98°C	1.82 MPa, MMA-*co*-styrene, annealed, injection-moulding grade, ASTM D648 [3]
2	99°C	1.82 MPa, MMA-*co*-styrene, annealed, extrusion grade, ASTM D648 [3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.14 $J^{1/2}$ $cm^{-3/2}$ (7.41 $cal^{1/2}$ $cm^{-3/2}$, butyl methacrylate-*co*-styrene, 58% wt styrene) [10], 15.14 $J^{1/2}$ $cm^{-3/2}$ (7.41 $cal^{1/2}$ $cm^{-3/2}$, isobutyl methacrylate-*co*-styrene, 80% wt styrene) [10]

Solvents/Non-solvents: MMA-*co*-styrene sol. CCl_4, toluene, *o*-xylene, C_6H_6, 2-butanone, chlorobenzene, CH_2Cl_2, Me_2CO, isopropyl methyl ketone, *o*-dichlorobenzene, cyclopentanone, pyridine, *o*-toluidine.; insol. Freon-215, isopentane, isooctane, pentane, hexane, octane, methylcyclohexane, cyclohexane, propanol, EtOH, MeOH; isobutyl methacrylate-*co*-styrene sol. white spirit, aromatics, esters, chlorinated hydrocarbons. Other solubility data have been reported [11]

Transport Properties:

Transport Properties General: At moderate concentrations in solvents that are selective (*i.e.*, solvent for one block only), the block copolymers form multinuclear micelles. Addition of a selective non-solvent for one component to a soln. of a block copolymer, e.g., acetonitrile to C_6H_6 soln., forms a colloidal dispersion with polystyrene at the core of the aggregated chains and poly(methyl methacrylate) at the surface [14,15,16]

Melt Flow Index:

No.	Value	Note
1	0.2 g/10 min	190°, 10 kg, MMA-*co*-styrene, extrusion grade, ASTM D1238 [3]
2	0.7 g/10 min	230°, 3.8 kg, MMA-*co*-styrene, extrusion grade, ASTM D1238 [3]
3	0.13 g/10 min	230°, 1.2 kg, MMA-*co*-styrene, extrusion grade, ASTM D1238 [3]
4	4.3 g/10 min	190°, 10 kg, MMA-*co*-styrene, injection-moulding grade, ASTM D1238 [3]

Polymer Solutions Dilute: Intrinsic viscosity (MMA-*co*-styrene, random copolymer) 0.93 dl g^{-1} (C_6H_6, 35% wt styrene, MW 250000), 0.96 dl g^{-1} (chlorobenzene), 0.94 dl g^{-1} (dioxane), 1.18 dl g^{-1} ($CHCl_3$), 0.95 dl g^{-1} (THF), 0.72 dl g^{-1} (*p*-xylene) [12]; (MMA-*co*-styrene, diblock copolymer) 0.227 dl g^{-1} (30°, toluene, 48% wt styrene, MW 581000) [13], 1.53 dl g^{-1} (C_6H_6, 52% wt styrene, MW 603000) [12], 1.42 dl g^{-1} (dioxane, 52% wt styrene, MW 603000) [12], 1.78 dl g^{-1} ($CHCl_3$, 52% wt styrene, MW 603000) [12], 1.36 dl g^{-1} (THF, 52% wt styrene, MW 603000) [12], 0.168 dl g^{-1} (diethyl malonate, 48% wt styrene, MW 581000) [13], 0.192 dl g^{-1} (*p*-xylene, 48% wt styrene, MW 581000) [13], 0.167 dl g^{-1} (30°, 1-chlorobutane, 48% wt styrene, MW 581000) [13]. Theta temps. 25° (butanone/MeOH, 99.4/0.6, isooctyl methacrylate-*co*-styrene, 80% styrene) [17]; (MMA-*co*-styrene): 20° (C_6H_6/hexane, 44/56, 76.3% styrene) [18], 63° (cyclohexanol, 70.2% styrene) [19], 58.4° (2-ethoxyethanol, 56.2% styrene) [19], 20° (C_6H_6/isopropanol, 48/52, 42.3% styrene) [18], 60.8° (cyclohexanol, 50% styrene, alternating copolymer) [20], 68.2° (cyclohexanol, 28.5% styrene, random copolymer) [21], 72.8° (2-ethoxyethanol, 69.4% styrene, random copolymer) [21], 84° (cyclohexanol, 84.6% styrene, block copolymer) [21], 69.5° (2-ethoxyethanol, 35.9% styrene, block copolymer) [21]

Polymer Melts: Viscoelastic coefficients have been reported [22]

Water Absorption:

No.	Value	Note
1	0.15%	24h, MMA-*co*-styrene, injection-moulding grade, ASTM D570 [3]
2	0.17%	24h, MMA-*co*-styrene, extrusion grade, ASTM D570 [3]

Mechanical Properties:

Mechanical Properties General: The tensile strength and hardness of the MMA/butyl acrylate/styrene copolymer increase with increasing polystyrene or methyl methacrylate content but the elongation decreases. Tensile strength decreases as the MW of the polystyrene macromonomer increases

Tensile (Young's) Modulus:

No.	Value	Note
1	3500 MPa	MMA-*co*-styrene, injection-moulding grade, ASTM D638 [3]
2	3300 MPa	MMA-*co*-styrene, extrusion grade, ASTM D638 [3]
3	2960 MPa	430 kpsi, MMA-*co*-styrene, ASTM D638 [5]
4	330 MPa	MMA-*co*-styrene, alternating copolymer [6]

Flexural Modulus:

No.	Value	Note
1	3300 MPa	MMA-*co*-styrene, extrusion grade, ASTM D790 [3]
2	3500 MPa	MMA-*co*-styrene, injection-moulding grade, ASTM D790 [3]
3	1790–2620 MPa	260-380 kpsi, MMA-*co*-styrene, ASTM D790 [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	57.2 MPa	MMA-*co*-styrene, injection-moulding grade, ASTM D638 [3]	2%
2	68.2 MPa	MMA-*co*-styrene, extrusion grade, ASTM D638 [3]	5%
3	68.9 MPa	10 kpsi, MMA-*co*-styrene, ASTM D638 [5]	3%
4	11.3 MPa	MMA-*co*-styrene, alternating copolymer [6]	3.4%

Flexural Strength at Break:

No.	Value	Note
1	103 MPa	MMA-*co*-styrene, injection-moulding grade, ASTM D790 [3]
2	116 MPa	MMA-*co*-styrene, extrusion grade, ASTM D790 [3]

Compressive Modulus:

No.	Value	Note
1	1650–2550 MPa	240–370 kpsi, MMA-*co*-styrene, ASTM D695 [5]

Compressive Strength:

No.	Value	Note
1	75.8–103.3 MPa	11–15 kpsi, MMA-*co*-styrene, ASTM D695 [5]

Viscoelastic Behaviour: Williams-Landel-Ferry constants of MMA-*co*-styrene [22] and hexyl methacrylate-*co*-styrene [4] for temp. superposition have been reported
Hardness: Rockwell M64 (MMA-*co*-styrene, injection-moulding grade, ASTM D785) [3], M80 (MMA-*co*-styrene, extrusion grade, ASTM D785) [3]
Izod Notch:

No.	Value	Notch	Note
1	20 J/m	Y	MMA-*co*-styrene, MEC, ASTM D256 [3]
2	16 J/m	Y	0.3 ft lb in^{-1}, MMA-*co*-styrene, ASTM D256 [5]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.53	MMA-*co*-styrene, extrusion grade, ASTM D542 [3]
2	1.56	MMA-*co*-styrene, injection-moulding grade, ASTM D542 [3]
3	1.567	MMA-*co*-styrene, ASTM D542 [5]

Transmission and Spectra: Light transmission 90% (MMA-*co*-styrene, MEC) [3]
Volume Properties/Surface Properties: Haze 2% (MMA-*co*-styrene, extrusion grade) [3]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	82–93°C	180–200°F, MMA-*co*-styrene, continuous [5]

Flammability: Burning rate of MMA-*co*-styrene is slow (1.3 in min^{-1}) (ASTM D635) [5]
Environmental Stress: MMA-*co*-styrene is unaffected by sunlight [5]
Chemical Stability: MMA-*co*-styrene is unaffected by weak acids, weak or strong alkalis. Attacked by strong oxidising acids and organic solvents (ketones, esters, aromatic hydrocarbons and chlorinated hydrocarbons) [5]
Stability Miscellaneous: Most of the volatile products from the γ-irradiation of the copolymers result from fragmentation of the MMA units [23]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed by compression or injection moulding
Mould Shrinkage (%):

No.	Value	Note
1	0.2–0.6%	MMA-*co*-styrene [5]

Applications: May be used to strengthen the interfaces between immiscible homopolymers; random copolymers are more effective than block copolymers. The copolymers are added to homopolymer blends to improve adhesion and hence the mech. props., e.g. the fracture toughness of the interface can be increased with the copolymer efficiency increasing in the order: block > graft > random. Styrene/MMA block copolymers are used as coupling agents between PS and PMMA or between PPO and PMMA in blends where miscibility is a problem. Strong interfaces result when the MW of the copolymer is ≥84000 (for PS/PMMA blends) and 80000 (PPO/PMMA blends). Other applications of the copolymers are as binders in lithographic and other coatings; as toners; in photographic paper; in optical discs and in adhesives

Syndiotactic polypropylene S-34

Synonyms: *Polypropene-syndiotactic. PP-syndiotactic. Poly(1-propene) syndiotactic*
Related Polymers: For more general information including other stereoisomers see Polypropylene.
Monomers: Propylene
Material class: Thermoplastic
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
9003-07-0

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
General Information: Only crystalline syndiotactic poly(1-alkene) known at present. Not as readily prepared by normal commercial processes as the other stereoisomers and so tends to be of limited application

Volumetric & Calorimetric Properties:

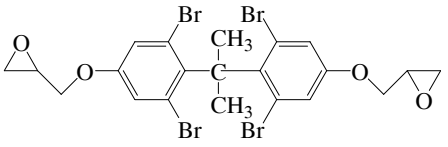
Density:

No.	Value	Note
1	d 0.91–0.989 g/cm^3	cryst.
2	d 0.856 g/cm^3	amorph., calc.

