Preface

The latest edition of *Polymers: A Property Database* is an improved version of an indispensable polymer reference work. The database is a comprehensive and in-depth collection of properties for a very wide range of polymers, both synthetic and natural; and where polymers exist with subtle variations in structure, these are also covered in some detail. Processing grades are also described along with typical applications for each major polymer.

Each polymer has a general properties section, where very useful information such as chemical structure, synonyms, CAS registration numbers, and monomers used in the polymerisation is given. The mechanical properties are particularly well presented and all source material is meticulously referenced.

The database is well indexed (even more comprehensively in the online version) and extremely easy to use making this a very desirable addition to any researcher's library. Polymers are indexed by common name allowing ease of access even to those with only a basic knowledge of polymers; industrial/commercial names are also used where these exist. This is particularly useful for those working in industry or in multidisciplinary fields where polymers are used.

Additional data collected by contributors to the *CRC Chemical Database*.

Introduction

Those of us who work with polymers and polymeric materials rely heavily on data regarding solution and bulk properties, and manufacturing procedures. These parameters usually can be found spread over different handbooks, encyclopedias, and the Internet. However, *Polymers: A Property Database* is one-stop shopping, whereby this information is now available from a single source. Entries range from a few lines for research polymers to encyclopedic submissions for more common polymers. (An online version of the *Database* for simplified data retrieval and entry updates is now available from Taylor & Francis Group.)

To produce this comprehensive *Database*, which conveniently can be used as a desk reference book, a double-column format was used with small, but easy to read font with spaced-out tables. Because main-chain or common polymer names are used as headers, arranged alphabetically in dictionary style, the *Database* is practical to use. (IUPAC approved nomenclature is given under a separate heading). To quickly locate a polymer, a comprehensive polymer name index is available.

The *Database* contains a listing of polymer properties that are, for the most part, associated with polymer manufacturing, processing, and applications. As such, the *Database* contains other useful information in addition to polymer properties, not found in other source books; an example of this is given for nylon 6,6, a well-studied commercial polymer:

Structural Formulae	Elastic Modulus
Additives	Poisson Ratio
Morphology	Tensile Strength Yield
Density	Compression Strength
Thermal Expansion Coefficient	Impact Strength
Latent Heat Crystallization	Viscoelastic Behavior
Thermal Conductivity	Hardness
Specific Heat Capacity	Failure Properties
Glass Transition Temperature	Fracture Mechanical Properties
Melting Temperature	Friction Abrasion and Resistance
Deflection Temperature	Electric Properties
Brittleness Temperature	Dielectric Permittivity
Surface Properties	Dielectric Strength
Solubility	Dissipation Power
Transport Properties	Magnetic Properties
Melt Flow Index	Optical Properties
Intrinsic Viscosity	Refractive Index
Polymer Melts	Molar Refraction
Permeability of Gases	Polymer Stability
Permeability of Liquids	Thermal Stability
Water Content	Upper-Use Temperature
Water Absorption	Decomposition
Gas Permeability	Flammability
Mechanical Properties	Environmental Stress
Tensile Modulus	Chemical Stability
Flexural Modulus	Hydrolytic Stability
Tensile Strength Break	Biological Stability
Flexural Strength at Break	Applications and Selected References

The *Database* also lists many types of polysaccharides, modified cellulosics, and other important biopolymers. Different types of polymers and polymeric structures are presented, such as inorganic polymers, blends, block copolymers, graft polymers, ionomers, elastomers, fibers, hydrogels, interpenetrating networks, structural foams, polymer composites, polysiloxanes, resins, and natural rubbers.

For this second edition, an introductory chapter has been added that reviews polymer complexity as it relates to polymer properties. Furthermore, tabulated lists of polymer properties are given to serve as a guide in selecting appropriate test procedures.

Polymer property data are now available on the Internet in a variety of tabular forms. The advantages and convenience of having a desk reference book of the magnitude of *Database* cannot be overstated. No other reference handbooks contain the caveats, descriptions, and explanations that are found in *Polymers: A Property Database* as exemplified in the above table.

A. IMPORTANCE OF POLYMER PROPERTIES

Because of their high molecular mass, polymers, as compared to small molecules, have unique properties that are often difficult to predict. As such, some background knowledge of the physical chemistry of polymers is desirable for dealing with polymers and polymeric materials.

Polymer properties, like solubility behavior, are used as a guide on a laboratory scale when analyzing or characterizing polymers or when determining structure-property relationships. On an industrial scale, properties such as melt viscosity or heat capacity are important for establishing polymerization and processing conditions. A listing of properties is required for selecting polymers to meet specific applications.

Polymers are ubiquitous as they are used in all applications, from consumer products to high-temperature industrial use to medical devices, under a wide-range of conditions. In modern polymer science and engineering, more complex structures, such as multilayer films, nanomaterials, electro-optical, and electronic devices, are being developed that require more specialized and complex testing for end-use performance evaluation. Furthermore, from knowledge of structure-property relations of polymers and polymeric materials, one can begin to design and tailor-make polymers and complex polymeric structures to meet specific end-use performance requirements.

It is sometimes difficult to accurately predict end-use performance characteristics of the final product using tabulated data of individual components. As a result, accurate measurements are those made on the final product itself, rather than using *model* polymers or components. In these cases, empirically derived measurements using the actual product, verified with authentic samples, may be the best option. It should be noted that most empirically derived data are trade secrets, and, as such, not available. Nevertheless, compilations of properties are still valuable.

B. POLYMER COMPLEXITY

Because of polymer complexity, property variability must be taken into consideration. In this section, we will discuss possible sources of polymer inconsistency and offer suggestions to recognize and reduce these errors.

Chemical or compositional *heterogeneity* refers to the chemical or structural difference among chains of the same polymer. Thus, a measured property of a chemically *heterogeneous* sample will be an *averaged* value dependent upon sample source. For chemically *homogeneous* samples, property variability will not be a concern. In a similar fashion, polymers that are *polydisperse* in molecular weight have averaged property values, while *monodisperse* samples will give accurate data. Obviously, samples that are both chemically *homogeneous* and *monodisperse* will give the most accurate and precise values.

Compared to synthetic polymers, almost all nucleic acids and mammalian proteins are compositionally (chemically) *homogeneous* and *monodisperse*. If not, there would be no life; biopolymers carry highly specific and selective information. Mammalian polysaccharides, for the most part, are also compositionally *homogeneous*, but are *polydisperse* in molecular weight; whereas plant polysaccharides are polydisperse. Chemically modified cellulose (cellulosics) are typically both compositionally heterogeneous and polydisperse in molecular weight. Starches (α-amylose and amylopectin), another major class of polysaccharides, are highly polydisperse in molecular weight, but quite compositionally homogeneous. In addition, amylopectin and many other polysaccharides are highly branched, which may further complicate listed property values.

Synthetic polymers can be quite complex and, as such, tabulated and measured property data must be interpreted with care. *Homogeneous* synthetic polymers are those produced from condensation polymerization reactions, in which all polymer chains are *chemically* indistinguishable from another. Even though these types of polymers show a finite polydispersity of two, accuracy and precision will not be compromised because all samples (and reference standards) will have the same degree of polydispersity. Lastly, synthetic polymers produced by addition polymerization (i.e., ionic, complex coordination catalytic or free-radical copolymerization) will have the greatest amount of compositional heterogeneity and, with the exception of anionically polymerized samples, will also have a large molecular weight polydispersity. For these polymers, tabulated data must be interpreted with caution, unless users establish their own data sets with reference polymers obtained from the same polymerization conditions.

Sequence distribution or polymer microstructure is the next higher level of complexity in which the average *arrangement* of monomers along a chain is considered. The polymerization mechanism and reactivity ratios of

monomers dictate this parameter. Monomers can be randomly arranged along chains in the case of statistic or random copolymers or, in the extreme form, as block copolymers. In any event, the microstructure of reference polymers should be defined when properties are listed.

Next in line of complexity is macromolecular *architecture*, or polymer *configuration*, in which the topological nature of the chain is of interest. Thus polymer branching can take on a wide range of configurations including short- and long-chain branching, and comb, star, and dendritic structures with or without comonomer segregation or blockiness. Because of the strong influence of polymer configuration on properties, this parameter needs to be defined and care taken when comparing tabulated data to those of actual samples.

In summary, polymers may have up to two or more distributed characteristics depending on the number of different monomers used in the polymerization, the type of polymerization mechanism, and whether or not the sample was fractionated during isolation. As a rough estimate, polymer ''complexity'' increases exponentially with the number of distributive properties, making it more difficult to measure accurate polymer properties.

Some polymers are modified *after* polymerization; however, this process can be somewhat difficult to control because polymer chain segments can influence the chemistry of a neighboring groups. Chemical modifications are done mainly on cellulosics and other polysaccharides to tailor-make specific property characteristics. Thus tabulated property data given for cellulosics and polysaccharides represent average values of the entire sample ensemble of polymer chains that differ in composition. To complicate matters further, insoluble gels, comprised of three-dimensional networks, may form if chains are allowed to chemically or physically (via hydrogen bonding) react with one another, either during or after polymerization.

Post-polymerization processes are also accomplished via vulcanization, irradiation, or through the addition of a low molecular weight cross-linking agent. The resulting polymer (i.e., rubber, elastomer, resin, or gel) in essence, is one super or giant molecule approaching infinite molecular weight. These *viscoelastic* materials have wonderful consumer, industrial, and aerospace end-use applications when properly formulated.

The next level of polymer complexity is polymer blends and multicomponent systems. To adjust the glass-transition temperature, plasticizers are added, often times at high concentrations. To increase polymer strength, reinforced polymeric materials are used that consist of added inorganic material, the most common being carbon black or glass fibers. Laminated structures are also produced for increased material strength.

High-value added, specialty products with controlled molecular weight, branching, or architecture are being developed for high-technology industries, most notably electronic and optical devices, printing inks, and coatings in the aerospace industry. Because of their specialized uses, most of these polymeric materials are not listed in this compilation.

C. REGULATORY AGENCIES

Most industries issue testing protocols and polymer property specifications to the trade. To ensure uniformity, national regulatory agencies have formed to deal with standardized methods and testing approaches. In the United States, ASTM is the most prominent independent agency supported by industry with about 100 test methods in place specifically for polymers and polymeric materials. API specializes in the development of procedures for petroleum products, some of which are polymeric. In Britain, BSI is the key agency for testing, while in Europe, DIN procedures are followed. Many of these agencies are overseen by ISO, a federation of national regulatory bodies. (See Table 1 for complete names and acronyms.)

Governmental departments of commerce, defense, and military are also involved in issuing protocols and specifications. For example, the FDA is responsible for establishing acceptable limits of extractable components from polymeric materials in contact with food and drugs.

Table 1. Key agencies involved in standardized testing of polymersand polymeric materials under the umbrella of ISO

Abbreviation	Organization
API	American Petroleum Institute
ASTM	American Society for Testing and Materials
BSI	British Standards Institution
DIN	Deutsches Institut fur Normung
FDA	Food and Drug Agency
ISO	International Organization for Standardization*

*Global federation of national standards bodies representing 100 countries

D. REFERENCE POLYMERS AND SPECIALTY MATERIALS

Sources of reference polymer standards that can be used for instrument calibration and validating methods are listed in Table 2. In the United States NIST is responsible for distributing a number of well-characterized polymer standards.

These standards have well-defined chemical composition and molecular weight, and are also suitable for formulating materials for R&D. All reference standards and polymeric material should come with certificates of analysis. (Because water content in polymers, especially hydrophilic ones and polysaccharides, may affect properties, it is advisable to vacuum dry and properly store them to prevent moisture buildup and degradation.)

E. POLYMER PROPERTIES

In this section we discuss and list polymer properties that are included in data tables of this book. Some properties reviewed in this section are not listed in this text, but they are included for completeness. Specific properties for certain classes of polymers are not given, especially those used for optical, electronic and magnetic devices.

Much of this section and the book's content is based on van Krevelen's (1976) property schemes, with modification. His book should be consulted for more detailed discussions. Other books of interest are listed at the end of this chapter.

Basic information that characterizes polymers is listed in Table 3. These properties can be estimated from the expected outcome of the polymerization, measured, or calculated from group contributions (see van Krevelen,

Table 3. Basic polymer information

Property measured	Remarks
CAS registration number	
Physical state at rt	
Chemical composition of repeat units	
Structural formula of repeat group	
Comonomer molar ratios	For copolymers
Molar substitution	For cellulosics
Molecular weight of repeat unit	
Statistical average molecular weights	M_n, M_v, M_w, M_z, and polydispersity
Percent added inorganic or carbon filler or plasticizer	Polymer additives used to impart selected performance
Polymer additives, e.g., antioxidants, UV stabilizers, etc.	
Moisture level	
Crosslinking density	If applicable
Branching, degree (frequency) and extent (length)	Short- or long-chain branching if applicable, as estimated
Polymer architecture (topology), other than linear or branched, if applicable	graft, star, comb, or dendritic
Crystallinity	
Tacticity	
Microstructure, i.e., monomer sequence distribution	Block, random, or alternate
Toxicity and stability	Should be determined or at least estimated from structure of corresponding comonomers
Environmental impact	Must be known or at least estimated for safe disposal

1976). Methods for measuring these properties can be found in the reference list (for example, see Barth and Mays 1991; Brady 2003; Wu 1995). Some of the more important properties will be considered here.

The most useful average molecular weights are the number- (M_n), weight- (M_w), and z-averages (M_z). These averages are easily determined from the molecular weight distribution obtained using size exclusion chromatography (Mori and Barth 2001). Oftentimes just the viscosity-average molecular weight (M_v) is available, which can be conveniently determined from the measured intrinsic viscosity of the polymer in a given solvent at a specified temperature using tabulated Mark–Houwink coefficients. Alternatively, M_w can be determined from light scattering and M_n from osmometry.

Branching, molecular topology, and comonomer sequence distribution along the chain are more difficult to estimate; these properties are best estimated by the chemistry of the polymerization procedure, with support from NMR measurements. Polymer toxicity and stability must be known or at least estimated from functional group and comonomer chemistry. It should be realized that polymer toxicity, to a first approximation, is lower than the corresponding comonomer toxicity; because of the low polymer diffusion coefficient, macromolecules cannot readily pass through biomembranes, thus have limited bioavailability.

The effect of molecular weight of a polymer in solution on its colligative properties, summarized in Table 4, is a well-established phenomenon. These properties are dependent on the *number* of macromolecules in solution, which independent on molecular weight and chemical composition. In fact, the number-average molecular weight of a polymer can be determined by measuring one of its colligative properties.

Table 4. Colligative polymer properties

Property measured	Remarks
Freezing point depression	MW dependent
Boiling point elevation	MW dependent
Vapor pressure depression	MW dependent
Osmotic pressure elevation	MW dependent

Table 5 lists volumetric properties of polymers in the liquid or solid state as a function of temperature; these properties are related to the compactness of chains and the interaction of comonomers within and among neighboring chains. These properties are more dependent on chemical composition, than molecular weight. Volumetric properties also depend on factors influenced by comonomer sequence distribution, such as tacticity, branching, and polymer crystallinity.

Table 5. Volumetric properties

Property measured	Remarks
Specific volume (reciprocal of specific density)	Depends on polymer state
Molar volume (reciprocal of molar density)	Depends on polymer state
Specific thermal expansivity	Depends on polymer state
Molar thermal expansivity	Depends on polymer state
Specific melt expansivity	Applicable to crystalline polymers
Molar melt expansivity	Applicable to crystalline polymers

Table 6 lists thermodynamic and calorimetric attributes of a polymer, while Table 7 deals with polymer solubility and cohesive energy. Except for molar entropy, all these properties depend mainly of chemical composition, rather than molecular weight. Furthermore, polymer crystallinity, in addition to the chemical nature of a polymer, plays a major role in dictating solubility behavior. In order to effect solubility in the case of crystalline or semicrystalline polymers, the solution must be heated near or above its melting point to break up crystalline regions.

Light scattering and inherent viscosity measurements made at infinite dilution are used to determine polymer size parameters, conformation, second virial coefficient, weight-average molecular weight, and long-chain branching parameters (Table 8). These are fundamental parameters that allow us to probe structural features of polymer molecules. These properties are dependent on molecular mass and shape, rather than polymer composition.

Table 6. Calorimetric and thermodynamic properties including transitiontemperatures

Property measured	Remarks
Molar entropy	
Molar enthalpy	
Molar heat capacity	
Latent heat of crystallization	
Thermal conductivity	
Melting temperature, T_m	Disappearance of polymeric crystalline phase
Glass-transition temperature, T_g	Onset of extensive macromolecular motion
Secondary transition temperatures	Other than T_m and T_g
Deflection temperature (heat distortion)	Highest continuous temperature material will withstand
Vicat softening point	Temperature at which a needle penetrates material
Brittleness temperature	

Table 7. Cohesive properties and solubilities

Property measured	Remarks
Cohesive energy	
Cohesive energy density	Related to the "internal pressure" of a polymer in solution
Surface and interfacial energy	
Solubility parameter	Equal to the square root of the cohesive energy density
Good Solvency	Good solvent imparts solubility via polymer solvation
Nonsolvency	Poor solvent cannot solvate polymer
Theta temperature	The temperature at which polymer–polymer, polymer–solvent, and solvent–solvent interactions are equal
Theta solvent	A solvent in which polymer–polymer, polymer–solvent, and solvent–solvent interactions are equal

Table 8. Dilute solution properties

Property measured	Remarks
Intrinsic viscosity	Measured quantity related to the hydrodynamic shape and molecular volume of a polymer in solution
Mark–Houwink coefficients	Coefficients related to the shape of macromolecules in solution.
Molecular conformation	Molecular shape parameter
Specific refractive index	Parameter needed for calculating M_w from light scattering data
Polymer-solvent 2nd virial coefficient	Determined from light scattering measurements
Radius of gyration	Macromolecular size parameter
End-to-end distance	Macromolecular size parameter
Hydrodynamic volume	Macromolecular volume parameter

Melt index and viscosity are critical parameters needed for polymer processing. These and other polymer transport properties are listed in Table 9. As in the case of other viscosity measurements, these properties depend mainly on higher statistical molecular weight averages, such as M_w and M_z.

Table 9. Transport properties

Property measured	Remarks
Melt viscosity	Depends on molecular weight and chain entanglement
Melt index	Inversely proportional to viscosity
Gas permeability across a polymer film or membrane	Usually water vapor, oxygen, nitrogen, or carbon dioxide, or specialty gases
Diffusion coefficient	Diffusion of polymer in a given solvent at defined conditions
Water absorption	Water content taken up at specified relative humidity and temperature

Tables 10 to 13 list polymer characteristics directly involved with end-use properties: mechanical properties (Table 10), electric and magnetic properties (Table 11), optical properties (Table 12), and polymer stability (Table 13). (A more complete discussion of these properties is given in selected references at the end of this chapter.)

Table 10. Mechanical properties

Property measured	Remarks
Adhesion (tackiness)	
Ball indentation hardness	
Bulk modulus (reciprocal of compressibility)	
Coefficient of friction	
Compression strength	Force needed to rupture material
Tensile creep	Shape change of material caused by suspended weight
Damping	Absorption or dissipation of vibrations
Dynamic mechanical behavior	
Elastic modulus	
Elongation	
Fatigue	Number of cycles required for fracture
Flexural stiffness	
Flexural strength at break	Amount of stress needed to break material
Fracture mechanical properties	Fracture energy, fatigue resistance, fatigue crack growth, void coalescence
Friction abrasion and resistance	
Hardness	Resistance to compression, indentation, and scratch
Impact strength	Energy absorbed by sample prior to fracture
Indention hardness	
Load deformation	
Mar resistance	
Mold shrinkage	
Poisson's ratio	
Scratch resistance	
Shear strength	Maximum load to produce a fracture by shearing
Surface abrasion resistance	
Tear resistance	
Tensile strength break (yield)	See Young's modulus
Toughness	Amount of energy to break a material (area under stress-strain curve)
Ultimate strength	
Viscoelastic behavior	
Young's modulus	
(Tensile strength)	Modulus of elasticity or tensile modulus

Table 11. Electrical and magnetic properties

Property measured	Remarks
Arc resistance	Time needed for current to make material surface conductive because of carbonization
Dielectric constant	Ability of material to store electric energy for capacitor application
Dielectric permittivity	
Dielectric strength	Voltage required to break down or arc material
Dissipation power factor (loss tangent)	Watts (power) lost in material used as insulator
Insulation resistance	
Magnetic susceptibility	
Resistivity	
Volume resistivity	

Table 12. Optical properties

Property measured	Remarks
Color	Physiological response; measured using three parameters: lightness, chroma, and delta
Luminous transmittance	Measure of plastic haze or clarity
Molar refraction	
Percent transmission	Transparency
Refractive index	
Specular gloss	Surface "flatness"; mirror "finish"
Total internal reflectance	
UV-visible absorbance spectrum	

Table 13. Polymer stability

Property measured	Remarks
Accelerated aging studies	
Biological stability	Stability in the presence of microorganisms
Burning rate	
Chemical resistance	Hydrolytic stability (extreme pH conditions), exposure to chemicals and solvents
Flammability	Flame resistance
Flash ignition temperature	
Long-term immersion	
Permeability	Amount of gas or liquid penetrating film
Recyclability	
Resistance to cold	
Self-extinguishing temperature	
Stress cracking	Caused by weathering
Thermal stability	In addition to temperature, decomposition products are measured
UV resistance	Color fading, pitting, crumbling, surface cracking, crazing, brittleness
Weathering (environmental stress)	Color and gloss change, cracks, crazing, weakening (see UV resistance)

CONCLUSIONS

Polymer science can be viewed as an applied branch of chemistry based on deliverable properties. It is of interest to note that most of these properties depend on just four attributes: (1) polymer molecular weight, (2) crystallinity, (3) chemical composition, and (4) macromolecular topology or architecture; furthermore, these parameters interact with one another in a complex manner. By varying these parameters, polymers can be tailor-made to fit a list of desirable characteristics.

It is hoped that this polymer property database will serve as a guideline to help pave the way for the development of newer materials of improved characteristics.

POLYMERS: A PROPERTY DATABASE ON THE WEB

To maintain state-of-the-art property listings and to facilitate searches, *Polymers: A Property Database, Second Edition* is also published online at http://www.polymersdatabase.com. Space considerations have precluded the inclusion of indexes other than a Name and Synonym Index in the hard-copy version of the *Polymer Database*. In contrast, the online version contains searchable indexes on each of the fields present in the database, covering all text and numerical fields in the following categories:

General Description
Volumetric and Calorimetric Properties
Surface Properties and Solubility
Transport Properties
Mechanical Properties
Electrical Properties
Optical Properties
Polymer Stability
Applications and Commercial Products
References

Upon entering the database you will be presented with the polymer search screen illustrated below (Figure 1). It is from here that searches will be performed.

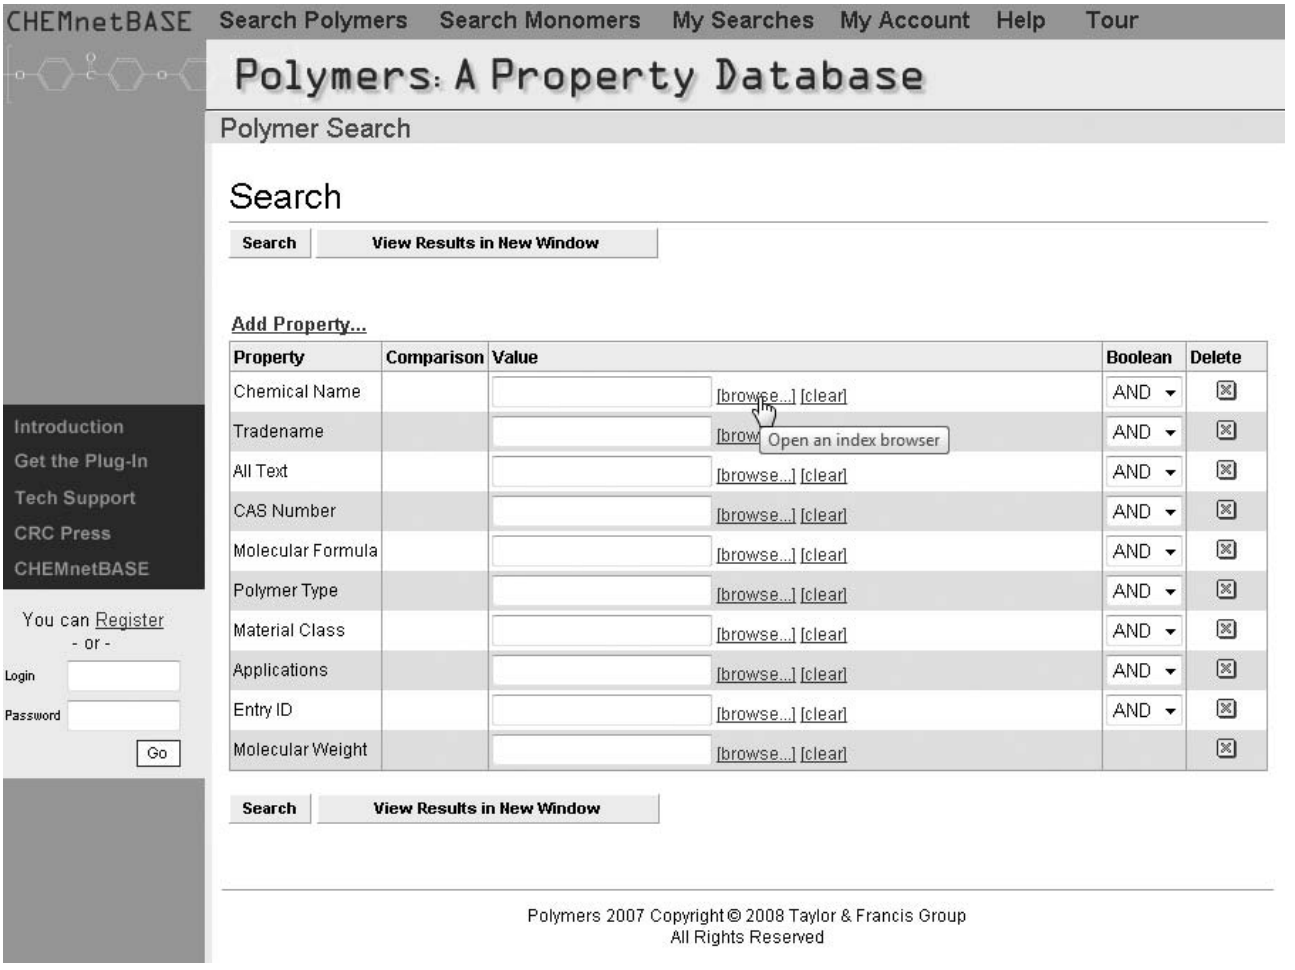

Figure 1

From the search window, design your search profile using text, numerical fields or a combination of both. Once your search has been performed the resultant hits are listed alphabetically by polymer name in the hit list window. Clicking on any one of the hits in the hit list window will result in that entry being displayed (Figure 2).

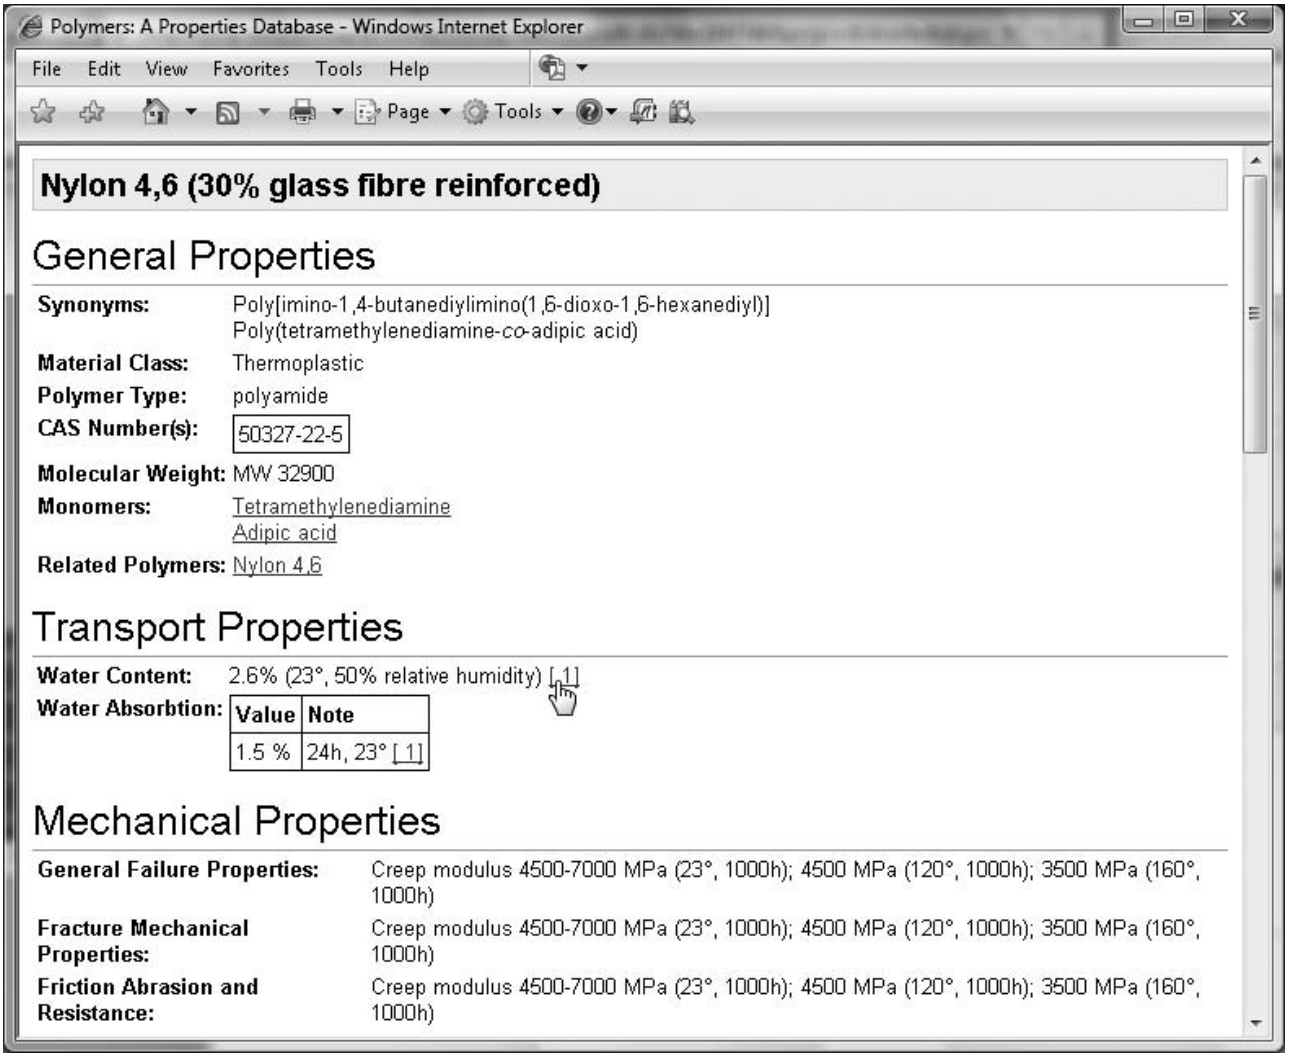

Figure 2

In addition, the online version also contains a searchable monomers database. Monomers may be searched by a combination of text and structure searching via a downloadable browser plug-in (Figure 3).

Cycolac MSL	General Electric Plastics

ABS, Carbon reinforced A-2

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-stryene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Composites, Copolymers, Thermoplastic
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
Additives: 15% Carbon fibre
General Information: An amorph. thermoplastic that combines high performance with design versatility and easy processability

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.12 g/cm^3	ASTM D792

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.6×10^{-5} K^{-1}	ASTM D696 [3]	L

Melting Temperature:

No.	Value	Note
1	210–260°C	[4]

Glass-Transition Temperature:

No.	Value	Note
1	100–110°C	[4]

Deflection Temperature:

No.	Value	Note
1	80°C	1.8 MPa, ASTM D648 [3]
2	90°C	0.45 MPa, ASTM D648 [3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones and some chlorinated hydrocarbons [5]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour in both the melt and solid states. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2]
Water Absorption:

No.	Value	Note
1	0.3 %	24h, ASTM D570 [3]
2	0.75 %	saturation, ASTM D570 [3]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range, with very good rigidity and toughness. Its tensile and flexural strength, tensile and flexural moduli are all higher than those of unreinforced ABS. Has very low notched Izod impact strength compared to that of unreinforced ABS grades. Elongation at break 1–2% (ASTM D638). [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	12409–13788 MPa	1800–2000 kpsi, ASTM D638 [4]

Flexural Modulus:

No.	Value	Note
1	6000 MPa	ASTM D790 [3]

Tensile Strength Yield:

No.	Value	Note
1	80 MPa	ASTM D638 [3]

Flexural Strength Yield:

No.	Value	Note
1	100 MPa	ASTM D790 [3]

Compressive Strength:

No.	Value	Note
1	75–117 MPa	ASTM D695 [3]

Impact Strength: Izod 60 J m^{-1} (notched, ASTM D256) [3], 280 J m^{-1} (unnotched, ASTM D256) [3]
Hardness: Rockwell M90 (ASTM D785) [3]
Fracture Mechanical Properties: Shear strength 45 MPa (ASTM D732) [3]. Coefficient of friction 0.2 (static) (LNP SOP) 0.15, (dynamic) (LNP SOP) [3]
Friction Abrasion and Resistance: Coefficient of friction 0.2 (static, (LNP SOP), 0.15 (dynamic, LNP SOP) [3]

Izod Notch:

No.	Value	Notch	Note
1	60 J/m	Y	ASTM D256
2	280 J/m	N	ASTM D256 [3]

Electrical Properties:

Electrical Properties General: Is electrically conductive. Surface resistivity 10^3–10^6 Ω cm (ASTM D257) [3]; Volume resistivity 10^4–10^6 Ω cm (ASTM D257) [3]

Polymer Stability:

Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. Retains its props. at low temps. [2,5]

Upper Use Temperature:

No.	Value	Note
1	60°C	[3]
2	60°C	UL 746B [3]

Flammability: Flammability rating HB (3.2 mm, UL94) [3]

Environmental Stress: Has poor weather and uv resistance unless protected. Undergoes stress cracking in contact with certain chemicals. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2,5]

Chemical Stability: Resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Has high resistance to staining agents in household applications. Attacked by conc. nitric and sulfuric acids. Unaffected by weak acids at room temp. and alkalis below 65°. Has poor resistance to most organic solvents [1,2,5]

Recyclability: Scrap and reject material can be reworked at an 80:20 (virgin:regrind) ratio if kept clean and segregated by colour and grade [4]

Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Evidence of morphological changes is shown by agglomeration of dispersed rubber particles during injection-moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [10]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and usually a chain transfer agent for MW control. [1,6,7,8,9] Processed on standard reciprocating-screw injection moulding machines at 210–216°. [4] Should be dried before melt processing.

Applications: Uses where high strength and stiffness are required

No.	Value	Note
1	92–101°C	50 K h^{-1}, 50 N, ISO 306 [3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones, some chlorinated hydrocarbons [5]

Transport Properties:

Transport Properties General: ABS exhibits viscoelastic behaviour in both the melt state and the solid state. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2].
Melt Flow Index:

No.	Value	Note
1	1–8 g/10 min	220°, 10 kg, ISO 1133 [3,4]

Polymer Melts: Storage shear modulus and loss shear modulus as a function of angular frequency, and shear stress as a function of shear rate depend strongly on grafting degree in the long-time region associated with particle-particle interactions. As the grafting degree increases, the viscoelastic functions first decrease and then increase. The minima in the functions occurs at the grafting degree of about 0.45 for ABS having a rubber particle size of 170 nm [6]
Water Absorption:

No.	Value	Note
1	0.4 %	23°, 24h, DIN 53495 [4]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range down to -40°, with very good rigidity and toughness and a high yield strength. Elongation at break 15–25% (5 mm min^{-1}, ISO 527) [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	1600–2700 MPa	1 mm min^{-1}, ISO 527 [3,4]

Flexural Modulus:

No.	Value	Note

Compressive Modulus:

No.	Value	Note
1	1030–2690 MPa	ASTM D695 [5]

Elastic Modulus:

No.	Value	Note
1	850–900 MPa	ISO 537 [4]

Tensile Strength Yield:

No.	Value	Note
1	35–45 MPa	50 mm min^{-1}, ISO 527 [3]

Flexural Strength Yield:

No.	Value	Note
1	52–85 MPa	5 mm min^{-1}, ISO 178 [3,4]

Compressive Strength:

No.	Value	Note
1	36–70 MPa	ASTM D695 [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1250–1400 MPa	$\leq$0.5% elongation, 1000h, ISO/IEC 899 [4]	tensile creep modulus

Viscoelastic Behaviour: Stress-strain behaviour, creep, stress and relaxation and fatigue have been reported [7]
Hardness: Ball indentation (H358/30) 75–110 MPa (ISO 2039) [4]. Rockwell R75–R115 (ASTM D785) [5]
Friction Abrasion and Resistance: Has good abrasion resistance [3]
Izod Area:

No.	Value	Notch	Note
1	19–42 kJ/m^2	Notched	23°, ISO 180/1A [3,4]
2	10–25 kJ/m^2	Notched	-30°, ISO 180/1A [3,4]

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$0.01–1 \times 10^{15}$ Ω.cm	IEC 93 [3,4]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3–3.4	100 Hz	
2	2.9–3	1 MHz	IEC 250 [3,4]

Dielectric Strength:

No.	Value	Note
1	34–85 $kV.mm^{-1}$	IEC 243-1 [3,4]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.009	100 Hz	
2	0.007–0.01	1 MHz	IEC 250 [3,4]

Optical Properties:

Transmission and Spectra: Transmittance 33.3% (ASTM D1003) [5]
Volume Properties/Surface Properties: Haze 100% [5]. Gloss 75–86% (measuring angle 20°) [3]. An extensive range of colours is available [3]. Inherent colour opaque [3]

Polymer Stability:

Polymer Stability General: Has very good dimensional stability and chemical resistance. Undergoes autooxidation resulting in embrittlement of the rubber, and is liable to photooxidative degradation [2,5]
Thermal Stability General: The polymer has a relatively flat stress-temp. response due to its amorph. character. The change in tensile, compressive and flexural props. is small below 80%. Retains its props. at low temps. [2,5]
Upper Use Temperature:

No.	Value	Note
1	60–90°C	[5]

Flammability: Flammability rating HB (1.6 mm thick, UL 94) [4]
Environmental Stress: Has poor weather and uv resistance unless protected. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber. [2] May yellow slightly in sunlight [2,5]
Chemical Stability: Is resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Is highly resistant to staining agents in household applications. It is attacked by conc. nitric and sulfuric acids but is unaffected by weak acids at room temp., or alkalis (up to 65°). Attacked by organic solvents (C_6H_6, toluene, xylene, ethers, esters, chlorinated aromatic and aliphatic hydrocarbons, amines, ketones and hot alcohols. Certain chemicals cause stress cracking [1,2,5]
Hydrolytic Stability: Stable to neutral salt solns. [1,5]
Biological Stability: Is biologically inert
Recyclability: Scrap and reject material can be reworked at an 80:20 (virgin:regrind) ratio if kept clean and segregated by colour and grade [8]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly onto the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isol. the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and, usually, a chain transfer agent for MW control [1,9,10,11,12]. Processed on conventional single or twin-screw extruders into pipe, sheet, blow moulded shapes or profiles. Extruded sheet can be thermoformed
Applications: Uses in automotive exterior applications including extruded/thermoformed fascias for large trucks; in refrigerator doors, luggage and as tank liners. Other uses in large structural components in transportation and pipes. Industrial uses include protective covers

ABS Flame retardant A-4

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_6H_8 C_4H_6C C_3H_3N
Additives: Flame retardants such as halogenated additives. Additive can be brominated, chlorinated or both
General Information: Thermoplastic, amorph. polymer that combines high performance with design versatility and easy processability. Has better fire resistance than standard grades of ABS. Good resistance to abrasion, chemicals and stress ensures a long lasting attractive surface finish. Has excellent flow props. [3, 4]

Compressive Strength:

No.	Value	Note
1	45–52 MPa	ASTM D695 [8]

Viscoelastic Behaviour: Stress-strain behaviour, creep, stress relaxation and fatigue in ABS materials have been reported [10]
Hardness: Ball indentation hardness 110 N mm^{-2} (ISO 2039-1) [6]. Rockwell R90-R107 (ASTM D785) [8]
Friction Abrasion and Resistance: Has good abrasion resistance [4]
Izod Area:

No.	Value	Notch	Note
1	7–15 kJ/m^2	Notched	23°, ISO 180-1A [4]
2	5–8 kJ/m^2	Notched	-30°, ISO 180-1A [4,6]

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$>1 \times 10^{15}$ Ω.cm	min., IEC 93 [4]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2.8–3.2	50 Hz	IEC 250 [4, 5]
2	2.7–3.1	1 MHz	IEC 250 [4, 5]

Dielectric Strength:

No.	Value	Note
1	24–25 kV.mm^{-1}	IEC 243-1 [4, 6]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	50 Hz	IEC 250 [4, 5]
2	0.004–0.011	1 MHz	IEC 250 [4, 5]

Optical Properties:

Volume Properties/Surface Properties: Supplied in either standard or custom colours, or as natural pellet for colouring [4]. An extensive range of colours is available [6]

Polymer Stability:

Polymer Stability General: Offers very good dimensional stability and chemical resistance. Undergoes autooxidation resulting in embrittlement of the rubber. Liable to photooxidative degradation [2, 8]

Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. The change in tensile, compressive and flexural props. is small up to 80°. Props. retained at low temps. [2, 8]

Upper Use Temperature:

No.	Value	Note
1	70°C	[7]
2	50–80°C	[7, 8]

Decomposition Details: Thermal decomposition of the fire retardant additives can occur at temps. in excess of 240° or during long residence times. In addition to the constituent monomers, antimony compounds, brominated hydrocarbons and hydrogen bromide might also be released [4]

Flammability: Flammability rating V0 (1.57–3.2 mm thick, UL 94) [4, 6]; 5VA (2.5–3.2 mm thick, UL 94) [4, 6]. Glow wire test, wire applied during 30 seconds, extinguishing time $\leq$ 5 s (1.5–3.2 mm, 960°, IEC 695-2-1/1) [4]. Limiting oxygen index 27–30% (ASTM D2863, ISO4589 IV) [4, 6]

Environmental Stress: Resistance to weathering and Uv is poor unless protected. Undergoes stress cracking when in contact with certain chemical agents under stress. ABS polymeric components differ in oxidative stability. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2]. May discolour in sunlight [2, 8]

Chemical Stability: Undergoes stress cracking when in contact with certain chemical agents. Resistant to mineral and vegetable oils, waxes and related household and commercial materials. High resistance to staining agents in household applications. Attacked by conc. nitric acid, sulfuric acid. Unaffected by weak acids, weak and strong bases up to 65°. Poor resistance to most organic solvents [2,8]

Biological Stability: Is biologically inert [4]

Recyclability: Can be recycled. The scrap should be clean, uncontaminated, and free from degradation. Normally the content of the reground material should not exceed 20–25 % [4]

Stability Miscellaneous: Sufficiently stable during processing provided that processing temp. is kept as low as conveniently possible and residence times are kept to an absolute minimum [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by grafting styrene and acrylonitrile directly upon the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, monomer concentration, extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; production of a rubber latex and subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and, usually, a chain transfer agent for MW control. [1,11,12,13,14]. Processed on standard reciprocating-screw injection moulding machines. Processing characteristics are short cycle time and low energy consumption giving an excellent price/performance ratio. Processing temps. must be minimised when moulding with flame-retardant grades due to the nature of the self-extinguishing mechanism. This is based on the thermal decomposition of additives. As they decompose, these additives release large volumes of flame-suppressant gases. A high processing temp., which may trigger the gas release, must be avoided. Melt temp. must never exceed 250°. Drying at 80–85° (2–4h) is required prior to use in moulding machines [4, 5]. Recommended melt temp. 200–230° [4, 6]. Recommended mould temp. 40–70° [4, 6]. Injection velocity 240 mm s^{-1} (ISO 294) [6]

Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.7%	ASTM D955 [5]

Applications: Transformer housings, switches, personal computer housings, television cabinets, oven doors, electric tool housings, institutional furniture and shelving, air conditioner housings, carpet cleaner housings, smoke detectors [6, 7]

ABS General purpose A-5

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
General Information: Thermoplastic amorph. polymer that combines high performance with design versatility and easy processability. Offers a combination of good mechanical props. and heat resistance. Excellent stiffness, flow characteristics and dimensional stability enable the production of consistent mouldings. Good resistance to abrasion, chemicals and stress ensure a long-lasting attractive surface finish

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.05 g/cm^3	ISO 1183 [5, 6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8.4×10^{-5}–9.6×10^{-5} K^{-1}	DIN 53752 [4, 6]	L

Thermal Conductivity:

No.	Value	Note
1	0.2 W/mK	DIN 52612 [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	[7]	P

Melting Temperature:

No.	Value	Note
1	220–260°C	[5, 6]

Glass-Transition Temperature:

No.	Value	Note
1	100°C	[7]

Deflection Temperature:

No.	Value	Note
1	89–95°C	1.8 MPa, 80°, 4 h, ISO 75
2	94–96°C	0.45 MPa, 80°, 4 h, ISO 75 [4, 6]
3	95–100°C	[7]

Vicat Softening Point:

No.	Value	Note
1	93–100°C	49 N, 50° h^{-1}, ISO 306/B50 [4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones, chlorinated hydrocarbons [8]

Transport Properties:

Transport Properties General: ABS Exhibits viscoelastic behaviour in the melt and solid state. Exhibits non-Newtonian behaviour, by the decrease in viscosity resulting from an increase in shear rate [2]
Melt Flow Index:

No.	Value	Note
1	9–45 g/10 min	220°, 10 kg, ISO 1133 [5, 6]

Polymer Melts: Viscoelastic functions, in terms of storage shear modulus and loss shear modulus as a function of angular frequency and shear stress as a function of shear rate, depend strongly on grafting degree in the long-time region associated with particle-particle interactions. As the grafting degree increases the viscoelastic functions first decrease and then increase. The minima in the functions occurs at the grafting degree of about 0.45 for ABS having rubber particle size of 170 nm [15]
Permeability and Diffusion General: Permeability decreases with increasing acrylonitrile content
Water Absorption:

No.	Value	Note
1	0.2–0.45 %	1.8" thick, 24h, ASTM D570 [8]

Gas Permeability:

No.	Gas	Value
1	O_2	79–102 cm^3 mm/(m^2 day atm)
2	N_2	9.8–13.8 cm^3 mm/(m^2 day atm)
3	CO_2	3.54–4.72 cm^3 mm/(m^2 day atm)

Mechanical Properties:

Mechanical Properties General: High impact resistance over a wide temp. range down to -40°. Excellent toughness and rigidity. Deforms in a ductile manner over a broad temp. range and at high strain rates. [2, 4] Elongation at break 13–26 % (50 mm min^{-1}, ISO 527) [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	2000–2700 MPa	1 mm min^{-1}, ISO 527 [4, 6]

Flexural Modulus:

No.	Value	Note
1	2400–2600 MPa	ISO 178 [5, 6]

Tensile Strength Break:

No.	Value	Note
1	13–26 MPa	50 mm min^{-1}, ISO 527 [4]

Compressive Modulus:

No.	Value	Note
1	830–1380 MPa	ASTM D695 [8]

Tensile Strength Yield:

No.	Value	Note
1	44–50 MPa	50 mm min^{-1}, ISO 527 [4, 5]

Flexural Strength Yield:

No.	Value	Note
1	68–81 MPa	ISO 178 [5, 6]

Compressive Strength:

No.	Value	Note
1	35–76 MPa	ASTM D695 [8]

Impact Strength: Impact strength is dependent on grafted rubber content. The ability of the rubber domains to promote craze formation and shear yielding accounts for improved impact props. [1, 2]
Viscoelastic Behaviour: Stress-strain behaviour, creep, stress relaxation and fatigue have been reported [9]
Hardness: Rockwell R110 (ISO 2039/2) [5]. Ball indentation hardness 105–120 N mm^{-2} (ISO 2039-1) [6]
Fracture Mechanical Properties: Shear strength 28 MPa [7]
Friction Abrasion and Resistance: Exhibits good abrasion resistance. Coefficient of friction 0.30-0.35
Izod Area:

No.	Value	Notch	Note
1	10–28 kJ/m^2	Notched	23°, ISO 180/1A, samples dry as moulded/accelerated conditioning according to ISO 1110, 70°, 63% humidity [4,6]
2	4–20 kJ/m^2	Notched	-30°, ISO 180/1A samples dry as moulded/accelerated conditioning according to ISO 1110, 70°, 63% humidity[4,6]

Electrical Properties:

Electrical Properties General: Exhibits electrical props. that are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]

Surface/Volume Resistance:

No.	Value	Note	Type
1	$>1\times10^{15}$ Ω.cm	min., IEC 93 [4]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3	50 Hz	IEC 250 [4, 6]
2	2.9–3	1 MHz	IEC 250 [4, 6]

Dielectric Strength:

No.	Value	Note
1	25–33 $kV.mm^{-1}$	IEC 243-1 [4, 6]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004	50 Hz	IEC 250 [4, 6]
2	0.007–0.008	1 MHz	IEC 250 [4, 6]

Optical Properties:

Transmission and Spectra: Poor Uv resistance unless protected by the use of stabilizing additives, pigments and proctective coatings and film. Continued exposure to strong Uv causes embrittlement [2]
Volume Properties/Surface Properties: Gloss, untextured, >90 (60°, ASTM D523) [5]. Supplied in either standard or custom colours or as a natural pellet for colouring. Available in most colours [4]. Haze 100 % (ASTM D1003) [8]

Polymer Stability:

Polymer Stability General: Offers very good dimensional stability and chemical resistance. Undergoes autoxidation resulting in embrittlement of the rubber. Liable to photooxidative degradation
Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. The change in tensile, compressive and flexural props. is small up to 80° [2]
Upper Use Temperature:

No.	Value	Note
1	75–85°C	[7]

Flammability: Flammability rating HB (1.6 mm thick, UL94) [4]. Limiting oxygen index 18% (ISO 4589, IV) [4]. Glow wire test, wire applied during 30 seconds extinguishing time 5 s (max., 2 mm thick, 650°, IES 695-2-1/1) [4]
Environmental Stress: Has poor Uv resistance unless protected by the use of stabilising additives, pigments and protective coatings and film. Continued exposure to strong uv radiation causes embrittlement. [2] Poor weather resistance unless protected. ABS polymeric components differ in oxidative stability. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2]. May show slight yellow discoloration in sunlight [2, 8]
Chemical Stability: Undergoes stress cracking when in contact with certain chemical agents. Resistant to mineral and vegetable oils, waxes and related household and commercial materials. High resistance to staining agents in household applications. Attacked

by concentrated nitric acid, sulfuric acid; unaffected by weak acids, weak and strong bases. Poor resistance to most organic solvents. Commercial grades may contain Uv absorbers [2, 8]
Biological Stability: Is biologically inert [4]
Recyclability: Can be recycled. The scrap should be clean, uncontaminated and free from degradation. Normally the content of the reground material should not exceed 20 to 25% [9]
Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Morphological changes can be evident during injection moulding (at higher temps.) as agglomeration of dispersed rubber particles. Physical effects such as orientation and moulded-in stress affect mech. props. [10]

Applications/Commercial Products:

Processing & Manufacturing Routes: Made by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. Grafting is achieved by the free-radical copolymerisation of styrene and acrylonitrile monomers in the presence of polybutadiene. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, monomer concentration, extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; production of a rubber latex and subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and, usually, a chain transfer agent for MW control [1,11,12,13,14]. Processed on standard reciprocating-screw injection moulding machines. ABS is slightly hygroscopic and requires drying prior to use in moulding machines. Drying temp./time 80–95° (2–4h) [4,5]. Recommended melt temp. 220–260° [4,5,6]. Recommended mould temp. 40–70° [4,5,6,]. Injection velocity 240 mm s^{-1} (ISO 294) [6] The superior flow props. of ABS mean that large products can be moulded with thinner walls - giving savings in product weight and shorter cycle times. Low energy consumption and short cycle times give an excellent price/performance ratio [4]
Applications: Housings for electrical domestic appliances, telecommunications equipment, audio and video equipment and business machines. Automotive interior and exterior components such as instrument panels, consoles, radiator grilles and headlight housings. Electrical powered tools and garden equipment. Other uses in furniture, toys, leisure articles

ABS, Glass fibre reinforced A-6

Synonyms: *Acrylonitrile-butadiene-styrene, Glass fibre reinforced*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS

Applications/Commercial Products:

Trade name	Supplier
ABS-G1FG-2	Washington Penn
AS-10GF	Compounding Technology
Novodor PTGV	Bayer Inc.
RTP 601	RTP Company
Styvex	Ferro Corporation
Thermocomp AF	LNP Engineering

ABS, Heat Resistant A-7

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene, α-Methylstyrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)(C_9H_{10})]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N C_9H_{10}
Additives: α-Methylstyrene
General Information: An amorph. thermoplastic that combines high performance with design versatility and easy processability. Addition of α-methylstyrene gives a heat distortion temp. higher than that of conventional grades of ABS. Good resistance to abrasion, chemicals and stress ensures a long lasting attractive surface finish. [2,3,4,5]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.06 g/cm^3	ISO 1183 [5]

Deflection Temperature:

No.	Value	Note
1	94–102°C	80°, 1.8 MPa, 4h, ISO 75
2	105–108°C	80°, 0.45 MPa, 4h, ISO 75 [4,5]

Vicat Softening Point:

No.	Value	Note
1	100–115°C	50 K h^{-1}, 50N, ISO 306 [4,5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones and some chlorinated hydrocarbons [7]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour in both the melt and solid states. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate

Melt Flow Index:

No.	Value	Note
1	2–18 g/10 min	220°, 10 kg, ISO 1133 [5]

Polymer Melts: Storage shear modulus and loss shear modulus as a function of angular frequency, and shear stress as a function of shear rate depend strongly on grafting degree in the long-time region associated with particle-particle interactions. As the grafting degree increases the viscoelastic functions first decrease and then increase. The minima in the functions occurs at the grafting degree of about 0.45 for ABS having rubber particles of 170 nm [16]

Water Absorption:

No.	Value	Note
1	0.2–0.45 %	23°, 24h, DIN 53495 [4,8]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range down to -40°. Has good toughness and rigidity and high yield strength. Can deform in a ductile manner over a broad temp. range and at high strain rates [2,5]. Its creep resistance is higher than that of other grades of ABS. Little change in tensile, compressive and flexural props. below 80° [2,7]

Tensile (Young's) Modulus:

No.	Value	Note
1	2400–3000 MPa	1 mm min^{-1}, ISO 527 [4,5]

Flexural Modulus:

No.	Value	Note
1	2500–2800 MPa	2 mm min^{-1}, ISO 178 [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	15–23 MPa	5 mm min^{-1}, ISO 527 [4,5]	Elongation at break

Compressive Modulus:

No.	Value	Note

Elastic Modulus:

No.	Value	Note
1	950 MPa	ISO 537 [8]

Tensile Strength Yield:

No.	Value	Elongation
1	44–48 MPa	50 mm min^{-1}, ISO 527 [4]

Flexural Strength Yield:

No.	Value	Note
1	75–85 MPa	5 mm min^{-1}, ISO 178 [5]

Compressive Strength:

No.	Value	Note
1	50–69 MPa	ASTM D695 [7]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2400–2500 MPa	1h, ISO 899-1	tensile creep modulus
2	1900 MPa	1000h, ISO 899-1 [5]	

Viscoelastic Behaviour: Stress-strain behaviour, creep, stress relaxation and fatigue have been reported [14]
Hardness: Ball indentation 110-120 N mm^{-2} (ISO 2039-1) [5]. Rockwell R100–R115 (ASTM D785) [7]
Friction Abrasion and Resistance: Has good abrasion resistance [4]
Izod Area:

No.	Value	Notch	Note
1	12–23 kJ/m^2	Notched	23°, ISO 180-1A
2	3–10 kJ/m^2	Notched	-30°, ISO 180-1A [4,5]

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$0.1–1 \times 10^{15}$ Ω.cm	IEC 93 [5]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2.7–3	100 Hz	
2	2.7–3.1	1 MHz	IEC 250 [5]

Dielectric Strength:

No.	Value	Note
1	25–33 $kV.mm^{-1}$	IEC 243-1 [4,5]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005–0.009	100 Hz	
2	0.005–0.008	1 MHz	IEC 250 [5]

Optical Properties:

Transmission and Spectra: Transmittance 33.3% (ASTM D1003) [7]. Commercial grades may contain uv absorber
Volume Properties/Surface Properties: Haze 100% [7]. Gloss 76–87% (measuring angle 20°) [5]. May be supplied in either standard or custom colours or as natural pellet for colouring [4]

Polymer Stability:

Polymer Stability General: Combines high heat resistance with dimensional stability at higher temps.
Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character [2,7]

Upper Use Temperature:

No.	Value	Note
1	80–110°C	[7]

Flammability: Flammability rating HB (1.6 mm, UL94) [4]. Oxygen index 18% (ISO 4589, specimen IV) [4]. Glow wire test, extinguishing time 55 (min), extinguishing temp. 650° (30s application, 2 mm thick, IES 695-2-1/1) [4]
Environmental Stress: Has poor weather and uv resistance unless protected. Undergoes stress cracking in contact with certain chemicals. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber. Yellows slightly in sunlight [2,4]
Chemical Stability: Is resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Has high resistance to staining agents in household applications. Attacked by conc. nitric acid and sulfuric acids. Unaffected by weak acid at room temp. and alkalis below 65°. Poor resistance to most organic solvents [2,7]
Hydrolytic Stability: Stable to solns. of acid, alkaline and neutral salts
Biological Stability: Is biologically inert [4]
Recyclability: Can be recycled. The scrap should be clean, uncontaminated, and free from degradation. Normally the content of the reground material should not exceed 20-25% [4]
Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Evidence of morphological changes is shown by agglomeration of dispersed rubber particles during injection-moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [9]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and usually a chain transfer agent for MW control [1,10,11,12,13]. α-Methylstyrene is added during the polymerisation step [15]. Processed on standard reciprocating-screw injection-moulding machines. Drying is required prior to use in moulding machines
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.7%	ISO 2577 [4,5]

Applications: Used in automotive components (radiator grilles, airvents and interior trim); in business machine housings; in domestic appliances (e.g., electric iron handles); in optical equipment and in instrument panel sections

ABS, High impact A-8

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
General Information: An amorph. thermoplastic that combines high performance with design versatility and easy processability

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.03 g/cm^3	ISO 1183 [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9.5×10^{-5}–0.00011 K^{-1}	ASTM D696, DIN 53732 [1,3]	L

Thermal Conductivity:

No.	Value	Note
1	0.2 W/mK	DIN 52612 [3]

Melting Temperature:

No.	Value	Note
1	230–270°C	[3,5]

Glass-Transition Temperature:

No.	Value	Note
1	91–110°C	[14]

Deflection Temperature:

No.	Value	Note
1	89–101°C	120 K h^{-1}, 1.8 MPa, ISO 75/A [3,4]
2	98°C	0.45 MPa [5]

Vicat Softening Point:

No.	Value	Note
1	91–100°C	50 K h^{-1}, 50 N, ISO 306B [3,4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones and some chlorinated hydrocarbons [6]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour in both the melt state and the solid state. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2]
Melt Flow Index:

No.	Value	Note
1	4.5–17 g/10 min	220°, 10 kg, ISO 1133 [3,4]

Polymer Melts: Storage shear modulus and loss shear modulus as a function of angular frequency, and shear stress as a function of shear rate depend strongly on grafting degree in the long-time region associated with particle-particle interactions. As the grafting degree increases, the viscoelastic functions first decrease and then increase. The minima in these functions occurs at the grafting degree of about 0.45 for ABS having a rubber particle size of 170 nm [8]
Water Absorption:

No.	Value	Note
1	0.2–0.3 %	23°, 24h, DIN 53495 [3,5]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range down to -40°. Has very good rigidity, high yield strength and a higher notched Izod impact strength than other types of ABS [3,5]. The change in tensile, compressive and flexural props. is small below 80°

Tensile (Young's) Modulus:

No.	Value	Note
1	1900–2250 MPa	1mm min^{-1}, ISO 527 [4,7]

Flexural Modulus:

No.	Value	Note
1	2100–2200 MPa	ASTM D790M [4,5]

Tensile Strength Break:

No.	Value	Note
1	10–40 MPa	ISO 527 [3,4]

Compressive Modulus:

No.	Value	Note
1	965–1380 MPa	ASTM D695 [6]

Elastic Modulus:

No.	Value	Note
1	800–845 MPa	23°, ISO 537 [4,7]

Tensile Strength Yield:

No.	Value	Note
1	38–42 MPa	50 mm min^{-1}, ISO 527 [3,4]

Flexural Strength Yield:

No.	Value	Note
1	65 MPa	ISO 178 [4]

Compressive Strength:

No.	Value	Note
1	31–55 MPa	ASTM D695 [6]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1150 MPa	100h, $\leq$0.5% elongation, ISO/IEC 899 [7]	tensile creep modulus

Viscoelastic Behaviour: Stress-strain behaviour, creep, stress relaxation and fatigue have been reported [9]
Hardness: Ball indentation (H358/30) 65-90 MPa (ISO 2039) [4,7]. Rockwell R80–R105 (ASTM D785) [1,4]
Friction Abrasion and Resistance: Has good abrasion resistance [3]
Izod Notch:

No.	Value	Notch	Note
1	35–38 J/m	Y	23°, ISO 180/1A [3,7]
2	17–26 J/m	Y	-30°, ISO 180/1A [3,7]

Izod Area:

No.	Value	Notch	Note
1	35–38 kJ/m^2	Notched	-30°, ISO 180/1A [3,7]
2	17–26 kJ/m^2	Notched	23°, ISO 180/1A [3,7]

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$>1\times10^{15}$ Ω.cm	min., IEC 93 [3]	S

Dielectric Permittivity (constant):

No.	Value	Frequency
1	2.9	50 Hz
2	2.9	1 MHz IEC 250 [3]

Dielectric Strength:

No.	Value	Note
1	16–31 $kV.mm^{-1}$	ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.01	50 Hz	[3]
2	0.008	1 MHz	IEC 250 [3]

Optical Properties:

Transmission and Spectra: Transmittance 28% (ASTM D10003) [6]. Commercial grades may contain uv absorber [6]
Volume Properties/Surface Properties: Haze 100% [6]. Colour supplied in either standard or custom colours, or as natural pellet for colouring [3]

Polymer Stability:

Polymer Stability General: Undergoes autooxidation resulting in embrittlement of the rubber and is liable to photooxidative degradation [2,6]
Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. Retains its props. at low temps. [2,6]
Upper Use Temperature:

No.	Value	Note
1	60–100°C	[6]

Flammability: Flammability rating HB (1.6 mm thick, UL 94) [3]. Oxygen index 18% (ISO 4589, specimen N) [3]. Glow wire test extinguishing time 5 s (max), extinguishing temp. 650°
Environmental Stress: Has poor weather and uv resistance unless protected. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2]
Chemical Stability: Resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Is highly resistant to staining agents in household applications. Attacked by conc. nitric and sulfuric acids but is unaffected by weak acids at room temp. and most alkalis up to 65°. Has poor resistance to most organic solvents [1,2,6]. Certain chemicals cause cracking under applied stress

Hydrolytic Stability: Is resistant to neutral salt solns [1,6]
Biological Stability: Is biologically inert [3]
Recyclability: Can be recycled. The scrap should be clean, uncontaminated, and free from degradation. Normally the content of the reground material should not exceed 20–25% [3]
Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Evidence of morphological changes is shown by agglomeration of dispersed rubber particles during injection-moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [15]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and, usually, a chain transfer agent for MW control. [1,10,11,12,13]. Processed on standard reciprocating-screw injection-moulding machines
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.7%	DSM [3]

Applications: Used in automotive industry (interior and exterior trims); in pipes, luggage, refrigerator inner liners, power tools, boat hulls, ski-boots, furniture and in agricultural parts

ABS, Injection moulding, Glass fibre reinforced A-9

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Composites, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
Additives: 20% Glass fibre
General Information: An amorph. thermoplastic that combines high performance with design versatility and easy processability

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.2 g/cm^3	ISO 1183 [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.4×10^{-5}–5.4×10^{-5} K^{-1}	23–55°, DIN 53732, ASTM E831 [3,5]	L

Volumetric Properties General: Fibre reinforcement reduces the coefficient of thermal expansion compared with that of standard ABS grades
Thermal Conductivity:

No.	Value	Note
1	0.22–0.24 W/mK	DIN 52612, ASTM C177 [3,4]

Melting Temperature:

No.	Value	Note
1	240°C	[5]

Glass-Transition Temperature:

No.	Value	Note
1	100–110°C	[12]

Deflection Temperature:

No.	Value	Note
1	100–103°C	120 K h^{-1}, 1.8 MPa, ISO 75/A
2	104–105°C	0.45 MPa, ASTM D648 [3,4,5]

Vicat Softening Point:

No.	Value	Note
1	103–104°C	50 K h^{-1}, 50 N, ISO 306B [3,5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones and some chlorinated hydrocarbons [7]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour both in the melt state and the solid state. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2]. Melt flow index 2.5–9.2 cm^3 10 min^{-1}, (220°, 10 kg, ISO 1133) [3,5]
Water Absorption:

No.	Value	Note
1	0.2–0.3 %	23°, 24h, DIN 53495 [3,4]
2	0.7 %	saturation, ASTM D570 [4]

Mechanical Properties:

Mechanical Properties General: Exhibits high impact resistance over a wide temp. range down to -40°. Has very good rigidity and toughness with tensile strength and modulus higher than those of standard grades of ABS. Elongation at break 1–2% (50 mm min^{-1}, ISO 527). [3,5] Notched Izod impact strength is very low compared with that of ordinary grades of ABS [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	5500–6700 MPa	1mm min^{-1}, ISO 527 [3,5]

Flexural Modulus:

No.	Value	Note
1	4500–5500 MPa	2mm min^{-1}, ISO 178 [4,5]

Compressive Modulus:

No.	Value	Note
1	5515 MPa	ASTM D695 [12]

Tensile Strength Yield:

No.	Value	Note
1	70–75 MPa	50mm min^{-1}, ISO 527 [3,5]

Flexural Strength Yield:

No.	Value	Note
1	95–100 MPa	ISO 178 [4,5]

Compressive Strength:

No.	Value	Note
1	65–96 MPa	ASTM D695 [4,12]

Hardness: Ball indentation 130 N mm^{-2} (ISO 2039-1) [5]. Rockwell M90 (ASTM D785) [4]
Failure Properties General: Shear strength 40 MPa (ASTM D732) [4]
Friction Abrasion and Resistance: Has good abrasion resistance. [3] Coefficient of friction 0.25 (static) (LNP S0P), 0.3 (dynamic) (LNP S0P) [4]
Izod Area:

No.	Value	Notch	Note
1	7 kJ/m^2	Notched	23°, ISO 180/1A [3,5]
2	6 kJ/m^2	Notched	-30°, ISO 180/1A [3,5]

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]
Surface/Volume Resistance:

No.	Value	Note	Type
1	$0.1–1 \times 10^{15}$ Ω.cm	IEC 93 [3,5]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3	50 Hz	
2	3	1 MHz	IEC 250 [3]

Dielectric Strength:

No.	Value	Note
1	25–32 $kV.mm^{-1}$	IEC 243-1 [3]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004	50 Hz	
2	0.008	1 MHz	IEC 250 [3]

Optical Properties:

Volume Properties/Surface Properties: Inherent colour is opaque. An extensive range of colours is available [5]

Polymer Stability:

Polymer Stability General: Has very good dimensional stability and high heat stability. Undergoes autooxidation resulting in embrittlement of the rubber and is liable to photooxidative degradation

Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. Retains its props. at low temps. [2,6]

Upper Use Temperature:

No.	Value	Note
1	70°C	[6]

Flammability: Flammability rating HB (1.6 mm, UL 94). [3] Oxygen index 18% (ISO 4589, Specimen N). [3] Glow wire test extinguishing time 5 s (min), extinguishing temp. 650°, (2mm thick, wire applied for 30 s, IEC 695-2-1/1) [3]

Environmental Stress: Has poor weather and uv resistance unless protected. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2]

Chemical Stability: Is resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Has high resistance to staining agents in household applications. Attacked by conc. nitric and sulfuric acids and organic solvents. Unaffected by weak acids at room temp. and most alkalis up to 65° [1,2,7]

Biological Stability: Is biologically inert [3]

Recyclability: Can be recycled. The scrap should be clean, uncontaminated, and free from degradation. Normally the content of the reground material should not exceed 20-25% [3]

Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Morphological changes can be evident as agglomeration of dispersed rubber particles during injection moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [13]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaption concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and usually a chain transfer agent for MW control. [1,8,9,10,11] Processed on standard reciprocating-screw injection-moulding machines

Mould Shrinkage (%):

No.	Value	Note
1	0.15–0.5%	glass fibre reinforcement lowers mould shrinkage compared with standard ABS grades, ISO 2577 [3,5]

Applications: Applications for automotive components such as instrument panel supports, rear light housings. Industrial ventilator housings and structural parts for office equipment (e.g. chassis)

Tensile Strength Yield:

No.	Value	Elongation	Note
1	46 MPa	6%	23°, ASTM D638 [1,3]

Impact Strength: Tensile impact strength 545 kJ m^{-2} (23°, ASTM D1822) [1]

Hardness: Rockwell R95 (23°, ASTM D785) [1]. Shore D75 (23°, ASTM D676) [1]
Friction Abrasion and Resistance: Has good abrasion resistance
Izod Notch:

No.	Value	Notch	Note
1	850 J/m	Y	23°, 1/8" bar, ASTM D256 [1]

Electrical Properties:

Electrical Properties General: Exhibits lower dielectric strength than polyamide and ABS
Surface/Volume Resistance:

No.	Value	Note	Type
2	8.3×10^{15} Ω.cm	ASTM D257 [1]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3.9	100 Hz	ASTM D150 [1]
2	3.8	1 kHz	ASTM D150 [1]
3	3.5	100 kHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	0.425 $kV.mm^{-1}$	short time, ASTM D149 [1]
2	0.35 $kV.mm^{-1}$	step by step, ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	108s	3.2 mm, ASTM D495

Static Electrification: Comparative tracking index 600 V (ASTM D3638) [1]. High voltage arc tracking rate 0.4 in min^{-1} (UL 746A)
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.015	100 Hz	ASTM D150 [1]
2	0.014	1 kHz	ASTM D150 [1]
3	0.024	100 kHz	ASTM D150 [1]

Polymer Stability:

Thermal Stability General: Stable at high temps.
Upper Use Temperature:

No.	Value	Note
1	70°C	[3]

Flammability: Flammability rating HB (1.6 mm, UL 94) [1]. Limiting oxygen index 20% (ASTM D2863) [1]
Chemical Stability: Good resistance to solvents; has better resistance compared to ABS

Applications/Commercial Products:

Processing & Manufacturing Routes: ABS and polyamide (Nylon 6) blends may be compatibilised with imidised acrylic polymers as well as with styrenic copolymers containing maleic anhydride. The compatibilising copolymer is miscible with the SAN matrix in ABS. The resulting blend has a well-defined ABS dispersion in the Nylon 6 matrix owing to the grafting reaction between maleic anhydride of the compatibiliser and the primary amine end group in Nylon 6. [4] Processed in conventional injection-moulding equipment. Various finishing techniques including painting, flocking, hot stamping, and some welding are possible. The blend should be dried before processing [1]
Mould Shrinkage (%):

No.	Value	Note
1	1.3–1.6%	ASTM D955 [2,3]

Applications: Housings for power tools, electro-technical components. Lawn and garden equipment, sporting goods, gears and impellers

ABS, Plating A-12

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
Additives: Nickel, copper and chrome
General Information: An amorph. thermoplastic that is electroplated to give parts with the more decorative finish of metals such as chrome, gold, silver and brass. The metal layer screens radio waves and conducts electricity. The adhesion of electroplated metal is excellent

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.04 g/cm^3	ISO 1183 [4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001 K^{-1}	23–55°, ASTM E831 [4]	L

Melting Temperature:

No.	Value	Note
1	240–285°C	[3,4]

Glass-Transition Temperature:

No.	Value	Note
1	100–110°C	[5]

Deflection Temperature:

No.	Value	Note
1	92°C	80°, 1.8 MPa, 4h, ISO 75 [4]
2	96°C	80°, 0.45 MPa, 4h, ISO 75 [4]

Vicat Softening Point:

No.	Value	Note
1	95°C	50 K h^{-1}, 50 N, ISO 306 B [4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents (esters, ketones and some chlorinated hydrocarbons) [6]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour in both the melt and solid states. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2]

Melt Flow Index:

No.	Value	Note
1	25 g/10 min	220°, 10 kg, ISO 1133/1991 [4]

Polymer Melts: Storage shear modulus and loss shear modulus as a function of angular frequency, and shear stress as a function of shear rate depend strongly on grafting degree in the long-time region associated with particle-particle interactions. As the grafting degree increases the viscoelastic functions first decrease and then increase. The minima in the functions occurs at the grafting degree of about 0.45 for ABS having rubber particle size of 170 nm [13]

Water Absorption:

No.	Value	Note
1	0.3 %	24 h [3]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range down to -40°. Has very good rigidity and toughness. Elongation at break 8–30% (5 mm min^{-1}, ISO 527). [2,4] Little change in tensile, compressive and flexural props. below 80° [2,6]

Tensile (Young's) Modulus:

No.	Value	Note
1	2200–2600 MPa	1 mm min^{-1}, ISO 527 [4,5]

Flexural Modulus:

No.	Value	Note
1	2100–2700 MPa	2 mm min^{-1}, ISO 178 [4,5]

Tensile Strength Yield:

No.	Value	Note
1	40–46 MPa	50 mm min^{-1}, ISO 527 [4,5]

Flexural Strength Yield:

No.	Value	Note
1	60–80 MPa	5 mm min^{-1}, ISO 178 [4,5]

Viscoelastic Behaviour: Stress-strain behaviour, creep, stress relaxation and fatigue have been reported [7]

Hardness: Ball indentation 90 N mm^{-2} (ISO 2039-1) [4]. Rockwell R103–R110 (ASTM D785) [2]

Friction Abrasion and Resistance: The plating can increase scratch resistance

Izod Notch:

No.	Value	Notch	Note
1	23 J/m	Y	23°, ISO 180-1A
2	10 J/m	Y	-30°, ISO 180-1A

Izod Area:

No.	Value	Notch	Note
1	23 kJ/m^2	Notched	23°, ISO 180-1A
2	10 kJ/m^2	Notched	-30°, ISO 180-1A

Electrical Properties:

Electrical Properties General: Electrical props. are fairly constant over a wide range of frequencies and are unaffected by temp. or humidity [2]

Surface/Volume Resistance:

No.	Value	Note	Type
2	1×10^{15} Ω.cm	IEC 93 [4]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2.8	100 Hz	
2	2.7	1 MHz	IEC 250 [4]

Dielectric Strength:

No.	Value	Note
1	34 $kV.mm^{-1}$	IEC 243-1 [4]

Dissipation Power Factor: tan δ 0.005 (100 Hz); 0.007 (1 MHz, IEC 250) [4]

Arc Resistance:

No.	Value	Note
1	50–90s	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	100 Hz	
2	0.007	1 MHz	IEC 250 [4]

Polymer Stability:

Polymer Stability General: Undergoes autooxidation, resulting in embrittlement of the rubber and is liable to photooxidative degradation [2,6]
Thermal Stability General: Has a relatively flat strss-temp. response due to its amorph. character. Retains props at low temps.[2,6]
Upper Use Temperature:

No.	Value	Note
1	70°C	[3]

Flammability: Flammability rating HB (UL94) [3] Oxygen index 19%
Chemical Stability: Is resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Has high resistance to staining agents in household applications. Attacked by conc. nitric and sulfuric acids. Unaffected by weak acids at room temp. and most alkalis up to 65°. Has poor resistance to most organic solvents [1,2,6]
Hydrolytic Stability: Resistant to solns. of acid, alkaline and neutral salts [1,6]
Recyclability: Regrind should not be used for items to be electroplated because of possible flaws in the surface finish [3]
Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Evidence of morphological changes is shown by agglomeration of dispersed rubber particles during injection-moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [12]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and usually a chain transfer agent for MW control. [1,8,9,10,11] Processed on standard reciprocating-screw injection-moulding machines. Must be dried before melt processing. Temp. profile and mould surface temps. need to be kept higher than for standard ABS grades. This is in order to ensure good surface finish for subsequent electroplating and to minimise moulded-in stresses. Mould release agents should not be used as they affect plating behaviour [3]
Applications: Used in the automotive industry (radiator grilles, wheel covers, headlight bezels, interior and exterior trim and knobs). Other uses in sanitary ware, in marine hardware, in parts for radios and TVs, in shavers, light fixtures and in appliance housings

ABS/Polycarbonate blend, General purpose injection moulding A-13

Synonyms: *Acrylonitrile-butadiene-styrene terpolymer/polycarbonate blend. ABS/PC blend. ABS/Polycarbonate alloy. PC/ABS blend. PC/ABS alloy. Polycarbonate/ABS blend. Polycarbonate/ABS alloy*
Related Polymers: ABS, Bisphenol A polycarbonate, ABS/Polycarbonate blends, Flame retardant
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene, Bisphenol A
Material class: Blends, Copolymers
Polymer Type: ABS, polycarbonate alloy blendsABS/PC
CAS Number:

CAS Reg. No.	Note
9003-56-9	ABS
80-05-7	Bisphenol A

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$ and $(C_{16}H_{14}O_3)_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N $C_{16}H_{14}O_3$
Additives: May also contain PTFE
General Information: An amorph. thermoplastic blend of ABS resin and polycarbonate, which has high heat distortion and high dimensional stability with excellent impact strength at low temps. It has great design flexibility, fast part production rates and high yields with consistent physical props. Has attractive cost/performance characteristics

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	ISO 1183 [2,3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8×10^{-5}–9×10^{-5} K^{-1}	4–80 mm thick, DIN 53752, ASTM D696 [2,3]	L

Thermal Conductivity:

No.	Value	Note
1	0.2 W/mK	ASTM C177 [3]

Melting Temperature:

No.	Value	Note
1	250–280°C	[3]

Transition Temperature General: Has higher deflection temps. under load than have ABS resins. The ductile-brittle transition temp. decreases with increasing ABS content up to 50% ABS [8]
Deflection Temperature:

No.	Value	Note
1	96–110°C	1.8 MPa
2	105–130°C	0.45 MPa, ISO 75, DIN 53461 [2,3]

Vicat Softening Point:

No.	Value	Note
1	112–131°C	VST/B120, DIN ISO 306 [2]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	2.5 g/10 min	230°, 3.8 kg, ISO 1133 [3]
2	8.8–17.6 g/10 min	260°, 5 kg, ISO 1133 [2]

Polymer Melts: The melt viscosity of PC/ABS blends relative to PC is significantly lower, even lower than that of pure ABS in some compositions. The presence of ABS, even at values as low as 20%, reduces the melt viscosity of PC significantly. The presence of ABS (35% or higher) in the blends results in viscosity close to or even lower than that of ABS. An increase in the MW of PC in PC/ABS blends results in low temp. fracture toughness improvement but higher melt viscosity. The selection of PC in PC/ABS blends must be a compromise between the toughness advantages of higher PC MW and the disadvantages of higher melt viscosity. A ratio of PC:ABS of 65:35 is usually ideal. [8] Viscosity 5100 P (510 Pa s) (270°, 100 s^{-1}); 1600 P (160 Pa s) (270°, 1000 s^{-1}); 1050 P (105 Pa s) (270°, 2000 s^{-1}) [3]
Water Absorption:

No.	Value	Note
1	0.2–0.6 %	ISO R62, DIN 53495-1L [2,3]

Mechanical Properties:

Mechanical Properties General: Has excellent impact strength down to -50° and improved stiffness and notched Izod impact strength compared with conventional high impact ABS. Its notched Izod impact resistance is lower than that of polycarbonate

Tensile (Young's) Modulus:

No.	Value	Note
1	2000–2200 MPa	ISO R527, DIN 53457-t [2,3]

Flexural Modulus:

No.	Value	Note
1	2000–2250 MPa	ISO 178, DIN 53457-B3 [2,3]

Tensile Strength Break:

No.	Value	Note	Elongation

Tensile Strength Yield:

No.	Value	Elongation	Note
1	44–55 MPa	4–5.5%	5 mm min^{-1}, ISO R527, DIN 53455 [2,3]

Flexural Strength Yield:

No.	Value	Note
1	70 MPa	ISO 178 [3]

Miscellaneous Moduli:

No.	Value	Note	Type
1	800 MPa	0°	Shear modulus
2	700 MPa	100°	Shear modulus
3	100 MPa	120°	Shear modulus

Viscoelastic Behaviour: Has good creep resistance [6]
Hardness: Ball indentation 80–97 MPa (ISO 2039, DIN 53459) [2,3]
Izod Notch:

No.	Value	Notch	Note
1	500 J/m	Y	23°, ISO R180 [3]
2	300 J/m	Y	-40°, ISO R180 [3]

Electrical Properties:

Electrical Properties General: Has good electrical insulation props.
Surface/Volume Resistance:

No.	Value	Note	Type
1	$>0.1 \times 10^{15}$ Ω.cm	min., IEC 93, DIN VDE 0303, part 3 [2]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2–3	50 Hz	IEC 250, DIN VDE 0303, part 4 [2]
2	2.9–3	1 MHz	IEC 250, DIN VDE 0303, part 4 [2]

Dielectric Strength:

No.	Value	Note
1	24 $kV.mm^{-1}$	IEC 243, DIN VDE 0303, part 2 [2]

Static Electrification: Comparative tracking index Grade 250–500 (IEC 112, DIN VDE 0303, part 1) [2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.004	50 Hz	IEC 250, DIN VDE 0303, part 4 [2]
2	0.007	1 MHz	IEC 250, DIN VDE 0303, part 4 [2]

Optical Properties:

Volume Properties/Surface Properties: Transparency not transparent. Colour many opaque colours. Surface finish good mould surface reproduction [2]

Polymer Stability:

Polymer Stability General: Has high dimensional accuracy and stability [2]. Retains props., allowing for long-term durability [7]
Thermal Stability General: Has good low temp. resistance [2]. Has high thermal stability during processing [3]
Upper Use Temperature:

No.	Value	Note
1	70°C	[5]
2	70°C	[6]

Flammability: Flammability rating HB (1.6 mm, UL94, IEC 707) [2,3]. Oxygen index 21-24% (ASTM D2863) [4]
Environmental Stress: Has stress crack resistance slightly better than that of PC [2]
Chemical Stability: Is resistant to oils and fats but has poor resistance to solvents
Recyclability: Trim or scrap can be reground and reused with virgin material in proportions of up to 30%, with little loss of physical props., provided materials are free of contaminants [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: ABS and polycarbonate are alloyed in a compounding operation using a range of equipment including batch or continuous melt mixers, and both single and twin-screw extruders. In the compounding step more than one type of ABS may be used (i.e., emulsion and mass produced) to obtain an optimum balance of props. for a specific application [1]. ABS/PC blends have a very wide processing window and can endure longer residence times in injection-moulding machines. This is due to the lower viscosities of ABS/PC blends. The resins absorb small amounts of moisture and must be dried (100–110°, 3-4h) before processing. Standard or vented injection moulded machines are used for processing [3]
Mould Shrinkage (%):

No.	Value	Note
1	0.3–0.7%	ASTM D955 [3]

Applications: Has applications in internal and external automotive components; housings for business machines and in electrical and electronic components. Typical automotive interior applications include air vents, central consoles, decorative trim, glove compartment doors, grilles, electrical housings, instrument frames and panels, buffer strips, steering column shrouds, wheel nut caps, window surrounds and mirror housings. Exterior applications include cowl vent grilles, body side mouldings, wheel covers, tail-light housings, headlamp surrounds, logo plates, spoilers and body components. May also be used in certain food and medical applications

No.	Value	Frequency	Note
1	0.004	60 Hz	ASTM D150 [3]
2	0.008	1 MHz	ASTM D150 [3]

Optical Properties:

Volume Properties/Surface Properties: Not transparent; available in many opaque colours [6]

Polymer Stability:

Polymer Stability General: Good dimensional stability; has good long-term property retention [2]
Thermal Stability General: Has good low-temp. resistance [6]
Flammability: Flammability rating HB (1.6 mm, UL 94) [2]
Environmental Stress: Resistance to stress cracking is slightly better than that of PC [6]
Chemical Stability: Is resistant to oils and fats, but has poor resistance to solvents

Applications/Commercial Products:

Processing & Manufacturing Routes: ABS and polycarbonate are alloyed in a compounding operation using a range of equipment including batch or continuous melt mixers, and both single and twin-screw extruders. In the compounding step more than one type of ABS may be used (i.e., emulsion and mass produced) to obtain an optimum balance of props. for a specific application. [1] The resins must be dried at 100° for 3–4h before processing. Processed by extrusion [2]

Mould Shrinkage (%):

No.	Value	Note
1	0.5–0.7%	ASTM D955 [3]

Applications: Uses in internal and external automotive components; in housings for business machines, electrical and electronic components; in certain food and medical applications

ABS/Polycarbonate blends, Flame retardant A-15

Synonyms: *Acrylonitrile-butadiene-styrene terpolymer/polycarbonate blends, Flame retardant. ABS/PC blends, Flame retardant. ABS/Polycarbonate alloys, Flame retardant*
Related Polymers: ABS, Bisphenol A polycarbonate, ABS/Polycarbonate blends
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene, Bisphenol A
Material class: Blends, Copolymers
Polymer Type: ABS, polycarbonate alloy blendsABS/PC
CAS Number:

CAS Reg. No.	Note
9003-56-9	ABS
80-05-7	Bisphenol A

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$ and $(C_{16}H_{14}O_3)_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N $C_{16}H_{14}O_3$
Additives: An additive free from antimony, bromine and chlorine
General Information: An amorph. thermoplastic blend of ABS and polycarbonate which has a good basis for flame-retardant formulations owing to its high polycarbonate content. If the components are appropriately distributed, carbonisation processing of the aromatic polymer component can be used to build up heat-shielding zones which inhibit the pyrolysis of the aliphatic components. Thus it is possible to produce flame-retardant systems containing little or no halogen. Blends have outstanding characteristics including heat resistance (between that of ABS and PC), good toughness and low temp. resistance, high stiffness and dimensional stability

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.17 g/cm^3	ISO 1183, DIN 53479 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7.6×10^{-5} K^{-1}	DIN 53752 [2]	L

Melting Temperature:

No.	Value	Note
1	220–270°C	[3,4]

Transition Temperature General: The ductile-brittle transition temp. decreases with increasing ABS content up to a max. of 50% [6]
Deflection Temperature:

No.	Value	Note
1	80–90°C	1.8 MPa [2]
2	90–100°C	0.45 MPa, ISO 75, DIN 53461 [2]

Vicat Softening Point:

No.	Value	Note
1	90–110°C	B120, DIN ISO 306 [2]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	16–31 g/10 min	240°, 5 kg, DIN ISO 1133 [2]

Polymer Melts: The melt viscosity of PC/ABS blends relative to PC is significantly lower, even lower than that of pure ABS in some compositions. The presence of ABS, even at values as low as 20%, reduces the melt viscosity of PC significantly. The presence of ABS ($\geq$ 35%) in the blends results in viscosity close to or even lower than that of ABS. An increase in the MW of PC in PC/ABS blends results in low-temp. fracture toughness improvement but higher melt viscosity. The selection of PC in PC/ABS blends must be a compromise between the toughness advantages of higher PC MW and the disadvantages of higher melt viscosity. A component ratio of PC:ABS of 65:35 is ideal [6]
Water Absorption:

No.	Value	Note
1	0.2 %	DIN 53495-1L [2]

Impact Strength: Charpy no break (23°, ISO 179, DIN 53453) [2]; 20–30 kJ m^{-2} (notched, 23°, ISO 179, DIN 53453) [2]
Hardness: Ball indentation H30 121–122 N mm^{-2} (ISO 2039, DIN 53456) [2]. Rockwell R115–R119 (ASTM D985) [3]
Charpy:

No.	Value	Notch	Note
1	20–30	Y	23°, ISO 179, DIN 53453 [2]

Electrical Properties:

Electrical Properties General: Has good electrical insulation props.
Surface/Volume Resistance:

No.	Value	Note	Type
2	$0.1–10 \times 10^{15}$ Ω.cm	min., IEC 93, DIN VDE 0303, part 3	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3	50 Hz	IEC 250, DIN VDE 0303, part 4 [2]
2	2.9	1 MHz	IEC 250, DIN VDE 0303, part 4 [2]

Dielectric Strength:

No.	Value	Note
1	30 $kV.mm^{-1}$	IEC 243, DIN VDE 0303, part 2 [2]

Static Electrification: Comparative tracking index Grade 300 (IEC 112, DIN VDE 0303, part 1) [2]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.003–0.005	50 Hz	IEC 250, DIN VDE 0303, part 4 [2]
2	0.007–0.008	1 MHz	IEC 250, DIN VDE 0303, part 4 [2]

Optical Properties:

Volume Properties/Surface Properties: Transparency not transparent. Colour many opaque colours. Surface finish good mould surface reproduction [2]

Polymer Stability:

Polymer Stability General: Has high dimensional stability and retains props., allowing for long-term durability [2,5]
Thermal Stability General: Has good low temp. resistance [2]
Flammability: Flammability rating V0 (1.6 mm, UL94, IEC 707) [2]. Oxygen index 30% (ASTM D2863) [3]
Environmental Stress: Stress crack resistance is slightly better than that of PC [2]
Chemical Stability: Is resistant to oils and fats but has poor resistance to solvents

Applications/Commercial Products:

Processing & Manufacturing Routes: ABS and polycarbonate are alloyed in a compounding operation using a range of equipment including batch or continuous melt mixers, and both single and twin-screw extruders. In the compounding step more than one type of ABS may be used (i.e., emulsion and mass produced) to obtain an optimum balance of props. for a specific application [1]. Because of their lower viscosity ABS/PC blends have a very wide processing window and can endure longer residence times in injection-moulding machines. Predrying (80–90°, 3–4h) prior to processing is essential to ensure desired appearance and property performance. Standard or vented injection-moulding machines are used for processing
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.6%	DIN 53464 [2]

Applications: Has applications in business machines (personal and point-of-sale computer housings typewriter housings; general office equipment). Electrical/electronic applications include general wiring devices, plugs and receptacles, control housings; telecom system connectors

ABS/Polycarbonate blends, Glass fibre reinforced A-16

Synonyms: *Acrylonitrile-butadiene-styrene terpolymer/polycarbonate blends. ABS/PC blends. ABS/Polycarbonate alloys*
Related Polymers: ABS/Polycarbonate blends, ABS, Bisphenol A polycarbonate
Monomers: Acrylonitrile, Bisphenol A, 1,3-Butadiene, Styrene
Material class: Blends, Copolymers
Polymer Type: ABS, polycarbonate alloy blendsABS/PC
CAS Number:

CAS Reg. No.	Note
9003-56-9	ABS
80-05-7	Bisphenol A

Additives: 20% Glass fibre
General Information: An amorph. thermoplastic blend of ABS and polycarbonate

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	ISO 1183, DIN 53479 [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.6×10^{-5} K^{-1}	DIN 53752 [2]	L

Volumetric Properties General: The coefficient of thermal expansion is reduced compared with the unreinforced ABS/PC blend due to glass fibre reinforcement
Melting Temperature:

No.	Value	Note
1	240–280°C	[3]

Transition Temperature General: Deflection temps. are higher than those of ABS resins. The ductile-brittle temp. decreases with increasing ABS content up to a max. of 50% ABS [5]
Deflection Temperature:

No.	Value	Note
1	115°C	1.8 MPa
2	130°C	0.45 MPa, ISO 75, DIN 53461 [2]

Vicat Softening Point:

No.	Value	Note
1	134°C	B120, DIN ISO 306 [2]

Transport Properties:

Polymer Melts: The melt viscosity of PC/ABS blends is significantly lower than that of PC and is even lower than that of pure ABS in some compositions. The presence of ABS, even at amounts as low as 20%, is able to reduce the melt viscosity of PC significantly. The presence of ABS (35% or greater) in the blends results in viscosity close to or even lower than that of ABS. An increase in the MW of PC in PC/ABS blends improves low-temp. fracture toughness but gives higher melt viscosity. A component ratio of PC/ABS of 65:35 can be considered as a compromise composition in terms of the product toughness (due to PC component), cost and the processing melt viscosity [5]
Water Absorption:

No.	Value	Note
1	0.2 %	DIN 53495-1L [2]

Mechanical Properties:

Mechanical Properties General: Has high impact strength down to -50°, and very good rigidity. Tensile and flexural moduli are both higher than unreinforced ABS/PC blends

Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Thermoplastic, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.	Note
9003-56-9	
108146-73-2	block
106677-58-1	graft copolymer

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N

Molecular Weight: MW is instrumental in determining the physical props. of ABS. As MW increases, the strength of the material increases while its processability declines
Additives: Glass fibre, carbon fibre, stainless-steel fibre. Fire retardants to improve flame retardancy. α-Methylstyrene to raise heat distortion temp. Uv resistant additives, films, laminates or paint coatings to retard colour, gloss and property value changes. Methyl methacrylate may replace acrylonitrile in order to improve transparency
General Information: ABS terpolymers are elastomeric and thermoplastic composites formed from three different monomers. Acrylonitrile contributes heat resistance, high strength and chemical resistance; butadiene contributes impact strength, toughness and low temp. property retention; styrene contributes gloss, processability and rigidity. Typical ABS contains 20% rubber, 25% acrylonitrile and 55% styrene. The elastomeric component polybutadiene or butadiene copolymer is dispersed as a grafted particulate phase in the thermoplastic matrix of styrene and acrylonitrile copolymer (SAN). Props. of ABS can be modified by varying the relative proportions of the basic components, the degree of grafting and the MW. ABS is normally opaque as it is a two-phase system, and each phase has a different refractive index. Very versatile material whose props. are tailored to meet specific product requirements. Speciality products include electroplating grades, high temp. resistant grades, fire retardant grades and ABS blends with other polymers such as polycarbonates and PVC. ABS is sold as an unpigmented powder, unpigmented pellets, precoloured pellets and 'salt and pepper' blends of ABS and colour concentrates. Reinforced ABS grades are available using glass, carbon and steel fibres
Morphology: Similar to high-impact polystyrene, but the dispersed rubber particles are much smaller (1–10 μm) and contain styrene-acrylonitrile copolymer inclusions. The average particle size and particle size distribution within the rubber phase have a significant effect on the overall balance of props. including strength, toughness and appearance. Large rubber particles typically enhance toughness while lowering gloss. The rigid phase chain length, as correlated to MW, can also have a significant effect on ABS resin props. Generally, the longer the polymer chain, the higher the strength including impact/ductility, but the lower the flow. The ratio of the rigid SAN phase to the rubber phase affects the flow/impact balance of the ABS resin. An increase in the rubber content will increase the impact/toughness of an ABS material, generally at the expense of the flow. The balance between the flow and impact props. of an ABS material is a basic product characteristic

Applications/Commercial Products:

Processing & Manufacturing Routes: Most ABS is made by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. In all manufacturing processes, grafting is achieved by the free-radical copolymerisation of styrene and acrylonitrile monomers in the presence of an elastomer. Ungrafted styrene-acrylonitrile is formed during graft polymerisation and/or added afterwards. Other commercial processes used for manufacturing ABS are mass and mass suspension. Each manufacturing method results in the formation of a material composed of discrete rubber particles dispersed in a rigid matrix. Can be processed by all the techniques commonly used for thermoplastic materials; compression and injection moulding, extrusion, calendering and blow-moulding. Post-processing operations include cold forming, thermoforming, metal plating, painting, hot stamping, ultrasonic, spin and vibrational welding and adhesive bonding. ABS materials have a broad processing window of operating conditions and favourable shear thinning flow characteristics
Mould Shrinkage (%):

No.	Value	Note
1	0.5–0.9%	[1]

Applications: Is the biggest selling engineering thermoplastic. The principal market worldwide is in transportation. Uses include

both interior and exterior applications. General purpose and high heat grades are used for automotive instrument panels, consoles, doorpost covers and other interior trim parts. Exterior applications include radiator grilles, headlight housings and extruded/thermoformed fascias for large trucks. ABS plating grades include applications such as knobs, light bezels, mirror housings, grilles and decorative trim. The second largest market is in appliances and applications including injection-moulded housings for kitchen appliances, power tools, vacuum cleaners, sewing machines, hair dryers, business machines and other electric and electronic equipment. Another significant market is pipe and fittings. Other uses include consumer and industrial applications such as luggage, toys, medical devices, furniture and bathroom fixtures

Tensile Strength Yield:

No.	Value	Elongation	Note
1	30–45 MPa	8%	ASTM D638, ISO R527 [2,3]

Hardness: Rockwell R100–R109 (ASTM D785) [2,3]
Izod Notch:

No.	Value	Notch	Note
1	100 J/m	Y	ASTM D256A [2]

Electrical Properties:

Electrical Properties General: Has good electrical insulation props.
Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3	1 kHz	ASTM D150 [2]

Dielectric Strength:

No.	Value	Note
1	23 kV.mm^{-1}	ASTM D149 [2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.04	1 kHz	ASTM D150 [2]

Polymer Stability:

Thermal Stability General: The thermal stability of the blends is lower than that of the individual components [4]
Upper Use Temperature:

No.	Value	Note
1	60°C	[2]

Decomposition Details: Each component of the blend may undergo thermal degradation. The polybutadiene rubber phase degrades most rapidly [4]
Flammability: Flammability rating V0 (UL 94) [2]. Limiting oxygen index 28% (ASTM D2863) [2]. Is flame resistant owing to the presence of PVC. Has self-extinguishing props.
Environmental Stress: PVC component enhances stability to uv
Chemical Stability: Has good resistance to solvents, oils and fats, except ethers and esters
Stability Miscellaneous: The presence of PVC lowers the processing stability

Applications/Commercial Products:

Processing & Manufacturing Routes: ABS and PVC are alloyed in a compounding operation using a range of equipment including batch or continuous melt mixers, and both single and twin-screw extruders. In the compounding step more than one type of ABS may be used (i.e. emulsion and mass produced) to obtain an optimum balance of props. for a specific application [1]. Processed in conventional injection-moulding equipment. The resin should be dried before processing [2]
Mould Shrinkage (%):

No.	Value	Note
1	0.45%	lower than unmodified ABS, ASTM D955 [2]

Applications: 80:20 ABS/PVC blends are used to prod. fire-retarding ABS-type materials. 10:90 Blends are used as impact-modified forms of unplasticised PVC. Other uses in blends with plasticised PVC to give a crashpad sheet material; in housings for domestic appliances and computers; in printer and plumbing components; in cash register bases

ABS/PSU blend A-20

Synonyms: *ABS/PSO blend. Acrylonitrile-butadiene-styrene/polysulfone blend*
Related Polymers: Polysulfone, ABS
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: Polysulfone
CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
General Information: Unique modified polysulfone formulated for maximum cost-effectiveness while maintaining key props. Is resistant to hot water and has dimensional stability, high heat deflection temp. and toughness. Can withstand temp. 38° higher than ABS at an increased cost compared to ABS [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.13 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	6.5×10^{-5} K^{-1}	ASTM D696 [1]	L

Volumetric Properties General: Has higher coefficient of linear thermal expansion compared to unreinforced and reinforced polysulfone grades
Melting Temperature:

No.	Value	Note
1	280–310°C	[1]

Deflection Temperature:

No.	Value	Note
1	150°C	1.8 MPa, ASTM D648 [2]

Transition Temperature:

No.	Value	Note	Type
1	150°C	[2]	High heat deflection

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.25 %	3.2 mm, 24h, 23°, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Has lower tensile strength at yield compared with unreinforced PSU. High tensile and flexural modulus. Lower tensile impact strength compared with unreinforced PSU. Better toughness than polysulfone [2]

Tensile (Young's) Modulus:

No.	Value	Note
1	2120 MPa	ASTM D638 [1]

Flexural Modulus:

No.	Value	Note
1	2180 MPa	ASTM D790 [1]

Tensile Strength Break:

No.	Note	Elongation
1	ASTM D638 [1]	75%

Tensile Strength Yield:

No.	Value	Note
1	> 50 MPa	min., ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	83 MPa	ASTM D790 [1]

Impact Strength: Tensile impact strength 189 kJ m^{-2} (ASTM D1822) [1]
Izod Notch:

No.	Value	Notch	Break	Note
1	374 J/m	Y		ASTM [1]
2		N	Y	ISO [1]

Izod Area:

No.	Value	Notch	Note
1	24.6 kJ/m^2	Notched	ISO [1]

Electrical Properties:

Electrical Properties General: Has excellent electrical props. which are maintained over a wide temp. range and after immersion in water [1]. Volume resistivity has been reported [2]
Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3.31	60 Hz	ASTM D150 [1]
2	3.28	1 kHz	ASTM D150[1]
3	3.25	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	17 kV.mm^{-1}	3.2 mm, ASTM D149 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0052	60 Hz	ASTM D150 [1]
2	0.0055	1 kHz	ASTM D150 [1]
3	0.013	1 MHz	ASTM D150 [1]

Optical Properties:

Volume Properties/Surface Properties: Opaque [1]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	125°C	[2]

Flammability: Flammability rating V2 (UL 94) [2]. Limiting oxygen index 22% [2]
Hydrolytic Stability: Very good hydrolytic stability and steam resistance [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Melt temp. range is 280–310° and mould temp. range is 70–120° in injection moulding. Prior to melt processing, the resin must be dried for 3h at 120°. Has improved melt flow over polysulfone. Can be electroplated in conventional ABS preplate systems [1,2]
Mould Shrinkage (%):

No.	Value	Note
1	0.66%	ASTM D955 [1]

Applications: Food contact application has FDA recognition. Used in automotive parts (painted and plated) and plumbing fixtures. Mindel A-670 is chromium-platable for automotive interior lighting fixtures

Trade name	Details	Supplier
Mindel A	modified polysulfone	Amoco Performance Products

ABS, Stainless steel filled, Flame retardant A-21

Synonyms: *Acrylonitrile-butadiene-styrene copolymer. Acrylonitrile-butadiene-styrene terpolymer. Poly(2-propenenitrile-co-1,3-butadiene-co-ethenylbenzene)*
Related Polymers: ABS, Stainless Steel filled
Monomers: Acrylonitrile, 1,3-Butadiene, Styrene
Material class: Composites, Copolymers
Polymer Type: ABS
CAS Number:

CAS Reg. No.
9003-56-9

Molecular Formula: $[(C_8H_8)(C_4H_6)(C_3H_3N)]_n$
Fragments: C_8H_8 C_4H_6 C_3H_3N
Additives: Stainless steel fibres. Brominated or chlorinated compounds added as fire retardants
General Information: An amorph. thermoplastic

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.27 g/cm^3	ASTM D792 [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7.5×10^{-5} K^{-1}	ASTM D696 [3]	L

Melting Temperature:

No.	Value	Note
1	230–245°C	[10]

Glass-Transition Temperature:

No.	Value	Note
1	100–110°C	[5]

Deflection Temperature:

No.	Value	Note
1	80°C	1.8 MPa, ASTM D648 [3]
2	90°C	0.45 MPa, ASTM D648 [3]

Vicat Softening Point:

No.	Value	Note
1	92°C	50° h^{-1}, 49 N, unannealed, DIN 53480 [10]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. polar solvents, esters, ketones and some chlorinated hydrocarbons [4]

Transport Properties:

Transport Properties General: Exhibits viscoelastic behaviour in both the melt and the solid states. Like other thermoplastics, it may be described as exhibiting non-Newtonian behaviour; viscosity decreases due to increasing shear rate [2]
Water Absorption:

No.	Value	Note
1	0.35 %	24h, ASTM D570 [3]
2	0.85 %	saturation, ASTM D570 [3]

Mechanical Properties:

Mechanical Properties General: Has high impact resistance over a wide temp. range down to -40°. Has very good rigidity and very low notched Izod impact strength compared with that of ordinary grades of ABS. Elongation at break 4–6% (ASTM D638) [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	2700 MPa	50 mm $min.^{-1}$, ISO R527 [10]

Flexural Modulus:

No.	Value	Note
1	2900 MPa	ASTM D790 [3]

Tensile Strength Yield:

No.	Value	Note
1	40 MPa	ASTM D638 [3]

Flexural Strength Yield:

No.	Value	Note
1	65 MPa	ASTM D790 [3]

Hardness: Rockwell M75 (ASTM D785) [3]
Friction Abrasion and Resistance: Has good abrasion resistance [2]
Izod Area:

No.	Value	Notch	Note
1	6 kJ/m^2	Notched	23°, ISO 179/2C) [10]
2	16 kJ/m^2	Unnotched	23°, ISO 179/2C) [10]

Electrical Properties:

Electrical Properties General: Is electrically conductive. Volume Resistivity 100–10000 Ω cm (ASTM D257) [3]; Surface Resistivity 10–1000 Ω (ASTM D257) [3]
Static Electrification: Shielding effectiveness 40-55 dB (field 3 mm, ASTM D4935) [10]

Polymer Stability:

Thermal Stability General: Has a relatively flat stress-temp. response due to its amorph. character. Retains its props. at low temps [2,4]
Upper Use Temperature:

No.	Value	Note
1	60°C	UL 746B [3]

Flammability: Flammability rating V0 (3.2 mm, UL94). [3] Limiting oxygen index 28% (ASTM 2883) [10]
Environmental Stress: Has poor weather and uv resistance unless protected. Undergoes stress cracking in contact with certain chemicals. The rubber phase in ABS oxidises more rapidly than the rigid component. Oxidation of polybutadiene results in embrittlement of the rubber [2]
Chemical Stability: Resistant to hydrocarbon solvents, mineral and vegetable oils, waxes and related household and commercial materials. Is highly resistant to staining agents in household applications. Attacked by conc. nitric and sulfuric acids. Unaffected by weak acids at room temp. and alkalis below 65°. Has poor resistance to most organic solvents [1,2,4]
Hydrolytic Stability: Resistant to solns. of acid, alkaline and neutral salts [1,4]
Biological Stability: Is biologically inert
Recyclability: Scrap and reject material can be reworked at an 80:20 (virgin:regrind) ratio if kept clean and segregated by colour and grade [5]
Stability Miscellaneous: Processing conditions can influence resultant props. by chemical and physical means. Degradation of the rubber and matrix phases occurs under very severe conditions. Evidence of morphological changes is shown by agglomeration of dispersed rubber particles during injection-moulding at higher temps. Physical effects such as orientation and moulded-in stress can affect mechanical props. [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by grafting styrene and acrylonitrile directly on to the polybutadiene latex in a batch or continuous emulsion polymerisation process. The degree of grafting is a function of the 1,2-vinyl content of the polybutadiene, the monomer concentration, the extent of conversion, temp. and mercaptan concentration. The emulsion polymerisation process involves two steps; (i) production of a rubber latex; (ii) subsequent polymerisation of styrene and acrylonitrile in the presence of the rubber latex to produce an ABS latex. This latex is then processed to isolate the ABS resin. The polymerisation ingredients include the monomers, an emulsifier, a polymerisation initiator and, usually, a chain transfer agent for MW control.[1,6,7,8,9] Processed on standard reciprocating-screw

injection-moulding machines. Recommended processing temp. 230–245° [10]
Mould Shrinkage (%):

No.	Value	Note
1	0.3–0.5%	3mm section, ASTM D955 [3]

Applications: Suitable for applications where protection against electrostatic discharges is important. Applications include all devices that have to comply with CISPR and FCC regulations regarding electromagnetic interference (EMI) shielding

Acemannan A-23

Synonyms: *Carrisyn. Polymannoacetate*
Material class: Polysaccharides
CAS Number:

CAS Reg. No.
110042-95-0

Molecular Weight: >10000 Dalton
Morphology: Long-chain polymer consisting of linear (1→4)-D-mannopyranosyl units, randomly acetylated (0.8 Ac per monomer)
Miscellaneous: Constit. of leaf juice of *Aloe barbadensis* and *Aloe arborescens* (Liliaceae). Biol. active component of carrisyn extract (73-90%). Potent inducer of Interleukin 1 and Prostaglandin E_2 production by human peripheral blood adherent cells *in vitro.* Influences activity and production of T-lymphocytes, fibroblasts, B-lymphocytes and endothelial cells. Adjuvant and immunoenhancer. Increases antibody production, stimulates phagocytosis. Shows specific antineoplastic activity against sarcoid tumours in horse. Used in the treatment of inflammatory bowel disease

Acetal copolymer A-24

Synonyms: *Poly(oxymethylene-co-ethylene oxide). Polyacetal copolymer. Ethylene oxide-trioxane copolymer. Poly(1,3,5-trioxane-co-oxirane)*
Related Polymers: Polyacetal, Polyoxymethylene
Monomers: Trioxane, Ethylene oxide
Material class: Thermoplastic, Copolymers
Polymer Type: Acetal, Polyethylene oxide
CAS Number:

CAS Reg. No.
24969-25-3

Molecular Formula: $[(CH_2O).(C_2H_4O)]_n$
Fragments: CH_2O C_2H_4O
Additives: Antioxidants, UV stabilisers, pigments, glass fibre, lubricants, PTFE
Miscellaneous: The exact composition of many available copolymers is undisclosed. Many are thought to be copolymers with ethylene oxide in the main chain

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed using conventional techniques such as extrusion, injection moulding and rotational moulding
Applications: Consumer goods, e.g. kettles. Plumbing such as fittings and valves, fuel caps, pump housings, gears, bearings, air flow valves and filter housings

General Information: One of the most useful groups of water-soluble polymers
Tacticity: The cotacticity parameters of the copolymer are very similar to those of the homopolymers in the range 0.4–0.5 [10]
Morphology: The copolymers prepared by either alkaline hydrol. or direct copolymerisation, are heterogeneous. Acid hydrol. produces blocks of acrylate [10,12]. The microstruct. of copolymer hydrogels varies with the amount of acrylate. Multifractal theory has been used to study and characterise the micromophologies of copolymer hydrogels [20]. Pattern formation during the shrinking of a constrained gel in Me_2CO aq. has been reported [26]
Miscellaneous: Can be cross-linked to form gels which are very highly water-absorbing [5]

Volumetric & Calorimetric Properties:

Equation of State: Mark-Houwink parameters have been reported [1]
Glass-Transition Temperature:

No.	Value	Note
1	96.6–99.8°C	1.5–5% acrylamide [5]
2	105–113.5°C	cross-linked copolymer; 1.5–5% acrylamide [5]

Surface Properties & Solubility:

Solubility Properties General: The solubility of copolymer in water can be affected to different degrees by the presence of salts. The acid copolymers are more susceptible to adverse effects than are the partially neutralised copolymers. A soln. of a copolymer with 37 mol% acrylic acid will become milky in the presence of $CaCl_2$ at a level of 0.08 mol l^{-1} and the copolymer is precipitated at 0.4 mol l^{-1} [15]

Transport Properties:

Polymer Solutions Dilute: The rheological and flow props. of copolymer solns. are adversely affected by the presence of CO_2. This is due to a combination of effects: chemical degradation of the copolymer and, more importantly, modification of the soln. struct. [6]. Zero shear intrinsic viscosity, molecular expansion factor and polymer size all vary with pH, showing a maximum in the region of pH 8 [4]. The viscoelastic props. and rheological behaviour of copolymer solns. can be seriously affected by the presence of salts. The presence of multivalent cations causes complex formation with the copolymer which in turn affects the viscosity behaviour. Univalent cations affect the viscosity but di- and trivalent cations affect chain conformation and solubility as well. The intrinsic viscosity increases with increasing temp. [7,13,18,19]. Two types of negative thixotropy have been reported in dilute solns. of partially hydrolysed polyacrylamide in water/glycerol mixtures. The character of the effect depends on amount of glycerol, shear rate and polymer concentration. The critical shear rate at which type I negative thixotropy occurs increases in the presence of NaCl, whereas critical shear rate of type II negative thixotropy is unaffected [17]. Intrinsic viscosity data have been reported [2]

Mechanical Properties:

Mechanical Properties General: The mechanical props. of the gels depend very much on the conc., degree of swelling and network density [11]. Di- and trivalent cations give rise to ionic cross-links which change the elastic modulus of the gel [9]

Optical Properties:

Optical Properties General: Refractive index increment 0.183-0.191 ml g^{-1} (dependent on amount) [2]. Aq. solns. of the copolymer show a flow-induced negative birefringence [14]
Transmission and Spectra: Ir and C-13 nmr spectral data have been reported [5,10,13]

Polymer Stability:

Decomposition Details: Decomposition starts at approx. 220° with some prior loss of moisture. Second decomposition starts at approx. 320° and ends at approx. 400° when a third stage begins. The maximum decomposition rate occurs during the third stage at approx. 425°. The main reaction in stage 1 is imidisation with loss of ammonia; in stage 2 degradation of carboxylate groups and in stage 3 breakdown of backbone. Mechanistic details have been reported [16]
Hydrolytic Stability: The hydrol. of the copolymer as a function of pH and composition has been studied [8]
Stability Miscellaneous: The copolymer is subject to shear degradation, the intrinsic viscosity falling as the degradation proceeds. Degradation is reduced for low soln. concentrations, in solns. of high ionic strength and with higher levels of ionic charge in the copolymer [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: The copolymer can be synth. by hydrol. of polyacrylamide or by the copolymerisation of acrylamide and acrylic acid. The hydrol. can be carried out under alkaline (or sometimes acid) conditions at elevated temps. (0.1*M* polyacrylamide, 0.25*M* NaOH, 0.1 *M* NaCl, at 30° or 50°). The copolymerisation can be performed by the same methods used for acrylamide, e.g. radical copolymerisation (using persulfate initiator and $K_2S_2O_8/Na_2S_2O_5$ redox system in water, or 0.1*M* NaCl soln. at 60°) or inverse emulsion copolymerisation [10,12,13,21]. Hydrol. of a homopolymer gel gives a copolymer gel with unchanged topography [11]
Applications: Used in the oil industry (drilling fluids and enhanced oil recovery), as paper filter retention aids and effluent water clarification aids

Acrylic fibres A-26

Related Polymers: Polyacrylonitrile
Monomers: Acrylamide, Acrylonitrile, Butyl acrylate, Vinyl acetate, Methylenebutanedioic acid, Ethylhexyl acrylate, Methyl acrylate
Material class: Thermoplastic, Fibres and Films, Copolymers
Polymer Type: Acrylic, Acrylonitrile and copolymers, Acrylic copolymers

Molecular Weight: M_n 40000-60000; MW 90000-140000
Additives: Dyes. Triclosan (as an antibacterial agent). Flame retardants (tris(dibromopropyl phosphate)
General Information: Acrylic fibre is available in a variety of forms including: coloured, uv-resistant, bi-component, abrasion resistant and various specialist forms (e.g. antibacterial). It is used in both staple and tow forms. Fibres are available with strengths of 1.2-15 den; 3 den is probably the normal strength. Acrylic microfibre is also available. Fibres are manufactured with a minimum of 85% acrylonitrile monomer: the comonomer(s) chosen to give a final product with the desired props. Perhaps the commonest forms of acrylic fibre are ternary copolymers containing 89–95% acrylonitrile, 4–10% of a non-ionogenic

monomer and 0–1% of an ionogenic monomer. 100% Acrylonitrile fibres are produced for industrial use. Much of the interest in PAN fibres in recent years has been in its application in the manufacture of carbon fibres

Tacticity: In a series of acrylonitrile/methyl acrylate copolymers the tacticities are virtually the same regardless of the copolymer composition [21]

Morphology: PAN and acrylonitrile copolymer fibres are paracrystalline. The conformn. of PAN chains is mainly planar zigzag. Packing of the chains is pseudohexagonal with sequences of average periodicity of approx. 2.4Å. [9,10] The shape of the fibre's cross-section depends on composition, spinning process and conditions, e.g. a dumbbell shape indicates a dry-spun fibre and a kidney shape a wet-spun fibre. Props. of the fibre, such as a lustre, moisture regain and some mech. props., are affected by the shape of its cross-section [1,12]

Miscellaneous: Acrylic fibre is wool-like in nature and is the only synthetic fibre with an uneven surface even when extruded from a round-hole spinneret. Acrylic fibres have excellent wickability, are quick-drying, resistant to uv degradation, oil, chemicals and moth-attack. They are readily dyeable to most colours with excellent fastness. They are washable and retain their shape after washing

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.14–1.19 g/cm^3	[2]

Melting Temperature:

No.	Value	Note
1	320°C	approx., PAN; decomposes
2	150°C	approx., 10% H_2O [34]

Glass-Transition Temperature:

No.	Value	Note
1	97°C	PAN
2	80°C	approx., commercial fibres [3]

Transition Temperature General: Measurement of T_m of PAN fibres is difficult owing to its decomposition. The presence of moisture lowers T_g by 35–50° and can lower T_m to approx. 150° [2,3,34]. Studies on the thermal transitions between 22° and 200° have been reported [11,13]

Surface Properties & Solubility:

Plasticisers: PAN is plasticised by H_2O and other hydrogen-bonding solvents of low MW [3,34]

Solvents/Non-solvents: Sol. DMF, DMSO, dimethyl acetamide, ethylene carbonate. Insol. H_2O, C_6H_6, mineral oil, CCl_4, aliphatic hydrocarbons, aliphatic alcohols, aliphatic esters, aliphatic ketones [1]

Wettability/Surface Energy and Interfacial Tension: Contact angle 48° (H_2O, advancing) [3]

Transport Properties:

Transport Properties General: The presence of water increases the melt flow index. Addition of ethylene carbonate to the hydrated PAN melt increases the melt flow index but replacement of some of the water with ethylene carbonate gives rise to significant decrease in melt flow index [34]

Melt Flow Index:

No.	Value	Note
1	0 g/10 min	approx., 170°, 1.5 MPa, 17% H_2O [34]
2	2 g/10 min	approx., 170°, 1.5 MPa, 20% H_2O [34]
3	10 g/10 min	approx., 170°, 1.5 MPa, 23% H_2O [34]
4	20 g/10 min	approx., 170°, 1.5 MPa, 26% H_2O [34]

Polymer Solutions Dilute: Intrinsic viscosity 1.67 dl g^{-1} (DMF, 30°, acrylonitrile, MW 370000); 1.71 dl g^{-1} (DMF, 30°, acrylonitrile/ethylhexyl acrylate/itaconic acid (98/1.5/0.5), MW 372000); 1.61 dl g^{-1} (DMF, 30°, acrylonitrile/ ethylhexyl acrylate/itaconic acid (93/6.5/0.5), MW 331000); 0.98 dl g^{-1} (DMF, 30°, acrylonitrile/methyl acrylate/itaconic acid, MW 165000); 1.88 dl g^{-1} (DMF, 30°, acrylonitrile/methyl acrylate/itaconic acid, MW 429000) [13]

Permeability of Gases: Acrylonitrile/methyl acrylate copolymer has a high intrinsic selectivity and a low intrinsic permeability. Acrylic fibres do not swell: articles made from them remain permeable to air even when wet [1,23]

Water Content: Moisure regain can be enhanced by incorporation of hydrophilic comonomers

Water Absorption:

No.	Value	Note
1	1.5–2.5 %	[2]
2	2.1–2.3 %	65% relative humidity, acrylonitrile/methyl acrylate [25]
3	7.2–7.5 %	65% relative humidity, acrylonitrile/acrylamido methylpropanesulfonic acid [25]

Mechanical Properties:

Mechanical Properties General: Mech. props. are affected by the crystallite sizes and orientation of the fibres and by varying composition and MW. [13,14] Wet conditions do not severely affect the mech. props. but hot, wet conditions adversely affect some props. Acrylic fibres are better than wool but similar to cotton in terms of their tensile strength and abrasion resistance. Gel-spinning can be used to produce high strength fibres from high MW polymer [1,2] As temps. increases elongation at break increases, slowly initially and then rapidly as T_g is approached. Creep rate also increases with temp., the rate of increase becoming greater nearer T_g. The effects of stretching a fibre at temps. below the stabilisation range (at 185°) have been reported. As the stretch ratio increases fibre diameter decreases and Young's modulus increases. Tensile strength initially decreases but then increases as stretch ratio is taken above zero; similarly, elongation initially increases slightly and then decreases. The mechanism of tensile extension/recovery has been reported. [4,8,17] Tenacity 0.09–0.33 N tex^{-1} (35–55% elongation, dry); 0.14–0.24 N tex^{-1} (40–60% elongation, wet); 0.09–0.3 N tex^{-1} (loopknot); 2 N tex^{-1} (7–10% elongation, gel-spun fibre); 0.7–0.8 N tex^{-1} (9–11% elongation, asbestos replacement grade) [2]; 0.22–0.3 N tex^{-1} (acrylonitrile/vinyl acetate (91/9), 17.4–20.7% elongation); 0.14–0.29 N tex^{-1} (polyacrylonitrile/vinyl acetate (91/9), flame retardant); 3.4–4.4 g den^{-1} (acrylonitrile/itaconic acid (97/3), 7.6–9.7% elongation, MW 131000; high temp. drawing); 1.8–3.1 g den^{-1} (acrylonitrile/itaconic acid (97/3), 11.1–11.8% elongation, MW 131000, boiling water drawing) [26]; average modulus 0.44–0.62 N tex^{-1} (dry). Tensile modulus 114–144g den^{-1} (acrylonitrile/itaconic acid (97/3), MW 131000, high temp. drawing); 78–90 g den^{-1} (acrylonitrile/itaconic acid (97/3), MW 131000, boiling water drawing) [26]

Tensile (Young's) Modulus:

No.	Value	Note
1	16000 MPa	hollow fibre, MW 307000, 10% doped [5,6]
2	21000 MPa	hollow fibre, MW 307000, 20% doped [5,6]
3	47000 MPa	hollow fibre, MW 326000 [5,6]

Tensile Strength Break:

No.	Value	Note
1	470 MPa	hollow fibre, MW 307000, 10% doped [5,6]
2	600 MPa	hollow fibre, MW 30700, 20% doped [5,6]
3	800 MPa	hollow fibre, MW 326000 [5,6]

Viscoelastic Behaviour: Elastic recovery 99% (2% stretch). Sonic modulus 95–207 g den^{-1} (acrylonitrile/itaconic acid (97/3), MW 131000, varying drawing conditions) [26]
Mechanical Properties Miscellaneous: Macromolecular entanglements in PAN and PAN-copolymer fibres and the effects of various thermal treatments on the texture of fibres have been reported [19]
Failure Properties General: Crease recovery is an important factor for fibres with a flat or rectangular cross-section. The effect of flatability (ratio of cross-sectional length to width) and modulus on crease recovery has been reported. Crease recovery of acrylonitrile/vinyl acetate (85/15) fibres improves with increasing modulus and flatability but reaches a maximum when the modulus reaches approx. 8.6 g den^{-1} [16]
Friction Abrasion and Resistance: Increasing the draw ratio gives fibres with an increased molecular orientation, a smoother surface and as a result, an increased fibre-to fibre coefficient of friction [32]

Electrical Properties:

Electrical Properties General: Fibres have high electrical resistance [2]. Electrically conducting acrylic fibres can be made by binding copper sulfide onto the surface of fibres which have pendant groups with an affinity for Cu(II) [33]
Static Electrification: Show moderate static build-up. Treatment of fibres or fabric with cationic/anionic surfactant mixtures can have a dramatic effect on the surface conductivity, greatly reducing the discharge time [2,29] . Can be made with antistatic props. by a treatment which results in the formation of polyaniline within and at the surface of the fibres. Antistatic fibres made in this way have a much lower max. static charge and half-life than the untreated material [30]

Optical Properties:

Optical Properties General: Birefringence -0.00042 (Dralon) [31]
Refractive Index:

No.	Value	Note
1	1.512	546.1 nm, Dralon, parallel to fibre axis [31]
2	1.5162	546.1 nm, Dralon, perpendicular to fibre axis [31]

Total Internal Reflection: Index of birefringence 0.1 [2]

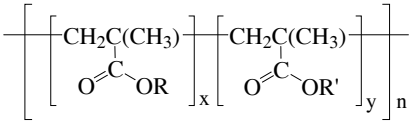
Polymer Stability:

Thermal Stability General: Fibres have good colour stability below 120°. [2] PAN fibres shrink by up to 9.4% when heated to 220° [15]
Decomposition Details: If heated above 200° PAN darkens, resulting in a black solid in which the nitrile groups have cyclised to give a conjugated ladder polymer with high thermal stability. The temp. at which cyclisation begins is dependent on the comonomers present. Further heating at higher temps. under the correct conditions can yield carbon fibres. The formation of the cyclised product, the ladder polymer, is of great interest because of its influence on the props. of the subsequently produced carbon fibres [7,21,24]
Flammability: On burning acrylic fibres melt, ignite and then burn with a sooty, yellow flame leaving a dark, brittle residue. [1] Fibres are moderately flammable. [2] Limiting oxygen index 18% [2] 33.3% (acrylonitrile/vinyl acetate, (91/9)) 38.5–39.6% (acrylonitrile/vinyl acetate, (91/9), 25% tributyl phosphate) 43.3% (acrylonitrile/vinyl acetate, (91/9), 25% aluminium hydroxide) 43.3–50.0% (acrylonitrile/vinyl acetate, (91/9), 25% tris(dibromopropyl) phosphate) [8] The flame resistance of PAN fibres can be improved by copolymerisation, blending and by surface treatment. Copolymerisation and blending can lead to significant changes in props., however, and surface treatments are often readily removed. Surface modification of PAN fibres by plasma polymerisation using hexamethyldisiloxane and ethyldichlorophosphate has been reported. [6] Stabilisation of PAN-based fibres, I.e cyclisation by heating above 200°, improves flame resistance [7]
Environmental Stress: Has excellent resistance to weathering and is lightfast. These props. are better than those of natural or other synthetic products. Discoloration brought about by weathering is very much a surface effect. A decrease in MW accompanies chemical change, evidenced by an increase in the oxygen content of the fibre and by changes in its ir spectrum [1,2,19]
Chemical Stability: Acrylic fibre has good chemical resistance. Is resistant to weak alkali, oxidising agents and moderately concentrated mineral acids. Dissolved by concentrated nitric acid or sulfuric acid. Fibres have good resistance to smoke, soot and industrial gases [1,2]
Hydrolytic Stability: PAN is resistant to hydrol. and can be used in humid atmospheres at temps. up to 140° [1]
Biological Stability: Acrylic fibre does not rot and is not attacked by bacteria, fungus or insects. Antibacterial props. can be imparted to PAN fibres by the incorporation of carboxylic groups into the polymer and subsequent impregnation with antibiotics [1,22]
Stability Miscellaneous: The effect of γ-irradiation on optical props. has been reported [31]

Applications/Commercial Products:

Processing & Manufacturing Routes: The polymers or copolymers used for acrylic fibre production can be made by anionic methods but radical polymerisation is more common. Precipitation polymerisation and soln. polymerisation are used to prepare the parent copolymer; soln. polymerisation has the advantage in that the polymer soln. can be spun with no further preparation step. Aq. media are the most widely used for acrylic fibre polymerisations. Commonly used non-ionogenic comonomers include methyl methacrylate, methyl acrylate, vinyl acetate and acrylamide. Ionogenic comonomers are generally monomers with sulfonic acid groups (e.g. styrenesulfonic acid) or basic compounds such as the vinylpyridine and dialkylaminoalkyl methacrylates. The composition of the copolymer determines the dyeing props. of the fibres: the use of different types of dye is made possible by use of the appropriate comonomers. Acrylic fibres can be dry spun or wet spun and can be used in staple or tow form. Polyacrylonitrile decomposes below its melting point and therefore cannot be spun from the melt. Mixtures of polyacrylonitrile and water, however, can melt to give a single phase without decomposition of the polymer but spinning from this has not been carried out commercially. The presence of water in excess of its saturation level gives rise to foaming during melt spinning. Fibres spun with foaming have a greatly reduced density and inferior mech. props. Spinning in the supercooled state can give foam-free fibres. The shape of the fibre's cross section depends on composition, MW, spinning process and conditions e.g. a dumbbell shape indicates a dry-spun fibre and a kidney shape a wet-spun product. Props. of the fibre, such as lustre, moisture regain and some mech. props. are affected by the shape of its cross-section. Fibres are spun to give the cross-section shape most appropriate for the intended use, e.g. triangular fibres where a good lustre is required and flat fibres for carpets, blankets and synthetic fur. Hollow fibres can be spun using an appropriate spinneret. After spinning, the fibres are put through several further stages including: washing, drawing, finish application, crimping, drying, cutting, steaming and packing. Dyeing of the fibre can be carried out before (spin-dyeing), during or immediately after (gel-dyeing) or during the after treatment of the spun fibre [1,2,5,12,13,25,23]. Acrylic fibres can be modified in many ways to achieve the required props. The incorporation of hydrophilic monomers can improve the moisture-absorbing props. of acrylic fibres as can increasing their porosity. Abrasion resistance can be improved by increasing fibre density. This may be achieved by adjustment of spinning conditions; the incorporation of comonomers with smaller molar volumes (e.g. vinylidene chloride); the incorporation of hydrophilic comonomers to reduce

void content (e.g. sulfonated or acrylamide derivatives). Pilling problems can be reduced by producing a more brittle fibre which may be achieved by adjustment of spinning conditions, annealing at lower temps., by using less comonomer or by adding an ionic comonomer [2]. Antistatic acrylic fibre can be prepared by exposing fibre impregnated with oxidising agent to aniline vapour [31]



Applications: One of the major uses of acrylic fibre is as a precursor for carbon fibre. Other uses include clothing (sportswear, knitwear, etc.); furnishings (upholstery, blankets, carpets, garden furnishings, awnings, etc.); in brake and clutch linings, as an asbestos replacement, and in concrete reinforcement. Stabilised PAN-based fibres (heated to 200–300°) find application in garments where non-burning fabric is required

Acrylic/methacrylic copolymers A-27

R = Me, Et, $CH_2CH_2CH_2CH_3$ (butyl), $CH_2(CH_2)_8CH_3$ (lauryl)

R' = Et, $CH_2CH_2CH_2CH_3$ (butyl), $CH_2(CH_2)_8CH_3$ (dodecyl)

= 

= $CH_2CH(CH_3)_2$

= $PhC(CH_3)_3$

Synonyms: *Poly(methyl methacrylate-co-ethyl methacrylate). Poly(methyl methacrylate-co-butyl methacrylate). Poly(methyl methacrylate-co-dodecyl methacrylate). Poly(methyl methacrylate-co-tert-butylphenyl methacrylate). Poly(methyl methacrylate-co-methyl acrylate). Poly(methyl methacrylate-co-ethyl acrylate). Poly(methyl methacrylate-co-butyl acrylate). Poly(ethyl methacrylate-co-ethyl acrylate). Poly(butyl methacrylate-co-isobutyl methacrylate). Poly(lauryl methacrylate-co-glycidyl methacrylate). Poly(methyl methacrylate-co-ethyl methacrylate-co-ethyl acrylate)*

Related Polymers: Polymethacrylates, General, Hydroxyalkyl methacrylate copolymers, Methacrylic ionomers, Poly(methyl methacrylate), Poly(ethyl methacrylate), Poly(butyl methacrylate), Poly(isobutyl methacrylate), Poly(*tert*-butyl methacrylate), Poly(-dodecyl methacrylate), Poly(methyl acrylate), Poly(ethyl acrylate), Poly(butyl acrylate)

Monomers: Methyl methacrylate, Ethyl methacrylate, Butyl methacrylate, Lauryl methacrylate, *tert*-Butylphenyl methacrylate, Glycidyl methacrylate, Methyl acrylate, Ethyl acrylate, Butyl acrylate

Material class: Thermoplastic

Polymer Type: Acrylic, Acrylic copolymers

CAS Number:

CAS Reg. No.	Note

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18 g/cm^3	MMA-*co*-ethyl methacrylate [1]
2	d 1.043–1.151 g/cm^3	MMA-*co*-butyl methacrylate, ASTM D1475 [2]
3	d 1.079 g/cm^3	MMA-*co*-dodecyl methacrylate, 50/50 copolymer [2]
4	d 1.083 g/cm^3	butyl methacrylate-*co*-isobutyl methacrylate [2]

Equation of State: Equation of state information for the MMA/butyl methacrylate copolymer has been reported [3]

Glass-Transition Temperature:

No.	Value	Note
1	101°C	MMA-*co*-ethyl methacrylate, 75% MMA, 25% ethyl methacrylate, MW 1690000 [5]
2	91.3°C	MMA-*co*-ethyl methacrylate, 50% MMA, 50% ethyl methacrylate, MW 2040000 [5]
3	29°C	MMA-*co*-ethyl methacrylate, 1:1 isotactic random copolymer, MW 31800 [6]
4	19°C	MMA-*co*-ethyl methacrylate, 1:1 isotactic block copolymer, MW 12500 [6]
5	79.4°C	MMA-*co*-ethyl methacrylate, 25% MMA, 75% ethyl methacrylate, MW 2070000 [5]
6	36–80°C	MMA-*co*-butyl methacrylate, ASTM D3418 [2]
7	89°C	MMA-*co*-butyl methacrylate, 78.3% MMA, 21.7% butyl methacrylate, MW 1590000 [5]
8	64.8°C	MMA-*co*-butyl methacrylate, 52.3% MMA, 47.7% butyl methacrylate, MW 2210000 [5]
9	-22–120°C	MMA-*co*-butyl methacrylate, random copolymers, varying tacticities [6]
10	54–74°C	MMA-*co*-butyl methacrylate [7]
11	90°C	MMA-*co*-dodecyl methacrylate, 50/50 copolymer [2]
12	-60–120°C	MMA-*co*-dodecyl methacrylate, syndiotactic random copolymers [6]
13	35°C	butyl methacrylate-*co*-isobutyl methacrylate [2]
14	60°C	ethyl methacrylate-*co*-ethyl acrylate [7]
15	43°C	MMA-*co*-ethyl acrylate [7]
16	65°C	MMA-*co*-ethyl methacrylate-*co*-ethyl acrylate [7]

Transition Temperature General: Generally T_g increases as the amount of MMA in the copolymer increases [4]

Vicat Softening Point:

No.	Value	Note
1	135°C	MMA-*co*-ethyl methacrylate [7]
2	150–190°C	MMA-*co*-butyl methacrylate [7,8]
3	43°C	MMA-*co*-ethyl acrylate [7]
4	135°C	MMA-*co*-ethyl methacrylate-*co*-ethyl acrylate [7]
5	143°C	ethyl methacrylate-*co*-ethyl acrylate [7]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 19.22 $J^{1/2}$ $cm^{-3/2}$ (9.4 $cal^{1/2}$ $cm^{-3/2}$) [1]