Latent Heat Crystallization: Entropy of polymerisation ΔS° 191 J K^{-1} mol^{-1} (25°, monomer gas phase, polymer crystalline/partly crystalline) [1,4]

Transport Properties:

Polymer Solutions Dilute: Theta temp. θ 42° (isoamyl acetate, by virial coefficients) [1,2]



Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [5]
Molar Refraction: dη/dc 0.1077 (30°, 436 nm, heptane) [1,2]

(2,2′,6,6′-Tetrabromobisphenol A diglycidyl ether) resin T-1

Synonyms: *[2,2′-[(1-Methylethylidene)bis(2,6-dibromo-4,1-phenylene)oxymethylene]]bisoxirane resin*
Monomers: 2,2′,6,6′-Tetrabromobisphenol A, (Chloromethyl)oxirane
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.	Note
33294-14-3	
107632-52-0	(copolymer with methylenedianiline)
105186-73-0	(copolymer with bisphenol A dicyanate)
87036-50-8	(copolymer with phthalic anhydride)

Molecular Formula: $(C_{21}H_{20}Br_4O_4)_n$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.646 g/cm^3	phthalic anhydride cured, 0.67 mol phthalic anhydride [13]

Transition Temperature General: T_g of methylenedianiline cured resin decreases with increasing water content [10]
Deflection Temperature:

No.	Value	Note
1	82°C	1.82 MPa, DER 542, anhydride cured [14]
2	192°C	dry, bisphenol A dicyanate cured [11]
3	172°C	wet, bisphenol A dicyanate cured [11]

Transport Properties:

Polymer Solutions Dilute: Viscosity has a minima at approx. 130° and depends upon the degree of B-staging of the resin; the lower the degree of B-staging, the lower the minimum viscosity [8]
Water Content: Cured resin shows very little water sorption compared to its non-brominated analogue [10]
Water Absorption:

No.	Value	Note
1	0.8%	64h, 92°, >95% relative humidity, bisphenol A dicyanate cured [11]

Mechanical Properties:

Mechanical Properties General: Elastic props. have been reported [1]
Flexural Modulus:

No.	Value	Note
1	3585 MPa	520 kpsi, bisphenol A dicyanate cured [11]
2	3589 MPa	36600 kg cm^{-2}, DER 542, anhydride cured [14]

Tensile Strength Break:

No.	Value	Note	Elongation
1	40.6 MPa	414 kg cm^{-2}, DER 542, anhydride cured [14]	0%

Flexural Strength at Break:

No.	Value	Note
1	124.8 MPa	18.1 kpsi, bisphenol A dicyanate cured [11]

Flexural Strength Yield:

No.	Value	Note
1	73 MPa	745 kg cm^{-2}, DER 542, anhydride cured [14]

Compressive Strength:

No.	Value	Note
1	229.5 MPa	2340 kg cm^{-2}, DER 542, anhydride cured [14]

Viscoelastic Behaviour: Acoustic behaviour has been reported [6]
Hardness: Rockwell M106 (DER 542, anhydride cured) [14]
Izod Notch:

No.	Value	Notch	Note
1	12.28 J/m	Y	0.23 ft lb in^{-1}, room temp., DER 542, anhydride cured [14]

Electrical Properties:

Electrical Properties General: Dielectric loss factor as a function of temp. has been reported [9]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.4	1 MHz	DER 542, anhydride cured [14]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.038	1 MHz	DER 542, anhydride, cured [14]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.614	20°, phthalic anhydride cured, 0.67 mol phthalic anhydride [13]

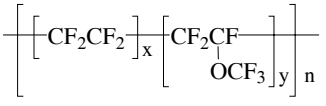
Transmission and Spectra: H-1 nmr spectral data have been reported [7]

Polymer Stability:

Polymer Stability General: Degradation studies have been reported [2]
Decomposition Details: Details of thermal degradation have been reported. [3] Pyrolysis produces hydrogen bromide gas, with max. liberation at 400° [5]
Flammability: Inherently flame retarding owing to a lowering of temp. through degradation and the formation of hydrogen bromide. [5] Flammability rating V0 (bisphenol A dicyanate cured, UL94) [11]

Environmental Stress: The effects of irradiation with uv have been reported [4]

Applications/Commercial Products:



Processing & Manufacturing Routes: Solventless curing may be undertaken using bisaspartimide-diamine compounds. [12]
Processed by casting [14]
Applications: Main use in printed circuit boards. Other applications where flame retardancy required

Trade name	Details	Supplier
DER 542	Anhydride; discontinued material	Dow
EpiRez	5163	Interez

Tetrafluoroethylene-perfluoromethylvinyl ether copolymer T-2

Synonyms: *PFA. Poly(tetrafluoroethene-co-trifluoro(trifluoromethoxy)ethene). Poly(tetrafluoroethylene-co-trifluoromethyl trifluorovinyl ether). Poly(tetrafluoroethylene-co-trifluorovinyl trifluoromethyl ether). Poly(tetrafluoroethene-co-perfluoro(methyl vinyl) ether)*
Related Polymers: Carbon-filled PFA, Glass filled PFA, PTFE filled PFA, Mineral and mica filled PFA, PTFE and carbon-filled PFA
Monomers: Tetrafluoroethylene, Perfluoro(methyl vinyl ether)
Material class: Copolymers, Thermoplastic
Polymer Type: PFA, fluorocarbon (polymers)
CAS Number:

CAS Reg. No.	Note
26425-79-6	
112652-06-9	alternating

Molecular Formula: $[(C_2F_4)_x(C_3F_6O)_y]_n$
Fragments: C_2F_4 C_3F_6O
Morphology: Chain flexibility is increased relative to PTFE alone [23]

Miscellaneous: The characteristic props. and uses of the Kalrez elastomer have been reported [8,20]. Props. of ECD-006 have been reported [21]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2.12–2.19 g/cm^3	[1]
2	d 2.14 g/cm^3	Hyflon [2]
3	d 2.15 g/cm^3	Teflon PFA [3]
4	d 2.13 g/cm^3	Teflon PFA 200 LP [25]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00012–0.000199 K^{-1}	[1]	L
2	0.000288 K^{-1}	Hyflon [2]	L

Melting Temperature:

No.	Value	Note
1	300°C	Hyflon [2]
2	306°C	Teflon PFA [3]

Glass-Transition Temperature:

No.	Value	Note
1	-12°C	17.5 mol% perfluoro(methyl vinyl) ether [13]
2	-12°C	PTFE/perfluoro(methyl vinyl) ether 60:40 mol% [26]

Transition Temperature General: Low-temp. transitions are observed only in copolymers where the perfluoro(methyl vinyl) ether content is below 4 mol% [11]
Transition Temperature:

No.	Value	Note	Type
1	-60°C	1 kHz, 17.5 mol% perfluoro(methyl vinyl) ether [13]	T_γ
2	-179°C	1 kHz, 17.5 mol% perfluoro(methyl vinyl) ether [13]	T_δ
3	-245°C	1 kHz, 17.5 mol% perfluoro(methyl vinyl) ether [13]	T_ϵ

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameters of the rubber have been reported [18,19]
Solvents/Non-solvents: ECD-006 sol. highly fluorinated solvents; insol. most organic solvents, acids, bases [26]

Transport Properties:

Transport Properties General: Melt flow index is only slightly dependent upon the time of thermal ageing [6]
Permeability of Gases: ECD-006 has low permeability to gases [26]
Permeability of Liquids: Permeability to moisture has been reported [12]
Water Absorption:

No.	Value	Note
1	0.03%	24h [1]

Gas Permeability:

No.	Gas	Value	Note
1	H_2O	985 cm^3 mm/(m^2 day atm)	1.5 × 10^{-10} cm^2 (s torr)$^{-1}$, Kalrez [17]

Mechanical Properties:

Mechanical Properties General: ECD-006 has poor mech. props. at high temps. [26]
Flexural Modulus:

No.	Value	Note
1	690 MPa	[1]
2	624.7 MPa	6370 kg cm^{-2}, Hyflon [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	29 MPa	room temp. [1]	200%
2	24.8 MPa	253 kg cm^{-2}, Hyflon [2]	300%

Tensile Strength Yield:

No.	Value	Note
1	13.8–18.6 MPa	141–190 kg cm^{-2}, Teflon PFA [3]

Hardness: Shore D60 [1,2], A74 (Kalrez 1050) [22]
Izod Notch:

No.	Notch	Break	Note
1	Y	No break	[1,2]

Electrical Properties:

Electrical Properties General: Dielectric props. at low temps. have been reported [16]. The dissipation factor spectrum shows only a small γ-transition peak [25]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.1	60–1 kHz	[1]
2	2.1	1 MHz	dry [1,2]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	[1]

Complex Permittivity and Electroactive Polymers: Stability to charge storage can be improved by constant current corona charging [4,15]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00415	50 Hz	Hyflon [2]

Optical Properties:

Transmission and Spectra: F-19 nmr spectral data have been reported [7,10]
Volume Properties/Surface Properties: Clarity transparent to translucent [1]

Polymer Stability:

Thermal Stability General: ECD-006 is stable to heating in air for one month at 300° [26]
Upper Use Temperature:

No.	Value	Note
1	260°C	[1,2,3]

Decomposition Details: The major products of pyrolysis include tetrafluoroethene, hexafluoroethane and perfluoro(methyl vinyl) ether [14]. Heating at 275° for up to 80h gives only low yields (approx. 0.0002 mol g^{-1} of polymer) of hydrogen fluoride [24]
Flammability: Flammability is dependent on struct. but not on MW [9]
Chemical Stability: Kalrez 1050 is swollen by 91.6% by dichlorotetrafluoroethane after 21 d at 177° and by 26.2% under the same conditions in geothermal brine. Essentially unaffected, apart from slight soln. discoloration, after immersion under the same conditions in Mobil lubricating oil [22]. ECD-006 is stable to inorganic acids, bases, oxidising and reducing agents, and is not swollen by most common solvents
Stability Miscellaneous: Effect of γ-irradiation upon physico-chemical props., including dielectric loss, has been reported [5]. Thermal annealing produces two melting peaks which depend strongly on annealing temp. and time [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed by compression, injection or extrusion moulding. May be synth. by aq. emulsion polymerisation at 40–100° under pressure for a few hours using ammonium persulfate initiator [26]
Mould Shrinkage (%):

No.	Value	Note
1	4%	[1]
2	5%	Hyflon [2]

Applications: Potential applications as coating for electrical wires; in hoses, pipes and tubes. ECD-006 has potential applications in electrical insulation and seals for aircraft engines and scientific equipment

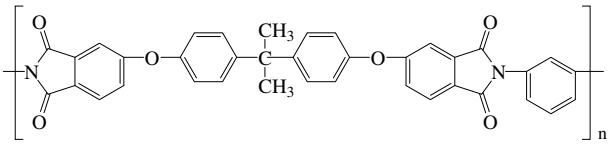
Tetrafluoroethylene-propylene copolymer T-3

Synonyms: *TFE/P copolymer. PTFE/PP copolymer. Poly(tetrafluoroethene-co-1-propene)*
Monomers: Tetrafluoroethylene, Propylene
Material class: Copolymers
Polymer Type: polypropylene, PTFEfluorocarbon (polymers)
CAS Number:

CAS Reg. No.
27029-05-6

Polymer Stability:

Polymer Stability General: Vulcanised elastomer displays excellent heat and chemical resistance, owing to high stability of cross-links, in addition to inherent thermal and chemical inertness
Thermal Stability General: When vulcanised is stable at temps. of approx. 230° for months
Upper Use Temperature:



No.	Value	Note
1	300°C	approx., short time

Decomposition Details: Onset of thermal decomposition in both air and N_2 occurs at approx. 415°
Chemical Stability: Swollen to some extent by trichoroethylene, $CHCl_3$, Me_2CO, CCl_4 and C_6H_6 vulcanised (peroxide-cured) elastomer displays excellent resistance to acids, bases, water, steam and oils (ASTM D471-68). Has excellent resistance to amine-corrosion inhibitors and bleach. A typical (peroxide-cured) vulcanisate approx. 55 mol% TFE) is unaffected by conc. strong acids and bases, even at high temp. Is fairly resistant to oxidising and reducing agents and lubricating oils, has limited resistance to aromatic hydrocarbons (relatively low fluorine content). Resistant to ketones, and display exceptional resistance to dehydrofluorination and embrittlement by organic bases such as amines, relatively highly swollen by AcOH

Ultem 1000 U-1

Synonyms: *Poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,3-phenylene(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)oxy-1,4-phenylene(1-methylethylidene)-1,4-phenyleneoxy]*
Related Polymers: Ultem 5001
Monomers: Bisphenol A
Material class: Thermoplastic
Polymer Type: polyether-imide
CAS Number:

CAS Reg. No.
61128-24-3

Molecular Formula: $(C_{37}H_{24}N_2O_6)_n$
Fragments: $C_{37}H_{24}N_2O_6$
Molecular Weight: M_n 8490–15000. MW 14700–28800. M_w/M_n 2.95. MW 35700
Additives: Glass fibre may be used to increase mech. props.
Morphology: Amorph.
Miscellaneous: Performance characteristics have been reported [5]. Reviews of props. have been reported [8,9,10,11,40]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d1.28 g/cm^3	1 mil thick film [18]
2	d1.285 g/cm^3	[24]
3	d1.278 g/cm^3	compression moulded [32]
4	d1.27 g/cm^3	ASTM D792 [36,41]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.6×10^{-5} K^{-1}	mould direction, ASTM D696 [36]	L

Thermal Conductivity:

No.	Value	Note
1	0.22 W/mK	ASTM C177 [36,41]

Thermal Diffusivity: 1.39×10^{-7} m^2 s^{-1} (40°, 50 μm thick). Thermal diffusivity decreases with increasing temp. [14]
Glass-Transition Temperature:

No.	Value	Note
1	215°C	[13,28]
2	231°C	[14,26]
3	215°C	[18]
4	218.7°C	[22]
5	230°C	[27]
6	217°C	[29]
7	220°C	[32,34]

Transition Temperature General: The temp. range of physical ageing extends from T_g to temps. within the T_β range [34]
Deflection Temperature:

No.	Value	Note
1	200°C	1.8 MPa, ASTM D648 [29,36,41]
2	210°C	0.45 MPa, ASTM D648) [29,36,41]

Vicat Softening Point:

No.	Value	Note
1	219°C	Method B, ASTM D1525 [36,41]

Transition Temperature:

No.	Value	Note	Type
1	82°C	approx. [22]	Tβ
2	74°C	approx. [34]	Tβ
3	-113°C	[22]	Tγ
4	-111°C	[34]	Tγ

Surface Properties & Solubility:

Solubility Properties General: Miscibility with poly(aryl ether ketones) is dependent on the struct. of both components. Poly(aryl ether ketones) based on bisphenol A or a sulfonyl diphenol struct. are immiscible with Ultem [4]. Miscible with poly(ether ether ketone) in the amorph. state [20]
Cohesive Energy Density Solubility Parameters: δ 28.8 J$^{1/2}$ cm$^{-3/2}$ [24]
Plasticisers: CO_2 [22]
Solvents/Non-solvents: Sol. DMF, $CHCl_3$, CH_2Cl_2, *N*-methylpyrrolidone, dimethylacetamide [28]. Insol. DMSO

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	8.9 g/10 min	ASTM D1238 [41]

Polymer Solutions Dilute: Rheological props. have been reported [17]. η 0.39–0.56 dl g^{-1} (DMF, 25°, dependent on method of synth.) [27], 0.28 dl g^{-1} (CH_2Cl_2) [27], 0.5 dl g^{-1} (*m*-cresol) [28]
Polymer Melts: Melt rheology has been reported [35]
Permeability of Gases: The permeability of CO_2 has been reported [1]. Diffusion coefficients (1 mil film, 35°) [CO_2] 1.14×10^{-8} cm^2 s^{-1}, [CH_4] 0.113×10^{-8} cm^2 [N_2] 0.572×10^{-8} cm^2 s^{-1} [18]. Diffusion coefficient of O_2 has been reported [31]
Water Absorption:

No.	Value	Note
1	0.25%	24 h, 23°, ASTM D570 [36,41]
2	1.25%	equilibrium, 23°, ASTM D570 [36,41]

Mechanical Properties:

Mechanical Properties General: Ultimate elongation 60% (4 mm thick) [32], (Type I, 0.125" thick) [41]

Tensile (Young's) Modulus:

No.	Value	Note
1	3000 MPa	4 mm thick [32]
2	3800 MPa	20°, compression moulded [32]

Flexural Modulus:

No.	Value	Note
1	2068.2 MPa	300 kpsi, 180° [29]

Tensile Strength Break:

No.	Value	Note
1	41.4 MPa	6 kpsi, 180° [29]

Poisson's Ratio:

No.	Value	Note
1	0.36	ASTM D638 [41]

Viscoelastic Behaviour: Stress-strain relationship under load is linear below the proportional limit [29]
Hardness: Rockwell M109 [33] (ASTM D785) [36,41]
Fracture Mechanical Properties: Shear strength 103.41 MPa (ASTM D732) [41]. K_{Ic} 2.93 Mpa $m^{1/2}$ (20°, 4 mm thick, 0.00016 s^{-1} strain rate) [32] G_{Ic} 2042 J m^{-2} (20°, 4 mm thick, 0.00016 s^{-1} strain rate) [32]. Stress endurance limit 24 MPa, which increases with orientation [32]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	100×10^{15} Ω.cm	24°, ASTM D257 [29]	S
2	0.17×10^{15} Ω.cm	150°, ASTM D257 [29]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.08	60 Hz	150°, ASTM D150 [29]
2	3.06	1 kHz	150°, ASTM D150 [29]
3	3.05	1 MHz	150°, ASTM D150 [29]
4	3.15	60 Hz	24°, ASTM D150 [29]
5	3.15	1 kHz	24°, ASTM D150 [29,36,41]
6	3.13	1 MHz	24°, ASTM D150 [29]
7	3.15	100 Hz	ASTM D150 [41]

Dielectric Strength:

No.	Value	Note
1	24 $kV.mm^{-1}$	24°, ASTM D149 [29]
2	28 $kV.mm^{-1}$	0.0625" thick, in oil, ASTM D149 [36,41]
3	33 $kV.mm^{-1}$	0.0625" thick, in oil, ASTM D149 [36,41]

Arc Resistance:

No.	Value	Note
1	128s	ASTM D495 [36]

Complex Permittivity and Electroactive Polymers: Comparative tracking index 160 V (24°, ASTM D3638) [29]

Optical Properties:

Optical Properties General: Complex refractive index data have been reported [2]

Refractive Index:

No.	Value	Note
1	1.662	22° [21]

Polymer Stability:

Thermal Stability General: Thermal stability under a flow of N_2 has been reported [6]
Upper Use Temperature:

No.	Value	Note
1	170°C	[36]