Solvents/Non-solvents: MMA-*co*-butyl methacrylate sol. chlorohydrocarbons, esters, ketones, toluene, xylene, acetonitrile, nitroparaffins, DMF, THF, ethoxyethanol. Insol. alcohols, formamide, hydrocarbons, vegetable oils, Et_2O, diisopropyl ether, turpentine. MMA-*co*-ethyl acrylate sol. aromatics, esters, ketones, chlorinated hydrocarbons. MMA-*co*-ethyl methacrylate-*co*-ethyl acrylate sol. aromatics, esters, ketones, chlorinated hydrocarbons, alcohols

Transport Properties:

Polymer Solutions Dilute: Theta temps. (lauryl methacrylate-*co*-glycidyl methacrylate, 3% glycidyl methacrylate, 97% lauryl methacrylate) -24° (EtOH/heptane, 69:31), 1° (EtOH/heptane, 62:38), 24° (EtOH/heptane, 56:44), 40° (EtOH/heptane, 49:51), 1° (propanol/heptane, 44:56), 24° (propanol/heptane, 30:70) [9]. Viscosity (MMA-*co*-butyl methacrylate, 25°) [2] 2.30–2.75 St (toluene, 40% solids), 0.50–0.6 St (toluene, 30% solids), 0.65–1.3 St (2-butanone, 40% solids), 0.15–0.31 St (2-butanone, 30% solids), 2.75–6.27 St (isopropyl acetate, 40% solids), 0.40–0.65 St (isopropyl acetate, 30% solids), 17.6–10.66 St (ethoxyethanol, 40% solids), 2.30–8.9 St (ethoxyethanol, 30% solids)

Water Absorption:

No.	Value	Note
1	0.35–0.5 %	max., MMA-*co*-butyl methacrylate [2]
2	<0.5 %	max., MMA-*co*-dodecyl methacrylate [2]
3	<0.4 %	max., butyl methacrylate-*co*-isobutyl methacrylate [2]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2910 MPa	23°, in air, MMA-*co*-ethyl methacrylate, 75% MMA, 25% ethyl methacrylate [5]
2	2420 MPa	37°, in H_2O, MMA-*co*-ethyl methacrylate, 75% MMA, 25% ethyl methacrylate [5]
3	2680 MPa	23°, in air, MMA-*co*-ethyl methacrylate, 50% MMA, 50% ethyl methacrylate [5]
4	2170 MPa	37°, in H_2O, MMA-*co*-ethyl methacrylate, 50% MMA, 50% ethyl methacrylate [5]
5	2270 MPa	23°, in air, MMA-*co*-ethyl methacrylate, 25% MMA, 75% ethyl methacrylate [5]
6	1890 MPa	37°, in H_2O, MMA-*co*-ethyl methacrylate, 25% MMA, 75% ethyl methacrylate [5]
7	2790 MPa	23°, in air, MMA-*co*-butyl methacrylate, 78.3% MMA, 21.7% butyl methacrylate [5]
8	2340 MPa	37°, in H_2O, MMA-*co*-butyl methacrylate, 78.3% MMA, 21.7% butyl methacrylate [5]
9	2080 MPa	23°, in air, MMA-*co*-butyl methacrylate, 52.3% MMA, 47.7% butyl methacrylate [5]
10	1680 MPa	37°, in H_2O, MMA-*co*-butyl methacrylate, 52.3% MMA, 47.7% butyl methacrylate [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	11–16 MPa	23°, 50% relative humidity, MMA-*co*-butyl methacrylate [2]	0.5–2%
2	15 MPa	23°, butyl methacrylate-*co*-isobutyl methacrylate [2]	175%

Hardness: Knoop 3.5–13 (23°, 50% relative humidity, MMA-*co*-butyl methacrylate, Tukon, 1.6 mm thick, 25 g load) [2], 16 (23°, MMA-*co*-dodecyl methacrylate, Tukon, 50/50 copolymer) [2], 4 (butyl methacrylate-*co*-isobutyl methacrylate, Tukon) [2]
Fracture Mechanical Properties: Fracture toughness 1.03 MPa $m^{1/2}$ (23°, in air, MMA-*co*-ethyl methacrylate, 75% MMA, 25% ethyl methacrylate) [5], 1.45 MPa $m^{1/2}$ (37°, in H_2O, MMA-*co*-ethyl methacrylate, 75% MMA, 25% ethyl methacrylate) [5], 0.98 MPa $m^{1/2}$ (23°, in air, MMA-*co*-ethyl methacrylate, 50% MMA, 50% ethyl methacrylate) [5], 1.24 MPa $m^{1/2}$ (37°, in H_2O, MMA-*co*-ethyl methacrylate, 50% MMA, 50% ethyl methacrylate) [5], 0.85 MPa $m^{1/2}$ (23°, in air, MMA-*co*-ethyl methacrylate, 25% MMA, 75% ethyl methacrylate) [5], 0.98 MPa $m^{1/2}$ (37°, in H_2O, MMA-*co*-ethyl methacrylate, 25% MMA, 75% ethyl methacrylate) [5], 0.99 MPa $m^{1/2}$ (23°, in air, MMA-*co*-butyl methacrylate, 78.3% MMA, 21.7% butyl methacrylate) [5], 1.1 MPa $m^{1/2}$ (37°, in H_2O, MMA-*co*-butyl methacrylate, 78.3% MMA, 21.7% butyl methacrylate) [5], 0.73 MPa $m^{1/2}$ (23°, in air, MMA-*co*-butyl methacrylate, 52.3% MMA, 47.4% butyl methacrylate) [5], 0.75 MPa $m^{1/2}$ (37°, in H_2O, MMA-*co*-butyl methacrylate, 52.3% MMA, 47.7% butyl methacrylate) [5]

Optical Properties:

Transmission and Spectra: C-13 nmr spectral data have been reported [10]

Applications/Commercial Products:

Processing & Manufacturing Routes: Stereoregular MMA/ethyl acrylate copolymers can be synth. using *tert*-BuLi-$AlEt_3$ to produce syndiotactic copolymers or *tert*-BuMgBr to produce isotactic copolymers [6]
Applications: Has uses in adhesives, coatings, paints, as a binder in inks; in cosmetics, dentistry, drug-delivery systems, imaging, optical lenses and as moulding additives. Copolymers, with *N*-methylolacrylamide as cross-linking agent, are used as auxiliary agents in the textile industry

Acrylonitrile-butadiene-isoprene terpolymer A-28

Synonyms: *Poly(acrylonitrile-co-butadiene-co-isoprene). Poly(2-propenenitrile-co-1,3-butadiene-co-2-methyl-1,3-butadiene)*
Monomers: Acrylonitrile, 1,3-Butadiene, Isoprene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: Polydienes, Acrylonitrile and copolymers, Polybutadiene
CAS Number:

CAS Reg. No.
25135-90-4

Applications/Commercial Products:

Trade name	Supplier
Nipol DN-1201	Nippon Zeon

Acrylonitrile-methyl acrylate copolymer A-29

Synonyms: *Barex. Poly(acrylonitrile-co-methyl acrylate). Poly(2-propenenitrile-co-(methyl 2-propenoate)*
Related Polymers: Acrylic fibres, Acrylonitrile-methyl acrylate copolymer - injection moulding, Polyacrylonitrile
Monomers: Acrylonitrile, Methyl acrylate
Material class: Thermoplastic
Polymer Type: Acrylonitrile and copolymers, Acrylic copolymers
CAS Number:

CAS Reg. No.
24968-79-4

General Information: Also contains some acrylonitrile-butadiene copolymer
Tacticity: Copolymers of varying composition synth. by aq. redox polymerisation similar tacticity [7]
Morphology: Morphology has been reported [10]

Volumetric & Calorimetric Properties:

Equation of State: Mark-Houwink-Sakurada equation of state parameters and second virial coefficients have been reported [9]
Glass-Transition Temperature:

No.	Value	Note
1	58°C	acrylonitrile: methyl acrylate 1:1 [1]
2	53°C	acrylonitrile: methyl acrylate 1:2 [1]
3	37°C	acrylonitrile: methyl acrylate 1:3 [1]
4	102°C	10% methyl acylate [1,4,5]
5	73°C	50% methyl acrylate [1,4,5]
6	30°C	90% methyl acrylate [1,4,5]

Transition Temperature General: T_g decreases with increasing methyl acrylate content [1,4,5]

Surface Properties & Solubility:
Solvents/Non-solvents: Swollen by nitromethane. Swelling causes a partial conformational change in the paracrystalline regions from hexagonal to orthorhombic [10]

Transport Properties:
Polymer Solutions Dilute: Intrinsic viscosity data 0.294 dl g^{-1} (DMF, 30°, acrylonitrile:methyl acrylate (1:0.86), 0.266 dl g^{-1} (DMF, 45°, acrylonitrile:methyl acrylate (1:0.86), 0.69 dl g^{-1} (DMF, 30°, acrylonitrile:methyl acrylate (91.5:8.5), MW 47800), 3.83 dl g^{-1} (DMF, 30°, acrylonitrile:methyl acrylate (91.5:8.5), MW 526000), 0.43 dl g^{-1} (82.5% aq. ethylene carbonate 30°, acrylonitrile:methyl acrylate (91.5:8.5), MW 71400), 1.12 dl g^{-1} (82.5% aq. ethylene carbonate, 30°, acrylonitrile:methyl acrylate (91.5:8.5, MW 526000), 0.48 dl g^{-1} (51% aq. nitric acid, acrylonitrile:methacrylate (91.5:8.5), MW 47800), 1 dl g^{-1} (80% aq. nitric acid, acrylonitrile:methyl acrylate (91.5:8.5), MW 47800 [6,9]

Optical Properties:
Transmission and Spectra: Ir, H-1 nmr and C-13 nmr spectral data have been reported [1,3,4,10]

Polymer Stability:
Thermal Stability General: The effect of composition on cyclisation behaviour under heating has been reported [7]. Three stages in the behaviour of the copolymer on annealing have been reported [10]
Decomposition Details: 51% Weight loss for a 1:1 copolymer occurs at 360-500°, with decomposition complete (97%) at 510–800°. 62% Weight loss for a 1:2 (acrylonitrile:methylacrylate) copolymer occurs at 360–510° with decomposition complete (98%) at 540–700°. 70% Weight loss for a 1:3 (acrylonitrile:-methylacrylate) copolymer occurs at 420–620° with decomposition complete (94%) at 700–850° [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by bulk polymerisation using benzoyl peroxide initiator; the kinetics of polymerisation have been reported [2,3,4]. Electro-copolymerisation of methyl acrylate and acrylonitrile onto graphite fibres has been reported [8]
Applications: Used in the manufacture of carbon fibres

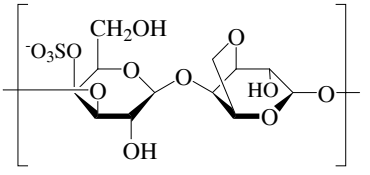
Acrylonitrile-methyl acrylate copolymer, Injection moulding A-30

Synonyms: *Barex 210*
Related Polymers: Acrylonitrile-methyl acrylate copolymer
Monomers: Acrylonitrile, Methyl acrylate
Material class: Thermoplastic
Polymer Type: Acrylonitrile and copolymers, Acrylic copolymers

Applications/Commercial Products:

Trade name	Supplier
Barex 210 resins	BP Chemicals



AES, Impact modified A-31

Monomers: Acrylonitrile, Styrene, Ethylene, Propylene
Material class: Synthetic Elastomers
Polymer Type: Polyolefins, Acrylonitrile and copolymers, Polystyrene

Applications/Commercial Products:

Trade name	Supplier
Royaltuf 372	Uniroyal Chemical

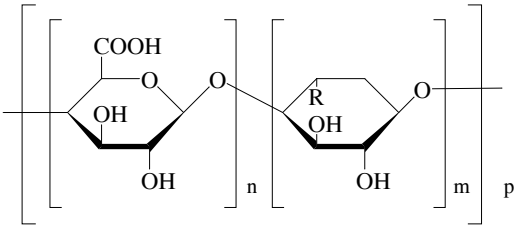
Agar A-32

Synonyms: *Agarose. Agar-Agar*
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.
9012-36-6

Molecular Formula: $(C_{12}H_{17}O_{13}S)_n$
Fragments: $C_{12}H_{17}O_{13}S$
General Information: Colloidal polysaccharide isol. from the red algae species *gelidium* and *gracilaria*. Agar samples are a mixture of agarose (28–80%) and agaropectin, itself a mixture of related galactose-based polymers

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. urea, DMSO [1]



Transport Properties:
Polymer Solutions Concentrated : Forms strong gels at 40° (approx.) [3]. Gels are formed at concentrations $\geq$1% at 20° [2]
Water Content: Absorbs 20 times its weight of cold water with swelling [3]. A hot 1.5% soln. gels at 32–39° and is liquefied by heating above 85°

Mechanical Properties:
Mechanical Properties General: Variation of Young's modulus with concentration has been reported in graphical form [2]

Alginic acid A-33

Synonyms: *Alginate. Polymannuronic acid. Polyguluronic acid*
Related Polymers: Cellulose
Monomers: Mannuronic acid, Guluronic acid
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.	Note
9005-32-7	mixture of monomers

Molecular Formula: $(C_6H_8O_6)_n$
Fragments: $C_6H_8O_6$
Molecular Weight: 30000-200000 (DP 186-930)
General Information: White-yellow powder isol. from brown seaweed (e.g. *Laminarae*) by extraction with alkali. Strongly hydrophilic with good colloidal props. Calcium alginate fibres have been manufactured for specialist uses. The arrangement and proportions of the two main acidic monomers vary widely with the source of the polymer

Surface Properties & Solubility:
Solubility Properties General: Polymer and fibre are sol. alkali
Solvents/Non-solvents: Insol. organic solvents [1]

Transport Properties:
Water Content: 10% [2]. Monovalent cationic salts of alginic acid can absorb 300 times their weight of water [2]

Optical Properties:
Total Internal Reflection: $[\alpha]_D^{20}$ -113–-148 [2]

Polymer Stability:
Flammability: Fibres made from metal alginates are flame-resistant [1]
Hydrolytic Stability: Has pK_a 2.95 at pH 2.8-6 [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Dried *Laminaria* (brown seaweed) is milled and treated with sodium carbonate/sodium hydroxide. The viscous soln. is bleached and sterilised with sodium hypochlorite. Acidification gives the free acid. Fibres are made by spinning solns. of sodium alginate into dilute hydrochloric acid/calcium chloride to give calcium alginate
Applications: Applications of the calcium salt include fireproof and dissolving fibres. Used as thickener and emulsifier in foods, cosmetics, agrochemical and pharmaceutical formulations, paper and textile coating, concrete waterproofing and drilling muds

Trade name	Supplier
Alginate fibre	Courtaulds

Amorphous Nylon A-34

Synonyms: *Poly(1,3-benzenedicarboxylic acid-co-1,4-benzenedicarboxylic acid-co-1,6-hexanediamine)*
Monomers: 1,3-Benzenedicarboxylic acid, 1,4-Benzenedicarboxylic acid, 1,6-Hexanediamine
Material class: Thermoplastic
Polymer Type: Polyamide
CAS Number:

CAS Reg. No.
25750-23-6

Molecular Formula: $(C_{14}H_{18}N_2O_2)_n$
Fragments: $C_{14}H_{18}N_2O_2$
General Information: An amorph. polyamide with good O_2 and CO_2 barrier props. especially at high moisture levels. 20% Blends with Nylon 6 and Nylon 6,6 give amorph. products with excellent barrier props. in refrigerated conditions. Wide ranging chemical resistance to dil. acids and bases, aliphatic and aromatic hydrocarbons, esters and ketones. When blended with Nylon 6, Selar improves O_2 barrier, transparency and glass thermoformability as well as processing of Nylon 6

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.19 g/cm^3	[1]

Glass-Transition Temperature:

No.	Value	Note
1	125°C	[1]

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. aliphatic hydrocarbons, aromatic hydrocarbons, ketones and esters

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	15 g/10 min	225°, 2.16 kg pressure

Polymer Solutions Dilute: η_{inh} 0.83 dl g^{-1} (*m*-cresol)
Polymer Solutions Concentrated : Apparent viscosity 1000 Pa s (approx., shear rate 50–100 s^{-1}, 280°) [1], 500 Pa s (approx., shear rate 50–100 s^{-1}, 300°)
Water Content: 1%
Gas Permeability:

No.	Gas	Value	Note
1	O_2	1.23 cm^3 mm/(m^2 day atm)	18.7 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 0% relative humidity [1]
2	O_2	0.4 cm^3 mm/(m^2 day atm)	6.1 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 100% relative humidity [1]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note	Elongation
1	68 MPa	ASTM D882 [1]	20%

Impact Strength: Spencer impact strength 4.5 J mm^{-1} (ASTM D3420, film) [1]
Failure Properties General: Elmendorf tear 16 g mil^{-1} (ASTM D1922) [1]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.597	measured on 25 m film

Transmission and Spectra: Uv transmission >80% (λ >320 nm). Light transmission 70% (approx., 25 μm monolayer blown film, ASTM D1003)
Volume Properties/Surface Properties: Transparency transparent. Haze 0.9% (20°, cast or blown film)

Polymer Stability:
Chemical Stability: Stable to hydrocarbons, dilute mineral acids and bases, ketones, esters and higher alcohols. Poor resistance to EtOH, isopropanol, ethylene glycol and AcOH

Applications/Commercial Products:
Processing & Manufacturing Routes: Similar to Trogamid T (Nylon 6(3)6). Packaged at <0.1% moisture content for immediate use. May be dry blended with Nylon 6 before extrusion. Blending temp. of 240-250° in extrusion processes
Applications: Modifier for semi-crystalline Polyamides to improve clarity, water vapour and oxygen impermeability. Thin extruded films used for packaging. Has FDA approval for food packaging applications. Also used as modifier for HDPE when suitably dispersed to provide platelets which form a 'tortuous path' for gas molecules. Selar PA is used in bottles, jars and other rigid structs. that require good physical props. (low weight and impact resistance) combined with the clarity and high oxygen barrier props. of glass. Often used in co-extrusion coatings or other multilayer-structs.

Amylopectin A-35
Related Polymers: Starch, Amylose
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics
CAS Number:

CAS Reg. No.
9037-22-3

Molecular Formula: $(C_6H_{10}O_5)_n$
Fragments: $C_6H_{10}O_5$
Molecular Weight: MW 65000000-500000000 (degree of polymerisation 400000-3000000, 160000-1600000 (degree of polymerisation 1000-10000), 36000000-25000000 (degree of polymerisation 200000-1500000)
General Information: One of the largest natural polymers, its MW range is variously quoted in the range 1-500000000, depending on source [1,4]. Branches occur at every tenth-twelfth glucose residue, usually by reaction at C-6, though C-3 bonds are also found. Each side-chain comprises 20-30 glucose residues, which may also be non-linear. Thus the struct. of amylopectin is variable and complex

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. H_2O, butanol [5]. Insol. EtOH, Me_2CO, Et_2O [5]
Surface Tension:

No.	Value	Note
1	35 mN/m	20°, contact angle method [3]

Polymer Stability:
Hydrolytic Stability: Hydrolysed by mineral acids
Biological Stability: Non-branched sections hydrolysed by α-amylase and β-amylase leaving a highly branched core unit (the limit dextrin)

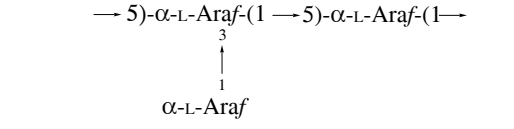
Amylose A-36
Synonyms: *Poly [(1→4)-α-D-glucose]. α-Amylose*
Related Polymers: Starch, Amylopectin
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.
9005-82-7

Molecular Formula: $(C_6H_{10}O_5)_n$
Fragments: $C_6H_{10}O_5$
Molecular Weight: MW 160000-320000 (degree of polymerisation 200-2000) , 160000-700000 (degree of polymerisation 200-4300)
General Information: This component of starch is usually found as a linear polymer, though occasional branching is found in samples from some sources. Amylose usually comprises 18–28% of the mixture in starch, though in some seeds it appears to make up approx. 85% of the total
Morphology: In parallel with starch, amylose has been identified in four forms, A, B, C and V, though detailed conformational information is scarce. Polymer chains appear to have a left-handed helical struct., containing six glucose residues per turn [7]. This struct. accounts for the ability of amylose to absorb water (up to 10%) and to form clathrates with a wide range of molecules. Complexation with butanol is important in its isolation and purification. In soln. amylose is thought to form random coils, consisting of helical sections separated by disordered areas of the polymer [8]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. hot H_2O, ethylenediamine, nitromethane, DMSO, aq. potassium hydroxide, aq. potassium chloride [5,6]. Insol. butanol, Et_2O [5,6]
Surface Tension:



No.	Value	Note
1	37 mN/m	20°, contact angle method [3]

Polymer Stability:
Hydrolytic Stability: Hydrolysed by mineral acids
Biological Stability: Hydrolysed by α-amylase and β-amylase

Arabinan A-37

Portion of idealised structure

Synonyms: *Araban*
Material class: Polysaccharides
CAS Number:

CAS Reg. No.
11078-27-6
9060-75-7

Molecular Formula: $(C_5H_8O_4)n$
Fragments: $C_5H_8O_4$
General Information: Minimum formula given
Morphology: A polymer of linearly α-(1→5)-linked L-arabinofuranose units with single L-arabinofuranose α-(1→3)-linked to the main chain at intervals.
Miscellaneous: Arabinans devoid of other sugars have been isol. from mustard seeds and maritime pine. Heteroarabinans have been found in sugar beet and apples

Optical Properties:

Optical Properties General: $[\alpha]_D$ -157; -114; -129 (H_2O)

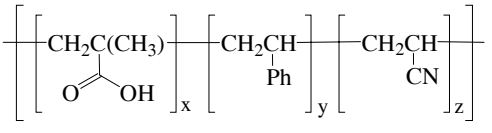
Aramids A-38

Related Polymers: Poly(*p*-phenylene terephthalamide), Poly(*m*-phenylene isophthalamide)
Material class: Polymer liquid crystals
Polymer Type: Polyamide
General Information: *Aramids* are defined as fibre forming substances comprising long-chain polyamides with >85% of amide groups attached to aromatic rings. These are synthetic polymers with the qualities of stiffness and heat resistance as well as high tenacity, which make them competitive substitutes for steel wire or glass fibres for the production of ropes, cables, hoses and coated fabrics etc. The three best known aramids are all manufactured by DuPont and include poly (*p*-phenyleneterephthalamide), poly *p*-benzamide see and poly *m*-phenylene isophthalamide. The chain stiffness of these materials has a large positive effect upon the initial modulus, which can be further increased by orientation due to drawing the fibre to several times its original length, and by crystallinity. Fibres spun from anisotropic solns. of rigid rods do not need to be hot drawn to attain high strength [1]. Anisotropic doped solns. permit higher spinning rates because they have much lower viscosity. Aramid fibres can survive temps. up to 500° and do not melt. Upper use temps. depend on Tg and are in range 250–400°. They are characterised by medium to ultrahigh tensile strength, medium to low elongation and moderate to ultrahigh modulus. Aramids with a high proportion of meta rings have superior heat and flame resistance to the ultrahigh modulus rigid rod types like Kevlar. Tensile props. are not only superior to Nylon 6,6 but at 250° are the equal of conventional textile fibres. Aramid fibres retain useful props. for up to two weeks of heat ageing in air at 300°. Aramid fibres amy be used for flame resistant applications, e.g. protective apparel, are highly resistant to most chemicals but are susceptible to UV degradation. High breakdown voltages suit aramids for dielectrics in transformers and motors. The stress-strain curves for ultrahigh modulus aramid fibres resemble those of glass and steel, on a specific basis, they are actually stronger and stiffer than steel or glass, and find use in composites
Morphology: Aramids exhibit lyotrpoic liquid crystalline behaviour, enhancing chain orientation and phys. props.

Applications/Commercial Products:



Processing & Manufacturing Routes: Aramids are prepared commercially from the reaction of the aromatic diacid chlorides with the diamine in *N*-methyl pyrrolidone (NMP) containing some calcium chloride which helps to keep the growing polymer in soln. The polymer is prepared under high shear mixing conditions below 95°. It is dried and dissolved in sulfuric acid to provide a dope for spinning [2]. Fibres are spun from sulfuric acid soln. because the acid forms a low melting complex with the aramid enabling higher levels to be spun [3]. Filament yarn is then crimped and cut to provide staple which can be blended and processed into fabrics and felts using conventional textile technology. Aromatic polyamides may also be prepared by the interfacial polym. method in which an acid chloride is dissolved in a water immiscible solvent and added to aq. diamine. High MW polymer is best obtained by stirring in the presence of an emulsifying agent at close to 0°. Direct polycondensation from the acid and amine can be achieved in soln.
Applications: The major areas where aramid fibres are employed commercially include ballistics, rope and cable, fibre optics, protective apparel, mechanical rubber goods and composites. The polymers are solid in the form of yarn, roving, staple, flock, pulp and selected spun yarns and fabrics [12]. Nomex (MPD-I) has been marketed since 1965 and is used in continuous filament yarn for reinforcement in rubber goods, radiator hose, conveyor belts, protective apparel and hot gas filtration. It is converted from spun yarn to paper used for wrapping tape, electric sheets or insulation for motors and transformers. Spun yarn is also converted to needle felts (used in hot gas filtration, laundry and office machine parts), pressboard (spacers, gaskets, electrical motor/transformer insulation), fabric (personal protective clothing, wrappers). Floc is converted to a honeycomb sheet for aerospace applications, ground and marine transportation, and sports equipment. The first and foremost application is in personal protective garments. Fire protective garments are produced for oil workers, firemen, and motor racing drivers. Needle felts are used for filter media to separate dust from flue gases continuously up to 200°. Nomex paper and pressboard are made by heat and pressure consolidation of fibre floc. Pressboard is used routinely for spacers and support in high performance electromechanical equipment. Nomex honeycomb technology finds applications in skis, tailfins of aircraft and helicopter blades. *Kevlar (PPD-T)* was originally designed at DuPont as a replacement for steel wire in radial tyres and has been marketed since 1974. As fabric, it gives excellent ballistic performance at low weight for body armour. Light weight military helmets offer superior head protection. Kevlar reinforced phenolics are employed as spall liners for armoured cars. Kevlar light weight knitted or woven gloves are widely used for protection against heat, chemical attack and/or cuts. Forestry workers use Kevlar protective clothing designed to protect against chain saw chaps. In composite form it is used in motorcycle racing to reinforce bodywork, tyres brake discs and helmets. It has found

many other uses in composites, e.g. to save weight in many aircraft parts while maintaining desired levels of strength, in boat hulls and canoes for its lightness and impact resistance as well as skis where its vibration damping props. are advantageous. It has replaced asbestos in brake and clutch linings, both on safety and performance criteria. Kevlar has many reinforced rubber applications, e.g. high performance tyres for racing, puncture resistant cycle tyres, truck and aircraft tyres. It is also used in conveyor belt construction and for car and other high pressure hydraulic hoses. There are many applications where Kevlar ropes provide the strength of steel at 5% of the weight, especially in marine moorings or anchor lines for ships and off-shore platforms. Trawl nets for fishing are now often made from Kevlar to reduce drag through the water. The automobile industry was seen as the major client for replacement of asbestos with aramid fibre [5], with uses in bullet proofing also important. The industrial applications of aramids has been assisted by the development of pultrusion processes for impregnating continuous fibres with thermoplastic resins, leading to pelleted products with up to twenty times as long fibred incorporated [6]. A fibre foam coining process was described as a means to reduce the tendency of long fibres to orient in the direction of matrix flow in moulding by ICI [7,8]. Their higher strength, stiffness and impact resistance made them suitable for a wide variety of markets in aerospace automotive and chemical sectors [9]. Moulded pellets made by melt coating coutinuous aramid fibres have been shown to have higher wear resistance than glass reinforced materials. Kevlar/nylon 6,6 compds. are being applied to wear plates, bushings and bearings [10] and a new composite material of Nylon 6,6 with Kevlar fibre has been used for car transmission components [11,12]

No.	Value	Frequency	Note
1	0.009	100 Hz	ISO 1325 [17]
2	0.034	1 MHz	[17]

Optical Properties:

Transmission and Spectra: Ir [2,3] and H-1 nmr [7] spectral data have been reported
Volume Properties/Surface Properties: Clarity clear to opaque, depending upon composition [16]

Polymer Stability:

Flammability: Flammability rating HB (0.81 mm, UL 94) [17]
Environmental Stress: Weathering data have been reported [8,10]. Excellent weathering resistance is due to the acrylic elastomer content
Chemical Stability: Acrylic terpolymers are resistant to gasoline and CCl_4 [16]
Hydrolytic Stability: Stable to boiling H_2O and to cold alkalis [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Terpolymer containing butyl acrylate may be synth. by a two-stage emulsion polymerisation [1]. Block terpolymer can be synth. by initial polymerisation of butyl acetate with a peroxide initiator at 68° under N_2. Acrylonitrile and styrene are added, and polymerisation continued at 110° [4]. Graft terpolymer can be synth. by grafting styrene and acrylonitrile onto butyl acrylate rubber in aq. media in the presence of anionic emulsifiers [11]. The mechanism of graft polymerisation has been reported [12]
Mould Shrinkage (%):

No.	Value	Note
1	0.5%	linear

Applications: Applications due to excellent weather resistance, mechanical props. and mouldability in automobile industry (door mirror and lamp housings, radiator grilles, bumpers); in building (gutters, shutters, baths); in air conditioner parts, lamps, sockets, surfboards, garden furniture, swimming pool pump and filter housings

Atactic Polypropylene A-45

Synonyms: *PP-atactic. Polypropene-atactic. Poly(1-propene) atactic*
Related Polymers: Polypropylene
Monomers: Propylene
Material class: Thermoplastic
Polymer Type: Polypropylene
CAS Number:

CAS Reg. No.
9003-07-0

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
General Information: Data given here are specific to atactic polypropylene. More general data, including the effect of the atactic content on commercial material, can be found under Polypropylene
Morphology: Soft and rubbery

Volumetric & Calorimetric Properties:

Latent Heat Crystallization: Entropy of polymerisation ΔS_{polym} 116 J K^{-1} (25°, monomer liq. phase, polymer condensed amorph. phase). [19,20,21] (See also polypropylene, isotactic polypropylene)
Specific Heat Capacity:

No.	Value	Note	Type
1	2.34 kJ/kg.C	[2,26]	P

Glass-Transition Temperature:

No.	Value	Note
1	-7.16°C	[3]

Transition Temperature General: Increase in M_n causes increase in Tg; non linear deviation if M_n <10000 [3]
Transition Temperature:

No.	Value	Type
1	-80°C	γ

Surface Properties & Solubility:

Internal Pressure Heat Solution and Miscellaneous: Heat of mixing at infinite dilution has been reported [22,24]
Solvents/Non-solvents: Sol. hydrocarbons, chlorinated hydrocarbons, isoamyl acetate, Et_2O. Insol. more polar organic solvents [16,17]

Transport Properties:

Polymer Solutions Dilute: Theta temps. have been reported [6,7,8,9,10,11,12,13]. Intrinsic viscosity and Huggins coefficients have been reported [18,27]
Polymer Melts: Viscosity has been reported [4]
Permeability of Gases: [He] 3.3 × 10^{-6}; [H_2] 1.5 × 10^{-6} cm^2 (s Pa)$^{-1}$ [5]

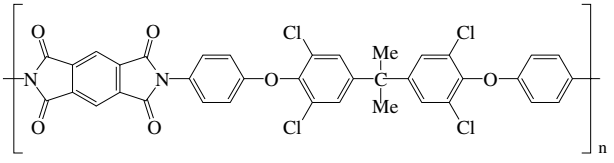
Optical Properties:

Volume Properties/Surface Properties: Concentration dependence of refractive index has been reported [14,15]

Polymer Stability:

Chemical Stability: More stable to sulfuric acid than isotactic polypropylene

Applications/Commercial Products:



Trade name	Details	Supplier
APP	Amorphous not truly atactic	Elf Atochem (UK) Ltd.

Avimid K-III A-46

Synonyms: *Poly[(5,7-dihydro-1,3,5,7-tetraoxobenzo[1,2-c:4,5-c′]dipyrrole-2,6(1H,3H)-diyl)-1,4-phenyleneoxy(2,6-dichloro-1,4-phenylene)(1-methylethylidene)(3,5-dichloro-1,4-phenylene)oxy-1,4-phenylene]. Poly[1H,3H-benzo[1,2-c:4,5-c′]difuran-1,3,5,7-tetrone-alt-4,4′-[(1-methylethylidene)bis[(2,6-dichloro-4,1-phenylene)oxy]]bis[benzenamine]]*
Monomers: 1*H*,3*H*-Benzo[1,2-*c*:4,5-*c*′]difuran-1,3,5,7-tetrone, 4,4′-[(1-Methylethylidene)bis[(2,6-dichloro-4,1-phenylene)oxy]]-bis[benzenamine]
Material class: Thermoplastic
Polymer Type: Polyimide
CAS Number:

CAS Reg. No.	Note
94148-53-5	
94148-82-0	source based

Molecular Formula: $(C_{37}H_{20}Cl_4N_2O_6)_n$
Fragments: $C_{37}H_{20}Cl_4N_2O_6$

Volumetric & Calorimetric Properties:

Latent Heat Crystallization: ΔH_m 26.9 J g^{-1} [2]
Melting Temperature:

No.	Value	Note
1	351°C	[2]
2	372°C	[3]

Glass-Transition Temperature:

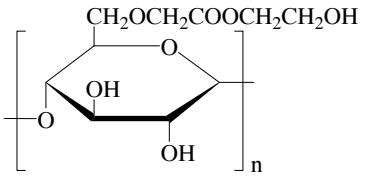
No.	Value	Note
1	240°C	[3]

Transition Temperature General: T_g reported not to be measurable [2]

Surface Properties & Solubility:

Solubility Properties General: May be blended with compounds containing both ketone and ether functional groups e.g.1,4-bis (4-phenoxybenzoyl)benzene, to improve processability [2]

Applications/Commercial Products:



Processing & Manufacturing Routes: Avimid K may be autoclave-moulded owing to its excellent tack and drape characteristics [1]. Synth. by reaction of benzenetetracarboxylic acid with 2,2-bis. (3,5-dichloro-4-(4-aminophenoxy)phenyl)propane [3]
Applications: Applications due to high temp. resistance in aircraft engine parts

Carboxymethylhydroxyethyl cellulose C-1

Synonyms: *CMHEC. 6-Carboxymethyl-2′-hydroxyethyl cellulose*
Related Polymers: Cellulose, Sodium carboxymethyl cellulose
Monomers: Base monomer unit 6-carboxymethyl-(2′-hydroxyethyl) glucose
Material class: Polysaccharides
Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9004-30-2

Molecular Formula: $(C_{10}H_{16}O_8)_n$
Fragments: $C_{10}H_{16}O_8$
General Information: The degree of substitution for commercial material is 0.3 carboxymethyl groups per base monomer unit and 0.7 hydroxyethyl groups per carboxymethyl substituted unit [1,2].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.6 g/cm^3	[2]

Transition Temperature:

Cardanol Resins C-2

Synonyms: *Cashew nut shell liquid resins. CNSL resins*
Monomers: Cardanol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.	Note
37311-73-2	polymer with formaldehyde
130572-32-6	polymer with formaldehyde, hexa cured

Molecular Formula: $[(C_{21}H_{32}O).(CH_2O)]_n$
Fragments: $C_{21}H_{32}O$ CH_2O
Additives: Glass fibre
General Information: Cardanol has a *meta*-substituted alkenyl chain. The *meta*-position enhances the reactivity of the monomer towards the addition of formaldehyde. The resin hardens by polyaddition and polymerisation to yield a solid infusible product which in powdered form is Friction Dust

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	126°C	resol, cured [5]
2	128°C	novolac, hexa cured [5]

Surface Properties & Solubility:

Solubility Properties General: Both novolac and resol-type resins form semi-interpenetrating networks with poly(methyl methacrylate) [5]
Solvents/Non-solvents: Uncured novolac sol. hexane, MeOH [4]

Mechanical Properties:

Mechanical Properties General: Tensile strength of hexa cured novolac decreases with increasing hexa content [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	5.3 MPa	novolac, hexa cured [1]	
2	4.4 MPa	novolac, hexa (3.5%) cured [5]	19.4%
3	1.87 MPa	novolac, hexa (7.0%) cured [5]	4.0%
4	2.63 MPa	resol, cured [5]	

Hardness: Shore A87.5 (novolac, hexa (3.5%) cured) [5], A92 (novolac, hexa (7.0%) cured); D45 (novolac, hexa (3.5%) cured) [5], D46 (novolac, hexa (7.0%) cured) [5] ; Shore A92 (resol, cured), D57.5 (resol, cured) [5]

Optical Properties:

Transmission and Spectra: Uv and ir spectral data have been reported [4]

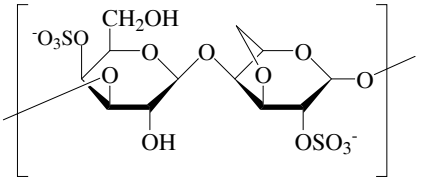
Polymer Stability:

Polymer Stability General: Stability may be improved by grafting on polysiloxanes [3]
Upper Use Temperature:

No.	Value	Note
1	93°C	200°F

Decomposition Details: Details of thermal degradation have been reported [6]
Flammability: Limiting oxygen index 21% (novolac, hexa cured, ASTM D3863-77) [1]. Fire retardant props. may be improved by phosphorylation of the prepolymer [1]
Chemical Stability: Resistant to acids and alkalis but attacked by aromatic hydrocarbons and chlorinated hydrocarbons

Applications/Commercial Products:



Processing & Manufacturing Routes: Cardanol is obtained from the fibrous shell of cashew nuts. (Cashew nut shell liq. results from a special heat treatment and decarboxylation). The reacted cashew nut shell liq. resin hardening reaction includes polym. and polyaddition yields a solid infusible product which in powdered form (Friction Dust) retains high binding power at raised temps. Kinetics of the alkaline catalysed reaction have been reported [2]. Novolak-type resin may be synth. by reaction of cardanol with aq. formaldehyde (mole ratio 1: 0.9) in the presence of oxalic acid catalyst [3]. Adipic acid also used as catalyst [4]. Use of succinic acid catalyst [6] yields "high-*ortho*" novolaks [7]. Resol-type resin synth. by reaction of cardanol and aq. formaldehyde in the presence of barium hydroxide catalyst. May be heat cured if desired [5]
Applications: Cardanol Friction Dust is used (5–15%) in brake lining formulations. Oil modification of phenolic resins may be achieved with Cashew nut shell liq. or other oils, leading to a softer braking action. Has other uses in inks and in anticorossive coatings and as a cement hardener

Carrageenan C-3

K - Carrageenan (idealised)

X - Carrageenan (idealised)

Monomers: D-Galactose
Material class: Polysaccharides
CAS Number:

CAS Reg. No.	Note
11114-20-8	κ carrageenan
9064-57-7	λ carrageenan
9062-07-1	ι carrageenan
51311-95-6	ϵ carrageenan
51311-96-7	μ carrageenan

Molecular Weight: 100000–1000000 (commercial)
General Information: Isol. from red algae spp. including *Chondrus, Furcellaria* and *Euchena* by hot water treatment at alkaline pH, followed by alcohol precipitation. At least six discrete polymers have been identified (prefixed ϵ, λ, μ, ν, ι, κ). κ-Carrageenan is the most regular polymer. All components are derived from D-galactose, 3,6-anhydrogalactose and related sulfates [1].
Gels result from complex interactions of polymer chains, giving coiled regions that are further strengthened by the presence of cations

Applications/Commercial Products:

Processing & Manufacturing Routes: Dried seaweed is macerated and extracted with hot water at alkaline pH. The polymer soln. is conc. before the polymer is precipitated with alcohol [1]
Applications: ι, κ and λ Carrageenans are of commercial significance. They are used to prod. high-strength gels with milk, and in other food applications as a viscosity modifier. Also used in cosmetics and pharmaceutical formulations

Casein C-4

Synonyms: *Calcium caseinate. Milk protein*
Related Polymers: Proteins, Casein Formaldehyde
Monomers: Amino acids
Material class: Proteins and polynucleotides

CAS Number:

CAS Reg. No.
9005-46-3

Molecular Weight: 33000–375000 Casein complex. Component protein MW's α 21000, β 24000, γ 11-20000, κ 19000
General Information: Casein, as its calcium salt, forms 3% of milk. It is a mixture of several related and interacting proteins. Fractions obtained are designated α, β, γ, and κ [1]. Its amino acid content is similar to that of wool, though its sulfur content is only 20% of that of wool

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	[1]
2	d 1.29 g/cm^3	Aralac fibre [3]

Surface Properties & Solubility:

Solubility Properties General: Low solubility in H_2O at neutral pH. Forms colloidal suspensions in acidic and alkaline soln. and in the presence of salts. Casein can also form colloids in some organic solvents [1]. Treatment with formaldehyde renders material waterproof and insol.
Solvents/Non-solvents: Spar. sol. H_2O [1]. Polymer and fibres insol. organic solvents [3]
Surface and Interfacial Properties General: Diameter of colloidal particles 20–140 nm [1]

Transport Properties:

Water Content: 8% (25°, 20% relative humidity), 12% (25°, 50% relative humidity) [1]
Water Absorption:

No.	Value	Note
1	14 %	standard conditions [3]

Electrical Properties:

Electrical Properties General: Isoelectric point of aq. soln. at pH 4.6 [1]
Dielectric Permittivity (Constant):

No.	Value	Note
1	8	[1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Wool like fibres are made by formaldehyde cross-linking of spun protein or by chrome tanning
Applications: Used to make plastics, paints and coatings. Other uses in food processing, paper coating and adhesives.

Trade name	Details	Supplier

Casein Formaldehyde C-5

Synonyms: *Casein Plastic. Artificial Horn. Galalith. CF. CS*
Related Polymers: Casein
Material class: Thermosetting resin
Polymer Type: polyamide
General Information: A polymer originating from natural proteins in sources such as milk, horn, soya beans, wheat etc. The first synth. was described in 1897, with commercial production starting in France in 1900, in Britain in 1913 and in the USA in 1920. Worldwide production reached 10000 tons by 1930. It was quickly superseded by synthetic compounds such as Bakelite and its uses were further restricted by its poor moulding quality and its low resistance to moisture. [1] Uses for Galalith have been reported [6].
Identification: Gives a pink colour when subjected to the biuret protein test. Gives a yellow precipitate when heated with conc. nitric acid (xanthoproteic test) [1]. Hydrol. with aq. sulfuric acid produces a cheese-like odour [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.35 g/cm^3	ASTM D792 [1]
2	d 1.34 g/cm^3	Erinoid [9]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4.1×10^{-5}–6.8×10^{-5} K^{-1}	ASTM D696 [1]	L

Deflection Temperature:

No.	Value	Note
1	149°C	ASTM D648 [1]

Vicat Softening Point:

No.	Value	Note
1	93.3°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Galalith sol. boiling 5% ammonium chloride; sl. sol. 1% potassium hydroxide, 1% ammonium oxalate; spar. sol. aq. ammonium sulfate [3]

Transport Properties:

Water Content: Water absorption may be reduced by addition of coal-tar pitch [4] or by coating with soluble quinones or tannic acid soln. [5]. Red-coloured Erinoid absorbs 1.43g H_2O after 400h exposure, whereas blue-coloured Erinoid absorbs 1.26g H_2O after the same exposure period [9]
Water Absorption:

No.	Value	Note
1	7–14 %	24h, $^1/_8$" thick, ASTM D570 [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3516–3930 MPa	510–570 kpsi, ASTM D638, ASTM D651 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	51.7–68.9 MPa	7.5–10 kpsi, ASTM D638, ASTM D651 [1]	2.5%

Flexural Strength at Break:

No.	Value	Note
1	69–124 MPa	10–18 kpsi, ASTM D790 [1]

Compressive Strength:

No.	Value	Note
1	186–365 MPa	27–53 kpsi, ASTM D695 [1]

Hardness: Rockwell M70–M100 (ASTM D785) [1]. Brinell 23 (2.5 mm ball, 25 kg load) [1]

Izod Notch:

No.	Value	Notch	Note
1	53.4 J/m	Y	1 ft lb in^{-1}, ASTM D256 [1]

Electrical Properties:

Electrical Properties General: Dielectric constant shows non-uniformity at wavelength of approx. 800 m. [7] Erinoid has good electrical insulating props. when dry [9]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	6.1–6.8	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	15.7–27.5 kV.mm^{-1}	400–700 V mil^{-1}, ASTM D149 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.052	1 MHz	ASTM D150 [1]

Optical Properties:

Volume Properties/Surface Properties: Clarity: transparent to opaque. May be coloured with both deep and pastel shades [1,9]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	135°C	[1]

Flammability: Has low flammability. [1,9] Burns very slowly with a smoky flame (ASTM D635); the ash does not glow upon removal of the flame [1]

Environmental Stress: Coloured product may be faded by sunlight [1]

Chemical Stability: Resistant to weak acids [9] and organic solvents but is decomposed by alkalis and strong acids (ASTM D543) [1]. Erinoid disintegrates after immersion in olive oil at 200° [9]

Hydrolytic Stability: Erinoid is softened by boiling H_2O [9]

Biological Stability: Undergoes very slow decomposition in soil [8]

Applications/Commercial Products:

Processing & Manufacturing Routes: First synth. in 1897 by the enzyme-catalysed reaction of whey with formaldehyde. The modern process involves dry extrusion. Rennet casein (obtained by the action of rennin on fresh skimmed milk) is wetted with sufficient water to produce a hand-mouldable mass. Any desired additives may be added at this stage. The mass is extruded under pressure into rods, ribbons or tubes. The extruded product is then cured by immersion in 5% formaldehyde soln. at room temp. for a period of days or months depending upon the thickness of the extruded material. Curing may be accelerated by the addition of alum, ammonium chloride or Werner amine complex. The cured material is dried in circulating hot air. [1] Galalith may be synth. by the reaction of powdered casein with 1–4% aq. paraformaldehyde for 2–3 h. Moulding under pressure follows, with the moulded product being cured at 30–35° for 2–4 d [2]

Applications: Used to make articles of simple contour that are unharmed by minor dimensional change due to moisture absorption: in coat buttons, fountain pens, cigarette cases, umbrella handles and radio cabinets. Other applications in dress ornaments, knitting needles and poker chips

Trade name	Details	Supplier
Ameroid		American Plastics Corp.