Decomposition Details: Heating at 380° *in vacuo* for 6 min. causes cross-linking. 5% Weight loss occurs at 514°. 30% Weight loss at 572° [26]. 5% Weight loss in air at 499° (at 508° under N2)[28]
Flammability: Self-ignition temp. 535° (ASTM D1929) [29]; fl. p. 520° (ASTM D1929) [29]. Flammability rating V0 (0.025" thick, UL94) [29,36,41], 5V (0.075" thick, UL94) [29,36,41]. Limiting oxygen index 47% (ASTM D2863) [29,36,41]. Other details on flammability have been reported [38]
Environmental Stress: Exposure to atomic oxygen for 4 h leads to mass loss and deterioration in flexural props. [16] Good resistance to uv, with only slight surface degradation after 2500 h exposure. [29] Has greater resistance to environmental stress cracking and crazing than do most other amorph. thermoplastics [30]
Chemical Stability: Has greater stability than most amorph. thermoplastics. [29] Attacked in the long term by aliphatic amines, NH_3 and hydrazine, and aq. solns. with pH greater than 8 [29]. Disintegrates on prolonged exposure to 10% sodium hydroxide at 96° [39]
Hydrolytic Stability: Stability to hot H_2O and steam has been reported [37] Exhibits internal crack formation upon both cyclic and continuous exposure to H_2O at 96°. The cracks form 0.0625" from the injection moulded surface [39]. Steam sterilisation causes only minimal internal crack formation and increases tensile strength. Tensile impact strength is only reduced significantly after 100 cycles of steam sterilisation [39]
Stability Miscellaneous: Electron-beam irradiation causes deterioration of tensile props. only at exposure levels of 100 Mrad [3]. Electron-beam irradiation at 1 Grad causes cross-linking and embrittlement due to dehydrogenation of the methyl groups and cleavage of ether linkages [7]. Good stability to γ-irradiation [29]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by imidisation of poly(amic acid) salts at 250–300° [12]. Also synth. by polyimidisation by treating dianhydrides with diamines [15]. Processed by injection moulding [23] or extrusion [41]. Synth. by reaction of the disodium salt of bisphenol A with a nitro-substituted bisimine in DMSO/toluene at 40–50° under N_2; displacement of the nitro groups is achieved to form the polymer [27,28]
Mould Shrinkage (%):

No.	Value	Note
1	0.5–0.7%	[36]

Applications: Potential use in underground trains, shipboards and in wiring of airframes. Other usage includes microwave oven trays, iron compounds and medical products which require repeated sterilisation

Trade name	Supplier
Standard sample	Mitsubishi Chem.
Ultem	General Electric

Ultem 5001 U-2

Synonyms: *Poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,4-phenylene(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)oxy-1,4-phenylene(1-methylethylidene)-1,4-phenyleneoxy]*
Related Polymers: Ultem 1000
Monomers: Bisphenol A
Material class: Thermoplastic
Polymer Type: polyether-imide
CAS Number:

CAS Reg. No.
61128-25-4

Molecular Formula: $(C_{37}H_{24}N_2O_6)_n$
Fragments: $C_{37}H_{24}N_2O_6$
Miscellaneous: The Ultem grade CRS5001 has improved resistance to strong acids, strong bases, aromatics and ketones. It complies with FDA and USP class VI regulations in colour 1000 [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d1.28 g/cm^3	ASTM D792 [2]

Deflection Temperature:

No.	Value	Note
1	208.8°C	1.82 MPa, 0.25 in. thick, unannealed, ASTM D648 [2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 14.14 [1]
Solvents/Non-solvents: Sol. CCl_4, $CHCl_3$, CH_2Cl_2, dichloroethane, THF, cyclohexanone, Me_2CO, 1,4-dioxane, *N,N*-dimethylacetamide, DMF, pyridine [1]. Insol. hexane, cyclohexane, xylene, toluene, C_6H_6, Et_2O, pentyl acetate, EtOAc, 2-butanone, butanol, isopropyl alcohol, propanol, EtOH, AcOH, formic acid, MeOH, glycol, glycerol

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	4.2 g/10 min	ASTM D1238 [2]

Permeability of Liquids: The diffusion of distilled H_2O through a membrane of the polymer at 28 psi decreases with an increase in polymer concentration but increases in the presence of additives, provided the additive concentration does not exceed 6% [1]
Water Absorption:

No.	Value	Note
1	0.16%	24 h, 23°, ASTM D570 [2]

Mechanical Properties:

Mechanical Properties General: Elongation at break of Ultem Type I material 70% (0.125" thick, ASTM D638) [2]

Tensile (Young's) Modulus:

No.	Value	Note
1	2895.5 MPa	420 kpsi, 0.125" thick, Ultem Type I, ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	3102.3 MPa	450 kpsi 0.25 in. thick, Ultem, ASTM D790 [2]

Tensile Strength Yield:

No.	Value	Note
1	99.96 MPa	14.5 kpsi 0.125 in. thick, Ultem Type I, ASTM D638 [2]

Flexural Strength Yield:

No.	Value	Note
1	137.9 MPa	20 kpsi, 0.25" thick, Ultem, ASTM D790 [2]

Hardness: Rockwell R123 (Ultem, ASTM D785) [2]
Friction Abrasion and Resistance: Taber abrasion 10 mg (1000 cycles)$^{-1}$ (CS-17, 1 kg, ASTM D1044) [2]
Izod Notch:

No.	Value	Notch	Note
1	1281 J/m	N	24 ft Ib in^{-1} , Ultem, ASTM D4812 [2]
2	53.3 J/m	Y	1 ft Ib in^{-1}, Ultem, ASTM D256 [2]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
2	58×10^{15} Ω.cm	ASTM D257 [2]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.12	100 Hz	ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	17.95 kV.mm^{-1}	456 V mil^{-1}, in oil, 125 mils, ASTM D149

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0017	100 Hz	ASTM D150 [2]

Polymer Stability:

Flammability: Flammability rating V0 (0.063 in. thick, UL94) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed by extrusion or injection moulding [2]

Trade name	Details	Supplier
Standard sample		Shanghai Synthetic Resin Institute
Ultem	5000	General Electric

Ultra high molecular weight PE U-3

Synonyms: *UHMWPE*
Related Polymers: Polyethylenes, HDPE, Polyethylene film, Polyethylene fibre
Monomers: Ethylene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	used for all density types

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
Molecular Weight: 3000000–6000000 (ASTM D4020), MW as low as 1000000 have been reported
Additives: Graphite fibre, powdered metal, glass fibre, glass bead fillers used to increase stiffness and heat deflection temp
General Information: High degree of linearity and very long chain length lead to low crystallinity (ca. 40–45%) and fairly low density, [1,2,3] giving rise to anomalous props.
Morphology: Drawing into fibres gives almost perfect orientations. This results in predominantly orthorhombic crystallisation (with traces of non-orthorhombic crystals and a low amorph. content) unit cell dimensions a 7.36, b 4.89. Thermal expansion coefficient is higher in 'a' direction than in 'b' direction giving a transformation to a pseudohexagonal form [4]
Miscellaneous: Props. can be substantially improved using a melt/solid phase compressive deformation process [24]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.93–0.94 g/cm^3	ASTM D742 [1,2,3,5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00013 K^{-1}	-30–30° ASTM D696 [2,5]	L
2	0.0002 K^{-1}	30–60°, ASTM D696 [2,5]	L

Melting Temperature:

No.	Value	Note
1	125–135°C	cryst. [2,5,6]

Transition Temperature General: T_m and crystallinity vary with thermal history of sample, size and batch variation [12]. Heating above T_m changes appearance from opaque to clear [2,5,6]
Deflection Temperature:

No.	Value	Note
1	75°C	70–80°, 0.45 MPa, ASTM D648 [2,5]
2	43–50°C	110–120°F, 1.84 MPa (264 psi) [5]

Vicat Softening Point:

No.	Value	Note
1	135°C	[1,2]

Brittleness Temperature:

No.	Value	Note
1	<-200 °C	max., ASTM D746 [1]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	<0.01 g/10 min	max., ASTM D1238 [1]

Water Absorption:

No.	Value	Note
1	0.01%	max. 24 h, $^1/_8$ in thick, ASTM D570 [5]

Mechanical Properties:

Mechanical Properties General: Stiffness and yield strength are less than for HDPE, but impact toughness (even at cryogenic temps) and abrasion resistance are the highest of all thermoplastics. ESCR creep resistance, cyclical fatigue resistance and corrosion resistance are also high. Friction coefficient is low. Under tension there is no necking but uniform stretching. Orientation can change tensile props by a factor of 15 [6]. Graphite fibre, powdered metal, glass fibre, glass bead fillers all increase stiffness and heat deflection temp. and decrease deformation under load, but all except graphite and glass fibre reduce abrasion resistance and impact strength [1,2] Poisson's ratio may be negative. [6] Sterilisation for biomedical applications results in a loss in fracture toughness of approx. 50% and a decrease in tearing modulus of approx. 30% [25]

Tensile (Young's) Modulus:

No.	Value	Note
1	650 MPa	[6]
2	10000 MPa	biaxially oriented [6]
3	150000MPa	max, gel spun fibres [1]

Flexural Modulus:

No.	Value	Note
1	896–965 MPa	130–140 kpsi, 23°, (73°F), ASTM D790 [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	21–42 MPa	ASTM D638 [1,2,5,6]	200–500%
2	330 MPa	biaxially oriented [6]	17%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	20–28 MPa	4%	ASTM D638 [2,5]

Impact Strength: Tensile impact resistance 893 kJ m^{-2} (425 ft lb in^{-2} 23°, 2.54 mm thick, ASTM D1822) [5]
Hardness: Shore D67 (ASTM D2240) [1]; Rockwell R50–R52 (ASTM D785) [2,5]. Scratch Hardness 50–150 MPa (V 0.0026 mm s^{-1}); 380–550 MPa (v 2.6 mm s^{-1} 21°) [21]
Fracture Mechanical Properties: Fracture toughness (critical J integral method) has been reported [23]
Friction Abrasion and Resistance: Coefficient of friction μ_{stat} 0.20–0.25; μ_{dyn} 0.15–0.2 [2]. Abrasion resistance is highest of all thermoplastics [1]. Wear props are of biomedical importance (use of UHMWPE for implants) [7,8,9] as well as other areas. [10,11] Effects of γ-irradiation on wear volume, surface area and coefficient of friction have been reported [27]. Wear rates of aged and non-aged γ-irradiated and gas-plasma sterilised materials have been reported [28]
Izod Notch:

No.	Value	Notch	Break	Note
1	1335–1708 J/m	N		double notch; 23° [2]
2		N	No break	single notch [5]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.3	1 kHz	ASTM D150 [5]

Dielectric Strength:

No.	Value	Note
1	27.95 kV.mm^{-1}	710 V mil^{-1} $^1/_8$ in thick, short time, ASTM D149 [5]
2	51.18 kV.mm^{-1}	1300 V mil^{-1}, 0.01 mil thick, ASTM D 149 [5]

Dissipation (Power) Factor:

No.	Value	Frequency
1	0.00023	1 kHz

Polymer Stability:

Polymer Stability General: Stabilisers not normally required (the long chains are resistant to scission) [2]. However, mechano-oxidative degradation (induced by microtaming) has been reported. [22]
Environmental Stress: Possesses excellent environmental stress crack resistance [1,2,3]
Chemical Stability: Chemical stability is as good as or better than other types of polyethylene
Stability Miscellaneous: Radiation resistant; has highest neutron resistance of thermoplastics [1] Effects of γ-irradiation have been reported [25,26,27,28]

Applications/Commercial Products:

Processing & Manufacturing Routes: Normally manufactured by slurry process but soln or bulk processes can be used. (see HDPE, LLDPE). Ziegler-Natta catalysts can be used. Processed by compression moulding at 204–260° (400–500°F) [5]; also by ram extrusion, forging or die stamping at ca. 150° or by gel spinning (MW 2000000–3000000) at 160–200° in decalin, 5–10 wt.% soln, passed through spinarette, cooled fibre stretched 10–40 times [1,2,13,14]
Applications: Used in chemical processing, food and drink industries, foundries, timber industry, electrical industry; for medical implants, mining, mineral processing, sewage treatment equipment, paper manufacture, recreational equipment, transport, textiles (inc. bullet proof vests), composites (both as fibre and matrix). Speciality film

Urea formaldehyde resins U-4

Synonyms: *Urea resins*
Related Polymers: Urea Resins, Wood applications, Urea Resin, Moulding powders, Cellulose filled
Monomers: Urea, Formaldehyde, Paraformaldehyde
Material class: Thermosetting resin
Polymer Type: urea formaldehyde
Miscellaneous: Urea is a tetra-functional monomer, which readily forms a tetra-methylol deriv. Melamine can also be co-condensed with urea to form a range of melamine urea formaldehyde (MUF) resins

Applications/Commercial Products:

Processing & Manufacturing Routes: Urea-formaldehyde resins are made by the condensation reaction of urea with formaldehyde, generally 37% aq. soln. The condensation generally proceeds with basic catalyst and a molar excess of formaldehyde. The resins are generally used in aq. soln., but may also be used if alcoholic solvents are added. They cure by application of heat or acid
Applications: Urea-formaldehyde resins have various applications. See the relevant cross references for further details

Urea resin, Moulding powders, Cellulose filled U-5

Related Polymers: Urea Formaldehyde Resins, Melamine Formaldehyde Resins, Melamine Resin, Moulding Compounds, Cellulose Filled
Monomers: Urea, Melamine, Formaldehyde
Material class: Thermosetting resin
Polymer Type: urea formaldehyde
Additives: Additives include cellulose filler, pigments and a curing catalyst

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.47–1.52 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.2×10^{-5}–3.6×10^{-5} K^{-1}	ASTM D896 [1]	L

Thermal Conductivity:

No.	Value	Note
1	0.00423 W/mK	ASTM C177 [1]

Deflection Temperature:

No.	Value	Note
1	130°C	1.8 MPa, ASTM D648 [1]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.48%	24h, 3.2 mm thick, ASTM D590

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	9000–9700 MPa	ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	9700–10300 MPa	ASTM D9700 [1]

Tensile Strength Break:

No.	Value	Note
1	38–48 MPa	ASTM D638 [1]

Flexural Strength at Break:

No.	Value	Note
1	70–124 MPa	ASTM D790 [1]

Tensile Strength Yield:

No.	Elongation	Note
1	0.5–1%	ASTM D638 [1]

Hardness: Rockwell M110–M120 (ASTM D785) [1]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	0.034–0.043	60 Hz	ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	80–100s	ASTM D495 [1]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	77°C	[1]

Flammability: Flammability rating V0 (UL 94) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Urea formaldehyde moulding materials combine a virtually unlimited range of colours and excellent colour retention with good electrical props., solvent resistance, high flame retardance, rigidity, surface hardness, scratch resistance and anti-static props. For the compression moulding process preheating of the resin powder pellets or granules is required. Injection moulding grades are preheated efficiently both by the injection machine and by the frictional heat generated as the material flows through the sprue, runner or gate

Mould Shrinkage (%):

No.	Value	Note
1	0.64–0.7%	compression moulding
2	0.073–0.78%	injection moulding

Applications: Urea formaldehyde materials give general purpose mouldings for all types of articles, particularly electrical accessories. Wet-granulated grades are used for thick section mouldings - such as toilet seats. Injection moulded material is used for household articles such as electrical accessories

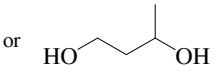
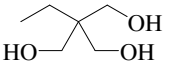
Urea resins, Wood applications U-6



Related Polymers: Urea Formaldehyde Resins, Melamine Resins, Wood Applications
Monomers: Urea, Melamine, Formaldehyde
Material class: Thermosetting resin
Polymer Type: urea formaldehyde
General Information: Relatively poor moisture resistance. For superior moisture resistance for outdoor applications refer to melamine urea resins (MUF) and also resorcinol (RF) or resorcinol-phenol resins (RPF)



Urethane coating U-7

Synonyms: *Urethane, polyether*
Related Polymers: Polyurethanes General Information
Monomers: 3,4-Diisocyanatotoluene, 2,6-Diisocyanatotoluene, 3,3-Dihydroxymethylbutanol, 2,4-Diisocyanatotoluene, 1,3-Butanediol
Material class: Fibres and Films, Fluids
Polymer Type: polyurethane
General Information: An isocyanate-terminated prepolymer. A one component polyether urethane coating cured by moisture

Transport Properties:

Polymer Solutions Dilute: Brookfield viscosity 1200 cP s (25°) [1]. Gardner-Holdt viscosity W
Permeability of Liquids: [H_2O] 130 g m^{-2} day^{-1} 10 mil film [1]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	34.5 MPa	5000 psi [1]	40%

Hardness: Sward 60; pencil hardness H [1]
Fracture Mechanical Properties: Taber abrasion resistance 18 mg $(1000 \text{ cycles})^{-1}$ (CS-10, 0.5 kg), 75 mg $(1000 \text{ cycles})^{-1}$ (CS-10, 1 kg) [1]
Friction Abrasion and Resistance: Has excellent resistance to abrasion and wear, excellent adhesion and resistance to chipping

Optical Properties:

Volume Properties/Surface Properties: Gloss 98% (Hunter) [1]. Colour 4 (max., Gardner 1953 scale) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Is applied as a soln. The solvent rapidly evaporates and moisture diffuses into the remaining film effecting the final cure
Applications: Used as a coating for wood, metal, concrete and electrical apparatus

Trade name	Supplier
ECD-154	DuPont
PR-942	Wyandotte Chemical Corp.

Urethane rubber, Multrathane based U-8

Related Polymers: Polyurethanes General Information
Monomers: 1,4-Butanediol, 4,4′-Diphenylmethanediisocyanate
Material class: Synthetic Elastomers
Polymer Type: polyurethane
General Information: A cast polyester urethane elastomer with improved low temp. flexibility. Based on a specifically designed polyester, multrathane F144. The struct. of the polymer is unknown

Mechanical Properties:

Mechanical Properties General: Has improved low temp. props.

Tensile (Young's) Modulus:

No.	Value	Note	Elongation
1	5.5 MPa	800 psi [1]	100%

Tensile Strength Break:

No.	Value	Note	Elongation
1	45 MPa	6500 psi [1]	550%

Hardness: Shore A85 [1]
Fracture Mechanical Properties: Shows solenoid brittleness at -70°

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	$5 \times 10^{-5} \times 10^{15}$ Ω.cm	[2]	S
2	$9 \times 10^{-6} \times 10^{15}$ Ω.cm	24h in H_2O [2]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	7.6	800 Hz	[2]
2	7.1	1 MHz	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.016	800 Hz	[2]
2	0.058	1 MHz	[2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Cast elastomer is processed in the fluid state. Prepolymer is mixed with diol curing agent and heated in the casting machine to effect cure. Can be gravity or centrifugally cast or compression or transfer moulded
Applications: Has applications in oil seals, drive wheels and diaphragms

Trade name	Details	Supplier
Multrathane	F66	Mobay

Vinyl methyl phenyl silicone rubber, Heat vulcanised V-1

Synonyms: *Vinyl phenyl methyl silicone rubber, Heat vulcanised. Methyl phenyl vinyl silicone rubber, Heat vulcanised. Phenyl methyl vinyl silicone rubber, Heat vulcanised. Vinyl methyl phenyl based silicone elastomer*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Vinyl methyl silicone rubber, Heat vulcanised, Methylphenylsilicone rubber, Heat vulcanised, Phenylsilicone rubber, Heat vulcanised
Monomers: Dichlorodimethylsilane, Dichloroethenylmethylsilane, Dichloromethylphenylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
158195-32-5

Molecular Formula: $[(C_2H_6OSi).(C_3H_6OSi).(C_7H_8OSi)]_n$
Fragments: C_2H_6OSi C_3H_6OSi C_7H_8OSi
Additives: Finely divided silica is incorporated as a reinforcer to improve mech. props.
General Information: Vinyl groups are present at less than 1%. They cause the gum to cure more readily with lower activity peroxides

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15 g/cm^3	[5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00075 K^{-1}	approx. 60% dimethyl siloxane, 40% methyl phenyl siloxane [1]	V
2	0.0009 K^{-1}	approx. 90% dimethyl siloxane, 10% methyl phenyl siloxane [1]	V

Thermal Conductivity:

No.	Value	Note
1	0.25–0.3 W/mK	0.0006–0.0007 cal cm^{-2} (s K)$^{-1}$ [12,13]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu lb^{-1}°F^{-1} [5]	P