Cellulose C-6

Related Polymers: Cellulose I, Cellulose II

Monomers: Base monomer unit glucose

Material class: Polysaccharides

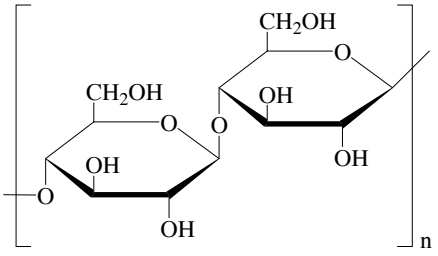
Polymer Type: cellulosics

CAS Number:

CAS Reg. No.
9004-34-6

Molecular Formula: $(C_6H_{10}O_5)_n$

Fragments: $C_6H_{10}O_5$



General Information: Cellulose is a polysaccharide polymer, containing a linear array of anhydroglucose units that are assembled into complex multi-stranded fibres and films. The polymer is the major structural component of plant cell walls and is particularly important in cells that form stems and wood. It is

also the major constit. of fibres such as cotton, flax, jute, hemp and ramie. Certain green algae and bacteria also produce the polymer. Chemical processing can rearrange the macromolecular struct. of the polymer, producing fibres such as rayon. The struct. and props. of cellulose can be described at several levels 1. The single polymer chain. 2. The arrays of multiple overlapping chains of the polymer that make elementary fibrils and microfibrils, the basic building blocks found in natural cellulose-containing structs. 3. Assemblies of microfibrils that combine to make fibrils, the intermediate building blocks in construction of components of plants, such as the framework for cell walls, the skeletons of complex structs. such as stems, wood etc. and valuable fibres such as cotton. 4. Reconstituted fibres produced commercially by re-precipitating cellulose polymer chains after solubilisation as salts of derivs.

Cellulose I C-7

Synonyms: *Natural cellulose. α-Cellulose. Cellulon*
Related Polymers: Cellulose II, Cellulose
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9004-34-6

Molecular Formula: $(C_6H_{10}O_5)_n$
Fragments: $C_6H_{10}O_5$
Molecular Weight: MW 331100 (cotton), 366100 (softwood), 339700 (hardwood). DP (of crystalline regions): 200–250 (purified cotton), 300–350 (ramie), 250–400 (unbleached sulfite wood pulp), 2000 (cotton). DP of whole fibres: 2000–14000 (cotton fibre), 9550 (bast fibres), 26500 (*Valonia*), 2000–3700 (*A. xylinium*), 8200–8450 (wood)
Additives: Flame retardants
General Information: Two different forms of crystalline Cellulose I named 1α and 1β have been recognised recently. The 1α form can be converted to 1β at high temps. in alkali. The 1β form is thought to predominate in most fibre and wood celluloses of commercial importance. Main component of higher plant cell walls. Also found in some bacteria, algae, fungi and tunicates. Secondary cell walls of fibres such as cotton are >90% cellulose, while in bast fibres it is *ca.* 70% and in woods the content is *ca.* 40–50%. Cellulose is the most abundant, continually synthesised chemical on earth, wth *ca.* 8×10^{10} t/yr produced and degraded. Pulping and processing gives the rearranged polymer, Cellulose II
Morphology: Degree of crystallinity: cotton 82–87% (acid hydrol.), 70% (X-ray), 60% (density), 60% (deuterium exchange), 72% (formylation); Ramie 95% (acid hydrol.), 70% (X-ray), 60% (density); wood pulp 65% (X-ray), 65% (density), 45–50% (deuterium exchange), 53–65% (formylation). A struct. based on a modified two-phase (crystalline-amorph.) model has been reported [27]
Miscellaneous: Crystalline average length: 144 nm (cotton), 120 nm (ramie), 153 nm (wood); width: 50 nm (cotton), 35 nm (ramie), 37 nm (wood); thickness 64 nm (cotton), 40 nm (ramie), 45 nm (wood)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.59–1.63 g/cm^3	crystalline, x-ray detn.
2	d 1.482–1.489 g/cm^3	amorph. x-ray detn. [1]
3	d 1.582–1.63 g/cm^3	[11]
4	d 1.545–1.585 g/cm^3	cotton [11]
5	d 1.55 g/cm^3	ramie [11]
6	d 1.535–1.547 g/cm^3	wood pulps [11,22]

Thermodynamic Properties General: Heat of combustion 17.43 kJ kg^{-1} K^{-1} (cotton) [1,4]. Heat of crystallisation 121.8 kJ kg^{-1} [11]
Thermal Conductivity:

No.	Value	Note
1	0.071 W/mK	cotton, density 0.5 g cm^{-1} [11]
2	0.029–0.17 W/mK	papers, various [11]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.214–1.357 kJ/kg.C	cotton [4]	P
2	1.365 kJ/kg.C	ramie [4]	P
3	1.327–1.353 kJ/kg.C	hemp [4]	P

Glass-Transition Temperature:

No.	Value	Note
1	220–245°C	[11]
2	243–433°C	[11]

Transition Temperature:

No.	Value	Note
1	>290°C	min. Ignition temp. [1]
2	475°C	Cotton [4]
3	19–23°C	Secondary transition temp. [13]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. DMF, chloral, pyridine, [7], conc. mineral acids (with degradation) [1], inorganic salts (e.g. $ZnCl_2$, LiCl, $Ca(SCN)_2$), strong alkalis, metal complexes (e.g. $[Cu(NH_3)_4](OH)_2$ (Cuoxam), $[Cd(en)_3](OH)_2$, (Cadoxen)) [11]. Swollen by: liq. NH_3, hydrazine [11]. Liq. cryst. with *N*-methylmorpholine-*N*-oxide [15]

Surface Tension:

No.	Value	Note
1	42 mN/m	20% cotton [17]
2	36–42 mN/m	20°, wood pulp [17]

Transport Properties:

Water Absorption:

No.	Value	Note
1	7–8 %	cotton [16]
2	0.6–11.7 %	amorph. cellulose, 11–97% relative humidity [16]
3	8–14 %	cellulose, 20°, 60% relative humidity [21]

Mechanical Properties:

Mechanical Properties General: Moduli of rigidity have been reported [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	900 MPa	dry, ramie [1]	2.3%
2	1060 MPa	wet, ramie [1]	2.4%
3	200–800 MPa	dry, cotton [1]	12–16%
4	200–800 MPa	wet, cotton [1]	6–13%
5	824 MPa	dry, flax [1]	1.8%
6	863 MPa	wet, flax [1]	2.2%

Elastic Modulus:

No.	Value	Note
1	78–108 MPa	flax [1]
2	59–78 MPa	hemp
3	48–69 MPa	ramie [1]

Electrical Properties:

Electrical Properties General: Insulating value 500 kV cm^{-1} [10]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	1.67	10 kHz	25°, cotton linters [4]
2	2.86	200 kHz	25°, cotton cellulose [4]
3	2.42	10 MHz	25°, cotton cellulose [4]
4	2.2–2.3		pulp sheets [1]
5	5.7		crystalline portions [1]

Dielectric Strength:

No.	Value	Note
1	50 $kV.mm^{-1}$	Native cellulose fibre [11]
2	30–50 $kV.mm^{-1}$	50Hz, cellophane [4]
3	7.7–9.2 $kV.mm^{-1}$	50Hz, insulating paper [11]

Strong Field Phenomena General: Zeta potential 21.1mV (cotton), 18mV (unbleached sulfite pulp, water), 9mV (unbleached sulfite pulp, 20°, water) [11]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.02	1 kHz	20° [11]
2	0.07	100 MHz	20° [11]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.618	parallel to fibre axis, cellulose 1 [11]
2	1.544	perpendicular to fibre axis cellulose 1 [11]
3	1.576–1.595	parallel, cotton [11,14]
4	1.527–1.534	perpendicular, cotton [11,14]
5	1.595–1.601	parallel, ramie
6	1.525–1.534	perpendicular, ramie [11,14]

Polymer Stability:

Thermal Stability General: Decomposition temp. 200–270° [11], 150° (cotton) [12]

Decomposition Details: Decomposes at 250–397° giving H_2O, CO_2, CO and tar. Major tar component is laevoglucosan [9]

Flammability: Fl. p. 361° (cotton) [4]. Limiting Oxygen Index 18.4 % [11]. Mechanism of pyrolysis and the use of flame retardants have been reported [28]

Hydrolytic Stability: Susceptible to acid hydrol., with amorph. regions reacting faster than crystalline sections. In alkali the polymer dissolves at elevated temps. undergoing depolymerisation by β-elimination of H_2O

Biological Stability: Degraded by cellulases prod. by bacteria such as *Trichoderma* sp.

Applications/Commercial Products:

Trade name	Details	Supplier
Cellulon	Bacterial cellulose	Weyerhauses

2	1.776 kJ/kg.C	isotopic rayon [1]	p
3	1.403 kJ/kg.C	oriented rayon [1]	p
4	1.357–1.595 kJ/kg.C	viscose [19]	P

Melting Temperature:

No.	Value	Note
1	235–245°C	[3]

Transition Temperature:

No.	Value	Note
1	450°C	Ignition temp. (rayon) [1]
2	350–420°C	[17]
3	-20°C	Secondary transition temp. [23]
4	15°C	Secondary transition temp. [23]

Surface Properties & Solubility:

Solubility Properties General: Solubility: 20–30% (6.5% NaOH soln. 20°, viscose) [1]
Solvents/Non-solvents: Sol. DMF, chloral, pyridine, conc. mineral acids (with hydrolytic degradation), inorganic salts (e.g. $ZnCl_2$, LiCl, $Ca(SCN)_2$), strong alkalis, metal complexes (e.g. $[Cu(NH_3)_4](OH)_2$ (Cuoxam), $[Cd(en)_3](OH)_2$, (Cadoxen)) [19,27]. Swollen by H_2O liq. NH_3, hydrazine [19], alkylamines. Liq. cryst. formed with: *N*-methylmorpholine-*N*-oxide, [26], dimethyl acetamide/LiCl [25]
Surface Tension:

No.	Value	Note
1	45.4 mN/m	20°, polarity 0.344, cellophane [19]

Transport Properties:

Polymer Solutions Dilute: Viscosity ranges in water: 20 000 mPa s (1%, type HH, 25°, ASTM 2364), 10 000 mPa s (2%, type M, 25°, ASTM 2364), 200 mPa s (5%, type L, 25°, ASTM 2364) [3]
Permeability of Gases: Gas permeability of cellophane at 25° [He] 0.005 $\times$ 10^{-10} cm^2 (5.cm Hg)$^{-1}$), [N_2] 0.0032 $\times$ 10^{-10}, [H_2] 0.0065 $\times$ 10^{-10}, [O_2] 0.0021 $\times$ 10^{-10}, [CO_2] 0.0047 $\times$ 10^{-10}, [H_2O] 1900 $\times$ 10^{-10}.
Permeability and Diffusion General: Gas and liq. permeabilities have been reported [14]
Water Content: Water retention 90–110% (regular rayon); 60–70% (polynosic rayon); 60–80% (HWM rayon); 130% (viloft); 100% (viscose) [16]

Water Absorption:

No.	Value	Note
1	11–13 %	24°, 65% relative humidity, rayon [16]
2	1–11 %	9–100%, relative humidity,viscose fibre [19]
3	45–115 %	cellophane [34]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	7239 MPa	extrapolated [12]

Tensile Strength Break:

No.	Value	Note	Elongation
1	200–400 MPa	dry [1]	8–26%
2	100–200 MPa	wet [1]	13–43%
3	610 MPa	oriented viscose, dry [2,4]	19%
4	520 MPa	oriented viscose, wet [2,4]	9%
5	80 MPa	cellophane [34]	30%

Elastic Modulus:

No.	Value	Note
1	33000 MPa	oriented rayon [2,4]
2	80000 MPa	mercerised ramie [2]

Miscellaneous Moduli:

No.	Value	Note
1	1100 MPa	calc. modulus of rigidity, Fortisan H [3]
2	70000–90000 MPa	7–9 × 10^{11} dyne cm^{-2} Fortisan H [13]

Impact Strength: 35–58 J m^{-1} (cellophane) [34]
Mechanical Properties Miscellaneous: Relative wet/dry strength 50% (viscose) [4], 86% (high, oriented viscose) [4]
Failure Properties General: Strength lost 150° (rayon) [16]. Tear strength 0.8–8 N mm^{-2} (cellophane) [34]. Burst strength (Mullen) 30–50 [34]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.67	1 kHz	[1]
2	2.2–2.7		paper [19]
3	7.3	10 kHz	25°, cellophane [30]
4	4.04	3000 MHz	cellophane [30]
5	3.5	100 kHz	0% relative humidity, viscose
6	8.4	1 kHz	65% relative humidity, viscose [20,19]

Dielectric Strength:

No.	Value	Note
1	79.99 kV.mm^{-1}	Cellophane [36]

Strong Field Phenomena General: Zeta potential: 30mV (filter paper) [33], 26mV (viscose rayon), $NaBH_4$-reduced sample, water) [19]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0026–0.0028		30°, 0.006–0.18% water, Kraft paper [31]
2	0.009	60 Hz	cellophane [32]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.58	Parallel to fibre axis [15,19]
2	1.52	Perpendicular to fibre axis [15,19]
3	1.529–1.547	Parallel, viscose fibres [19,24]
4	1.512–1.52	Perpendicular viscose fibres [19,24]

Total Internal Reflection: Birefringence (by refractive index) 0.018 (regular viscose); 0.036–0.057 (high tenacity rayon); 1.040–1.045 (polynosic rayon) [2]
Volume Properties/Surface Properties: Haze 3.5% (cellophane) [34]

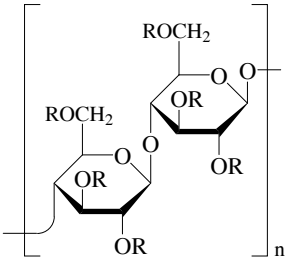
Polymer Stability:

Polymer Stability General: Crosslinking of cellulose chains is important for production of crease-resistant and crease-retaining materials. This process also prevents swelling of the polymer in alkali and hence reduces degradation
Thermal Stability General: Decompostion temp. 175–240° (rayon) [16], 180° (viscose) [20]. Minimum use temp. -17° (cellophane) [34]
Upper Use Temperature:

No.	Value	Note
1	177°C	cellophane [34]

Decomposition Details: Limiting oxygen index 19 % [17], 19.7 % [19]. Heat of combustion 18 J kg^{-1} [17]
Flammability: Ignition temp. 450° (rayon) [1]. Fl. p. 322° (rayon) [1]

Applications/Commercial Products:



Processing & Manufacturing Routes: Cellulose from trees is obtained by pulping (high-grade material is from spruce and eucalyptus). Pulp is dissolved in sodium hydroxide soln. and the alkali-cellulose converted to cellulose xanthate (CS_2). The resulting syrup is extruded into a soln. of sulfuric acid. Filaments are spun into a continuous tow, which can be cut to produce staple fibre
Applications: Textiles: woven and knitted fabrics, blends with polyesters, wool, mohair and silk, used in knitting yarns, furnishings and upholstery. Stitch-bonded non-wovens in drapes, ticking, cloth and footwear. Needle-punched non-wovens in blankets and wall/floor coverings. Medical and hygiene uses as dressings, swabs and sanitary towels. Drylaid non-wovens: wipes, interlinings, filters. Wetlaid non-wovens: food casings, apparel. Flock: wall coverings, apparel, shoes, packaging

Cellulose acetate C-9

R = Ac, H

Synonyms: *Acetate*
Related Polymers: Cellulose II, Cellulose acetate propionate, Cellulose acetate butyrate, Cellulose triacetate
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics
CAS Number:

CAS Reg. No.
9004-35-7

Molecular Formula: $(C_{11\text{-}12}H_{15\text{-}16}O_{7.5\text{-}8})_n$
General Information: Thermoplastic polymer with excellent optical props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.28 g/cm^3	[1]
2	d 1.3–1.31 g/cm^3	[2]
3	d 1.26 g/cm^3	varies with degree of acetylation [8]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001–0.00015 K^{-1}	sheet [3]	L
2	8×10^{-5}–0.00018 K^{-1}	mould [3]	L
3	0.00014 K^{-1}	[4]	L
4	0.00012 K^{-1}	ASTM D696 [8]	L

Thermodynamic Properties General: Heat of combustion 17179 kJ kg^{-1}
Thermal Conductivity:

No.	Value	Note
1	0.17–0.34 W/mK	[3,8]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.26–1.67 kJ/kg.C	23°, ASTM C177 [8]	P
2	1.26–2.09 kJ/kg.C	sheet [1,9]	P
3	1.26–1.76 kJ/kg.C	moulding [1,9]	P

Melting Temperature:

No.	Value	Note
1	230°C	[3]
2	235–255°C	[2]

Deflection Temperature:

No.	Value	Note
1	49–98°C	0.455 MPa
2	44–91°C	1.82 MPa, moulding [3]
3	61°C	0.0383 Mpa
4	72°C	0.0096 MPa, ASTM D648 [4]
5	70°C	0.0455 MPa
6	57°C	1.82 MPa, ASTM D648 [8]
7	55–118°C	0.455 MPa, ASTM D648 [1]
8	44–113°C	1.82 MPa, ASTM D648 [1]

Vicat Softening Point:

No.	Value	Note
1	70°C	[5]

Surface Properties & Solubility:

Plasticisers: Diglycerol ethers
Solvents/Non-solvents: Sol. ketones, esters and alcohols (ASTM D543) [5]. Liq. cryst. trifluoroacetic acid/CH_2Cl_2
Surface Tension:

No.	Value	Note
1	45.9 mN/m	20°, polarity 0.296 [13,14]

Transport Properties:

Water Absorption:

No.	Value	Note
1	3–8.5 %	[2]

Gas Permeability:

No.	Gas	Value	Note
1	He	893 cm^3 mm/(m^2 day atm)	13.6 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [3]
2	N_2	18.4 cm^3 mm/(m^2 day atm)	0.28 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 30° [3]
3	H_2	229.8 cm^3 mm/(m^2 day atm)	3.5 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20° [3]
4	O_2	51.2 cm^3 mm/(m^2 day atm)	0.78 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20° [3]
5	H_2O	361163 cm^3 mm/(m^2 day atm)	5500 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20° [3]
6	H_2S	229.8 cm^3 mm/(m^2 day atm)	3.5 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 30° [3]
7	Ethylene oxide	1116.3 cm^3 mm/(m^2 day atm)	17 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 0° [3]
8	Bromomethane	446.5 cm^3 mm/(m^2 day atm)	6.8 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 60° [3]
9	C_6H_6	33621 cm^3 mm/(m^2 day atm)	512 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35° [3]
10	Hexane	183.9 cm^3 mm/(m^2 day atm)	2.8 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35° [3]
11	CCl_4	245.6 cm^3 mm/(m^2 day atm)	3.74 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35° [3]
12	EtOH	195685 cm^3 mm/(m^2 day atm)	2980 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35° [3]
13	EtOAc	236069 cm^3 mm/(m^2 day atm)	3595 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35° [3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2174 MPa	ASTM D638 [4]
2	2800–3000 MPa	2.8–3 × 10^{10} dyne cm^{-2}, DS 1.87–2.99 [6]

Flexural Modulus:

No.	Value	Note
1	1749 MPa	ASTM D790 [4]
2	1449 MPa	ASTM D790 [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	13.5–58.6 MPa	23°, ASTM D638 [1,9]	
2	5.5–41.4 MPa	70°, ASTM D638 [1,9]	50–56%
3	75 MPa	film [2]	15–55%

Elastic Modulus:

No.	Value	Note
1	620.7–1793 MPa	ASTM D790 [1,9]
2	1310 MPa	ASTM D790 [8]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	13.8–48.3 MPa		73°, ASTM D638 [1,9]
2	15.2–51 MPa		sheet [3]
3	28.3–52.4 MPa		mould [3]
4	22.8 MPa	30%	ASTM D638 [8]

Flexural Strength Yield:

No.	Value	Note
1	13.8–110.3 MPa	ASTM D790 [1,10]
2	33.1 MPa	ASTM D790 [8]
3	41–68.9 MPa	sheet [3]
4	13.8–110 MPa	mould [3]

Compressive Strength:

No.	Value	Note
1	13.1–64.1 MPa	ASTM D695 [1,10]

Hardness: Rockwell R39–R120 (ASTM D785) [1], R100–R123 (moulding) [3], R85–R120 (sheeting) [3], R82 (ASTM D785) [4]
Failure Properties General: Deformation under load 40–1% (13.79 MPa), 15–1% (6.9 MPa, ASTM D621) [1]. Tear strength 1.6–3.9 N mm^{-1} (film) [2]. Burst strength (Mullen) 30-60 [2]
Izod Notch:

No.	Value	Notch	Note
1	132.7–136.6 J/m	N	23°, ASTM D256 [1,9]
2	1.9–14.3 J/m	N	-40°, ASTM D758 [1,9]
3	107–454 J/m	N	23°, sheet [3]
4	53–214 J/m	N	23°, mould [3]
5	235 J/m	Y	23°, ASTM D256 [8]
6	59 J/m	Y	-40°, ASTM D256 [8]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
3	0.68×10^{15} Ω.cm	ASTM D257 [8]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.2–7	1 MHz	ASTM D150 [5]
2	3.4–7.4	60 Hz	sheet [3]
3	3.2–7	1 MHz	sheet [3]
4	3.5–7.5	60 Hz	mould [3]
5	3.2–7	1 MHz	mould [3]
6	3.5	1 MHz	ASTM D150 [8]

Dielectric Strength:

No.	Value	Note
1	0.25–0.365 $kV.mm^{-1}$	0.125 cm thick [1,9]
2	13.4 $kV.mm^{-1}$	ASTM D149 [4]
3	11–24 $kV.mm^{-1}$	sheet [3]
4	9–24 $kV.mm^{-1}$	mould [3]
5	14.5 $kV.mm^{-1}$	ASTM D149 [8]
6	126–197 $kV.mm^{-1}$	sheet [2]

Complex Permittivity and Electroactive Polymers: Zeta potential 52 mV (cellulose acetate fibre, H_2O) [12]

Optical Properties:

Optical Properties General: Uv light screening >99% absorbed (ASTM E308) [8]
Refractive Index:

No.	Value	Note
1	1.46–1.5	25°, ASTM D542 [1,9]
2	1.49–1.5	sheet [3]
3	1.46–1.5	mould [3]
4	1.46–1.49	ASTM D542 [8]

Total Internal Reflection: $[\alpha]_D^{20}$ +12.6 (MeCN), +5.15 (Me_2CO), -10 (dioxan), -26 (pyridine) [7]
Volume Properties/Surface Properties: Light transmittance 88% (sheet) [3], >90% (sheet, 1.52 mm thick, ASTM E308) [8]. Haze <1% (sheet) [3]. Haze <8.5% (sheet, 1.52 mm thick, ASTM D1003) [8]

Polymer Stability:

Polymer Stability General: Aq. potassium or calcium iodide stabilises the polymer against thermal degradation and discoloration during processing
Upper Use Temperature:

No.	Value	Note
1	79°C	film [2]
2	-26°C	film [2]

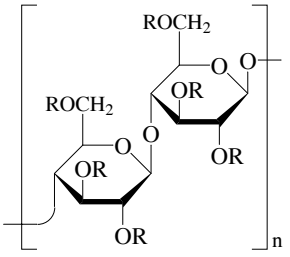
Decomposition Details: Weight loss in accelerated ageing of 0.4–12.0% (82°, 72h, ASTM D706) [1,2]
Flammability: 1.27–5.08 cm min^{-1} (ASTM D635) [1]
Chemical Stability: Stable to chlorine bleach and to dilute acids and alkalis. Decomposed by strong mineral acids and alkalis, particularly at higher temps. [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Cellulose fibres (or cellulose dissolved in *N*,*N*-dimethylacetamide-LiCl) is treated with Ac_2O in AcOH, using sulfuric acid as catalyst. Water is added to terminate the reaction. Partial hydrol. of acetyl groups can also be achieved to give a range of products. The product is collected by precipitation into water or dil. AcOH
Mould Shrinkage (%):

No.	Value	Note
1	0.2–0.6%	ASTM D955

Applications: Fibres, films, plastics, liquid crystals, cigarette filters, packaging



Trade name	Supplier

Cellulose acetate butyrate C-10

R = Ac, $CH_2CH_2CH_2CH_3$

Related Polymers: Cellulose II, Cellulose acetate, Cellulose acetate propionate
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics
CAS Number:

CAS Reg. No.
9004-36-8

General Information: Composition by weight: Ac 13–15%, Butyrate 36–38%, H 1–2%. Commercial grades: Ac 6–29.5%, Butyrate 17–48%, H 1–2.5%. Commercial grades (lacquers, plastics and coatings): Degree of substitution Ac: Bu: H = 0.5–2.1: 0.7–2.3: 0.2–0.5

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15–1.22 g/cm^3	ASTM D792 [1]
2	d 1.19 g/cm^3	ASTM D792 [2,5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00011–0.00016 K^{-1}	ASTM D696 [1]	L
2	0.00012 K^{-1}	ASTM D696 [5]	L

Equation of State: Equation of state information has been reported [9]
Thermal Conductivity:

No.	Value	Note
1	0.16–0.33 W/mK	ASTM C177 [1,6]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.2–1.6 kJ/kg.C	ASTM C177 [1,6]	P

Melting Temperature:

No.	Value	Note
1	140°C	[4]

Deflection Temperature:

No.	Value	Note
1	65°C	0.038 MPa [2]
2	72°C	0.0096 MPa, ASTM D648 [2]
3	74°C	1.82 MPa [5]
4	85°C	0.455 MPa, ASTM D648 [5]
5	59.5–112°C	0.455 MPa [1]
6	50–99°C	1.82 MPa, ASTM D648 [1]

Vicat Softening Point:

No.	Value	Note
1	70°C	[6]

Surface Properties & Solubility:

Solubility Properties General: Compatible with polyester, acrylic, vinyl and alkyd resins [1]
Solvents/Non-solvents: Sol. ketones, esters and alcohols (ASTM D543) [6]
Surface Tension:

No.	Value	Note
1	34 mN/m	20° [10,11]

Transport Properties:

Water Absorption:

No.	Value	Note
1	1–4 %	24h, ASTM D570 [1]
2	1.5 %	24h, ASTM D570 [2]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	320.7 cm^3 mm/(m^2 day atm)	4.61 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [7]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1725 MPa	ASTM D638 [2]

Flexural Modulus:

No.	Value	Note
1	482.8–1379 MPa	ASTM D790 [1]
2	1449 MPa	ASTM D790 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	13.8–51.7 MPa	23°, ASTM D638 [1,3]	
2	8.3–39.3 MPa	70°, ASTM D638 [1,3]	
3	34.5 MPa	ASTM D638 [2]	50%

Elastic Modulus:

No.	Value	Note
1	1379 MPa	ASTM D790 [5]

Tensile Strength Yield:

No.	Value	Note
1	10.3–48.3 MPa	73°, ASTM D638 [1,3]

Flexural Strength Yield:

No.	Value	Note
1	10.3–64.1 MPa	ASTM D790 [1,3]
2	27.6–62 MPa	sheet [4]
3	12.4–64.1 MPa	moulding [4]

Compressive Strength:

No.	Value	Note
1	7.6–52.4 MPa	ASTM D695 [1,3]

Hardness: Rockwell 29–117 (ASTM D785) [1]. Rockwell R75 (ASTM D785) [2]
Failure Properties General: Deformation under load 40–1% (13.79 MPa), 15–1% (6.9 MPa, ASTM D621) [1]
Izod Notch:

No.	Value	Notch	Note
1	187 J/m	Y	ASTM D256 [2]
2	133–288 J/m	Y	23°, sheet [4]
3	53–582 J/m	Y	23°, moulding [4]
4	240 J/m	Y	23°, ASTM D256 [5]
5	96 J/m	Y	-40°, ASTM D256 [5]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	14×10^{15} Ω.cm	ASTM D257 [5]	S

Dielectric Strength:

No.	Value	Note
1	0.25–0.4 $kV.mm^{-1}$	0.125 cm thick, ASTM D149 [1,3]
2	16.6 $kV.mm^{-1}$	ASTM D149 [5]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.46–1.49	25°, ASTM D542 [1,3]

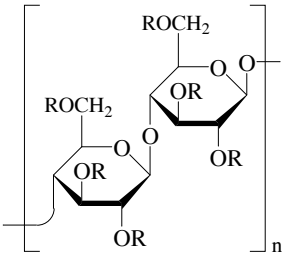
Volume Properties/Surface Properties: Light transmittance >90% (sheet, 1.52 mm thick, ASTM E308) [5]. Haze <8.5% (sheet, 1.52 mm thick, ASTM D1003) [5]

Polymer Stability:

Decomposition Details: Weight loss in accelerated ageing of 0.1–4.0% at 82° over 72h (ASTM D706) [1]
Flammability: 1.27–3.81 cm mm^{-1} (ASTM D635) [1,3]
Chemical Stability: Decomposed by strong acids and alkalis; slightly decomposed by weak acids and alkalis (ASTM D543) [6]

Applications/Commercial Products:

Mould Shrinkage (%):



No.	Value	Note
1	0.2–0.4%	ASTM D955

Cellulose acetate propionate C-11

R = Ac, $CH_2CH_2CH_3$

Related Polymers: Cellulose acetate, Cellulose II
Monomers: Base monomer unit glucose
Material class: Lyotropic, Polysaccharides

Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9004-39-1

General Information: Composition by weight Ac 1.5–3.5%; propionate 43–47%; H 2–3% (commercial grades)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.17–1.24 g/cm^3	[4]
2	d 1.19 g/cm^3	[3]
3	d 1.19–1.23 g/cm^3	ASTM D792 [2,6]
4	d 1.2 g/cm^3	ASTM D792 [5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00012–0.00016 K^{-1}	ASTM D696 [2,6]	L
2	0.00011 K^{-1}	ASTM D696 [5]	L

Thermal Conductivity:

No.	Value	Note
1	0.16–0.33 W/mK	ASTM C177 [2,6]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.2–1.6 kJ/kg.C	[2,6]	P

Melting Temperature:

No.	Value	Note
1	190°C	[4]

Deflection Temperature:

No.	Value	Note
1	72°C	0.038 MPa [3]
2	80°C	0.0096 MPa, ASTM D648 [3]
3	75°C	1.82 MPa [5]
4	83°C	0.455 MPa, ASTM D648 [5]

Vicat Softening Point:

No.	Value	Note
1	100°C	ASTM D1525 [3]

Transport Properties:

Water Absorption:

No.	Value	Note
1	1.3 %	24h, ASTM D570 [3]
2	1–3 %	24h, ASTM D570 [2,6]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	414–1480 MPa	[4]
2	1725 MPa	ASTM D638 [3]

Flexural Modulus:

No.	Value	Note
1	689.7–1931 MPa	ASTM D790 [2,6]
2	1449 MPa	ASTM D790 [3,5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	35 MPa	ASTM D638 [3]	60%
2	13.8–51.7 MPa	23°, ASTM D638 [2,6]	
3	6.7–44.8 MPa	70°, ASTM D638 [2,6]	

Tensile Strength Yield:

No.	Value	Note

Cellulose nitrate C-12

R = ONO_2

Synonyms: *Nitrocellulose. Collodion cotton. Collodion wool. Colloxylin. Celloidin. Gun cotton. Pyrocellulose. Celluloid*
Related Polymers: Cellulose I, Cellulose II
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics
CAS Number:

CAS Reg. No.	Note
9004-70-0	Cellulose nitrate
8050-88-2	Celluloid

Molecular Weight: Trinitrate unit molar mass 297. Dinitrate unit molar mass 252. Mononitrate unit molar mass 207. MW 630000, M_n 6900
Additives: H_2O, EtOH, isopropanol, butanol as damping agents
Identification: Trinitrate Nitrogen content 14.14%. Dinitrate Nitrogen content 11.12%. Pyrocellulose Nitrogen content 12.6 ± 0.10%. Gun cotton Nitrogen content >13.35%

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

Transition Temperature:

No.	Value	Note	Type
1	155–220°C	[1]	Parr softening point

Surface Properties & Solubility:

Solubility Properties General: Compatible with most resins and plasticisers, but incompatible with waxes and tars. Also compatible with ethyl cellulose, cellulose acetate and ethylhydroxyethyl cellulose [1]. Wide compatibility with adipates, phthalates, phosphates and vegetable oils [11]
Plasticisers: Dibutyl phthalate, tricresyl phosphate
Solvents/Non-solvents: Sol. esters, ketones, Et_2O/EtOH mixtures [1]
Surface Tension:

No.	Value	Note
1	38 mN/m	20° [7,8]

Transport Properties:

Water Absorption:

No.	Value	Note
1	1 %	24h, 21°, 80% relative humidity [1]

Gas Permeability:

No.	Gas	Value	Note
1	He	453 cm^3 mm/(m^2 day atm)	6.9 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [4]
2	N_2	7.87 cm^3 mm/(m^2 day atm)	0.12 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [4]
3	H_2	131.3 cm^3 mm/(m^2 day atm)	2 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20° [4]
4	O_2	128 cm^3 mm/(m^2 day atm)	1.95 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [4]
5	CO_2	139.2 cm^3 mm/(m^2 day atm)	2.12 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [4]

8	H_2O	413039 cm^3 mm/(m^2 day atm)	6290 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [4]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1310–1520 MPa	[4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	62–110.3 MPa	23°, 50% relative humidity [1]	13–14%
2	48.3–55.2 MPa	[4]	40–45%

Hardness: Sward 90% of glass [1]. Rockwell R95–R115 [4]

Electrical Properties:

Electrical Properties General: Specific resistance 10^{11}–10^{12} Ω cm [11]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	7–7.5	60 Hz	25–30° [6]
2	7	1 kHz	25–30° [1]
3	6	1 MHz	25–30° [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.09–0.12	50–60 Hz	[11]
2	0.06–0.09	1 MHz	[11]

Optical Properties:

Refractive Index:

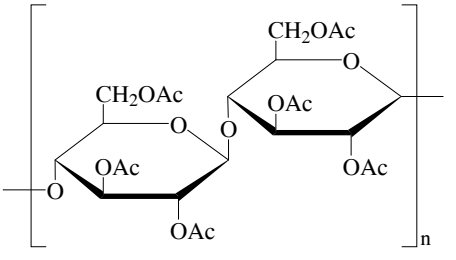
No.	Value	Note
1	1.51	[1]
2	1.49–1.51	[4]

Volume Properties/Surface Properties: Lower limit of substantially complete transmission 313 nm [1]

Polymer Stability:

Flammability: Fl. p. 13° [5]. Autoignition temp. 160–170° [5]
Chemical Stability: Has excellent resistance to water, hydrocarbons and mineral oils, and good resistance to aromatic hydrocarbons but has poor resistance to strong acids and alkalis [1]

Applications/Commercial Products:



Processing & Manufacturing Routes: Batch process using nitric acid and 2–5% sulfuric acid as catalyst. The reaction mixture is poured into water, washed and centrifuged
Applications: Lacquers and coatings

Trade name	Supplier
Walsroder Nitrocellulose	Wolff
	Hercules
	SNPE (France)
	ICI, UK

Cellulose triacetate C-13

Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics

CAS Number:

CAS Reg. No.
9012-09-3

Molecular Formula: $(C_{12}H_{16}O_8)_n$
Fragments: $C_{12}H_{16}O_8$
Molecular Weight: DP 300 (fibres). Degree of substitution ≥ 2.8

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.27–1.29 g/cm^3	[1]
2	d 1.3 g/cm^3	fibres [1]

Thermodynamic Properties General: Heat of combustion 17598 kJ kg^{-1} [7]
Melting Temperature:

No.	Value	Note
1	265–295°C	[3]

Glass-Transition Temperature:

No.	Value	Note
1	49–478°C	[9]

Transition Temperature:

No.	Value	Note	Type
1	310–315°C	[1]	Decomposition temp.
2	195°C	[4]	Crystalline rearrangement
3	130°C	in steam [4]	Crystalline rearrangement

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. CH_2Cl_2, formic acid, glacial AcOH. Slightly sol. dioxan, Me_2CO. Insol. hydrocarbons, C_6H_6, toluene, CCl_4, tetrachloroethene [4]. Liq. crystal sol. trifluoroacetic acid/water [8]. Swollen by H_2O [1], dichloroethene, trichloroethene [4]

Transport Properties:

Water Content: Water retention capacity 16–17% [1], 10% (after heat setting) [4]
Water Absorption:

No.	Value	Note
1	4–4.5 %	20°, 65% relative humidity [1]
2	2.5 %	after heat setting [4]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	137.39–245.2 MPa	14–25 kg mm^{-2}, fibres [1]	
2	117.78–235.3 MPa	12–24 kg mm^{-2}, foil, longitudinal [1]	
3	98.1–117.7 MPa	10–12 kg mm^{-2}, foil, transverse [1]	
4	86 MPa		10–50% elongation [10]

Viscoelastic Behaviour: Viscoelastic behaviour has been reported [3]
Failure Properties General: Tear strength 1.6–11.8 N mm^{-1} [10]. Burst strength (Mullen) 50–70 [10]

Electrical Properties:

Electrical Properties General: Specific resistance 10^{13}–10^{15} Ω cm [1]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3–4.5	50–60 Hz	[1]
2	4		[10]

Dielectric Strength:

No.	Value	Note
1	1.46 kV.mm^{-1}	[10]

Complex Permittivity and Electroactive Polymers: Zeta potential 37 mV (H_2O) [9]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.01–0.02	50–60 Hz	[1]
2	0.016		[10]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.469	fibres, along axis [1]
2	1.472	fibres, transverse to axis [1]

Total Internal Reflection: $[\alpha]_D$ -22.5 ($CHCl_3$) [2]. Double refraction -0.003 [1]
Volume Properties/Surface Properties: Appearance yellowish flakes [2]

Polymer Stability:

Thermal Stability General: Crystallinity increases after heating at 240° for 1 min. [6]
Upper Use Temperature:

No.	Value	Note
1	175°C	[10]

Decomposition Details: Thermal decomposition range 230–320°. Decomposes to give gaseous products together with acetylated derivatives of D-glucose [5]
Chemical Stability: Fibres are resistant to slightly acid/alkaline conditions at ambient temp. Resistant to chlorine bleaches. Decomposed by strong mineral acids [6]
Biological Stability: Resistant to microorganisms (similar to polyesters and nylon) [6]

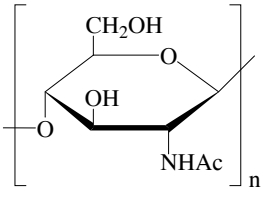
Chicle C-14

Related Polymers: *cis*-1,4-Polyisoprene, *trans*-1,4-Polyisoprene, Jelutong, Balata, Gutta-percha
Monomers: 2-Methyl-1,3-butadiene
Material class: Thermoplastic, Gums and resins
Polymer Type: polybutadiene
Molecular Weight: MW and MW distribution have been determined for chicle and related polymers. M_n 91000 (*cis*), M_n 16000 (*trans*)
Additives: Contains large amounts of resin, (75–80%) starch, salts, sugars and ethers
General Information: Contains both *cis* and *trans* polyisoprene in a ratio of 1:3 [7,8]. Is gummy rather than hard and rubbery due to low MW
Miscellaneous: Physical and chemical props. have been reported [2,3]. The occurrence, location, props. and biosynth. of natural isoprene polymers, including chicle, have been reported [9]

Optical Properties:

Transmission and Spectra: Nmr spectra for chicle have been analysed, revealing structural details [4,5,6] including terminal OH groups



Applications/Commercial Products:

Processing & Manufacturing Routes: Isol. from *Achras sapota* [9]
Applications: Used in chewing gum

Chitin C-15

Synonyms: *Poly[(1→4)-β-2-acetamido-2-deoxy-D-glucose]. Poliglusam*
Related Polymers: Chitosan
Monomers: Base monomer unit 2-acetamido-2-deoxyglucose
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.
1398-61-4
26023-36-9

Molecular Formula: $(C_8H_{13}NO_5)_n$
Fragments: $C_8H_{13}NO_5$
Molecular Weight: MW 1000000–2000000 [9]
General Information: A white, amorph., translucent solid. Chitin is estimated to be the world's second most abundant natural polymer after cellulose. It is a linear polymer predominantly made of (1,4)-β linked 2-acetamido-2-deoxy-D-glucose (*N*-acetyl glucosamine), though approx. one amine moiety in six appears to be unacetylated. Chitin does not usually occur as a pure polymer but is generally associated with proteins, in what is thought to be a non-covalent interaction that may involve the free amine groups. It is found in this form in many species of fungi, algae, protozoa, bryozoa, molluscs and arthropods. In the hard cuticle of insects the polymer can comprise 30–45% of the total mass. In a few instances, such as the spines of certain diatoms, chitin does appear to occur as a pure, crystalline polymer. Here the polymer appears to be fully acetylated [1]
Morphology: Analysis of the assembly of chitin polymer chains in insect cuticle shows that they form microfibrils, which are of almost uniform size within particular samples but which vary widely between species. Microfibril diameters can vary from 2.5 nm [2] to 300 nm [3]. A survey of thirteen arthropod species gave an average microfibril diameter of 2.8 nm [2], suggesting that each microfibril contains eighteen chitin chains arranged in three sheets, though this interpretation may underestimate the dimensions [4]. The microfibrils form lamellae which build up in around five layers to make the thin insect epicuticle which is $<1\mu m$ thick. Chitin is isolated by removal of associated protein with dilute alkali. Purified chitin is generally fibrous in appearance but contains crystalline regions that have been found in three forms: α-, β- and γ-. In the most stable α-form, found in insect cuticle, chains are aligned in an antiparallel array [5]. The β-form contains chains arranged in a parallel array [6]. For the γ-form, it has been suggested that a unit contains two parallel chains and one antiparallel chain, [7] though this interpretation has been challenged. A distorted form of one of the α- or β- forms may be involved [8]. The α-chains are assembled via three-dimensional hydrogen bonding. This permits formation of long fibrils of high tensile strength, which do not swell in water. β Crystallites appear to contain mainly two-dimensional hydrogen bonds, allowing them to absorb water and form crystalline hydrates. Treatment with cold 6M hydrochloric acid is reported to convert this form to the α-form [7]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. concentrated mineral acids [15] including formic acid, dichloroacetic acid and trichloroacetic acid [11]. Sol. in concentrated solutions of salts such as lithium thiocyanate, lithium chloride/*N*-methylpyrrolidinone etc. [14]. α-Chitin dissolves in ≥98% formic acid. β-Chitin dissolves slowly in 88–90% formic acid [12]. Insol. organic solvents

Transport Properties:

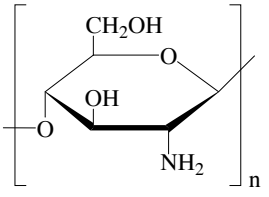
Permeability and Diffusion General: [O_2] 30–35 $cm^3\ m^{-2}\ day^-$ (loligo pen) [13,18]. [H_2O] 1.69–2.17 $cm_3\ cm^{-2}\ s^{-1}$ (6100–7800 $g\,cm^{-2}\ h^{-1}$, loligo pen)
Water Content: 2–10% [20]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	8900–11300 MPa	(Loligo pen) [13,17]
2	5100 MPa	(Crab shell) [13,17]
3	4300 MPa	(non-woven sheet) [13,17]

Mechanical Properties Miscellaneous: Breaking length 6.3–6.9 km (Loligo pen), 3 km (Crab shell) [13,16]. Bursting factor 5.3–7.4 (Loligo pen) [13,16]. Tearing factor 37–40 (Loligo pen) [13,16]. Viscosity 200–3000 MPa s (1% soln. in 1% AcOH) [20]



Optical Properties:
Optical Properties General: Amorph. form is semi-transparent
Total Internal Reflection: $[\alpha]_D^{18}$ +22 (c. 1 in methanesulfonic acid) [19]

Polymer Stability:
Chemical Stability: Hydrolysed by strong mineral acids
Biological Stability: Degraded by chitinase-producing bacteria
Stability Miscellaneous: Dissociation constant Ka 6.0-7 [19]

Chitosan C-16

Synonyms: *Poly[(1→4)-2-amino-2-deoxy-β-D-glucose]*
Related Polymers: Chitin
Monomers: Base monomer unit glucosamine
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.
9012-76-4

Molecular Formula: $(C_6H_{11}NO_4)_n$
Fragments: $C_6H_{11}NO_4$
Molecular Weight: MW 90000–1140000. (Depending on method of preparation MW can be as low as 3000)
Morphology: Though some data on fibre struct. have been obtained, the unit cell dimensions and chain alignment in chitosan have not yet been determined. Fibres contain crystalline areas, allowing preparation of microcrystalline material in a manner analogous to that of cellulose. The average MW of this material is 420000, with loss of 62% of the original *N*-acetyl groups [12].
Miscellaneous: The name chitosan is also applied to some partially de-acetylated samples of chitinous material, which is rendered sol. in dilute acids. **Chitosan - sources and props.** Chitosan is a cationic linear polymer of 2-amino-2-deoxy-D-glucose (glucosamine), which is prepared by alkaline deacetylation of chitin. Chain lengths vary widely with the method of preparation and are usually less than 50% of those of the parent chitin polymers. Reported values range from >2250 [13], to as low as 20 residues [3]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. dilute acids such as HCl, HNO_3, $HClO_4$; insol. H_2SO_4. Forms H_2O sol. salts with many organic acids [4,5]

Transport Properties:
Polymer Solutions Concentrated : Viscosity 73–76 cps (commercial Protasan) [6]. Viscosity has been reported [12]
Water Content: Water retention value 700% [12]
Water Absorption:

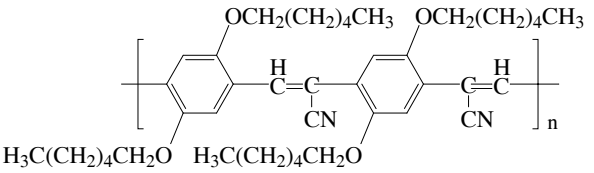
No.	Value	Note
1	2–10 %	[11]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note	Elongation
1	132.39 MPa	13.5 kg mm^{-2}, dry [9]	14.1%
2	31.38 MPa	3.2 kg mm^{-2}, wet [9]	78.0%

Optical Properties:
Total Internal Reflection: $[\alpha]_D^{11}$ -3–-10 (c, 0.5 in AcOH aq.) [10]

Polymer Stability:
Chemical Stability: Stable in soln. at pH 4.6–5.1
Stability Miscellaneous: Dissociation constant *K*a 6.0–7 [12]



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. in the form of solns., powders, beads and fibres
Applications: Used as a cationic flocculant, humectant, viscosifier and selective chelator. Also used in water clarification and soilds concentration. Absorbs heavy metals from industrial wastes. Used as an assistant in dyeing and in photographic emulsions

Trade name	Details	Supplier
Chitosan		Katacura
Chitosan		Kypro Co.
Protasan	87% deacetylated chitin	Protan Inc.