Melting Temperature:

No.	Value	Note
1	-77°C	approx. 60% dimethyl siloxane, 40% methyl phenyl siloxane [1,10]

Glass-Transition Temperature:

No.	Value	Note
1	-96°C	approx. 60% dimethyl siloxane, 40% methyl phenyl siloxane [1]
2	-84°C	approx. 60% dimethyl siloxane, 40% methyl phenyl siloxane [10]
3	-112°C	approx 90% dimethyl siloxane, 10% methyl phenyl siloxane [1]

Transition Temperature General: For transitions of high content silicone rubber see (phenylsilicone rubber (heat-vulcanised)). For transitions of low phenyl content silicone rubber see (methyl phenyl silicone rubber, heat vulcanised))
Transition Temperature:

No.	Value	Note	Type
1	-70°C	approx. 60% dimethyl siloxane, 40% methyl phenyl siloxane [1]	Stiffening
2	-109°C	approx. 90% dimethyl siloxane, 10% methyl phenyl siloxane [1]	Stiffening

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16–17 J$^{1/2}$ cm$^{-3/2}$ (7.7–8.2 cal$^{1/2}$ cm$^{-3/2}$). Value increases with increasing phenyl substitution [8]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters, ethers; insol. alcohols, H_2O [7,8,9]
Surface and Interfacial Properties General: Generally low surface adhesion [3]

Transport Properties:

Polymer Solutions Concentrated : Viscosity 100000 St ((approx.) pre-cure gum)
Permeability of Gases: For permeability of gas see (methyl phenyl silicone rubber, heat vulcanised). Gas permeability falls sharply as phenyl substitution rises [4]

Mechanical Properties:

Mechanical Properties General: Mech. props. are improved by incorporation of vinyl groups; phenyl groups reduce high temp. performance
Tensile Strength Break:

No.	Value	Note	Elongation
1	6.4 MPa	65 kg cm^{-2}, 25°, filled [3,6]	400%

Viscoelastic Behaviour: Compression set 30% ((max.) 150° 22h compression for high phenyl filled rubber) [7]

Electrical Properties:

Electrical Properties General: Excellent insulating props. though inferior to dimethyl silicone rubber
Dielectric Permittivity (Constant):

No.	Value	Note
1	3	approx. [2,11]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	500 V mil^{-1} [5]

Optical Properties:

Transmission and Spectra: No transmission below 290 nm [3,7]

Polymer Stability:

Thermal Stability General: Usable over very wide temp. range [7]. -100° to 315° low temp. rubber *ca.* 10% methyl phenyl silicone; high temp. rubber >40% methyl phenyl silicone

Upper Use Temperature:

No.	Value	Note
1	315°C	high phenyl rubber

Decomposition Details: Oxidation temp. 350° (dry air, 55% methyl phenyl silicone) [7]
Environmental Stress: Resistant to oxidative degradation, water, weathering, ozone and corona. Unaffected by uv. Very resistant to high energy radiation (radioactivity) [3]
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. H_2SO_4. Relatively unaffected by weak alkali, weak acids and alcohols [9]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam, or by acid catalysis [3]
Stability Miscellaneous: Stability to solvents is reduced by phenyl incorporation [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethylmethylphenyl and methylvinyl cyclic polysiloxanes are equilibrated and polymerised together at 150–200° with an alkaline catalyst. Methyl vinyl cyclic polysiloxane is only present in small amounts producing a linear polymer with less than 1% methyl vinyl siloxane. Traces of hexamethyldisiloxane are added to terminate the siloxane chains. Elastomer is readily cured by low activity organic peroxides (typically 1–2 parts per 100 rubber) at temps. of over 110°. Several hours post cure treatment is required to remove residual peroxide
Applications: Used in low and very high temp. applications; as encapsulant coating, insulation for electric cables, and in pads and belts

Trade name	Supplier
C-154	Wacker Silicones

Vinyl methyl silicone rubber, Heat vulcanised V-2

Synonyms: *Methyl vinyl silicone rubber, Heat vulcanised. Vinyl methyl based silicone elastomer*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Vinyl methyl phenyl silicone rubber, Heat vulcanised
Monomers: Dichlorodimethylsilane, Dichloroethenylmethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones

CAS Number:

CAS Reg. No.
155665-02-4

Molecular Formula: $[(C_2H_6OSi).(C_3H_6OSi)]_n$
Fragments: C_2H_6OSi C_3H_6OSi
Additives: Finely divided silica incorporated as a reinforcer to improve mech. props.
General Information: Vinyl groups are present at less than 1%. They cause the gum to cure more readily with lower activity peroxides

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[12]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00095 K^{-1}	[6]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal cm^{-1} cm^{-2} s^{-1} [11]

Specific Heat Capacity:

No.	Value	Note	Type
1	1300 kJ/kg.C	0.3 Btu (lb °F)$^{-1}$ [12]	P

Melting Temperature:

No.	Value	Note
1	-54°C	[6]

Glass-Transition Temperature:

No.	Value	Note
1	-123°C	[6,15]

Transition Temperature General: Stiffening temp. is related to T_m rather than to T_g [2,3,4,5,6]
Brittleness Temperature:

No.	Value	Note
1	-65°C	-85°F [13]

Transition Temperature:

No.	Value	Note
1	-38°C	stiffening temp. [6]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 J$^{1/2}$ cm$^{-3/2}$ (7.5–7.6 cal$^{1/2}$ cm$^{-3/2}$); δ_d 15.9; δ_p 0.0; δ_h 4.1 J$^{1/2}$ cm$^{-3/2}$ [3,7,8,9] (see methylsilicone rubber heat vulcanised for more details)

Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons [3,7,8]. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [3,7,8]
Surface and Interfacial Properties General: Generally low surface adhesion [4]

Transport Properties:

Transport Properties General: Silicone rubber is ten times more permeable to gases than other rubbers. [14] The solubility of gases in polysiloxanes is similar to that for other polymers but the diffusion coefficients are much higher
Polymer Melts: Viscosity 100000 St (approx., pre-cure gum) [3], 100–1000 St (pre-cure liq. silicone rubber) [16]

Mechanical Properties:

Mechanical Properties General: The vinyl groups sharply reduce compression set at elevated temps. [1]. Silicone rubbers preserve their mechanical props. better up to higher temps. compared to other elastomers. Requires vulcanisation with a reinforcing filler (usually silica) in order to possess acceptable mechanical props. [1]
Tensile Strength Break:

No.	Value	Note	Elongation
1	6.5 MPa	65 kg cm^{-2}, 25°, filled [4]	300%
2	3.4 MPa	500 psi, 200°, filled [10]	150%
3	2.7 MPa	400 psi, 250°, filled [10]	100%
4	5 MPa	0.5 kg f mm^{-2}, 25°, high vinyl content, unfilled [3]	200%
5	5.5 MPa	liq. silicone rubber [16]	520%

Viscoelastic Behaviour: Compression set 10% at 175° and 22h compression (filled) [1]
Hardness: Shore A55–A60 [12]. Shore A32 (liq. silicone rubber) [16]
Fracture Mechanical Properties: Tear strength 1.6 J cm^{-2} (90 pse, 25°, filled) [13]. Tear strength 1.4 J cm^{-2} (14 kN m^{-1}, liq. silicone rubber) [16]

Electrical Properties:

Electrical Properties General: Silicone rubber has excellent insulating props. [4]
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.5–4.5	depends on filler [4]

Dielectric Strength:

No.	Value	Note
1	21 kV.mm^{-1}	[4]

Arc Resistance:

No.	Value	Note
1	200–250s	[17]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	800 Hz	[4]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.404	[3]

Transmission and Spectra: Uv absorption at 290 nm [4]

Polymer Stability:

Polymer Stability General: Stable material with a wide range of uses see (vinylmethyl phenyl silicone rubber (heat vulcanised)) [2]
Thermal Stability General: Usable from -60 to 260°. Some varieties are usable at slightly higher temps.
Upper Use Temperature:

No.	Value
1	260°C

Decomposition Details: Oxidation temp. dry air 290° (CO produced) [2,16]
Flammability: Limiting oxygen index 20% (approx.) [2]
Environmental Stress: Resistant to oxidative degradation, water, weathering, ozone and corona. Unaffected by uv [4]
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. sulfuric acid. Relatively unaffected by weak alkalis, weak acids, alcohols and oils (except silicone oil) [3]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam or acid catalysis [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethyl and methyl vinyl cyclic polysiloxanes are polymerised together at 150–200° with an alkaline catalyst. Less than 1% of the methyl vinyl siloxane monomer and small quantities of hexamethyldisiloxane are added to terminate the siloxane chains. The elastomer is readily cured by low activity organic peroxides (typically 1–2 parts per 100 rubber) at temps. of over 110°. Several hours post cure treatment are required to remove residual peroxide. Liq. silicon process involves low viscosity (<1000 St) vinyl methyl gums which can be vulcanised as a liq. in the presence of (polymethyl hydrogen siloxane) as crosslinker and platinum catalyst at temps. no higher than 100°. Cure takes only a few minutes [2,16]
Mould Shrinkage (%):

No.	Value
1	0.025%

Applications: Used where good temp. props. and stability are important particularly where temps. of >200° may be encountered. Used for coatings, electrical cables, encapsulants, pads and belts. Used in aircraft engines. gas turbines, autoclaves, irons and ovens. Important use as electrical insulant and in aircraft and the aerospace industry

CAS Reg. No.	Note
25086-25-3	
123698-11-3	copolymer with diaminodiphenylsulfone

Molecular Formula: $(C_8H_{12}O_2)_n$
Fragments: $C_8H_{12}O_2$
General Information: Uncured ERL-4206 is a low viscosity liq. with a characteristic odour [9]. Props. of cured resin depend on curing agent, stoichiometry, cure time and cure temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.08–1.1 g/cm^3	ERL-4206, uncured [8]
2	d 1.1 g/cm^3	ERL-4206, uncured [9]

Transition Temperature General: Heat distortion temp. of Unox 206 cured with Sylkyd 50-H_3BO_3 increases with decreasing curing agent content [6]. Bp 227° (ERL-4206, uncured) [8,9]
Deflection Temperature:

No.	Value	Note
1	95°C	1.82 MPa, borosiloxane polymer (30% wt) cured [1,6]

Transport Properties:

Polymer Solutions Dilute: Viscosity 20 cP (25°, RD-4), 8 cP (25°, ERL-4206)
Water Absorption:

No.	Value	Note
1	0.36%	7 d, 25°, borosiloxane polymer (30% wt) cured [1,6]
2	1.9%	30 d, 25°, borosiloxane polymer (30% wt) cured [1,6]
3	0.5%	7 d, 100°, borosiloxane polymer (30% wt) cured [1,6]

Mechanical Properties:

Mechanical Properties General: Flexural strength of Unox 206 cured with Sylkyd 50-H_3BO_3 increases on ageing at 135° or 160°, but decreases on ageing at 180° [6]
Flexural Strength at Break:

No.	Value	Note
1	56.5 MPa	8.2 kpsi, borosiloxane polymer (30% wt) cured [1,6]
2	77.9 MPa	11.3 kpsi, borosiloxane polymer (30% wt) cured, 135°, 30 d [1,6]

Electrical Properties:

Electrical Properties General: Dissipation factor of Unox 206 cured with Sylkyd 50-H_3BO_3 generally decreases after heat ageing in air [6]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	60 Hz	25°, Sylkyd 50-H_3BO_3 (50% wt) cured, Unox 206 [6]
2	0.002	60 Hz	25°, Sylkyd 50-H_3BO_3 (20% wt) cured, Unox 206 [6]
3	0.014	60 Hz	100°, Sylkyd 50-H_3BO_3 (20–50% wt) cured, Unox 206 [6]

Optical Properties:

Volume Properties/Surface Properties: Colour 1 (max., 1933 Gardner, ERL-4206, uncured) [8]

Polymer Stability:

Thermal Stability General: Thermal stability can depend on the method of polymerisation used. The least stable polymers result from electroinitiation or use of BF_3-etherate as initiator [4]
Decomposition Details: Borosiloxane polymer (30% wt) cured material shows 3.5% weight loss after 30 d at 180° [1,6]. Diaminodiphenylsulfone cured material shows approx. 35% weight loss in air after 2h at approx. 290° [2]. Activation energy for 5–10% weight loss 148 kJ mol^{-1} (diaminodiphenylsulfone cured) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: 4-Vinylcyclohexene dioxide can be cationically polymerised in bulk using coumarin/onium salt as initiator [3]; by bulk polymerisation in the presence of a free radical donor and cationic salt [5]. Soluble or cross-linked (depending on radiation dose) product may be obtained by γ-ray-induced polymerisation of 4-vinylcyclohexene dioxide [7]
Applications: Used to improve the thermal stability of polyamide resins. Potential application in electron microscopic embedding. May also be used as a reactive diluent in epoxy resin formulations

Trade name	Details	Supplier

VLDPE V-5

Synonyms: *Very low-density polyethylene. PE-VLD. Ultra low-density polyethylene. ULDPE*
Related Polymers: polyethylene, LLDPE, High-density polyethylene
Monomers: Ethylene, 1-butene, 1-octene, 4-methyl-1-pentene, 1-hexene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types
25087-34-7	1-butene comonomer
25213-02-9	1-hexene
26221-73-8	1-octene comonomer
25213-96-1	4-methyl-1-pentene comonomer
60785-11-7	1-hexene, 1-butene comonomers
74746-95-5	4-methyl-1-pentene 1-butene comonomers

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
Molecular Weight: 50000–200000
General Information: Two types of PE with density less than 0.915 g cm^{-3}; PE plastomers of low crystallinity (ca. 10–20%) and amorph. PE elastomers. [1] Elastomers approach ethylene-propene elastomers in prop., and the plastomers compete with poly(ethene -*co*-vinyl acetate), as flexible film material. In general, VLDPE may be regarded as a modification of LLDPE. Struct. consists of high number of branches from high proportion of comonomers.
Morphology: Crystallinity is low, typically 25% (10–20% for VLDPE plastomers; 10% (max) for ULDPE-elastomers) but exceptions (a resin with crystallinity 42.9%) do exist. Crystallinity decreases with an increase in α olefin content; branching uniformity and chain length of α olefin. [1] Mech. and optical props vary with crystallinity.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.9–0.915 g/cm^3	VLDPE, plastomers
2	d 0.86–0.9 g/cm^3	ULDPE, elastomers [1]

Volumetric Properties General: Density is affected by comonomer, comonomer content and branching uniformity [1]
Melting Temperature:

No.	Value	Note
1	125–128°C	non-uniform branching [1,3]
2	110°C	max, uniform branching [1]

Transition Temperature General: T_m is dependent on α-olefin content
Brittleness Temperature:

No.	Value	Note
1	<-100°C	max. [1]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	1–3.8 g/10 min	[1]

Polymer Melts: Introduction of long-chain branches (using metallocene catalysts in the soln process) increases shear thinning, thereby decreasing viscosity.

Mechanical Properties:

Mechanical Properties General: Higher values of moduli and lower values of strain recovery are associated with higher α olefin content and with non-uniformity of branching. [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	25–150 MPa	[1]

Elastic Modulus:

No.	Value	Note
1	60 MPa	8% butene, 25% crystallinity, non-uniform branching
2	1.3 MPa	18% butene, uniform branching [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	35–310 MPa	1 Hz [1]	Dynamic modulus

Mechanical Properties Miscellaneous: Strain recovery 63–98% [1]

Optical Properties:

Volume Properties/Surface Properties: Haze 4–50%. Increases with higher α olefin content and non-uniformity of branching [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured using Ziegler, metallocene or chromium based catalysts in gas phase, solution or slurry processes as for LLDPE

Applications: Used for clear film (used for uniformly branched mVLDPE); heavy duty film [5]; mVLDPE is extensively used for blending with HDPE, commodity grade LLDPE and PP. Other uses in speciality flexible tubing; wire and cable insulation.

Trade name	Supplier

Wool W-1

Synonyms: *Keratin*
Related Polymers: Proteins
Monomers: Amino acids
Material class: Proteins
General Information: Natural staple fibre from the fleece of sheep, alpaca, vicuna and some goats. Composed of keratin, which is assembled into cross-linked and complex multistrand fibres. Partly crystalline

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.32 g/cm^3	[3]
2	d 1.304 g/cm^3	[4]

Glass-Transition Temperature:

No.	Value	Note
1	170°C	dry [1]
2	-10°C	wet [1]

Transport Properties:

Water Content: 15% (65% relative humidity) [1,6], 16% (21.2°, 65% relative humidity) [3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3550 MPa	3.55 × 10^{10} dynes cm^{-2}, 65% relative humidity [9]
2	1400 MPa	1.4 × 10^{10} dynes cm^{-2}, 20° [10]

Tensile Strength Break:

No.	Value	Note
1	152–207.9 MPa	1550–2120 kg cm^{-2}, 65% relative humidity, 22° [7]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1400 MPa	[2]	longitudinal modulus

Electrical Properties:

Electrical Properties General: Mass specific resistance 10000000000 Ω g cm^{-2} (65% relative humidity) [8]

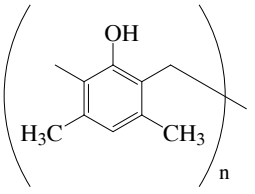
Optical Properties:

Refractive Index:

No.	Value	Note
1	1.553–1.555	along fibre axis
2	1.542–1.546	transverse [5]

Polymer Stability:

Decomposition Details: Decomposes above 126° with scorching at 204° [3]
Flammability: Combustible
Chemical Stability: Stable in moderately acidic media (except sulfuric acid). Decomposed by alkalis and hypochlorite bleach



Applications/Commercial Products:

Processing & Manufacturing Routes: The wool is cleaned and then spun
Applications: Applications include clothing and insulating material

Xylenol formaldehyde resins X-1

Synonyms: *Dimethylphenol formaldehyde resins*
Related Polymers: Phenol Aldehyde Resins, Phenolic Resoles, Phenolic Novolaks, Cresol Formaldehyde Resins
Monomers: Formaldehyde, 2,4-Xylenol, 2,3-Xylenol, 2,5-Xylenol, 3,5-Xylenol, 3,4-Xylenol
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.	Note
25053-90-1	2,5-xylenol-formaldehyde copolymer
25053-93-4	2,6-xylenol-formaldehyde copolymer
25053-87-6	3,4-xylenol-formaldehyde copolymer
25086-35-5	3,5-xylenol-formaldehyde copolymer
25053-91-2	2,3-xylenol-formaldehyde copolymer
25053-94-5	2,4-xylenol-formaldehyde copolymer

Molecular Formula: $(C_9H_{10}O.CH_2O)_n$
Fragments: $C_9H_{10}O$ CH_2O
Molecular Weight: M_n 1043 (3,4-xylenol resin), 488 (3,5-xylenol resin)
General Information: Xylenol isomers have different functionality in the condensation reaction with formaldehyde and this influences the degree of cross-linking possible. Of the possible isomers, 2,4-xylenol is monofunctional; 2,3- 3,4- and 2,5-xylenol are difunctional; the only trifunctional isomer is 3,5-xylenol. The methyl groups tend to activate the phenolic molecule and 3,5-xylenol is a reactive cross-linking component

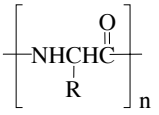
Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	178–191°C	3,4-xylenol resin [1]
2	136–142°C	3,5-xylenol resin [1]

Polymer Stability:

Decomposition Details: The major pyrolysis products of 3,5-xylenol-formaldehyde resin (hexa cured) at 600° are 2,3,5-trimethylphenol (35.3 mol%) and 3,5-dimethylphenol (17.8 mol%) [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by reaction of the appropriate dimethylphenoxymagnesium bromide with paraformaldehyde in dry C_6H_6 for 12 h at 80° followed by acidic quenching [1]. This procedure can be used to synth. "high-*ortho*" novolaks [3] Xylenol-formaldehyde resins are made by the condensation reaction of molten xylenols with formaldehyde, generally 37% aq. soln. With basic catalyst and a molar excess of formaldehyde, a Resole is formed. With an acidic catalyst and excess xylenol, a Novolak resin is formed
Applications: 3,4 and 3,5-xylenol resins have potential applications as antimicrobial agents. High-*ortho* 3,4-xylenol resin has potential application as an antioxidant in lard

Zein Z-1

Synonyms: *Vicara. Maize protein*
Related Polymers: Groundnut protein fibre, Proteins
Material class: Amino acid
Polymer Type: protein
General Information: A naturally coiled protein polymer isol. from maize meal [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.25 g/cm^3

Melting Temperature:

No.	Value	Note
1	240°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot alkalis. Insol. organic solvents

Transport Properties:

Water Absorption:

No.	Value	Note
1	10%	moisture regain [1]
2	40%	imbibition max.