CN-PPV6 C-17

Synonyms: *Poly[[2,5-bis(hexyloxy)-1,4-phenylene](1-cyano-1,2-ethenediyl) [2,5-bis(hexyloxy)-1,4-phenylene] (2-cyano-1,2-ethenediyl)]*
Monomers: 2,5-Bis(hexyloxy)terephthalaldehyde, 2,5-Bis(hexyloxy)benzene-1,4-diacetonitrile
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.
151897-69-7

Molecular Formula: $(C_{42}H_{60}N_2O_4)_n$
Fragments: $C_{42}H_{60}N_2O_4$
Molecular Weight: M_n 4000–12000
General Information: Is a bright powder [1,2]
Miscellaneous: XPS, UPS and optical absorption spectroscopy have been used to study both doped and undoped polymer [16]. Other related cyano-substituted polymers are also available (CN-PPPV1, CN-PPV1A, CN-PPV6, CN-PPVV1,8)

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	225°C	CN-PPV6 [3]

Transition Temperature:

No.	Value	Type
1	32°C	CN-PPV6

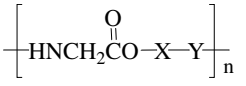
Surface Properties & Solubility:

Solvents/Non-solvents: CN-PPV6 sol. $CHCl_3$, toluene [1,17]
Surface and Interfacial Properties General: Interface formation with aluminium has been reported [11]

Optical Properties:

Optical Properties General: The electronic struct. in both the ground state and the excited state and photo/electroluminescence props. have been reported [13,14]. Luminescence from both intermolecular and intramolecular photoexcitation has been reported [16,18]. Photoluminescence efficiency 0.35–0.46 (CN-PPV6; 488 nm excitation; 0.48 (CN-PPV1,8, 488 nm excitation) [12]
Transmission and Spectra: H-1 nmr [1], photoluminescence [3,8,9,10], uv [4] and absorption spectral data [5] for CN-PPV6 have been reported

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by Knoevenagel condensation polymerisation of 2,5-bis(hexyloxy)terephthalaldehyde and 2,5-bis(hexyloxy)benzene-1,4-diacetonitrile [1,2,16]. *In situ* doping has been reported [16]
Applications: Used in electro-optical devices and photoresponsive devices. Potential application in LEDS

Supplier
Uniax Corp.

Collagen C-18

where X and Y = proline, hydroxyproline, alanine or arginine

Related Polymers: Proteins, Gelatin
Monomers: Amino acids
Material class: Proteins and polynucleotides
Molecular Weight: 95000 (monomer strand), 1700000 (polymer)
General Information: This protein occurs in all but the most primitive organisms, providing extracellular support elements and, in higher animals, tendons, ligaments and other connective tissues. It is the most abundant protein in most animals. The polymer forms 3-chain helical structs., high in proline and hydroxyproline

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.34 g/cm^3	[2]

Melting Temperature:

No.	Value	Note
1	230°C	[6]

Glass-Transition Temperature:

No.	Value	Note
1	120°C	[5]

Transition Temperature:

No.	Value	Note	Type
1	37–40°C	[1]	Denaturation temp.

Transport Properties:
Polymer Solutions Dilute: [η] 62–70 dl g^{-1} (invertebrate collagen) [8]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	2600 MPa	2.6 × 10^{10} dynes cm^{-2}, acid or enzyme-solubilised collagen [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	2–7 MPa	2–7 × 10^{7} dyn cm^{-2}, nature collagen [4]	15%

Optical Properties:
Total Internal Reflection: [α] -350–-400 [1]. $[\alpha]_D$ -390 (invertebrate) [8]

Polymer Stability:
Thermal Stability General: Denatures above 40° [1]

Cresol-formaldehyde Resins C-19

Related Polymers: Cresole Resoles, Cresol Novolaks
Monomers: *o*-Cresol, *m*-Cresol, *p*-Cresol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: Phenolic
Molecular Formula: $[(C_7H_8O).(CH_2O)]_n$
Fragments: C_7H_8O CH_2O
General Information: The cresol isomers have different functionalities in the condensation reaction with formaldehyde. This influences the degree of crosslinking possible, with *ortho*-cresol and *para*-cresol being difunctional while *meta*-cresol is trifunctional

Applications/Commercial Products:
Processing & Manufacturing Routes: Cresol-formaldehyde resins are made by the condensation reaction of molten cresols with formaldehyde, generally 37% aq. soln. With basic catalyst and a molar excess of formaldehyde, a resole is formed. With an acidic catalyst and excess cresol, a Novolak resin is formed. Cresol Resoles may be used as solids or in soln. They cure by application of heat or acid. Cresol Novolaks may be used as solid powdered resin, or in alcoholic solvents. They require a curing agent, generally hexamethylenetetramine
Applications: See Phenol-aldehyde resins for a general discussion of the uses of Cresol-formaldehyde resins

Cresol Resoles C-20

Synonyms: *Methylphenol-formaldehyde Resoles. Cresol-formaldehyde Resoles. Cresylic Resoles*
Related Polymers: Cresol-formaldehyde Novolaks, Cresol-formaldehyde resins
Monomers: *o*-Cresol, *m*-Cresol, *p*-Cresol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.	Note
25053-96-7	*o*-cresol-formaldehyde copolymer
25086-36-6	*m*-cresol-formaldehyde copolymer
25053-88-7	*p*-cresol-formaldehyde copolymer

Molecular Formula: $[(C_7H_8O).(CH_2O)]_n$
General Information: Of the three isomers, *m*-cresol is the most desirable material as it is the only isomer with three reactive positions necessary for cross-linking

Optical Properties:
Transmission and Spectra: C-13 nmr [1], H-1 nmr [1], Raman [3] and esr [4] spectral data have been reported

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by the condensation of molten cresols with formaldehyde with basic catalyst. Cresol resoles may be used as solids or in soln. Cured by application of heat or acid. Effect of synthetic procedure on yield and viscosity has been reported [2]
Applications: Solid cresol resoles may be used to make friction materials, which are used as brake and clutch linings. Other applications in electrical engineering as varnishes in the manufacture of laminates in coatings and as hardeners for epoxy resins

Cresylic Novolaks C-21

Synonyms: *Cresol-formaldehyde Novolaks. Cresol Novolaks. Methylphenol-formaldehyde Novolaks*
Related Polymers: Cresol-Resoles
Monomers: *o*-Cresol, *m*-Cresol, *p*-Cresol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: Phenolic
CAS Number:

CAS Reg. No.	Note
25053-96-7	*o*-cresol-formaldehyde copolymer
25086-36-6	*m*-cresol-formaldehyde copolymer
25053-88-7	*p*-cresol-formaldehyde copolymer

Molecular Formula: $[(C_7H_8O).(CH_2O)]_n$
Fragments: C_7H_8O CH_2O
Molecular Weight: MW 2790 (*o*-cresol), 702 (*p*-cresol). M_n 1468 (*o*-cresol), 595 (*p*-cresol)
General Information: Of the three isomers, *m*-cresol is the most desirable as it contains the three reactive positions necessary for cross-linking
Morphology: *Ortho*-linked *p*-cresol resins have a highly ordered structure owing to intramolecular hydrogen bonding which may favour formation of a cyclic tetramer structure [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3 g/cm^3	*o* and *p*-cresol, uncured, film [4]

Equation of State: Mark-Houwink-Sakurada equation of state information for *o*- and *p*- cresol resins has been reported [1]

Melting Temperature:

No.	Value	Note
1	65°C	*p*-cresol, uncured [5]
2	104–140°C	*m*-cresol, uncured, dependent on synth. [5]
3	60°C	*o*-cresol, uncured [5]
4	71–78°C	all *orthop*-cresol, uncured [6]
5	128–144°C	all *orthom*-cresol, uncured [6]
6	85°C	*m*-cresol, uncured [15]
7	90°C	*p*-cresol, uncured [15]

Glass-Transition Temperature:

No.	Value	Note
1	93°C	*o*-cresol, uncured [4]
2	81°C	*p*-cresol, uncured [4]

Transition Temperature General: Softening temp. of uncured *m*-cresol orthonovolac decreases with a decrease in formaldehyde content [3]

Vicat Softening Point:

No.	Value	Note
1	115–117°C	*m*-cresol orthonovolac, uncured, formaldehyde mole ratio 1 [3]
2	69–72°C	*m*-cresol orthonovolac, uncured, formaldehyde mole ratio 0.6 [3]
3	80°C	*p*-cresol, uncured [5]
4	125–160°C	*m*-cresol, uncured, dependent on synth. [5]
5	75°C	*o*-cresol, uncured [5]

Surface Properties & Solubility:

Solvents/Non-solvents: Uncured *o, m*- and *p*-cresols sol. Me_2CO, 2-butanone, EtOAc, EtOH [5,15]; insol. petrol. Uncured *p*-cresol sol. C_6H_6, turpentine, toluene, CCl_4, $CHCl_3$ [5], MeOH [15]. Uncured *o* and *m*-cresols insol. C_6H_6, turpentine, toluene, CCl_4 [5]. Uncured *m*-cresol insol. $CHCl_3$ [5], CCl_4, toluene [15]. Uncured *o*-cresol sol. $CHCl_3$ [5]

Transport Properties:

Polymer Solutions Dilute: Reduced viscosity 0.044–0.049 dl g^{-1} (DMF/H_2O (90:10), 35°, *p*-cresol, concentration 1.15–2.14%) [14], 0.086–0.075 dl g^{-1} (pyridine, 35°, *p*-cresol, concentration 2.14–1.15%) [14], 0.108–0.141 dl g^{-1} (piperidine, 35°, *p*-cresol, concentration 2.14–1.15% [14]. Viscosity 0.065–0.072 dl g^{-1} (DMF/H_2O (90:10), 35°, *m*-cresol) [14], 0.028–0.036 dl g^{-1} (DMF/H_2O (90:10), 35°, *o*-cresol) [14], 0.043–0.048 dl g^{-1} (2-butanone, 35°, *o*-cresol) [14], 0.029–0.04 dl g^{-1} (2-butanone, 35°, *p*-cresol) [14]. Theta temp. 119.2° (1,2-dichlorobenzene, *o*-cresol [16])

Optical Properties:

Transmission and Spectra: C-13 nmr [7,9,17,19], H-1 nmr [10], ms [11] and ir [17] spectral data have been reported

Volume Properties/Surface Properties: Colour 7 (*o* and *p*-cresol, uncured, Gardner scale), 12 (*m*-cresol, uncured, Gardner scale) [5]

Polymer Stability:

Thermal Stability General: Thermal stability of high MW *o* and *p*-cresol resins has been reported [17]

Decomposition Details: Uncured *m*-cresol orthonovalac resins decompose at 149–181° in air depending upon the amount of formaldehyde used in synth.; decomposition temp. increases with increasing formaldehyde content. 10% Weight loss in air of uncured orthonovolacs occurs at 311-369° depending on amount of formaldehyde used in synth.; temp. increases with increasing formaldehyde content [3]. Char yield (800° in N_2) 30% (*m*-cresol, uncured), 33% (*p*-cresol, uncured), 51% (*m*-cresol, trioxane cured), 34% (*m*-cresol, terephthaloyl chloride cured), 39% (*p*-cresol, terephthaloyl chloride cured) [15]. Pyrolysis of *p*-cresol resin at 600° yields *p*-cresol and methylxanthenes among the products; pyrolysis of the *o*-cresol resin at 600° yields various methyl-substituted derivatives of *o*-cresol whereas *m*-cresol resin yields dimers [12,13]. Uncured *m*-cresol resin degrades at 270° whereas uncured *p*-cresol resin degrades at 350° [15]

Flammability: Oxygen index 33% (*m*-cresol, trioxane cured), 23% (*m*-cresol, terephthaloyl chloride cured), 25% (*p*-cresol, terephthaloyl chloride cured) [15]

Chemical Stability: Uncured *o* and *p*-cresols have excellent compatibility at 250° with linseed oil, tung oil, castor oil and double-boiled linseed oil. Under the same conditions, the *m*-isomer is compatible only with double-boiled linseed oil and with castor oil, provided hydrochloric acid and not oxalic acid has been used as the catalyst in synth. [5]

Stability Miscellaneous: Electron beam irradiation *in vacuo* causes cross-linking of *o* and *p*-cresol resins [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by the condensation reaction of molten cresols with formaldehyde with acidic catalyst. May be used as solids or in soln. They require a curing agent, generally hexamethylenetetramine. Synth. in the presence of water-miscible organic solvents gives products of higher MW [2,7]. All-*ortho*-linked novolaks may be synth. by reaction of bromomagnesium cresol derivative with paraformaldehyde in C_6H_6 [8]. Resins with narrow MW distribution (M_w/M_n 1.25) may be synth. using hydroxycarboxylic acids (e.g. citric acid) as catalysts [18]

Applications: Cresol novolaks are used as host material for positive photoresists in microelectronics and in printing plates. They are reacted with a photoreactive compound (e.g. 5-substituted diazonaphthalene) and when exposed to uv radiation, the resist is transformed into an indene carboxylic acid which is sol. in buffered alkaline soln. Other uses in coatings and as hardeners for epoxy resins. All-*ortho* resins have potential applications as antimicrobial agents and antioxidants in lard

Crystalline modified polysulfone with glass fibre C-22

Synonyms: *Poly[oxy-1,4-phenylenesulfonyl-1,4-phenyleneoxy-1,4-phenylene-(1-methylethylidene)-1,4-phenylene]*
Related Polymers: Polysulfone
Monomers: 4,4′-Dichlorodiphenyl sulfone, Bisphenol A
Material class: Thermoplastic
Polymer Type: Polysulfone
CAS Number:

CAS Reg. No.	Note
25135-51-7	Udel

Molecular Formula: $(C_{27}H_{22}O_4S)_n$
Fragments: $C_{27}H_{22}O_4S$
Additives: Glass fibre
General Information: Unique modified polysulfone formulated for maximum cost-effectiveness while maintaining key props. The resin is a blend of amorph. polysulfone and a proprietary semi-crystalline polymer which combines key features of both the warp-free props. of polysulfone and the chemical resistance of the semi-crystalline material. Levels of the latter are selected to meet end-use thermal requirements

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.47 g/cm^3	ASTM D792 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.7×10^{-5} K^{-1}	ASTM D696 [1]	L

Melting Temperature:

No.	Value	Note
1	270–315°C	[1]

Deflection Temperature:

No.	Value	Note
1	160°C	1.8 MPa, ASTM D648 [1]

Transition Temperature:

No.	Value	Note	Type
1	160°C	[1]	High heat deflection

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	6.5 g/10 min	0.3 MPa, 275°, ASTM D1238 [1]

Water Absorption:

No.	Value	Note
1	0.14 %	3.2 mm, 24h, 23°, ASTM D570 [1]

Mechanical Properties:

Mechanical Properties General: Has higher tensile strength at yield and flexural modulus, but lower tensile impact strength compared with unreinforced PSU. Tough and rigid
Flexural Modulus:

No.	Value	Note
1	6900 MPa	ASTM D730 [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	121 MPa	17600 psi, ASTM D638 Mindel B-430 [1]	2.5%

Tensile Strength Yield:

No.	Value	Note
1	103 MPa	ASTM D638 [1]

Flexural Strength Yield:

No.	Value	Note
1	159 MPa	ASTM D790 [1]

Impact Strength: Tensile impact strength 84 kJ m^{-2} (ASTM D1822) [1]
Izod Notch:

No.	Value	Notch	Note
1	53 J/m	Y	ASTM [1]

Izod Area:

No.	Value	Notch	Note
1	7 kJ/m^2	Notched	ISO [1]
2	31.7 kJ/m^2	Unnotched	ISO [1]

Electrical Properties:

Electrical Properties General: Has excellent electrical props., which are maintained over a wide temp. range and after immersion in water [1]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.7	60 Hz	[1]
2	3.7	1 kHz	[1]
3	3.7	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	3.2 mm, ASTM D145 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	60 Hz	ASTM D150 [1]
2	0.003	1 kHz	ASTM D150 [1]
3	0.009	1 MHz	ASTM D150 [1]

Optical Properties:
Volume Properties/Surface Properties: Opaque [1]

Polymer Stability:
Polymer Stability General: Stable over a wide temp. range. Has the warp resistance of polysulfone and the chemical resistance of the semi-crystalline material [1]
Thermal Stability General: Very good high temp. performance
Upper Use Temperature:

No.	Value	Note
1	160°C	UL 746 [1]

Flammability: Flammability rating V0 (0.79 mm thick, UL 94) [1]
Chemical Stability: Good chemical resistance [1]
Hydrolytic Stability: Very good hydrolytic stability and steam resistance [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Melt temp. range is 270–315° and mould temp. range is 65–100° for injection moulding. Prior to melt processing, the resin must be dried for 4h at 150° [1]
Mould Shrinkage (%):

No.	Value	Note
1	0.3–0.5%	ASTM D955 [1]

Applications: Food contact applications, has FDA approval. Used in electrical/electronic components, connectors, snap-fit assemblies. Glass-filled Mindel A-322 is used for miniature relays which are warp and shrink free, and have the necessary electrical props. It combines the best props. of crystalline and amorph. polymers for high-density connectors

Cyclomethicone C-23

Synonyms: *Cyclic dimethyl siloxane. Cyclic dimethyl polysiloxane. Cyclosiloxane. Hexamethylcyclotrisiloxane. Octamethylcyclotetrasiloxane. Decamethylcyclopentasiloxane. Dodecamethylcyclohexasiloxane*
Related Polymers: Polysiloxanes
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane, Octamethylcyclotetrasiloxane, Decamethylcyclopentasiloxane, Dodecamethylcyclohexasiloxane
Material class: Fluids, Oligomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
69430-24-6	
556-67-2	n = 4
541-05-9	n = 3
540-97-6	n = 6
541-02-6	n = 5

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi
Molecular Weight: MW 300–400 (specifically 222, 296, 370, 444)

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.959 g/cm^3	[1,2,3]

Melting Temperature:

No.	Value	Note
1	17°C	primarily D4 [1,2,3]
2	-40°C	primarily D5 [1,2,3]

Transition Temperature General: Boiling point 175° (D4); 190–210° (D5)

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. H_2O. Misc. alcohols, esters, ethers, ketones, aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons [2]

Transport Properties:
Polymer Melts: Viscosity values have been reported [1,2,3,5]. $\eta^{25°}$ 0.023 St (primarily D4), $\eta^{25°}$ 0.039 St (primarily D5), $\eta^{38°}$ 0.017 St (primarily D4), $\eta^{38°}$ 0.03 St (primarily D5), Viscosity temp. coefficient 0.6. Viscosity more temp. dependent than for linear siloxanes of the same MW

Optical Properties:
Refractive Index:

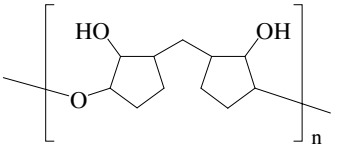
No.	Value	Note
1	1.394	[1,2,3]

Polymer Stability:
Thermal Stability General: Usable from -40–190° (primarily D4) [1,2,3].
Upper Use Temperature:

No.	Value	Note
1	190°C	primarily D5

Flammability: Fl. p. 55° (primarily D4). Fl. p. 82° (primarily D5) [1,2]
Hydrolytic Stability: Stable to H_2O at room temp. At higher temps., particularly in acid or alkaline conditions, it can break down into linear polysiloxanes
Biological Stability: Non-biodegradable [4]

Applications/Commercial Products:



Processing & Manufacturing Routes: Formed as a major product of the hydrolysis and equilibration of dichlorodimethylsilane
Applications: Sold as a lubricant and emollient. Used industrially as intermediate in manufacture of long linear polydimethylsiloxanes

Bis(2,3-epoxycyclopentyl)ether resin B-1

Synonyms: *Poly[2,2′-oxybis(6-oxabicyclo[3.1.0]hexane)]*
Monomers: Bis(2,3-epoxycyclopentyl)ether
Material class: Thermosetting resin
Polymer Type: Epoxy
CAS Number:

CAS Reg. No.	Note
25322-94-5	homopolymer
119280-14-7	copolymer with *m*-phenylenediamine
75260-76-3	copolymer with 1,2-propanediol
29439-76-7	copolymer with ethylene glycol and methylenedianiline
26010-47-9	copolymer with ethylene glycol and *m*-phenylenediamine

Molecular Formula: $(C_{10}H_{14}O_3)_n$
Fragments: $C_{10}H_{14}O_3$
Additives: Glass fibre, carbon fibre
General Information: Props. of cured resin depend on curing agent, stoichiometry, cure time and cure temp. Uncured ERRA-0300 is a solid whereas uncured ERLA 0400 is an amber liq. [11]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: The linear thermal expansion coefficient of ERLA 4617 and of its carbon fibre reinforced analogue increases with increasing temp. A discontinuity in α_L occurs in the range 119–131° due to an approach to the glass transition [10]
Melting Temperature:

No.	Value	Note
1	40–60°C	ERRA-0300, uncured [11]

Deflection Temperature:

No.	Value	Note
1	115°C	ERLA 4300/4305, *m*-phenylenediamine cured, ASTM D648-56 [4,5]
2	175°C	ERLA 4617, *m*-phenylenediamine cured, ASTM D648-56 [4,5]
3	190°C	ERRA 0300, *m*-phenylenediamine cured [11]
4	180°C	ERLA 0400, *m*-phenylenediamine cured [11]
5	151°C	ERLA 0400, Tonox cured [11]
6	187°C	1.82 MPa, ERLA 0400, *m*-phenylenediamine cured [12]

Transport Properties:

Polymer Solutions Dilute: Viscosity 38 cps (25°, ERLA 0400, uncured) [11]
Water Content: Water absorption is dependent upon the nature of the curing agent used [6]. Water absorption of cured ethylene glycol copolymers, reinforced with carbon fibre, increases with increasing temp. [7]

Water Absorption:

No.	Value	Note
1	2.95 %	24h, 100°, ERRA 4205, methylenedianiline cured [6]
2	5.92 %	24h, 100°, ERRA 4205, diaminodiphenylsulfone cured [6]
3	3.12 %	24h, 100°, ERLA 4617, methylenedianiline cured [6]
4	5.23 %	24h, 100°, ERLA 4617, *m*-phenylenediamine cured [6]
5	7.4 %	24h, 100°, copolymer with 1,2-propanediol, *m*-phenylenediamine cured [6]
6	4.53 %	24h, 100°, copolymer with 1,2-propanediol, methylenedianiline cured [6]

Mechanical Properties:

Mechanical Properties General: The flexural props. of ERRA 0300 (Tonox cured, glass reinforced) deteriorate with increasing temp. [11]. Increasing cure time of ERRA 0300 or ERLA 0400 with *m*-phenylenediamine has little effect on mechanical props.

Tensile (Young's) Modulus:

No.	Value	Note
1	4481 MPa	650 kpsi, ethylene glycol/methylenediamine cured [2]
2	5377 MPa	780 kpsi, ethylene glycol/*m*-phenylenediamine cured [2]
3	5805 MPa	842 kpsi, ERLA-4300, *m*-phenylenediamine cured, ASTM D638-64T [4,5]
4	6008 MPa	871.5 kpsi, ERLA-4305, *m*-phenylenediamine cured, ASTM D638-64T [4,5]
5	5398 MPa	783 kpsi, ERLA-4617, *m*-phenylenediamine cured, ASTM D638-64T [4,5]
6	4688 MPa	680 kpsi, ERRA 0300, *m*-phenylenediamine cured [11]
7	4895 MPa	710 kpsi, ERLA 0400, *m*-phenylenediamine cured [11]
8	19924 MPa	2890 kpsi, ERRA 0300, Tonox cured, glass reinforced [11]

Flexural Modulus:

No.	Value	Note
1	4653 MPa	675 kpsi, ethylene glycol/methylenedianiline cured [2]
2	5515 MPa	800 kpsi, ethylene glycol/*m*-phenylenediamine cured [2]
3	5998 MPa	870 kpsi, ERLA-4300, *m*-phenylenediamine cured, ASTM D790-66 [4,5]
4	6273 MPa	910 kpsi, ERLA-4305, *m*-phenylenediamine cured, ASTM D790-66 [4,5]
5	5619 MPa	815 kpsi, ERLA-4617, *m*-phenylenediamine cured, ASTM D790-66 [4,5]
6	24818 MPa	3600 kpsi, 23°, ERRA 0300, Tonox cured, glass reinforced [11]

Tensile Strength Break:

No.	Value	Note	Elongation
1	121 MPa	17.5 kpsi, ethylene glycol/ methylenedianiline or ethylene glycol/*m*-phenylenediamine cured [2]	2-9%–5.1%
2	94 MPa	13.65 kpsi, ERLA-4300, *m*-phenylenediamine cured [4,5]	
3	108 MPa	15.65 kpsi, ERLA-4305, *m*-phenylenediamine cured [4,5]	
4	132 MPa	19.2 kpsi, ERLA-4617, *m*-phenylenediamine cured [4,5]	
5	345 MPa	50 kpsi, ERRA 0300, Tonox cured, glass reinforced [11]	
6	131 MPa	19 kpsi, ERRA 0300, *m*-phenylenediamine cured [11]	
7	121–124 MPa	17.5-18 kpsi, ERLA 0400, *m*-phenylenediamine cured [11,12]	

Flexural Strength at Break:

No.	Value	Note
1	172 MPa	25 kpsi, ethylene glycol/methylenedianiline cured [2]
2	217 MPa	31.5 kpsi, ethylene glycol/*m*-phenylenediamine cured [2]
3	160 MPa	23.25 kpsi, ERLA-4300, *m*-phenylenediamine cured [4,5]
4	164 MPa	23.8 kpsi, ERLA-4305, *m*-phenylenediamine cured [4,5]
5	214 MPa	31 kpsi, ERLA-4617, *m*-phenylenediamine cured [4,5]
6	503 MPa	73 kpsi, 23°, ERRA 0300, Tonox cured, glass reinforced [11]
7	190 MPa	27.6 kpsi, ERLA 0400, *m*-phenylenediamine cured [12]

Compressive Modulus:

No.	Value	Note
1	4736 MPa	687 kpsi, ethylene glycol/methylenedianiline cured [2]
2	5846 MPa	848 kpsi, ethylene glycol/*m*-phenylenediamine cured [2]
3	6791 MPa	985 kpsi, ERLA-4300, *m*-phenylenediamine cured, ASTM D695-63T[4,5]
4	6808 MPa	987.5 kpsi, ERLA-4305, *m*-phenylenediamine cured, ASTM D695-63T[4,5]
5	6136 MPa	890 kpsi, ERLA-4617, *m*-phenylenediamine cured, ASTM D695-63T[4,5]
6	4757 MPa	690 kpsi, ERRA 0300, *m*-phenylenediamine cured [11]
7	4826 MPa	700 kpsi, ERLA 0400, *m*-phenylenediamine cured [11]

Poisson's Ratio:

No.	Value	Note
1	0.35	ERRA 0300, *m*-phenylenediamine cured [11]

Compressive Strength:

No.	Value	Note
1	176 MPa	25.6 kpsi, ethylene glycol/methylenedianiline cured [2]
2	227 MPa	32.9 kpsi, ethylene glycol/*m*-phenylenediamine cured [2]
3	256 MPa	37.15 kpsi, ERLA-4300, *m*-phenylenediamine cured [4,5]
4	246 MPa	35.65 kpsi, ERLA-4305, *m*-phenylenediamine cured [4,5]
5	226 MPa	32.8 kpsi, ERLA-4617, *m*-phenylenediamine cured [4,5]
6	207 MPa	30 kpsi, ERRA 0300 and ERLA 0400, *m*-phenylenediamine cured [11]

Miscellaneous Moduli:

No.	Value	Note	Type
1	4736 MPa	687 kpsi, ERLA 0400, *m*-phenylenediamine cured [12]	tensile tangent modulus
2	4715 MPa	684 kpsi, ERLA 0400, *m*-phenylenediamine cured [12]	compressive tangent modulus
3	5012 MPa	727 kpsi, ERLA 0400, *m*-phenylenediamine cured [12]	flexural tangent modulus

Hardness: Barcol 35-40 (methyl nadic anhydride cured) [8]
Izod Notch:

No.	Value	Notch	Note
1	28.8 J/m	Y	0.54 ft lb in $^{-1}$, ERRA 0300, *m*-phenylenediamine cured [11]
2	13.9 J/m	Y	0.26 ft lb in $^{-1}$, ERRA 0300, Tonox cured [11]
3	15.5 J/m	Y	0.29 ft lb in $^{-1}$, ERLA 0400, Tonox cured [11]

Polymer Stability:

Decomposition Details: 10% Weight loss for *m*-phenylenediamine cured resin occurs after 2h heating in air at 212°; 20% weight loss occurs at 257° [3]. Activation energy for 10–15% weight loss 111 kJ mol^{-1} (*m*-phenylenediamine cured), 97 kJ mol^{-1} for 15–20% weight loss (*m*-phenylenediamine cured) [3]
Flammability: ERLA 4617 (carbon fibre filled) does not meet the requirements of the FAR standard [9]. Not self-extinguishing (ERLA 4617, carbon fibre filled, FAA standard) [9]

Applications/Commercial Products:

Processing & Manufacturing Routes: Curing with *m*-phenylenediamine is probably a two-step process [1]. ERLA-4300 and ERLA 4305 are synth. by reaction of bis(2,3-epoxycyclopentyl) ether with H_2O (1 mol) in the presence of benzyldimethylamine catalyst for 7h at 100° [4]. Strong, tough polymers may be synth. by curing bis(2,3-epoxycyclopentyl)ether with methyl nadic anhydride [8] or *m*-phenylenediamine [11] using a tin octoate catalyst

Applications: In prepreg systems. Potential applications in military filament winding applications (missiles, submarines) and in environments exposed to cryogenic temps.

Trade name	Details	Supplier
ERLA	4617 (ethylene glycol copolymer)/4300/4305	Union Carbide
ERLA	4617 (ethylene glycol copolymer)	Bakelite Xylonite Ltd

2	47–67°C	aniline cured [8]	T'_β

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 22.2–25.9 $MPa^{1/2}$ (*N*-tetraethyldiaminodiphenylmethane cured) [7], 23.0–27 $MPa^{1/2}$ (aniline cured) [7], 23.5–26.7 $MPa^{1/2}$ (diaminodiphenylmethane cured) [7], 25.6–27.7 $MPa^{1/2}$ (diaminodiphenylsulfone cured) [7]

Transport Properties:

Polymer Solutions Dilute: Viscosity 2500–5000 cP (25°, uncured)
Permeability of Liquids: Diffusivity [H_2O] 27×10^{-9} cm^2 s^{-1} (diaminodiphenylmethane:aniline (75:25) cured) [8], 28×10^{-9} cm^2 s^{-1} (diaminodiphenylmethane:aniline (50:50) cured) [8], 33×10^{-9} cm^2 s^{-1} (diaminodiphenylmethane:aniline (25:75) cured) [8], 47×10^{-9} cm^2 s^{-1} (aniline cured) [8]
Water Content: The equilibrium concentration of absorbed H_2O in diaminodiphenylmethane-aniline cured systems decreases with the weight fraction of aniline [8]
Water Absorption:

No.	Value	Note
1	5.47 %	48h, 100°, 95% relative humidity, diaminodiphenylmethane:aniline (75:25) cured [8]
2	4.98 %	48h, 100°, 95% relative humidity, diaminodiphenylmethane:aniline (50:50) cured [8]
3	4.92 %	48h, 100°, 95% relative humidity, diaminodophenylmethane:aniline (25:75) cured [8]
4	5.29 %	48h, 100°, 95% relative humidity, aniline cured [8]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3530 MPa	20°, diaminodiphenylmethane:aniline (75:25) cured
2	3660 MPa	20°, diaminodiphenylmethane:aniline (50:50) cured
3	3810 MPa	20°, diaminodiphenylmethane:aniline (25:75) cured
4	3910 MPa	20°, aniline cured [8]

Poisson's Ratio:

No.	Value	Note
1	0.372	diaminodiphenylmethane:aniline (75:25) cured [8]
2	0.374	diaminodiphenylmethane:aniline (50:50) cured [8]
3	0.366	diaminodiphenylmethane:aniline (25:75) cured [8]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1600 MPa	20°, 0.3 Hz, diaminodiphenylmethane:aniline (75:25) cured [8]	dynamic modulus
2	1940 MPa	20°, 0.3 Hz, diaminodiphenylmethane:aniline (50:50) cured) [8]	dynamic modulus
3	1820 MPa	20°, 0.3 Hz, diaminodiphenylamine:aniline (25:75) cured [8]	dynamic modulus
4	1750 MPa	20°, 0.3 Hz, aniline cured [8]	

Viscoelastic Behaviour: Longitudinal sound velocity 2983 m s^{-1} (20°, diaminodiphenylmethane:aniline (75:25) cured), 2953 m s^{-1} (20°, diaminodiphenylmethane:aniline (50:50) cured), 2905 m s^{-1} (20°, diaminodiphenylmethane:aniline (25:75) cured) [8]

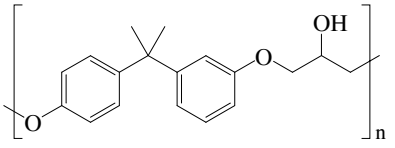
Optical Properties:

Transmission and Spectra: H-1 nmr spectral data have been reported [3]

Polymer Stability:

Decomposition Details: Decomposition characteristic depend upon the nature of the curing agent. For example, 10% weight loss in air occurs at 285° for resin cured with diaminodiphenylsulfone but at 240° when cured with diethylenetriamine [4]. Char yield 8.3% (diaminodiphenylsulfone cured), 3.8% (diethylenetriamine cured) [4]
Hydrolytic Stability: Exposure of uncured ERL 0500 to 96% relative humidity at 60° results in loss of 20% of the epoxide groups after approx. 4.5 d [9]

Applications/Commercial Products:



Processing & Manufacturing Routes: Kinetic studies on the curing process with acid anhydrides have been reported [1]. Curing with aromatic diamines follows first order kinetics [2]. Other details of curing behaviour have been reported [5]. Kinetics of cure with diaminodiphenylsulfone have been reported [6]
Applications: Uncured resin has applications due to its low viscosity and low temp. reactivity. Increases heat resistance and cure speed of bisphenol A epoxy resins; other uses in adhesives, as toolings compounds and as laminating system. Molecularly distilled resin has applications as a binder for solid propellants and in military flares

Trade name	Details	Supplier
ERL	0500/0510	Ciba-Geigy Corp.

Bisphenol A Diglycidyl ether resin B-3

Synonyms: *Poly(4,4′-(1-methylethylidene)bisphenol-co-(chloromethyl)oxirane). Diglycidyl ether of Bisphenol A. BADGE. DGEBPA*
Monomers: Bisphenol A, (Chloromethyl)oxirane
Material class: Thermosetting resin
Polymer Type: Epoxy
CAS Number:

CAS Reg. No.	Note
40364-42-9	copolymer with methylenedianiline
56727-50-5	copolymer with hexamethylenediamine
76397-91-6	copolymer with tetrahydromethylisophthalic anhydride
71745-12-5	copolymer with 4,4-diaminodiphenylsulfone
25068-38-6	

Molecular Formula: $C_{18}H_{20}O_3$
Fragments: $C_{18}H_{20}O_3$
Molecular Weight: MW 370 (approx., commercial liq. resin, M_n 900-3750 (n=2-12, solid resin), MW 9454 (Epikote 1009), M_n 4746 (Epikote 1009), M_n 1400 (Epikote 1004)
Additives: Carbon fibre, glass fibre, aramid fibre, aluminium borate to improve mechanical props. Copper acrylate to improve electrical props. and thermal and chemical resistance. TiO_2 (30–40%) or graphite to improve thermomechanical props. Silica, talc, calcium silicate, mica, clay, calcium carbonate to reduce shrinkage and improve dimensional stability. Reactive diluents (e.g. glycidyl ethers) to reduce viscosity
General Information: MW of the commercial product (liq. resin with degree of polymerisation approx. zero) may be increased by reaction of epichlorohydrin and bisphenol A in a mole ratio as close to 1:1 as possible. Typically, however, an excess (10:1) of epichlorohydrin is preferred. Solid resins have a degree of polymerisation of 2-30 [1]
Identification: Uncured liq. resin is characterised by hydrolysable chlorine content [1,16]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

2	95–105°C	solid resin, M_n 1400
3	125–135°C	solid resin, M_n 2900
4	145–155°C	solid resin, M_n 3750 [1]

Glass-Transition Temperature:

No.	Value	Note
1	124°C	BF_3-amine complex cured [4]
2	122°C	diethylenetriamine cured [4]
3	132°C	*m*-phenylenediamine cured [4]
4	102°C	tetrahydro-5-methylisophthalic anhydride cured [5]
5	145°C	4,4′-methylenedianiline cured [5]
6	130°C	polyamide cured [26]
7	82°C	Epikote 1009 [25]
8	51°C	Epikote 1004 [27]
9	-24°C	Epon 828 [32]
10	61°C	Epon 828, BF_3.ethylamine complex cured, 0.045 equiv. curing agent [32]
11	94°C	[33]
12	96°C	PKHH [35]
13	145°C	methylenedianiline cured, 150°, 4h, 0.1 MPa pressure [37]
14	117°C	diaminodiphenylsulfone cured, 81% cured [38]
15	55°C	diaminodiphenylsulfone cured, 58% cured [38]
16	187°C	AER-331, 4,4′-sulfonyldianiline cured [39]
17	-28°C	ED-22, tetrahydromethylisophthalic anhydride cured, 30% curing agent [42]
18	-41°C	ED-22, tetrahydromethylisophthalic anhydride cured, 64% curing agent [42]
19	47°C	dry, room temp. cured with Versamid 125 [43]
20	51°C	dry, cured 50°, Versamid 125 [43]
21	37°C	wet, cured 50°, Versamid 125 [43]
22	47°C	dry, cured 80°, Versamid 125 [43]

Transition Temperature General: T_g decreases with increasing cure pressure [37]. T_g of Epon 828 cured with BF_3.ethylamine complex increases amount of curing agent used [32]. T_g of tetrahydromethylisophthalic anhydride cured resin varies linearly with the composition of resin and curing agent in the composite [42]

Deflection Temperature:

2	93°C	diethylenetriamine cured, modified ASTM D1525-70 [4]
3	136°C	*m*-phenylenediamine cured, modified ASTM D1525-70 [4]

Surface Properties & Solubility:

Solubility Properties General: High MW resins form miscible blends with poly(ether sulfone) [10] and poly (*N*-vinyl pyrrolidone) [35]. Miscible with poly(tetrahydrofurfuryl methacrylate) [14]. Incompatible with epoxidised natural rubber [31]

Solvents/Non-solvents: Solubility data have been reported [17]. Uncured liq. resin sol. nitric acid, sulfuric acid [26], insol., C_6H_6, toluene, dioxane, hydrochloric acid, MeOH, sodium hydroxide, H_2O, DMF [26]

Wettability/Surface Energy and Interfacial Tension: Studies on contact angle have been reported [11]. Contact angle 39° (22°, equilib., ED-20 on untreated OT-4 (titanium) alloy) [41]. Contact angle decreases upon treatment of the alloy surface with chelated transition metal compounds [41]

Surface Tension:

No.	Value	Note
1	32.9 mN/m	diethylaminopropylamine cured [3]
2	44 mN/m	diethylenetriamine cured [3]

Transport Properties:

Transport Properties General: Transport props. have been reported [19]

Polymer Solutions Dilute: η 11000–15000 mPa s (25°, liq. resin, commercial grade); 3000 mPa s (min., 25°, cured with aliphatic polyamide), 10000–20000 mPa s (25°, cured with aromatic polyamide), 10000 mPa s (25°, cured with polyamine) [1]. Viscosity of the cured resin can be lowered by the addition of diluents such as glycidyl ethers and dibutyl phthalate. Certain mechanical props., however, may be sacrificed [1]

Polymer Melts: Theta temp. 63° (1,2-dichloroethane) [35]. The temp. dependence of melt viscosity, itself related closely to dielectric relaxation time, may be described by the Williams-Landel-Fern equation [48]

Permeability of Gases: Sorption by amorph. films of N_2, CH_4 and CO_2 is low [33]. Diffusion coefficients [CO_2] $0.129–0.206 \times 10^8$ cm^2 s^{-1} (35°, 1.7 mil thick); [N_2] $0.316–0.322 \times 10^8$ cm^2 s^{-1} (1.7 mil thick, 35°); [CH_4] $0.063–0.069 \times 10^8$ cm^2 s^{-1} (35°, 1.7 mil thick) [3]

Water Absorption:

No.	Value	Note
1	0.5 %	1h 100°, cured with hexahydrophthalic anhydride [1]

Gas Permeability:

No.	Gas	Value	Note
1	[H_2O]	11163 cm^3 mm/(m^2 day atm)	1.7×10^{-8} cm^2 (s cm Hg)$^{-1}$, 40° [34]
2	[CO_2]	26.5 cm^3 mm/(m^2 day atm)	0.403×10^{-10} cm^2 (s cm Hg)$^{-1}$, 35°, 10 atm, 1.7 mil thick [45]
3	[CH_4]	1.25 cm^3 mm/(m^2 day atm)	0.019×10^{-10} cm^2 (s cm Hg)$^{-1}$, 35°, 10 atm, 1.7 mil thick [45]
4	[He]	164.2 cm^3 mm/(m^2 day atm)	2.5×10^{-10} cm^2 (s cm Hg)$^{-1}$, 35°, 10 atm, 1.7 mil thick [45]
5	[O_2]	6.6 cm^3 mm/(m^2 day atm)	0.1×10^{-10} cm^2 (s cm Hg)$^{-1}$, 35°, 10 atm, 1.7 mil thick [45]

Mechanical Properties:

Mechanical Properties General: Mechanical props. are dependent upon the type of curing agent used. Mechanical props. of resin cured with hexamethylenediamine have been reported [20]. Tensile props. of Epon 828 have been reported [24]. Mechanical props. decrease with increasing cure pressure [37]. Tensile modulus is increased by addition of fillers to cured resin. The increase is especially marked with the addition of graphite [40]. Tensile strength of Epikote 828 is improved by post-curing at up to 100° [43]. Mech. props. of cured DER 331 may be improved by incorporation of poly(4-phenyleneterephthalimide) anion [46]. Epon 828 cured with polyamide, aliphatic or aromatic amine undergoes plastic yield under compression and brittle failure under tension. Compressive strength increases with increasing resin density and increasing T_g [47]

Tensile (Young's) Modulus:

No.	Value	Note
1	3600 MPa	Epon 828, cured [30]
2	2230 MPa	methylenedianiline cured, 200°, 1.5h, 0.1 MPa pressure [37]
3	1390 MPa	methylenedianiline cured, 200°, 1.5h, 1 kPa pressure [37]
4	3400 MPa	25°, cured with hexahydrophthalic anhydride [1]
5	20.2 MPa	equilib., ED-20, polyethylene polyamine cured [40]
6	2000 MPa	DER 331, *m*-phenylenediamine cured [46]

1	0.4	Epon 828, cured [30]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	82–97 MPa		Epon 828, cured [30]
2	37.2 MPa	5.4%	5.4 kpsi, Epon cured with norbornyl anhydride siloxane [36]

Flexural Strength Yield:

No.	Value	Note
1	85.5 MPa	872 kg cm^{-2}, DER 331, BF_3.ethylamine cured [49]
2	163.8 MPa	1670 kg cm^{-2}, DER 331, diaminodiphenyl-sulfone cured [49]
3	93 MPa	947 kg cm^{-2}, DER 331, methylenedianiline cured [49]

Compressive Strength:

No.	Value	Note
1	138–227 MPa	aliphatic polyamine cured [1]
2	207 MPa	aromatic polyamine cured [1]
3	62–76 MPa	polyamide cured [1]
4	124 MPa	25°, cured with hexahydrophthalic anhydride [1]
5	112 MPa	triethylenetetramine cured [2]
6	116 MPa	4,4′-methylenedianiline cured [2]
7	85.6 MPa	Versamide cured [2]
8	126 MPa	4,4′-methylenedianiline cured [2]
9	130 MPa	tetrahydro-5-methylisophthalic anhydride cured [5]
10	116.7 MPa	1190 kg cm^{-2}, DER 331, BF_3.ethylamine cured [49]
11	17.9 MPa	1830 kg cm^{-2}, DER 331, diaminodiphenylsulfone cured [49]
12	116 MPa	1180 kg cm^{-2}, DER 331, methylenedianiline cured [49]

Viscoelastic Behaviour: Acoustic emission behaviour under tensile loading has been reported [30]
Hardness: Pencil hardness 2H (aliphatic polyamine cured), F (polyamide cured) [1]. Scratch hardness 1000g (film, polyamide cured) [26]. Rockwell M115 (DER 331, BF_3.ethylamine cured), M80 (DER 331, diaminodiphenylsulfone cured), M106 (DER 331, methylenedianiline cured) [49]
Failure Properties General: Tensile modulus is increased by addition of fillers to cured resin. The increase is especially marked with the addition of graphite [40]. Tensile strength of Epikote 828 is improved by post-curing at up to 100° [43]. Mechanical props. of cured DER 331 may be improved by incorporation of poly *p*-phenyleneterephthalamide) anion [46]. Epon 828 cured with polyamide, aliphatic or aromatic amine undergoes plastic yield under compression and brittle failure under tension. Compressive yield strength increases with increasing resin density and increasing T_g [47]
Fracture Mechanical Properties: K_{IC} 0.567–1.074 MPa $m^{1/2}$ (Epon 828, cured) [30]. The dependence of crack growth on curing agent has been reported [21]. Shear strength 41 MPa (max., Epon 828, unspecified cure) [50]. K_{IC} 0.62 M_n $m^{-3/2}$ (AER-331) 4,4′-sulfonyldianiline cured) [39]
Izod Notch:

No.	Value	Notch	Note
1	12.8 J/m	Y	0.24 ft Ib $^{-1}$, room temp., DER 331, BF_3.ethylamine cured [49]
2	30.9 J/m	Y	0.58 ft Ib $^{-1}$, room temp., DER 331, methylenedianiline cured [49]

Electrical Properties:

Electrical Properties General: Electrical props. are dependent upon the curing agent used. Dielectric loss per mole of Epon 828 is increased upon changing from toluene to THF as a solvent [23]. Dielectric relaxation time of Epikote 1009 has temp. dependency that fits the Williams-Landel-Ferry equation [25]. Dielectric constant of resin cured with diaminodiphenylsulfone increases with increasing temp. but decreases with increasing degree of cure. Dielectric loss factor of diaminodiphenylsulfone cured resin increases with increasing degree of cure at low temps. [38]
Surface/Volume Resistance:

No.	Value	Note	Type
1	780×10^{15} Ω.cm	25°, triethylenetetramine cured [2]	S
2	$> 790 \times 10^{15}$ Ω.cm	min., 25°, 4,4′-methylenedi-aniline cured [2]	S
3	550×10^{15} Ω.cm	25°, Versamide cured [2]	S
4	$> 7.85 \times 10^{15}$ Ω.cm	min., DER 331, BF_3.ethylamine or methylenedianiline cured [49]	S
5	0.0067×10^{15} Ω.cm	43°, polyamide cured, conductivity value [26]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	4–5	50 Hz	25°, aliphatic and aromatic polyamine cured [1]
2	3.2–3.6	50 Hz	25°, polyamide cured [1]
3	3.4	60 Hz	cured wth hexahydrophthalic anhydride [1]
4	3.9	1 kHz	triethylenetetramine cured [2]
5	4.06	1 kHz	4,4′-methylenedianiline cured [2]
6	3.19	1 kHz	Versamide cured [2]
7	3.15	1 MHz	DER 331, BF_3.ethylamine cured [49]
8	4.89	1 kHz	DER 331, diaminodiphenylsulfone cured [49]
9	3.44	1 MHz	DER 331, methylenedianiline cured [49]

Dielectric Strength:

No.	Value	Note
1	14.1 $kV.mm^{-1}$	DER 331, diaminodiphenylsulfone cured [49]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.006	60 Hz	cured with hexahydrophthalic anhydride [1]
2	0.02	1 kHz	cured triethylenetetramine [2]
3	0.015	1 kHz	cured 4,4′-methylenedianiline [2]
4	0.007	1 kHz	cured with Versamide [2]
5	0.023	1 MHz	DER 331, BF_3.ethylamine cured [49]
6	0.022	1 kHz	DER 331, diaminodiphenylsulfone cured [49]
7	0.033	1 MHz	DER 331, methylenedianiline cured [49]
8	0.002–0.02		room temp., Epon 828, anhydride or amine cured [50]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5695	liq., uncured [26]
2	1.573	25°, Epon 828, uncured [50]

Transmission and Spectra: Uv [13], ir [13,22], ms [28], C-13 nmr [22] and H-1 nmr [22] spectral data have been reported
Volume Properties/Surface Properties: Colour pale yellow (Epon 828, uncured) [32]

Polymer Stability:

Thermal Stability General: Thermal stability [18] is dependent upon the nature of the curing agent used; thermal props. are a measure of the degree of cure [1]. Heat resistance is decreased by addition of V_2O_5 [40]

Upper Use Temperature:

No.	Value	Note
1	205°C	AER-331, 4,4′-sulfonyldianiline cured [39]

Decomposition Details: Decomposition temp. 392° (cured with hexahydrophthalic anhydride), 420° (cured with 2-methylimidazole) [1]. Shows 6.8% weight loss (triethylenetetramine cured), 5.5% weight loss (4,4′-methylenedianiline cured), 5% weight loss (Versamide cured) after heating at 210° for 300h [2]. Epon 828 shows 10% weight loss in N_2 atmosphere at 402° (cured with 4,4′-diaminodiphenylsulfone); at 375° (cured with 4,4′-diaminodiphenylether). It shows 50% weight loss in N_2 at 427° and 398° for the same respective curing agents. Char yield at 600° 21.8% (N_2, 4,4′-diaminodiphenylsulfone cured), 19.2% (N_2, 4,4′-diaminodiphenylether cured) [6], 2.4% (N_2, 700°, Epon 828, uncured) [32]. Epon 828 shows 10% weight loss in air at 392° (4,4′-diaminodiphenylsulfone cured); at 368° (4,4′-diaminodiphenylether cured); shows 50% weight loss at approx. 420° for both curing agents. Char yield at 600° in air 3.1% (4,4′-diaminodiphenylsulfone cured); 16.7% (4,4′-diaminodiphenylether cured) [6]; char yield at 700° 11.5–19.6% (in N_2, Epon 828, BF_3.ethylamine complex cured, 0.0045 equiv. curing agent, cure 120–140°) [32]. 5% Weight loss in air at 420° (Epon, norbornyl dianhydride siloxane cured) [36]
Flammability: Epon 828 has no fl. p. at 249° [50]
Chemical Stability: Resin cured with triethylenetetramine, 4,4′-methylenedianiline or Versamide is swollen by 50% sodium hydroxide, 30% sulfuric acid, Me_2CO, toluene and H_2O [2]. Epon 828 is highly resistant to sodium hydroxide, acids, fuels and solvents [50]
Hydrolytic Stability: Hydrolysed by H_2O, leading to degradation of mech. props. [8]
Stability Miscellaneous: The effect of γ-irradiation upon dissipation factor depends on the nature of the curing agent and the radiation dose [44]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. commercially by reacting excess epichlorohydrin with bisphenol A under alkaline conditions [22]. The resin comprises approx. 80% of the monomeric material and is a viscous liq. Solid resins may be synth. by two processes; the taffy process using epichlorohydrin and bisphenol A with a stoichiometric amount of sodium hydroxide; chain-extension involving reaction of bisphenol A with crude liq. resin. Depending upon the desired use, a curing agent such as a primary or secondary aliphatic polyamine is used to cross-link the crude resin to obtain optimum props. The use of dicyandiamide in combination with a urone solvent as a curing agent has been reported [7]. Temp. must be greater than 145° for dicyandiamide to act as a curing agent [27]. Change in struct. during cure has been reported [9]. Product yield studies have been reported [15]. Mechanism of epoxidation has been reported [29]
Applications: Liq. resin used in casting and tooling; in adhesives; in coatings; in the synth. of modified resins and high MW epoxy resins. Use of cured resin depends upon the type of curing agent employed. Typical applications include castings, adhesives; coatings, electrical laminates; in flooring, mouldings, filament wiring and structural laminates. Epon 828 when appropriately formulated and cured is passed by FDA regulations for food contact applications

Bisphenol A-isophthalic acid polyester carbonate B-4

Synonyms: *Bisphenol A-1,3-benzenedicarboxylic acid polyester carbonate. Poly[4,4′-(1-methylethylidene)bis[phenol]-co-1,3-benzenedicarboxylic acid-co-carbonic acid]. PCI*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polyester carbonates
Monomers: Carbonic dichloride, Bisphenol A, 1,3-Benzenedicarboxylic acid, Carbonic acid
Material class: Thermoplastic, Copolymers
Polymer Type: polyester, bisphenol A polycarbonate
CAS Number:

CAS Reg. No.	Note
31133-79-6	source: carbonic acid
67536-57-6	source: carbonic dichloride

Molecular Formula: $[(C_{16}H_4O_3)_x.(C_{23}H_{18}O_4)_y]_n$
Fragments: $C_{16}H_{14}O_3$ $C_{23}H_{18}O_4$
General Information: The polymers have both carbonate and ester linkages, which confer props. intermediate between those of polycarbonate and the polyester. Common usage of the form PCI(X), where I refers to the isophthalate ester moiety and X to the mole fraction of ester (relative to total ester + carbonate). The molar ratio of Bisphenol:(ester + carbonate) residues is 1:1
Morphology: Polyester carbonates with ester:carbonate molar ratios up to 4.9 (PCI (0.83)) are amorph. [2,3]; ordering is not observed (cf. terephthalates) [2]. Isophthalate polyester carbonates are less easily crystallised than the terephthalates; at ester:carbonate ratios of 6 (PCI (0.86)) and above the cast films are about 10% cryst. [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1958 g/cm^3	PCI (0.5) [4]
2	d 1.24 g/cm^3	15.6°, ester:carbonate 3.3, PCI (0.77) [3]
3	d 1.245 g/cm^3	15.6°, ester:carbonate 4.9, PCI (0.83) [3]
4	d 1.248 g/cm^3	15.6°, ester:carbonate 6.7, PCI (0.87) [3]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.17–0.21 kJ/kg.C	ester:carbonate 3.3, PCI (0.77) [3]	p
2	0.18–0.22 kJ/kg.C	ester:carbonate 4.9, PCI (0.83) [3]	p
3	0.22–0.26 kJ/kg.C	ester:carbonate 6.7, PCI (0.87) [3]	p

Glass-Transition Temperature:

No.	Value	Note
1	160°C	PCI (0.1) [1]
2	168°C	PCI (0.3) [1]
3	178°C	PCI (0.5) [1]
4	159°C	[4]
5	166°C	PCI (0.67) [4]
6	184–188°C	ester:carbonate 3.3, PCI (0.77) [3]
7	188–192°C	ester:carbonate 4.9, PCI (0.83) [3]
8	184–188°C	ester:carbonate 6.7, PCI (0.87) [3]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	47 MPa	23°, 40% relative humidity, ester:carbonate:3.3, PCI (0.77) [3]	32%
2	53 MPa	23°, 40% relative humidity, ester:carbonate 4.9, PCI (0.83) [3]	56%
3	52 MPa	23°, 40% relative humidity, ester:carbonate 6.7, PCI (0.87) [3]	39%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	56.5–57.5 MPa	8%	23°, 40% relative humidity, ester:carbonate 3.3, PCI (0.77) [3]
2	58.3–59.3 MPa	9%	23°, 40% relative humidity, ester:carbonate 4.9, PCI (0.83) [3]
3	58.7–59.7 MPa	8%	23°, 40% relative humidity, ester:carbonate 6.7, PCI (0.87) [3]

Complex Moduli: PCI (0.5) tan δ 0.016 (80°) [4]
Viscoelastic Behaviour: Some tensile stress-strain curves have been reported [3]. There is a viscoelastic region up to the yield point, followed by a stress drop and then some necking behaviour until the break point is reached

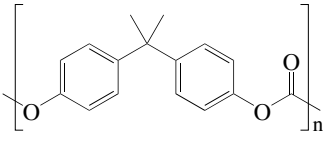
Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [2]
Volume Properties/Surface Properties: Ester:carbonate molar ratios up to 4.9 (PCI (0.83)) are transparent, but at 6 (PCI (0.86) and above the cast films are white due to increasing crystallinity [3]

Polymer Stability:

Decomposition Details: Decomposition curve (0-800°) in air has been reported [5]. The isophthalate polyester carbonates are more stable to thermo-oxidation than the corresponding terephthalates [5]. An additional major breakdown mechanism is also found above 390° for the high ester content isophthalate polyester carbonates [5]. Initial weight loss temp. 360° (air, ester:carbonate 4.2, PCI (0.81)) [5], 370° (air, ester:carbonate 6.7, PCI (0.87)) [5]. Weight loss temp. 415°, 505°, 540° (PCI (0.81)); [5] 480°, 545° (PCI (0.87)) [5]
Stability Miscellaneous: Good stability to thermal ageing [4]

Applications/Commercial Products:



Processing & Manufacturing Routes: Polyester carbonates may be synth. in soln. in two stages or by interfacial polycondensation in one stage [6,7]. Isophthaloyl chloride in CH_2Cl_2 is added to bisphenol A in anhydrous pyridine under N_2 at 25° with *p-tert*-butyl phenol as a chain capping agent - this results in oligomer formation. Phosgenation is then carried out by adding phosgene to the vapour space of the reaction vessel [3,6]. Interfacial polycondensation route; bisphenol A is dissolved in aq. NaOH soln., to which is added a mixture of isophthaloyl chloride and phosgene in an organic solvent (e.g. CCl_4) at room temp. [2,7] tertiary amines, quaternary ammonium or phosphonium salts are used as catalysts; phenols, phenyl chlorocarbonates and aromatic carbonyl halides are used as chain terminators [7]
Applications:

Bisphenol A polycarbonate B-5

Synonyms: *Poly[2,2-propanebis(4-phenyl)carbonate]. Poly[oxycarbonyloxy-1,4-phenylene(1-methylethylidene)-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-2,2-propane-co-carbonic dichloride). Polycarbonate fast cycling resins. Easy flow polycarbonate. Polycarbonate, Uv stabilised. Polycarbonate, Flame retardant. Extrusion polycarbonate. Polycarbonate film*
Related Polymers: Bisphenol A Polycarbonate, Structural foam, Bisphenol A Polycarbonate, Glass fibre reinforced, Bisphenol A Polycarbonate, PTFE lubricated, Bisphenol A Polycarbonate, Carbon fibre reinforced, Bisphenol A Polycarbonate, Glass filled, Bisphenol A Polycarbonate, Metal filled, Polycarbonate/polyester alloys, Polycarbonate/polyethylene alloy, Polycarbonate/polyurethane alloy, Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(ethylene oxide), Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-polysulfone, Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(dimethylsiloxane), Poly[2,2-propanebis(4-phenyl)carbonate]-*block*-poly(methyl methacrylate), Polyester carbonates
Monomers: Bisphenol A, Carbonic dichloride
Material class: Thermoplastic, Fibres and Films
Polymer Type: bisphenol A polycarbonate
CAS Number:

CAS Reg. No.	Note
24936-68-3	
25037-45-0	source: carbonic acid
25971-63-5	source: carbonic dichloride

Molecular Formula: $(C_{16}H_{14}O_3)_n$
Fragments: $C_{16}H_{14}O_3$

Molecular Weight: 18000–22000 (high flow), 74000–91000 (film), 32000 (extrusion grade), 32000–60000 (extruded film), 60000 (min., film cast from soln.)
Additives: May contain impact modifiers (such as graft copolymers based on butadiene and acrylate rubbers); uv stabilisers (benzotriazoles); coloured terminal groups; mould release agents (<1% esters of long-chain carboxylic acids); heat stabilisers (<0.5% phosphites, phosphonites or phosphines if necessary in combination with epoxide compounds, or also organosilicon compounds); for easy-flow, modification is with higher branched alkyl phenyl end groups. Flame retardants include small amounts of salt-like compounds *e.g.* $C_4F_9SO_3K$ or sodium 2,4,5-trichlorobenzenesulfonate; chlorinated organic sulfonates; PTFE
General Information: High flow, uv stabilised, flame retardant, high impact and extrusion versions are all available. Flame retardant grades defined in this entry are only those having a UL94 flammability rating of V0 or 5V. Films may have surface finishes of matt, gloss, velvet, polished, suede, dazzle-free, light diffusing and scratch resistant. Film thicknesses of 125–475 μm are available depending on the surface props. required. Very thin films (<10 μm) are also available

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.196 g/cm^3	amorph. [2,3]
2	d 1.316 g/cm^3	cryst., specific volume 0.76 cm^3 g^{-1} [4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.9×10^{-5} K^{-1}	0-60°, ASTM D696 [1]	L
2	7×10^{-5} K^{-1}	0-100° [5]	L
3	6.4×10^{-5} K^{-1}	0° [6]	L
4	0.00024–0.00026 K^{-1}	87°, glass, 9.8 MPa (100 kg cm^{-2}) [7]	V
5	0.00051–0.00071 K^{-1}	310°, melt [7]	V

Volumetric Properties General: C_p depends on the degree of crystallinity [15,16,17], and $C_p(T)$ for amorph. and crystalline samples may be calculated
Equation of State: Equation of state information has been reported [8,9,10]
Thermodynamic Properties General: ΔC_p (C_p amorph. glass - C_p melt) 0.29 kJ kg^{-1} °C^{-1} (146°) [17]. ΔC_p (C_p crystalline -C_p melt) 0.03 kJ kg^{-1} °C^{-1} (146°) [16,17]
Latent Heat Crystallization: Heat of fusion varies with degree of crystallinity [15,23]; extrapolation gives ΔH_f for the crystalline solid. ΔH_f 109.7 kJ kg^{-1} (26.2 cal g^{-1}) [23]; 127.3 kJ kg^{-1} (30.4 cal g^{-1}) [15]. ΔS_f 0.066 E.U. g^{-1} [18]
Thermal Conductivity:

No.	Value	Note
1	0.18 W/mK	0.00043 cal (cm s °C)$^{-1}$, 20°, thin film [11]
2	0.04 W/mK	-263° [13]
3	0.15 W/mK	-173° [13]
4	0.115 W/mK	-213° [13]

Thermal Diffusivity: α 0.00015 m^2 s^{-1} (1.5 cm^2 s^{-1}, 20°) [12]; α 0.00013 m^2 s^{-1} (1.3 cm^2 s^{-1}, 100°) [12]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.81 kJ/kg.C	solid, 20° [14]	P
2	0.803 kJ/kg.C	cryst., 0.192 cal g^{-1} °C^{-1}, 20°, calc. [17]	P
3	1.178 kJ/kg.C	amorph., 0.281 cal g^{-1} °C^{-1}, 20°, calc. [17]	P

Melting Temperature:

No.	Value	Note
1	233°C	1 atm [18]
2	177–247°C	450–520K, from C_p measurements [16]

Glass-Transition Temperature:

No.	Value	Note
1	145°C	[13,17,19]

Transition Temperature General: Polycarbonate displays a number of secondary (sub-T_g) dynamic relaxations, designated β, γ and δ (in order of decreasing temp.; the glass transition is designated α). These relaxations have been associated with changes in physical props. [24], and have been identified [24,25,26] with molecular motions. T_g is a function of MW [15]
Deflection Temperature:

No.	Value	Note
1	138°C	280°F, 1.82 MPa, ASTM D648 [1]
2	143°C	290°F, 0.45 MPa, ASTM D648[1]

Vicat Softening Point:

No.	Value	Note
1	157.1°C	[20]

Brittleness Temperature:

No.	Value	Note

2	-130°C	[22]

Transition Temperature:

No.	Value	Note	Type
1	50–80°C	[25,27,28]	β
2	-100°C	approx. [25,26,28]	γ

Surface Properties & Solubility:

Solubility Properties General: Most of the commercial polymer is prod. and characterised in soln. [1], the preferred solvent being CH_2Cl_2. Polycarbonate can be combined with a number of other polymers to form blends [29]. Commercial blends include the bulk polymers PC/ABS, PC/PBT and PC/PET, and also the blends PC/acrylic, PC/polyethylene, PC/styrene copolymer and PC/PU. Polycarbonate forms blends, miscible in all proportions, with polymers such as tetramethylpolycarbonate [30], "Kodar" (a copolyester formed from 1,4-cyclohexanedimethanol and a mixture of iso- and terephthalic acids) [31] and poly(vinylidene chloride-*co*-vinyl chloride) (13 wt.% vinyl chloride) [32].

Polycarbonate forms some partially miscible blends, including those with polystyrene [33], PET [34], PBT [35] and polymethylmethacrylate [36]. The polymer-polymer compatibility depends on various factors including composition [33,36,37], temp. [37,38,39], the preparation process [40] and the presence [30] and nature of solvents [40] used. A further compatibilising effect is that of transesterification at high temps. [41,42,43]. Immiscible blends include PC/PVC [32], PC/poly(vinylidene fluoride) [32], PC/ABS [44] and PC/polyethylene [45,46]. Despite their immiscibility, PC/ABS blends display good mechanical props. resulting from strong interfacial adhesion between phases [47,48]. The compatibility of PC/PE blends can be improved by block copolymers [46]. Flory-Huggins interaction parameters [36], spreading coefficients in the melt [49] and interfacial adhesion measurements [48] for pairs of polymers can all be related to miscibility

Cohesive Energy Density Solubility Parameters: Polymer-solvent interaction parameters (Flory-Huggins), 0.42 (CH_2Cl_2, 230°) [50]; 0.28 ($CHCl_3$, 250°) [50]; 1.33 (*n*-decane, 250°) [50]; 0.03 (cyclohexanol, 250°) [50]. Cohesive energy, E_{coh} (563 J g^{-1}) (-273°) [51]; E_{coh} 92400 J mol^{-1} [52,53]. δ 39.8–44.4 $J^{1/2}$ $cm^{-3/2}$ (9.5–10.6 $cal^{1/2}$ $cm^{-3/2}$) (poorly H bonded solvents); δ 39.8–41.9 $J^{1/2}$ $cm^{-3/2}$ (9.5–10 $cal^{1/2}$ $cm^{-3/2}$) (moderately H bonded solvents) [54]; δ 40.2–41 $J^{1/2}$ $cm^{-3/2}$ (9.6–9.8 $cal^{1/2}$ $cm^{-3/2}$) [69]; δ_d 39.8 $J^{1/2}$ $cm^{-3/2}$ (9.5 $cal^{1/2}$ $cm^{-3/2}$) [55]; δ_a 12.6 $J^{1/2}$ $cm^{-3/2}$ (3 $cal^{1/2}$ $cm^{-3/2}$) [55]

Internal Pressure Heat Solution and Miscellaneous: Excess partial molar heats of mixing [50] -4.98 kJ mol^{-1} (-1.19 kcal mol^{-1}, 200–230°, CH_2Cl_2); 4.65 kJ mol^{-1} (1.11 kcal mol^{-1}, 200–250°, *n*-decane); -0.88 kJ mol^{-1} (-0.21 kcal mol^{-1}, 200–250°, C_6H_6); 14.24 kJ mol^{-1} (3.4 kcal mol^{-1}, 200–250°, cyclohexanol)

Plasticisers: Commercial polycarbonate does not usually include plasticisers. Polycarbonate may form plasticised (T_g lowered, elastic modulus lowered) or antiplasticised (T_g lowered, elastic modulus raised) systems with other species. Plasticisers include dibutyl succinate [56] (25°, 0-25 wt.%), dibutyl phthalate [56,57] (25°, greater than 20 wt.%), dioctyl phthalate [58] (0.8 wt.%) and 1,3- and 1,4-dichlorobenzene [58] (0-5 wt.%). Antiplasticisers include diphenyl phthalate [56,57] (25°, 0-25 wt.%) and dinitrobiphenyl (25°, 0-25 wt.%) [56]. Some species show both plasticising and antiplasticising props., depending on the concentration and temp. of the additives [59,60,61,62]. For example di-*n*-butyl phthalate [56,60] is an antiplasticiser at concentrations of 5-20 wt.% and a plasticiser at concentrations greater than 20 wt.%. Plasticisers also accelerate the rate of crystallisation of polycarbonate [63,64]

Solvents/Non-solvents: Sol. CH_2Cl_2, $CHCl_3$, 1,1,2,2-tetrachloroethane, 1,1,2-trichloroethane, *cis*-1,2-dichloroethene [1]. Slightly sol. dioxane, cyclohexanone, DMF, nitrobenzene [1]. Swelling effects are observed with C_6H_6, chlorobenzene, Me_2CO, EtOAc, CCl_4, acetonitrile and 1,1-dichloroethane [1]. Insol. H_2O, aliphatic hydrocarbons, cycloaliphatic hydrocarbons, ethers, carboxylic acids [1]

Wettability/Surface Energy and Interfacial Tension: Surface free energy of solid, γ_s 40.4 mJ m^{-2} (40.4 erg cm^{-2}, 25°) [65]; γ_s 49.5 mJ m^{-2} (49.5 erg cm^{-2}) [69]; γ_s 40.8 mJ m^{-2} (20°) [49]. Dispersion component of surface free energy of solid, γ_s^d 33.6 mJ m^{-2} (33.6 erg cm^{-2}, 25°) [65]; γ_s^d 44.3 mJ m^{-2} (44.3 erg cm^{-2}) [69]. Polar component of surface free energy of solid, γ_s^p 6.8 mJ m^{-2} (6.8 erg cm^{-2}, 25°) [65]; γ_s^p 5.69 mJ m^{-2} (5.69 erg cm^{-2}) [69]. Critical surface tension, γ_c 34.5 mJ m^{-2} (34.5 dyne cm, 25°) [66]. Temp. dependence of solid surface tension 0.06 mJ m^{-2} K^{-1} (0.06 dyne cm^{-1}) [66]; 0.065 mJ m^{-2} K^{-1} (estimated from similar polymers) [49]. Surface free energy of melt, γ_m 24.6 mJ m^{-2} (calc., 270°) [49]. Dispersion component of surface free energy of melt, γ_m^d 18 mJ m^{-2} (calc., 270°) [49]. Polar component of surface free energy of melt, γ_m^p 6.6 mJ m^{-2} (calc., 270°) [49]. Work of adhesion between polycarbonate and water 97 mJ m^{-2} (pH 1-4, room temp.) [67]; 86 mJ m^{-2} (pH 10-14, room temp.) [67]; W^d 86 mJ m^{-2} (calc., room temp.) [67]; $W^{acid\text{-}base}$ 11 mJ m^{-2} (calc., room temp.) [67]. Work of adhesion between polycarbonate and ice, W 105 mJ m^{-2} (-15°) [68] Wettability may be improved by irradiation with argon ions [251]

Transport Properties:

Polymer Melts: Power law parameters have been reported [75,76]

Permeability of Gases: Permselectivity for CO_2/CH_4 19 (35°, 10 atm) [77,78]; 24.2 (35°, 5 atm, measured for mixture of gases) [79]; 23.3 (35°, 20 atm) [81]; 22.8 (35°, 2 atm) [83]; 20 (35°, 5 atm) [85]; 3.7 (175°, 5 atm) [85]. Permselectivity for O_2/N_2: 4.3 (35°, 2 atm) [78]; 4.8 (35°, 2 atm) [77]; 5.13 (35°, 1 atm) [81]. Permselectivity for He/CH_4: 35 (35°, 10 atm) [78]; 32.3 (35°, 2 atm) [83]; 53 (35°, 20 atm) [81]. Permselectivity for He/N_2: 45 (35°, 5 atm) [85]; 11 (175°, 5 atm) [85]. Permselectivity for CO_2/O_2: 4.3 (25°, 1 atm, 0% relative humidity) [80]. Pre-exponential permeability factor, P_o [CO_2] 7.5 × 10^{-11} cm^3 cm^{-1} s^{-1} Pa^{-1} (1000 Barrers, 35–120°, 5 atm) [85]; [CH_4] 6.3 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (8400 Barrers, 35–120°, 5 atm); [He] 8.25 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (11000 Barrers, 35–125°, 5 atm) [85]; [O_2] 4.1 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (5400 Barrers, 35–125°, 5 atm) [85], 7 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (9.3 × 10^{-8} cm^3 cm^{-1} s^{-1} $(cmHg)^{-1}$, 35–65°, 1 atm) [82]; [N_2] 3.8 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (5000 Barrers, 35–120°, 5 atm) [85], 1.01 × 10^{-10} cm^3 cm^{-1} s^{-1} Pa^{-1} (13.42 × 10^8 cm^3 cm^{-1} s^{-1} $(cmHg)^{-1}$, 35–65°, 1 atm) [82]. Gas permeability decreases with increasing gas pressure up to about 20 atm [87,88,89,90]. However, for CO_2 at pressures above about

50 atm (800 psi) an increase in pressure leads to a rapid increase in permeability, due to the onset of plasticisation [89]. Subsequent depressurisation from about 60 atm (900 psi) shows hysteresis. This effect is known as "conditioning", and can be achieved by exposing the polycarbonate film to CO_2 at high pressures for about 2–7 days [89,91,92]. Hysteresis occurs for CO_2 at pressures of 40 atm (600 psi) and 61 atm (900 psi), but not 20 atm (300 psi) [92], and does not appear to occur with other gases [89]. Changes induced by CO_2 conditioning include increased permeability to other gases [84,89], without significant loss in permselectivity [84], which gives improvements in separation membrane props.

Permeability of Liquids: Liq. transport in polycarbonate is complicated by solvent induced crystallisation [94,95,96,97,98,99]. One consequence of crystallisation by common solvents (such as Me_2CO, EtOAc or xylene) is a loss of mech. props. [100,101]. Diffusion coefficient, D [Me_2CO] 74.2×10^{-8} cm^2 s^{-1} (20°) [96], 6.3×10^{-7} cm^2 s^{-1} (25°) [102], 5.5×10^{-7} cm^2 s^{-1} (24–26°) [100], 4×10^{-7} cm^2 s^{-1} (25°) [94]; [CCl_4] 1.9×10^{-9} cm^2 s^{-1} (25°) [102]; [toluene] 13.8×10^{-7} cm^2 s^{-1} (25°) [102]; [MeOH] 4.3×10^{-10} cm^2 s^{-1} (22°) [97]; [xylene] 3.6×10^{-8} cm^2 s^{-1} (20°) [96]; [methyl isobutyl ketone] 3×10^{-8} cm^2 s^{-1} (20°) [96]; [1,2-dichloroethane] 4.6×10^{-7} cm^2 s^{-1} (25°) [104]; [CH_2Cl_2] 1.4×10^{-7} cm^2 s^{-1} (25°) [104]; [H_2O] 6.5×10^{-8} cm^2 s^{-1} (23°) [103], 6×10^{-7} cm^2 s^{-1} (80°) [105], 1×10^{-6} cm^2 s^{-1} (96°) [103], 8.7×10^{-7} cm^2 s^{-1} (100°) [105]

Volatile Loss and Diffusion of Polymers: Volatile loss of 2.4-3.05 wt.% occurs upon heating in air at 350° [83,106]

Permeability and Diffusion General: Diffusity, D [He] 5×10^{-6} cm^2 s^{-1} (35°, 10 atm) [78], 7×10^{-6} cm^2 s^{-1} (35°) [86], 64.5×10^{-7} cm^2 s^{-1} (35°, 20 atm) [82], 5.5×10^{-6} cm^2 s^{-1} (35°, Henry) [88], 74.4×10^{-6} cm^2 s^{-1} (35°, Langmuir) [88]; [CO_2] 3.2×10^{-8} cm^2 s^{-1} (35°, 10 atm) [77,78], 30.9×10^{-9} cm^2 s^{-1} (35°, 20 atm) [81,82], 62.2×10^{-9} cm^2 s^{-1} (35°, Henry) [82,87,88], 48.5×10^{-9} cm^2 s^{-1} (35°, Langmuir) [82,87,88]; [O_2] 5×10^{-8}-6×10^{-8} cm^2 s^{-1} (25°, 0.03 atm) [93], 5.8×10^{-8} cm^2 s^{-1} (35°, 2 atm) [78], 56.1×10^{-9} cm^2 s^{-1} (35°, 1 atm) [81,82]; [Ar] 3.3×10^{-8} cm^2 s^{-1} (35°, Henry) [88], 59.4×10^{-10} cm^2 s^{-1} (35°, Langmuir) [88]; [N_2] 18.1×10^{-9} cm^2 s^{-1} (35°, 1 atm) [81,82], 17.6×10^{-9} cm^2 s^{-1} (35°, Henry) [82,87,88], 50.9×10^{-9} cm^2 s^{-1} (35°, Langmuir) [82,88], 51.4×10^{-10} cm^2 s^{-1} (35°, Langmuir) [87]; [CH_4] 4.8×10^{-9} cm^2 s^{-1} (35°, 20 atm) [81,82], 10.9×10^{-9} cm^2 s^{-1} (35°, Henry) [82,87], 1.3×10^{-9} cm^2 s^{-1} (35°, Langmuir) [82,87]

Water Content: Water is absorbed when polycarbonate is immersed. At lower temps. (0-60°) the water molecules are thought to form hydrogen bonds with the carbonate residue [109]. Polycarbonate immersed in water at about 100° absorbs water, the distribution of which changes with time. Initially (20-24h), the water is evenly distributed throughout the polymer matrix [110], and after about 10 days pools of aggregated water or clusters also form g, cluster formation is thought to be due to hydrol. [111,112]. The formation of clusters has an activation energy of 155 kJ mol^{-1} (37 kcal mol^{-1}) [111]

Mechanical Properties:

Mechanical Properties General: Tensile stress-strain curve at 25° [113,114,115,116]. Stress-strain behaviour is very sensitive to the testing temp.. The yield stress is less affected by changes in the strain rate [113,114,117,120,121,122,123,124]. Tensile stress-strain curve shows a viscoelastic region up to the yield point, then a stress drop, then necking occurs and increase in stress until the break point [114,116,117,118]

Tensile (Young's) Modulus:

No.	Value	Note
1	2300 MPa	room temp., strain rate 0.00083 s^{-1} [125]
2	2200 MPa	DIN 53 454 [126]
3	2160 MPa	21°, 100 mm min^{-1} [127]
4	2410 MPa	23°, ASTM D638 [122]
5	2068–2275 MPa	300-330 kpsi, ASTM D689-44 [62]

Flexural Modulus:

No.	Value	Note
1	2585 MPa	375 kpsi, ASTM D790 [128]
2	2209 MPa	21°, calc. [127]
3	2360 MPa	ambient temp. [129]
4	2151 MPa	312 kpsi [130]

Tensile Strength Break:

No.	Value	Note	Elongation
1	121 MPa	strain rate 10% min^{-1} [122]	85%
2	120 MPa	strain rate 0.0017 s^{-1} [126]	65%
3	100.7 MPa	strain rate 5.08 mm min^{-1} [121]	74%
4	60.2–61.8 MPa	strain rate 5% min^{-1} [125]	106%
5	69 MPa	[135]	107%

Compressive Modulus:

No.	Value	Note
1	1990 MPa	289 kpsi, 22° [131]
2	1660 MPa	241 kpsi, ASTM D695 [128]
3	2030 MPa	20.3 kbar, room temp. [132]

Elastic Modulus:

No.	Value	Note
1	1740 MPa	253 kpsi, 22° [131]
2	4940 MPa	4.94×10^{10} dyn cm^{-2}, 25° [136]
3	420 MPa	23°, shear <0.15 [126]

Poisson's Ratio:

No.	Value	Note
1	0.31	22° [131]
2	0.38	room temp. [132]
3	0.36	room temp. [133]
4	0.3043–0.3135	room temp. [134]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	68 MPa	6.9%	strain rate 10% min^{-1} [122]
2	72 MPa		strain rate 0.0017 s^{-1} [126]
3	64.81 MPa		strain rate 5.08 mm min^{-1} [121]
4	58–59.2 MPa	6.6–7.0%	strain rate 5% min^{-1} [125]
5	65 MPa		[135]

Flexural Strength Yield:

No.	Value	Note
1	98.6 MPa	14.3 kpsi [129]
2	76–90 MPa	11–13 kpsi, ASTM D790 [128]

Compressive Strength:

No.	Value	Note
1	75.8 MPa	11 kpsi, ASTM D695 [128]
2	72.52 MPa	10.52 kpsi, 22°, 6.9% strain [131]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2200 MPa	-268° [142]	Complex shear storage modulus
2	1900 MPa	-196° [142]	Complex shear storage modulus
3	1300 MPa	-190° [140]	Complex shear storage modulus
4	1000 MPa	20° [129]	Complex shear storage modulus
5	740 MPa	20° [140]	Complex shear storage modulus
6	700 MPa	140° [129]	Complex shear storage modulus
7	550 MPa	140° [140]	Complex shear storage modulus

Complex Moduli: Tensile storage modulus decreases slowly with increasing temp. [137,138]. The degree of crystallinity is also found to be important: 2300 MPa (23°, 110 Hz, 27% crystallinity), 1500 MPa (23°, 110 Hz, 0% crystallinity) [138]. Above T_g, E′ falls rapidly with increasing temp. [139]. Above T_g, E′ also increases with frequency [139]. The complex shear storage modulus decreases with temp., with a more rapid decrease occurring above about 130° [116,129,140] and below about -100° [140,142]. Loss tangent has been reported [116,138,140,141]

Impact Strength: Izod impact strength varies with notch depth. Dart drop impact strength 2013–2753 J m^{-2} [147]. Charpy impact energy 3100 J m^{-2} (sharp notch 25 μm, ASTM D256) [148], 12 kJ m^{-2} (blunt notch, 250 μm, ASTM D256) [148], 9800 J m^{-2} (2500 μm) [135]

Viscoelastic Behaviour: A typical creep-time curve has been reported [149,150,151,152]. Below the T_g, the creep rate increases with increasing temp. [150] and with increasing applied stress [152,153]. Stress relaxation curves have been reported [152,153,154]. Time-temp. shift factors have been reported [139,157,158,159]

Hardness: Rockwell M65 (ASTM D785) [144], Rockwell M70 (ASTM D785) [128], Rockwell M80 (ASTM D785) [130], Rockwell R118 (ASTM D785) [128], Rockwell R115 (ASTM D785) [143]

Failure Properties General: Polycarbonate yields before fracture for a wide range of strain rates (0.01-2000 s^{-1}) and over a wide range of temps. (-100-200°) [117]. The mode of failure (brittle/ductile) depends on temp. [146,160], and sample thickness [121,160,161,162,163]. At room temp., thin samples (approx. 3 mm) show ductile failure and thicker specimens show brittle failure. At temps. below -100°, samples show brittle failure. K_I 3.0–3.3 MPa $m^{1/2}$ (23°) [164], 3.7 MPa $m^{1/2}$ (room temp.) [148], 3.3 MPa $m^{1/2}$ (20°) [165], 3.6 MPa $m^{1/2}$ (25°) [165], 3.15–3.31 MPa $m^{1/2}$ (ASTM E399-83) [167]

Fracture Mechanical Properties: The shape of the fatigue fracture lifetime curve depends on temp. and stress: above 75° typical decay behaviour is seen, but below 75° S-shaped fatigue fracture lifetime curves are observed [168,169]. There are two types of fatigue failure: shear fracture cracking and craze growth, with the latter predominating at low temps. [168]. For a fixed temp. crazing occurs at low stresses, with shear fracture predominating at higher stresses and necking occurring at still higher stresses [168,170]. Other factors include the frequency of the applied stress, and the history of the sample. Within these constraints the following fatigue strengths can be considered 7.8 MPa (10^7 cycles, 20°, JIS K7119, 30 Hz) [171], 4.9 MPa (10^7 cycles, 50°, JIS K7119, 30 Hz) [171]. Other values have been reported [168,169]. Strain rate sensitivity index, 0.0102–0.028 [172], 0.028 [119], 0.027 [126]. Shear strength at break, 63.4 MPa (9.2 kpsi, ASTM D732) [128], 56 MPa (23°, shear rate 0.003 s^{-1}) [126]
Friction Abrasion and Resistance: Dynamic friction coefficient, μ_{dy}, 0.46 (27°, polymer/hardened steel, 10.7 cm s^{-1}) [173], 0.45 (polymer/steel, 173–202 cm s^{-1}) [128], 0.35 (polymer/steel, 1 cm s^{-1}) [128], 0.38–0.42 (23°, polymer\cold rolled steel, 0.08 cm s^{-1}, ASTM D1894) [174]. Abrasion resistance 24 mg (1000 cycles)$^{-1}$ (ASTM D1044, Taber CS-17 test) [128]
Izod Notch:

No.	Value	Notch	Note
1	107–160 J/m	Y	2-3 ft lb in^{-1}, 0.5 in., ASTM D256 [130,143]
2	160 J/m	Y	3 ft lb in^{-1}, 0.245 in., ASTM D256-56 [144]
3	640–854 J/m	Y	12-16 ft lb in^{-1}, 0.125 in., ASTM D256 [1,140,143,145,146]

Electrical Properties:

Electrical Properties General: Polycarbonate conducts electricity at moderate to high fields by two mechanisms: the Richardson-Schottky mechanism of charge transport at moderate fields (50 to 1000 V) and space charge-limited conduction at high fields (> 100 V) [175,176]. Dielectric permittivity is approx. independent of temp. in the range -30° to 125° [128,177], but increases with increasing temp. above 125° [177]. It has a small inverse dependence on frequency. Dielectric strength varies with temp. and sample thickness. tan δ depends on temp. and frequency [1,128, 180,181]
Surface/Volume Resistance:

No.	Value	Note	Type
4	$0.9–1.1 \times 10^{15}$ Ω.cm	500 V [179]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3.47	800 Hz	30°, from graph [177]
2	3.63	800 Hz	160° [177]
3	3.8	800 Hz	170° [177]
4	3.17	60 Hz	23°, ASTM D150 [1,128]
5	2.96	1 MHz	23°, ASTM D150 [1,128]
6	2.74	10 GHz	23°, ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	153.9 kV.mm^{-1}	3910 V mil^{-1}, 25°, 1.5 mil, ASTM D149 [128]
2	44.5 kV.mm^{-1}	1130 V mil^{-1}, 25°, 23 mil, ASTM D149 [128]
3	26.9 kV.mm^{-1}	683 V mil^{-1}, 23°, 55 mil [178]
4	15.7 kV.mm^{-1}	400 V mil^{-1}, 25°, 125 mil, ASTM D149 [128]
5	23.6 kV.mm^{-1}	600 V mil^{-1}, 100°, 125 mil, ASTM D149 [128]

Arc Resistance:

No.	Value	Note
1	10–11s	23°, stainless-steel electrodes, ASTM D495 [1,128]
2	12s	ASTM D495 [143]
3	120s	23°, tungsten electrodes, ASTM D495 [1]

Complex Permittivity and Electroactive Polymers: The variation of complex relative permittivity, as a function of frequency and temp., has been reported [128,180,182,183,184]. Imaginary relative permittivity has been reported [180,182,183,184]
Magnetic Properties: Magnetic susceptibility, -0.981×10^{-5} – -0.931×10^{-5} (room temp., 0.3–0.6 T) [185]. Details of magnetic birefringence have been reported [186]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001–0.03	0.1–1 MHz	-200–140° [1,128,180]
2	0.03–25	0.1–1 MHz	140–190° [1,180]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.61097	435.8 nm [187]
2	1.5995	486.1 nm [188]
3	1.5976–1.6006	514.5 nm [189]
4	1.59006	546.1 nm [187]
5	1.58545	587.6 nm [187]
6	1.58071	643.8 nm [187]
7	1.58	656.3 nm [188]
8	1.4237	435.8 nm, CH_2Cl_2 [72]
9	1.4445	435.8 nm, $CHCl_3$ [72]

Transmission and Spectra: 75–84% transmittance (400–450 nm, 5.08 nm thick film) [190]. 84–89% transmittance (450–900 nm, 5.08 nm thick film) [190]. 90% transmittance (400–800 nm, 100 μm thick film) [1]. Transmission of x-rays 91% (5.37 Å, 2 μm thick film) [191], 85% (7.12 Å, 2 μm thick film) [191], 78% (8.34 Å, 2 μm thick film) [191], 56% (11.91 Å, 2 μm thick film) [191]. Uv [177,187,192,193], fluorescence [192,193]and ir [1,175,187,194] spectral data have been reported
Molar Refraction: Concentration dependence of refractive index, dn/dc 0.162 ($CHCl_3$, 546.1 nm) [73], 0.156 ($CHCl_3$, 546.1 nm) [74], 0.177 (CH_2Cl_2, 435.8 nm) [72], 0.188 (dioxane, 546 nm) [195]
Total Internal Reflection: Intrinsic birefringence 0.189 (546 nm) [196], 0.132 (514.5 nm) [189], 0.186–0.198 (546 nm) [197]. Stress optical coefficient 0.089×10^{-9} Pa^{-1} (room temp.) [198], 0.087×10^{-9} Pa^{-1} (87×10^{-13} $dyne^{-1}$ cm^2, 150°) [199], 0.035×10^{-9} Pa^{-1} (166–170°) [139], 5×10^{-9} Pa^{-1} (166–170°) [139], 5.9×10^{-9} Pa^{-1} (157°) [200], 3.5×10^{-9} Pa^{-1} (200°, melt) [201], 3.45×10^{-9} Pa^{-1} (201–233°, melt) [198]
Volume Properties/Surface Properties: Front surface reflectance 5.476% (435.8 nm) [187], 5.190% (546.1 nm) [187], 5.063% (643.8 nm) [187]. Rayleigh light scattering loss, $\alpha_{anisotropic}$ 0.106 db m^{-1}

(633 nm) [202], $\alpha_{isotropic}$ 0.06 db m^{-1} (633 nm) [202]. Clarity transparent [143]

Polymer Stability:

Polymer Stability General: Shows good stability under a wide range of conditions
Thermal Stability General: Has high degree of thermal stability. Remains essentially intact up to 400°, although degradation begins above 300°, and rearrangement above T_g [203]
Upper Use Temperature:

No.	Value	Note
1	100–125°C	air [207]
2	135–140°C	[1]
3	135°C	[1]

Decomposition Details: At temps. between 300 and 400°, mechanism of decomposition depends on the conditions [208,209]. In a sealed evacuated environment, viscosity decreases; a continuously evacuated flask results in gel formation. Mechanism is via an ionic ester interchange route, or by free radical scission [205,211] giving cyclic dimers, cross-linked species and CO_2. Above 420°, a complex series of degradation reactions occur, resulting in branching, cross-linking, formation of ester, ether and unsaturated compds. and other products [204,206]. Most functionality of the original polymer is removed by 490°; above 500° aromatisation, and above 540° extensive carbonisation. Maximum rate of decomposition temp. 470° (N_2) [210]; 458–462° (N_2, or vacuum) [205]. Temp. 35% wt. loss 400° (N_2) [203]; temp. 75% wt. loss 42–52° (He) [206]. Polymer appears optically black at 490° [204]. Char yield 30% (800°, no fire retardant) [212]. Char yield 27% (800°, N_2, fire retardant) [212]
Flammability: Self extinguishing (ASTM D635) [1,128]. Flammability rating HB (1.57 mm), V2 (1.57 mm, 3.18 mm, UL 94) [213]; V0 (0.8 mm, 3.2mm, flame retardant, UL 94); 5V (3.2 mm, flame retardant, UL 94) [210]. Limiting oxygen index 32.0% (3 mm, no flame retardant, ASTM D2863) [212]; 33.5% (3 mm, flame retardant, ASTM D2863) [212]
Environmental Stress: Processed polycarbonate gradually becomes more glass-like with age, resulting in a decrease in Young's modulus [214,215]. Elongation at break also decreases over time as does loss tangent [215]. Exhibits good resistance to atmospheric oxygen between -30-100° [1,216]; however, ozonolysis occurs on exposure to ozone [217]. Non uv-stabilised polycarbonate outdoors for several years becomes yellow, and cross-linked, with evidence of pitting and cracking [218]. Photochemical reactions taking place vary in type with wavelength of radiation [207,218,219]. Photo-oxidation predominates in natural weather conditions, in more humid conditions mech. props. are affected as well as yellowing; polymer loses ductility and becomes brittle [221,222]. The effects are reduced by the use of stabilisers [222]. Critical strain, below which cracking or crazing does not occur on exposure to liquids, increases with T_g of swollen polymer. Value decreases as solubility increases [95,223] and with variation of solvent, e.g. as chain length increases [69,95,223]
Chemical Stability: Commercial grades may contain uv stabilisers or flame retardants. Solvent resistance is limited; unaffected by aliphatic hydrocarbons and alcohols except MeOH; swollen or dissolved by most other solvents [1,69,95,128]. Also fully resistant to aq. solns. of soap, detergents, bleaches, oils, waxes, fruit juices, photographic chemicals, foodstuffs including beverages and dyes and pigments [1,128]. Stable to dilute and conc. oxidising agents and weak alkali but degraded by ammonia and amines [1,230]. Rapidly attacked by strong alkali solns. at room temp. Good resistance to salt solns. at room temp. [1]. Degraded by organic salts at melt temp.
Hydrolytic Stability: Very stable to hydrol. at room temp. [1,103,222] but at higher temp. results in breakdown of mech. props. [105,112,222]. Long term use above 60° in water is not recommended. Exposure to water vapour results in increasing brittleness, [236,237] and rate of hydrol. is dependent on temp. and relative humidity [236,238]. Hydrol. mechanism involves chain scission [239,240,241] and decarboxylation [240] but at higher temps. annealing occurs [239]. This results in a self-catalytic hydrol. process [241,243]. Presence of glass enhances hydrol. [105,242]
Biological Stability: Soil burial shows no real effects from soil corrosion agents [1,244], microorganisms or insects. Non toxic to animals [1,245]. Has demonstrated oestrogenic effects in rats [1]
Stability Miscellaneous: Annealing increases yield stress [124,167,214,215,246,247,248,249,250], decreases Young's modulus [248] and increases brittleness [167,247,249], reduces loss tangent [215], and reduces fatigue lifetime [250]. Annealing effect increases with increasing temp. [124,248]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by interfacial polymerisation of Bisphenol A disodium salt in aq. alkaline soln. or suspension via reaction with phosgene in the presence of an inert organic solvent. The oligocarbonates formed are condensed to high MW polycarbonates over catalysts such as tertiary amines. For processing there is a need to keep the materials dry, so product stored in vacuum sealed tins heated for several hours at 110° prior to use. Processing by injection moulding, extrusion, compression moulding, cold forming, and casting. Processing temp. between 230° and 300°. Blow moulded articles, films, sheets, profiles, tubes and rods are formed by conventional processing methods. Melt temp. at die outlet 230–236°; moisture content must be below 0.01%. Films may be cast from soln. or extruded (blow moulded). Extremely thin films (<10 μm) are cast on to a carrier film from which they are not separated before the final manufacturing step (e.g. winding capacitors)
Mould Shrinkage (%):

No.	Value
1	0.5–0.7%
2	0.3–0.8%

Applications: Electrical applications (for insulation) as voltage carrying components, covers for electrical equipment, coil formers. Household and consumer articles (special grades conform to food laws) as housing for razors; in kitchen sinks and appliances. Automotive applications as light coverings; in motorcycle windscreens, ventilation and radiator grilles, aircraft windows, motorcycle safety helmets, safety glasses, helmet visors. Photographic and optical equipment in camera housings, binoculars, slide projectors, microscope components. Sporting goods (ski sticks, surfboards). Used in construction for windows, double sheets for glazing greenhouses and industrial windows, dome construction. Computer and office machines. Medical applications as blood filters, dialysers, pacemaker components, sterilising equipment. Used in packaging (transparent bottles and containers, re-usable packaging, e.g. baby bottles, food containers, milk pails, electronic packaging). Laser-optical data storage systems such as CDs. Telecommunications in telephone switching mechanisms

Bisphenol A polycarbonate, Carbon fibre reinforced B-6

Synonyms: *Poly[2,2-propanebis(4-phenyl)carbonate], Carbon fibre reinforced*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polycarbonate, carbon fibre reinforced, PTFE lubricated, Glass fibre reinforced and carbon fibre reinforced polycarbonate
Monomers: Bisphenol A, Carbonic dichloride
Material class: Thermoplastic, Composites
Polymer Type: Bisphenol A polycarbonate
CAS Number:

CAS Reg. No.
24936-68-3
25037-45-0

Molecular Formula: $(C_{16}H_{14}O_3)_n$
Fragments: $C_{16}H_{14}O_3$
Additives: 10–40% Carbon fibre
General Information: The props. of carbon fibre reinforced polycarbonate depend on a range of factors including fibre type and treatment, processing conditions, fibre orientation and fibre concentration. Often the material tested is in the form of a single coated fibre, rather than a composite of fibres and polymer matrix. Flame retardant and nickel coated versions available

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.23 g/cm^3	10% carbon fibre [1]
2	d 1.24 g/cm^3	10% carbon fibre [1]
3	d 1.29 g/cm^3	20% carbon fibre [1]
4	d 1.34 g/cm^3	30% carbon fibre [1]
5	d 1.33 g/cm^3	30% PAN based carbon fibre [1]
6	d 1.35 g/cm^3	30% pitch carbon fibre [1]
7	d 1.38 g/cm^3	40% carbon fibre [1]
8	d 1.28 g/cm^3	
9	d 1.37 g/cm^3	

Thermodynamic Properties General: The longitudinal thermal conductivity increases linearly with increasing fibre content up to about 20% volume fraction. Above 20% volume fraction the conductivity is constant [2] and is about 50 times that of unreinforced polycarbonate and is similar to that of metal alloys such as stainless steel [2]. The transverse thermal conductivity is much less than the longitudinal value. From 5–30% volume carbon fibre the thermal conductivity increases approx. linearly with carbon fibre level without reaching saturation point
Thermal Conductivity:

No.	Value	Note
1	1.4–2.1 W/mK	longitudinal, 5% pitch carbon fibre [2]
2	3.3–4.9 W/mK	longitudinal, 10% vol. pitch carbon fibre [2]
3	8.6–10.4 W/mK	longitudinal, 20% vol. pitch carbon fibre [2]
4	0.33 W/mK	transverse, 10% vol. pitch carbon fibre [2]
5	0.49 W/mK	transverse, 20% vol. pitch carbon fibre [2]
6	0.63 W/mK	transverse, 30% vol. pitch carbon fibre [2]

Melting Temperature:

No.	Value	Note
1	288–316°C	20–40% carbon fibre [1]

Glass-Transition Temperature:

No.	Value	Note
1	138°C	0% carbon fibre [3]
2	136°C	10% wt. carbon fibre [3]
3	134°C	20% wt. carbon fibre [3]
4	133°C	30% wt. carbon fibre [3]
5	133°C	40% wt. carbon fibre [3]

Transition Temperature General: T_g of carbon fibre composites depends on the formation conditions [3], and decreases with increasing carbon fibre content [3]
Deflection Temperature:

No.	Value	Note
1	138–143°C	280–290°F, 1.8 MPa, 10% carbon fibre [1]
2	146°C	294°F, 1.8 MPa, 20% carbon fibre [1]
3	146–149°C	295–300°F, 1.8 MPa, 30% carbon fibre [1]
4	149°C	300°F, 1.8 MPa, 30% PAN based carbon fibre [1]
5	143°C	290°F, 30% pitch carbon fibre [1]
6	147–149°C	296°F, 1.8MPa, 40% carbon fibre [1]

Surface Properties & Solubility:

Wettability/Surface Energy and Interfacial Tension: Generally, the adhesion between carbon fibres and the polycarbonate matrix is relatively weak, with failure occurring at the fibre-matrix interface, rather than cohesive failure of the matrix [4,5,7]. SEM studies show single fibres pulled out from the composite in tensile tests [5,7,8,9]. Adhesion, however, does depend on the nature of the carbon fibre [4,7], and can be improved by oxidation of the fibres. For example, treatment with RF plasma in oxygen [6] or oxygen at 400° for 30 mins. [5] gives improved adhesion; still better results are achieved using 0.75% ozone at 100° for 1 min. [5]. In the case of ozone, SEM shows bundles of fibres pulled out from the composite - the fibres are linked together with polymer [5]. Adhesion also improves with increased processing temp. [5]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.1 %	10% carbon fibre [1]
2	0.1 %	20% carbon fibre [1]
3	0.04–0.08 %	30% carbon fibre [1]
4	0.1 %	40% carbon fibre [1]

Mechanical Properties:

Mechanical Properties General: Carbon fibre reinforced polycarbonate shows greatly increased tensile and flexural moduli and increased tensile and flexural strengths relative to the unreinforced polycarbonate; these values increase with increasing carbon fibre content. However, the improvement in strength is achieved at the expense of toughness. The composites are harder than their unreinforced counterparts, but display brittle fracture. The mech. props. vary with factors such as fibre type and orientation as well as concentration. Elongation at break 4% (20% wt. carbon fibre) [1], 3% (30% wt. carbon fibre) [1], 3% (40% wt. carbon fibre) [1]

Tensile (Young's) Modulus:

No.	Value	Note
1	7310 MPa	1060 kpsi, 10% vol. graphite, random fibre orientation [10]
2	11240 MPa	1630 kpsi, 10% vol. graphite, unidirectional fibre orientation [10]
3	8550 MPa	1240 kpsi, 20% vol. graphite, random fibre orientation [10]
4	12580 MPa	1825 kpsi, 20% vol. graphite, unidirectional fibre orientation [10]
5	11030 MPa	1600 kpsi, 30% vol. graphite, random fibre orientation [10]
6	28950 MPa	4200 kpsi, 30% vol. graphite, unidirectional fibre orientation [10]
7	10620 MPa	1540 kpsi, 40% vol. graphite, random fibre orientation [10]
8	23920 MPa	3470 kpsi, 40% vol. graphite, unidirectional fibre orientation [10]
9	109000–121000 MPa	57-62% vol. PAN based carbon fibre, commercial oxidation treatment, unidirectional fibre orientation [5]

Flexural Modulus:

No.	Value	Note
1	42000 MPa	50% vol. unidirectional carbon fibre, longitudinal [11]
2	8000 MPa	50% vol. unidirectional carbon fibre, transverse [11]

Tensile Strength Break:

No.	Value	Note	Elongation
1	64.1 MPa	9.3 kpsi, 10% vol. graphite, random fibre orientation [10]	1.1%
2	97.9 MPa	14.2 kpsi, 10% vol. graphite, unidirectional fibre orientation [10]	1.4%
3	68.9 MPa	10 kpsi, 20% vol. graphite, random fibres [10]	0.84%
4	176.5 MPa	25.6 kpsi, 20% vol. graphite, unidirectional fibres [10]	1.66%
5	77.9 MPa	11.3 kpsi, 30% vol. graphite, random fibres [10]	0.64%
6	261 MPa	37.8 kpsi, 30% vol. graphite, unidirectional fibres [10]	1.17%
7	78.6 MPa	11.4 kpsi, 40% vol. graphite, random fibre orientation [10]	0.83%
8	345 MPa	40% vol. graphite, unidirectional fibres [10]	1–40%

Flexural Strength at Break:

No.	Value	Note
1	138–152 MPa	20–22 kpsi, 10% carbon fibre [1]
2	220–221 MPa	31.9 kpsi, 20% carbon fibre [1]
3	247–262 MPa	35.9–38 kpsi, 30% carbon fibre [1]
4	248 MPa	36 kpsi, PAN based carbon fibre [1]
5	117 MPa	17 kpsi, pitch carbon fibre [1]
6	251–254 MPa	36.4 kpsi, 40% carbon fibre [1]
7	1435.8–1571.2 MPa	57–62% vol. PAN based carbon fibre, commercially oxidised fibres, unidirectional orientation, DIN 29971 [5]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	103.4 MPa	1–4%	15 kpsi, 10% wt. carbon fibre [1]
2	110.3 MPa		16 kpsi, 10% wt. carbon fibre [1]
3	159 MPa		20% wt. carbon fibre [1]
4	157 MPa		22.8 kpsi, 20% wt. carbon fibre [1]
5	171.1 MPa		30% wt. carbon fibre [1]
6	169–172 MPa		24.5–25 kpsi, 30% wt. carbon fibre [1]
7	165 MPa		24 kpsi, 30% wt. PAN based carbon fibre [1]
8	80 MPa		11.6 kpsi, 30% wt. pitch carbon fibre [1]
9	176 MPa		40% wt. carbon fibre [1]
10	179 MPa		26 kpsi, 40% wt. carbon fibre [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	3767–5613 MPa	53% vol. graphite [12]	shear modulus

Hardness: Rockwell M85 (20% carbon fibre) [1]; M85 (30% carbon fibre) [1]; R110 (30% carbon fibre) [1]; M90 (40% carbon fibre) [1]

Failure Properties General: Generally, in tensile tests of carbon fibre reinforced polycarbonate the mode of failure is primarily fibre-matrix debonding [7,8,13] followed by fibre cracking and pull-out [13]. However, the failure mode is influenced by the fibre type and any treatment (e.g. oxidation) [4,5,6]. These features are reflected in the shear strength values.

Fracture Mechanical Properties: Shear strength 18 MPa (single filament, PAN based graphite fibre) [8]; 62.2–90.6 MPa (single filament, high strength carbon fibre) [7]; 39.9 MPa (20% vol. unidirectional graphite fibre) [9]. Engineering shear strength 79.5–101.1 MPa (53% vol. graphite) [12]. Shear strength 60.7 MPa (57–62% vol. unidirectional PAN based carbon fibre, no oxidation treatment, ASTM D2344) [5]; 62.6 MPa (57–62%

vol. unidirectional PAN based carbon fibre, oxidation treatment, ASTM D2344) [5]; 66.3 MPa (57–62% vol. unidirectional PAN based carbon fibre, ozone treated, ASTM D2344) [5].Carbon fibre reinforced polycarbonate displays brittle fracture [9,11]. Fracture energy (longitudinal) 60 kJ m^{-2} (50% vol. carbon fibre, unidirectional) [11]. Fracture energy (transverse) 3 kJ m^{-2} (50% vol. carbon fibre, unidirectional) [11], 2.9–3.9 kJ m^{-2} (34–40% wt. PAN based carbon fibre) [14]. Under fatigue testing, cohesive failure of the polycarbonate matrix occurs as well as polymer-fibre debonding [7]. Fatigue strength 35 MPa (43000 cycles, 37°, 1 Hz) [7]

Friction Abrasion and Resistance: Carbon fibre at levels of about 15% reduces the friction coefficient of unreinforced polycarbonate by a factor of 2.1 [15]

Izod Notch:

No.	Value	Notch	Note
1	85–96 J/m	Y	1.6-1.8 ft lb in^{-1}, ¼" thick, 10% carbon fibre [1]
2	107 J/m	Y	2 ft lb in^{-1}, 10% carbon fibre [1]
3	96.2 J/m	Y	20% carbon fibre [1]
4	91 J/m	Y	1.7 ft lb in^{-1}, ⅛" thick, 20% carbon fibre [1]
5	96 J/m	Y	1.8 ft lb in^{-1}, ⅛" thick, 30% carbon fibre [1]
6	101–107 J/m	Y	1.9-2 ft lb in^{-1}, 30% carbon fibre [1]
7	96 J/m	Y	1.8 ft lb in^{-1}, 30% PAN based carbon fibre [1]
8	53 J/m	Y	1 ft lb in^{-1}, 30% pitch carbon fibre [1]
9	101.6 J/m	Y	40% carbon fibre [1]
10	80 J/m	Y	1.5 ft lb in^{-1}, ⅛" thick, 40% carbon fibre [1]

Electrical Properties:

Electrical Properties General: The presence of carbon fibres gives composites with greatly reduced electrical resistivity, changing by 5 orders of magnitude between 3 and 20% volume fraction. Volume resistivity 1000–20000 Ω cm (3% vol. pitch carbon fibre) [2]; 8–30 Ω cm (5% vol. pitch carbon fibre) [2]; 0.5–0.8 Ω cm (10% vol. pitch carbon fibre) [2]; 0.07 Ω cm (20% vol. pitch carbon fibre) [2]; 0.04 Ω cm (30% vol. pitch carbon fibre) [2]

Polymer Stability:

Thermal Stability General: Heat resistance decreases as the carbon fibre content increases [15]

Decomposition Details: The temp. at which autocatalytic thermal oxidation of polycarbonate occurs is lower in carbon fibre reinforced polycarbonate than in unreinforced [15]

Flammability: Flammability rating V0 (10% carbon fibre, UL94) [1]; V1 (30% PAN based carbon fibre, UL94) [1]; V1 (30% pitch carbon fibre, UL94) [1]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value
1	0.1–0.25%

Trade name	Details	Supplier
EMI-X	DC-1008 (40%)	LNP Engineering
Karlex BKC	13000 series (20%, 30%, 40%)	Ferro Corporation
PC-1100	H30 (30%)	Bay Resins
PC-CF	flame retardant and nickel coated available	Compounding Technology
Stat-Kon D	carbon powder	LNP Engineering
Stat-Kon DC	1006 (30%), 1002 FR (10%, flame retardant), 1003 FR (15%, flame retardant)	LNP Engineering
Thermocomp DC	1006 (30%)	LNP Engineering

Bisphenol A Polycarbonate, Glass fibre reinforced B-7

Synonyms: *Poly[2,2-propanebis(4-phenyl)carbonate], Glass fibre reinforced*

Related Polymers: Bisphenol A polycarbonate, Polycarbonate foam, Glass fibre reinforced, Polycarbonate, Glass fibre and carbon fibre reinforced, Polycarbonate, Glass fibre reinforced, PTFE lubricated

Monomers: Bisphenol A, Carbonic dichloride

Material class: Thermoplastic

Polymer Type: Polycarbonates (miscellaneous), Bisphenol A polycarbonate

CAS Number:

CAS Reg. No.	Note
24936-68-3	
25037-45-0	source: carbonic acid

Molecular Formula: $(C_{16}H_{14}O_3)_n$

Fragments: $C_{16}H_{14}O_3$

Additives: 10–50% Glass fibre. May include easy mould release agents. Adhesion promoters such as aminosilanes or epoxysilanes are added. Alkali metal salts are added for flame retardancy

General Information: Uv stabilised, flame retardant and extrusion versions available

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26 g/cm^3	10 wt.% glass fibre [1,2]
2	d 1.27 g/cm^3	10 wt.% glass fibre or bead[2]
3	d 1.34–1.35 g/cm^3	20% glass fibre [2]
4	d 1.43–1.44 g/cm^3	30% glass fibre [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.5×10^{-5} K^{-1}	10 wt.% glass fibre, estimated [3]	L
2	3.2×10^{-5} K^{-1}	10 wt.% glass fibre [1]	L
3	2.5×10^{-5} K^{-1}	20 wt.% glass fibre, estimated [3]	L
4	1.9×10^{-5} K^{-1}	30 wt.% glass fibre, estimated [3]	L

Thermal Conductivity:

No.	Value	Note
1	0.66 W/mK	4.6 Btu h^{-1} ft $^{-2}$ °F^{-1}, 10% glass fibre [1]

Melting Temperature:

No.	Value	Note
1	271–316°C	10% glass fibre [2]
2	274–316°C	20% glass fibre [2]
3	293–316°C	30% glass fibre [2]
4	293–316°C	40% glass fibre [2]

Deflection Temperature:

No.	Value	Note
1	138–141°C	1.82 MPa, 10% glass fibre [2]
2	146–149°C	1.8 MPa, 20% glass fibre [2]
3	143–149°C	1.8 MPa, 30% glass fibre [2]
4	146–152°C	1.8 MPa, 40% glass fibre [2]
5	149–154°C	1.8 MPa, 50% glass fibre [2]
6	147–150°C	1.81 MPa, 10% glass staple fibre [2]
7	139–147°C	1.8 MPa, 10% glass fibre [2]
8	129°C	265°F, 1.82 Mpa, 10% glass bead [2]
9	135–147°C	1.81 MPa, 20% glass staple fibre [2]
10	140–147°C	1.8 MPa, 20% glass fibre [2]
11	139°C	1.81 MPa, 30% glass staple fibre [2]
12	142–150°C	1.8 MPa, 30% glass fibre [2]
13	141°C	285°F, 264 psi, 10% glass fibre [1]
14	146°C	1.8 MPa, 30% glass fibre [1]
15	149–154°C	300–310°F, 264 psi, 30–50% long fibre glass [1]

Vicat Softening Point:

No.	Value	Note
1	146–166°C	20% glass fibre [2]
2	151–166°C	30% glass fibre [2]
3	150°C	35% glass fibre [2]
4	166°C	40% glass fibre [2]
5	150–153°C	10% glass staple fibre, B [2]
6	150°C	20-30% glass staple fibre, B [2]

Surface Properties & Solubility:

Surface and Interfacial Properties General: Examination by SEM of glass fibre containing composites shows poor adhesion between fibres and matrix [4,5]. This is improved by silane coupling agents (e.g. aminopropyltriethoxysilane, glycidoxypropyltriethoxysilane, methacryloxypropyltriethoxysilane, aminophenyltriethoxysilane), because of better wetting (but these are susceptible to hydrol.) [4]. Annealing of bare glass fibre composites at 275° for 1h gives a high quality interface. It is thought that sub-microscopic ordered domains form in the PC matrix melt above 265°, and nucleate on the glass surface. SEM shows extensive plastic deformation near the fibre surface [4]. In addition the surface is significantly rougher for glass fibre composites compared with the pure polycarbonate [7]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	5 g/10 min	10% glass fibre [2]
2	5.4 g/10 min	300°, 20 wt.% short glass fibre, 1.2 kg load, ASTM D1238, estimated [6]
3	5–9 g/10 min	20% glass fibre [2]
4	5–10 g/10 min	30% glass fibre [2]
5	5 g/10 min	40% glass fibre [2]

Polymer Melts: Melt flow rate as a function of MW is found to deviate from the theoretical power law expectations, and the deviation increases with increasing glass fibre content [5]. Melt viscosity as shear rate approaches zero 1200 Pa s (290°, 10 wt.% glass fibre, estimated) [7], 3800 Pa s (290°, 20 wt.% glass fibre, estimated) [7], 1600 Pa s (290°, 30 wt.% glass fibre, estimated) [7], 2000 Pa s (290°, 40 wt.% glass fibre, estimated) [7]

Water Absorption:

No.	Value	Note
1	0.12–0.14 %	10% glass fibre [2]
2	0.15 %	10% glass fibre [1,2]
3	0.09–0.16 %	20% glass fibre [2]
4	0.07–0.14 %	30% glass fibre [2]
5	0.08 %	40% glass fibre, ASTM D570 [16]
6	0.06–0.12 %	40% glass fibre [2]
7	0.07 %	50% glass fibre [2]
8	0.14 %	10% glass bead [2]
9	0.13 %	20% glass fibre [2]
10	0.11 %	30% glass fibre [2]

Mechanical Properties:

Mechanical Properties General: The effect of glass fibre reinforcement (relative to the parent polycarbonate matrix) on mech. props. is to give increased rigidity, greater hardness, greater tensile and flexural strengths, less creep tendency, less fatigue, less shrinkage, less thermal expansion and a greater heat deflection temp. On the other hand, glass fibre reinforced polycarbonate is less tough, has some reduction in impact strength, does not extend by neck formation and displays brittle failure. Many of these property values are largely unchanged if the temp. is lowered to -40°. Examples of tensile stress-strain curves for different glass fibre contents have been reported [17,18]. Both the fibre length and orientation can make significant differences to the mech. props. For example both longer and undirectional glass fibres increase the tensile strength and modulus. It should be noted that for some commercial data, the orientation information is not available (or not known). Some improvement in general props. can be achieved by annealing at 275° for 1h

Tensile (Young's) Modulus:

No.	Value	Note
1	2700 MPa	10% wt. glass fibre, estimated [3]
2	4200 MPa	20% wt. glass fibre, estimated [3]
3	3240 MPa	470 kpsi, =20 wt.% glass fibre, random fibre orientation [18]
4	5410 MPa	785 kpsi, =20 wt.% glass fibre, undirectional fibre orientation [17]
5	6500 MPa	30 wt.% glass fibre, estimated [3]
6	3940 MPa	572 kpsi, =35 wt.% glass fibre, random fibre orientation [18]
7	7540 MPa	1093 kpsi, =35 wt.% glass fibre, undirectional fibre orientation [17]
8	11700 MPa	1700 kpsi, 40% glass fibre, ASTM D638 [16]
9	8800 MPa	40 wt.% glass fibre [3]
10	6740 MPa	977 kpsi, =50 wt.% glass fibre, random fibre orientation [18]
11	11770 MPa	1707 kpsi, =50 wt.% glass fibre, undirectional fibre orientation [17]
12	10300–15200 MPa	1500–2200 kpsi, 30–50 wt.% long glass fibre [1]

Flexural Modulus:

No.	Value	Note
1	4100 MPa	600 kpsi, 10% glass fibre [1]
2	3170–3310 MPa	20 wt.% short glass fibre [6]
3	7200 MPa	30% glass fibre [1]
4	8030 MPa	30 wt.% glass fibre [8]
5	8300 MPa	1200 kpsi, 40 wt.% glass fibre, ASTM D790 [16]
6	3800–12200 MPa	=40 wt.% glass fibre [10]
7	18300–19300 MPa	=50 wt.% glass fibre [10]
8	26000 MPa	=50 wt.% glass fibre [9]
9	4900 MPa	=50 wt.% glass fibre [9]
10	9000–14500 MPa	1300–2000 kpsi, 30–50% long glass fibre [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	48–63 MPa	7000-9100 psi, 10% glass fibre [2]	4–8%
2	50.64–58.44 MPa	20 wt.% short glass fibre [6]	
3	100–110 MPa	20% glass fibre [2]	3–6%
4	48.3 MPa	7 kpsi, 10 vol.% (=20 wt.%) glass fibre, random fibre orientation [18]	
5	88.6 MPa	10 vol.% (=20 wt.%) glass fibre, unidirectional fibre orientation [17]	
6	130–141 MPa	30% glass fibre [2]	3–5%
7	135 MPa	35% glass fibre [2]	3–8%
8	61.4 MPa	8.9 kpsi, 35 wt.% glass fibre, random fibre orientation [18]	
9	114 MPa	16.54 kpsi, 35 wt.% glass fibre, unidirectional fibre orientation [17]	
10	160 MPa	40% glass fibre [2]	3–5%
11	124 MPa	40% glass fibre, ASTM D638 [16]	
12	93.1 MPa	13.5 kpsi, =50 wt.% glass fibre, random fibre orientation [18]	
13	160 MPa	23.17 kpsi, =50 wt.% glass fibre, unidirectional fibre orientation [17]	
14	159.7 MPa	23.1 kpsi, 40% long glass fibre [2]	1.7%
15	173–176 MPa	25.1–25.5 kpsi, 50% long glass fibre [2]	1.5–4%
16	159–173 MPa	23.0–25.1 kpsi, 30-50% long glass fibre [1]	
17	70 MPa	10% glass staple fibre [2]	7–8%
18	70–80 MPa	10% glass staple fibre [2]	4–6%
19	55–100 MPa	20% glass staple fibre [2]	3.8–7%
20	90–100 MPa	20% glass staple fibre [2]	3–5%
21	70 MPa	30% glass staple fibre [2]	3.5%
22	100–130 MPa	30% glass staple fibre [2]	3–4%

Flexural Strength at Break:

No.	Value	Note
1	110 MPa	16 kpsi, 10% glass fibre [2]
2	128–165 MPa	24 kpsi, 20% glass fibre, upper limit [2]
3	141.4–193 MPa	28 kpsi, 30% glass fibre, upper limit [2]
4	166 MPa	30% glass fibre [1]
5	151 MPa	=30 wt.% glass fibre [8]
6	241 MPa	35 kpsi, 30% long glass fibre [2]
7	160 MPa	35% glass fibre [2]
8	179–221 MPa	26 kpsi, 40% glass fibre, lower limit [2]

9	186 MPa	27 kpsi, 40% glass fibre, ASTM D790 [16]
10	251 MPa	36.4 kpsi, 40% long glass fibre [2]
11	248–346 MPa	40 wt.% long glass fibre [10]
12	281–290 MPa	40.8-42 kpsi, 50% long glass fibre [2]
13	286–362 MPa	50 wt.% long glass fibre [10]
14	241–281 MPa	35.0-40.8 kpsi, 50% long glass fibre [1]
15	130 MPa	10% glass staple fibre [2]
16	110–120 MPa	10% glass staple fibre [2]
17	52 MPa	7500 psi, 10% glass bead [2]
18	120–160 MPa	20% glass staple fibre [2]
19	130–150 MPa	20% glass staple fibre [2]
20	130 MPa	30% glass staple fibre [2]
21	140–190 MPa	30% glass staple fibre [2]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	66 MPa		10% glass fibre [2]
2	59.7–64.64 MPa		20 wt.% short glass fibre [6]
3	107 MPa		20% glass fibre [2]
4	120.7 MPa		30% glass fibre [2]
5	159 MPa		40% glass fibre [2]
6	58 MPa	1-4% elongation	8400 psi, 10% glass bead [2]

Flexural Strength Yield:

No.	Value	Note
1	169.8–172.8 MPa	20% short glass fibre [6]

Compressive Strength:

No.	Value	Note
1	96.5 MPa	14 kpsi, 10% glass fibre [1]
2	128 MPa	18.5 kpsi, 40% glass fibre, ASTM D690 [16]
3	205–225 MPa	29.8-32.7 kpsi, 30–50% long glass fibre [1]

Miscellaneous Moduli:

No.	Value	Note
1	3500 MPa	37 wt.% short glass fibre, highly oriented [12]
2	6700 MPa	37 wt.% highly oriented short glass fibre [12]

Complex Moduli: The storage modulus for glass-fibre reinforced polycarbonate depends on the angle between the measurement direction and that of the fibres. It is also expected to depend on temp. and frequency

Hardness: Rockwell M88 (10% glass fibre) [2], R118 (10% glass fibre) [2], M92 (20% glass fibre) [2]; R118–R122 (20% glass fibre), M85–M90 (10% glass fibre), M90–M95 (20–30% glass fibre) [2], M93–M95 (30% glass fibre) [2], R119–R120 (30% glass fibre) [2], M95–M97 (40% glass fibre) [2], R119–R120 (40% glass fibre) [2], M97 (50% long glass fibres) [2]. Ball indentation hardness 150 MPa (20% glass fibre) [2], 155 MPa (35% glass fibre), 125 MPa, (10% glass staple fibre), 140 MPa (20% glass staple fibre), 145 MPa (30% glass staple fibre) [2]

Failure Properties General: Glass fibre reinforced polycarbonate displays brittle failure (compare Bisphenol A polycarbonate) [11,19]. However, the composites show a decreased rate of fatigue crack propagation relative to the pure matrix, because of crack stopping by fibre bundles (if present) [14,15]. The failure mechanism involves matrix cracking, followed by fibre-matrix debonding, then fibre cracking in the bundle and finally crack propagation as in the pure matrix [14,15,19]

Fracture Mechanical Properties: Fracture toughness K_c 4.18–4.28 MPa $m^{1/2}$ (parallel to direction of melt flow, 20% short glass fibre) [6]; 4.74–5.06 MPa $m^{1/2}$ (transverse direction, 20% short glass fibre) [6]. The crack stopping props. of the polycarbonate-glass fibre composite lead to an increase in fatigue lifetime by several orders of magnitude relative to the pure matrix [14,15]. Fatigue strength 32.4 MPa (20°, flexure, =30 wt.% glass fibre, 10^7 cycles, 30 Hz, JIS K7119) [8]; 30.4 MPa (50°, flexure, 17 vol.% (=30 wt.%) glass fibre, 10^7 cycles, JIS K7119, 30 Hz) [8]; 75.7 MPa (7.7 kg mm^{-2}, tension, 23°, 30% glass fibre, 10^4 cycles, 10 Hz) [11]; 67 MPa (20°, estimated, flexure, 17 vol.% (=30 wt.%) glass fibre, 10^4 cycles, 30 Hz, JIS K7119) [8]

Izod Notch:

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [6]
Volume Properties/Surface Properties: Not transparent [11]

Polymer Stability:

Thermal Stability General: The thermal stability of glass-reinforced polycarbonate is similar to that of bisphenol A polycarbonate. At 650° the glass fibres devitrify and become brittle [6]
Flammability: Flammability rating V1 [1,2]; V0 (3.2 mm) [2] (10% glass fibre); V0 (10% glass fibre, flame retardant) [2]; V1 (1.47 mm, 20% glass fibre) [2]; V0 (1.6–3.2 mm, 20% glass fibre) [2]; V1 (1.47 mm, 30% glass fibre) [2]; V0 (3.2 mm, 30% glass fibre) [2]; V0 (1.57 mm, 30% glass fibre, flame retardant) [2]; V1 (1.47 mm, 30% glass fibre) [2]; V0 (3.05–3.2 mm, 40% glass fibre) [2] V2 (1.47 mm, 10% glass fibre); V0 (10% glass staple fibre, with flame retardant); V2 (1.47–1.6 mm, 20% glass staple fibre); V1 (20% glass staple fibre); V2 (1.6 mm, 30% glass staple fibre); V2 (1.47 mm, 30% glass staple fibre) [2]
Hydrolytic Stability: Exposure to water at 45° for up to 3 months gives no statistically significant changes in flexure props. [10]. Glass-reinforced polycarbonate is fairly resistant to stress relaxation; at deflections up to 50° and submersion in water at 37° for 60 days, 90% of the original bending moment is retained [10]. Immersion in water at 85° for 100h increases the rate of hydrol. for glass fibre reinforced polycarbonate relative to the parent matrix [5,16]. Hydrol. results in a reduction in MW, but the tensile strength and longitudinal flexural strength and modulus are not significantly affected [5,9]. The transverse flexural modulus and strength, however, show significant deterioration, thought to be caused by water absorption and then degradation at the matrix-fibre interface [9]. In the presence of silane coupling agents to aid adhesion, significant deterioration of the interface occurs after exposure to water at 85° [4]. Resistance to water is improved by annealing at 275° for 1h, which decreases the permeability of water at the interface [9]
Recyclability: Reprocessing by grinding and re-moulding results in severe physical degradation of the glass fibres, resulting in a decrease in relative mean fibre length, increase in melt flow index [6] and decrease in Charpy impact strength for 20% short glass fibre filled polymer [6]. The tensile strength at yield and break are not significantly changed on recycling and the ir spectrum is unchanged [9]. Changes in props. following recycling are caused by fibre shortening and some reduction in the polymer chain length [9]
Stability Miscellaneous: Annealing the polycarbonate-glass fibre composite for 1h at 275° improves the adhesion between the two components, resulting in an increased flexural modulus and strength, and improved water resistance [9]. Exposure to higher shear rates, such as during processing (extrusion, injection), results in degradation of the glass fibres (reduced length) [6,7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Glass fibres are usually chopped strands or short fibres (typically 6 mm long, 8–12 μm diameter). Incorporation reduces the mean fibre length to 0.1–0.3 mm. The fibre is E-glass-alkali free aluminium borosilicates containing <0.8% alkali metal oxides
Mould Shrinkage (%):

No.	Value	Note
0	0.05–0.5%	depending on glass fibre content
2	0.1–0.7%	

Applications: Housings of electrical components, transportation, electronics, sporting gear, connectors, switches, structural applications, office machine parts

Bisphenol A polycarbonate, Structural Foam B-11

Synonyms: *Polycarbonate, Structural foam*
Related Polymers: Bisphenol A polycarbonate, Glass fibre reinforced polycarbonate foam, Poly[2,2-propanebis(4-phenyl)-carbonate]
Monomers: Bisphenol A, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: Bisphenol A polycarbonate
CAS Number:

CAS Reg. No.
24936-68-3

Molecular Formula: $(C_{16}H_{14}O_3)_n$
Fragments: $C_{16}H_{14}O_3$
Molecular Weight: MW 28000-32000
Additives: Flame retardants; blowing agents e.g. 5-phenyltetrazole
General Information: Foams are classified by density; 0.96 g cm^{-3}, 20% volume foam; 0.84 g cm^{-3} 30% volume foam and 0.72 g cm^{-2} 40% volume foam. Foam densities increased with fillers present

7	0.15 %	17% vol. foam, 20% glass fibre [4]
8	0.12 %	10% vol. foam, 30% glass fibre [4]

Mechanical Properties:

Mechanical Properties General: The values of the tensile props. are generally reduced by foaming, and are further reduced as the foam content increases. [7] Foamed polycarbonate is less tough (break strain 5–8%) than unfoamed (break strain 80–110%). The relative tensile toughness decreases with foaming time. [2,6] The presence of foam improves impact resistance props. and the failure mode is ductile, unlike unfoamed polycarbonate which displays brittle failure under some conditions. [1] Foamed polycarbonate shows an increased tendency to creep compared with unfoamed, but creep rupture occurs at higher strains. [2] The fatigue lifetime appears to depend on the foam level. [7] Extension to break 5.2–7.8% (10% vol. foam) [4]; 4.8% (10% vol. foam, 7% glass fibre). [4]; 3.6% (10% vol. foam, 20% glass fibre) [4]; 3% (10% vol. foam, 30% glass fibre) [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1800 MPa	261 kpsi, 20% vol. foam, 5% glass fibre [3]

No.	Value	Note
1	66.2 MPa	675 kg cm^{-2}, Lexan [8]

Impact Strength: Charpy: 40 kJ m^{-2} (23°, 30% foam, 5% glass fibre, DIN 53453) [5]; 40 kJ m^{-2} (-20°, 30% foam, 5% glass fibre, DIN 53453) [5]
Hardness: Rockwell M85 (30% vol. foam, 5% glass fibre) [4]
Failure Properties General: Unfoamed polycarbonate displays brittle failure in thicker films or sharp-notched specimens. Foamed polycarbonate, however, shows ductile failure for sharp-notched samples, and the fracture energy is about 16 times higher for foamed relative to unfoamed polycarbonate. [1] Blunt-notched samples, which show ductile failure in unfoamed polycarbonate, remain ductile when foamed. [1] The bubbles are thought to act as impact modifiers, and this effect appears to be optimised for 40μm diameter bubbles and 28% vol. fraction [1]
Fracture Mechanical Properties: The fatigue lifetime depends on the stress, and also on the foam level; the fatigue lifetime for 3% vol. foam is significantly higher than that of unfoamed polycarbonate, but higher foam levels show progressively shorter lifetimes. Average fatigue lifetime 28500 cycles (48.9 MPa, 0% vol. foam). [7], 132100 cycles (46.5 MPa , 10 Hz, 3% vol. foam) [7], 30000 cycles (46.5 MPa, 10 Hz, 17% vol. foam) [7], 10000 cycles (46.5 MPa, 10 Hz, 32% vol. foam) [7], 7000 cycles (46.5 MPa, 10 Hz, 48% vol. foam) [7]

Bisphenol A-terephthalic acid-isophthalic acid polyester carbonate B-12

Synonyms: *2,2-Propanebis[4-phenol]-1,4-benzenedicarboxylic acid-1,3-benzenedicarboxylic acid polyester carbonate. Poly [4,4′-(1-methylethylidene)bis[phenol]-co-1,4-benzenedicarboxylic acid-co-1,3-benzenedicarboxylic acid-co-carbonic acid]. Poly [4,4′-(1-methylethylidene)bis[phenol]-co-1,4-benzenedicarbonyl-dichloride-co-1,3-benzenedicarbonyldichloride-co-carbonic dichloride]*

Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polyester carbonates

Monomers: Bisphenol A, 1,3-Benzenedicarboxylic acid, 1,4-Benzenedicarboxylic acid, Carbonic acid

Material class: Thermoplastic, Copolymers

Polymer Type: Polyester, Bisphenol A polycarbonate

CAS Number:

CAS Reg. No.	Note
89001-40-1	source: carbonic dichloride and diacids
31133-80-9	source: carbonic acid and diacids
71519-80-7	source: carbonic dichloride and acid chlorides

Molecular Formula: $[(C_{23}H_{18}O_4).(C_{16}H_{14}O_3)]_n$

Fragments: $C_{23}H_{18}O_4$ $C_{16}H_{14}O_3$

General Information: Contains approx. equal amounts of terephthalic acid and isophthalic acid in random distribution with Bisphenol A carbonate. The polymers have both carbonate and ester linkages, conferring props. intermediate between those of polycarbonate and the polyesters

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.6	[2]

Transmission and Spectra: Transmittance 85% [2]
Molar Refraction: Haze 1% [2]. Transparent (bisphenol A: terephthalate:isophthalate 1:0.25:0.25) [2]

Polymer