Mechanical Properties:

Mechanical Properties General: Tensile strength at break 0.75–12 g den^{-1}. [2] Tenacity 1060 N tex^{-1} (dry); 574 N tex^{-1} (wet)
Tensile Strength Break:

No.	Value	Note
1	120.1–133 MPa	1225–1365 kg cm^{-2} [1]

Tensile Strength Yield:

No.	Value	Note
1	25–35 MPa	dry [1]
2	30–45 MPa	wet

Polymer Stability:

Decomposition Details: Decomposes at 185° [1]
Flammability: Has low flammability
Environmental Stress: Undergoes some deterioration on prolonged exposure to sunlight
Chemical Stability: Very resistant to acids. Sol. hot alkali with deterioration.

Applications/Commercial Products:

Processing & Manufacturing Routes: Corn meal protein is dissolved in aq. 2-propanol. The extracted Zein is dissolved in alkali and spun into an acidic soln. The resulting fibre can be stabilised by cross-linking with formaldehyde [1,2]
Applications: Used in fabrics as a blend with nylon, rayon, cotton and wool

1	105 MPa	ASTM D621, Zenite 6130 [1]
2	7130 MPa	ASTM D621, Zenite 7130 [1]

Mechanical Properties Miscellaneous: Isochronous stress-strain 20 MPa stress, 0.6% strain (10 g) [1]

Hardness: Rockwell M61–M63 [1], R108–R110 [1]

Failure Properties General: Flexural fatigue 60 MPa (10000 h); 40 MPa (10000000 h)

Friction Abrasion and Resistance: Static coefficient of friction μ_{stat} 0.09 (steel, Zenite 6130); 0.1 (steel, Zenite 7130) [1]; 0.29 (self, Zenite 7130) [1]. Dynamic coefficient of friction μ_{dyn} 0.12 (steel, Zenite 6130) [1]; 0.1 (steel, Zenite 7130) [1]; 0.23 (self, Zenite 7130) [1]. Taber abrasion 49 mg (1000 cycles)$^{-1}$ (CS-17, Zenite 6130); 63 mg (1000 cycles)$^{-1}$ (CS-17, Zenite 7130) [1]

Izod Notch:

No.	Value	Notch	Note
1	110 J/m	Y	-40°, ASTM D256, Zenite 6130 [1]
2	120 J/m	Y	23°, ASTM D256, Zenite 6130 [1]
3	160 J/m	Y	23°, ASTM D256, Zenite 6330 [1]

4	185 J/m	Y	-40°, ASTM D256, Zenite 6130 [1]
5	225 J/m	Y	23°, ASTM D256, Zenite 7130 [1]
6	440 J/m	N	-40°, ASTM D4812, Zenite 6130 [1]
7	655 J/m	N	23°, ASTM D4812, Zenite 6130 [1]
8	555 J/m	N	-40°, ASTM D4812, Zenite 7130 [1]
9	740 J/m	N	23°, ASTM D4812, Zenite 7130 [1]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	10×10^{15} Ω.cm	ASTM D257, Zenite 6130 [1]	S
2	1×10^{15} Ω.cm	ASTM D257, Zenite 7130 [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	4.4	1 kHz	23°, Zenite 6130 [1]
2	5	1 kHz	120–200°, Zenite 6130 [1]
3	3.9	1 MHz	23°, Zenite 6130 [1]
4	4.8–4.9	1 MHz	120–200°, Zenite 6130 [1]
5	4.3	1 GHz	23°, Zenite 6130 [1]
6	4.4–4.5	1 GHz	120–200°, Zenite 6130 [1]
7	4.3	1 kHz	23°, Zenite 7130 [1]
8	4.9–5	1 kHz	120–200°, Zenite 7130 [1]
9	3.8	1 MHz	23°, Zenite 7130 [1]
10	4.5–4.9	1 MHz	120–200°, Zenite 7130 [1]
11	4.3	1 GHz	23°, Zenite 6130 [1]
12	4.4–4.7	1 GHz	120–200°, ASTM D150, Zenite 7130 [1]

Dielectric Strength:

No.	Value	Note
1	28–29 kV.mm^{-1}	23–120°, ASTM D149 [1]
2	27 kV.mm^{-1}	150–200°, ASTM D149 [1]
3	24–26 kV.mm^{-1}	23°, step by step [1]

Strong Field Phenomena General: Comparative Tracking Index 175 V (ASTM D3636, Zenite 6130) [1]; 167 V (ASTM D3636, Zenite 7130) [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.013	1 kHz	23°, ASTM D150, Zenite 6130 [1]
2	0.027	1 MHz	23°, ASTM D150, Zenite 6130 [1]
3	0.004	1 GHz	23°, ASTM D2520, Zenite 6130 [1]
4	0.013	1 kHz	23°, ASTM D150, Zenite 7130 [1]
5	0.029	1 MHz	23°, ASTM D150, Zenite 7130 [1]
6	0.004	1 GHz	23°, ASTM D2520, Zenite 7130 [1]

Polymer Stability:

Polymer Stability General: Is extremely stable

Thermal Stability General: Resins have excellent thermal stability even in melt above 300°. Physical and electrical props. retained at high temp. over long periods [1]

Flammability: Very inflammable

Chemical Stability: Resistant to a range of automotive fluids, unstable to antifreeze at 100°

Hydrolytic Stability: Very stable to most alkalis and acids and to salt solns. ($ZnCl_2$)

Recyclability: A very high retention level of physical props. is maintained when reusing resin (as regrind) even after six passes. All major props. retained in excess of 80% of original level

Applications/Commercial Products:

Processing & Manufacturing Routes: Normally synth. from the diacetate of aromatic hydroxyl compound and aromatic acid. Acetates may be formed in situ or separately by treatment with glacial AcOH using 1% sulfuric acid catalyst. Stoichiometric quantities of diacids and diacetates/acetoxy aromatic acids are mixed in the melt with distillation of AcOH from the mixture. Polymers may be formed in a continuous reactor and extruded to form oriented fibrous material. Processing is carried out by injection moulding (melt temp. 350–370°, injection pressure 20–40 MPa. Mould temp. 60–110°). Melt viscosity falls dramatically with shear rate. Very high fill rates can be utilised over the whole injection stroke. Fast injection rates also contribute to anisotropic props., including high physical props., low thermal expansion and shrinkage in the flow direction.

Mould Shrinkage (%):

No.	Value	Note
1	-0.07%	flow direction, Zenite 6130
2	0.5%	transverse direction, 23°, Zenite 6130
3	0%	flow direction, 80°, Zenite 6130
4	0.05%	flow direction, 100°, Zenite 6130
5	0.08%	flow direction, 140°, Zenite 6130
6	0.5%	transverse direction, 23°, Zenite 7130
7	0%	50°, Zenite 7130
8	0.08%	flow direction, 100°, Zenite 7130

Applications: Suitable for applications requiring high temp. performance with retention of props. over a wide temp. range, dimensional stability, chemical resistance and excellent electrical props. Main applications include: electrical/electronic; uses such as surface mount components, sockets, connectors, chip carriers, bobbins, ceramic replacements, electric motor insulation components, fibre optic connectors, guides, closures, fuse holders. Automotive; sensors, lamp sockets, coil forms, chip carriers, transmission system components, pump components, ignition system components. Aerospace; all electrical components, imaging and optoelectric components, sensor devices, composite materials

Trade name	Details	Supplier
Zenite	Several grades	DuPont

POLYMERS
A PROPERTY DATABASE
SECOND EDITION

EDITED BY BRYAN ELLIS and RAY SMITH
formerly Sheffield University, UK

International Advisory Board

Dr. C. Feger, Dr. S. Gabrielson, Dr. G. Griffin, Dr. P. Hope, Prof. F.R. Jones, Dr. C. McArdle, Dr. P.T. McGrail, Prof. R.A. Pethrick, Dr. R. Smith

Polymers: A Property Database, Second Edition offers a central and reliable source for scientific and commercial information on over 1000 polymers with industrial as well as specialized applications. Each entry includes trade names, properties, constituent monomers, commercial applications, manufacturing processes, references, and more!

Revised, updated, and expanded with 25% new material, the new database adds 50 entirely new entries reflecting the latest developments in areas such as conducting polymers, hydrogels, biomaterials, and controlled-release formulations for drug delivery.

Interactive Web Version Accompanies the Latest Edition

The second edition consists of a 1200-page print edition together with access to a complete, fully searchable Web version of the reference. Powerful retrieval software allows users to customize their searches and refine results.

Web Version Features Include:

- Physical and chemical properties for over 1000 polymers
- Powerful retrieval software and a user-friendly interface
- Customizable searches by monomer, trade name, various properties, and other characteristics
- Tabulated displays of search results and polymer data
- Superior cross-referencing and browsable indexes
- Links to constituent monomers
- Up-to-date literature references and supplier details

Polymers: A Property Database, Second Edition continues to meet the needs of those working in the rapidly expanding area of polymer research and its applications.
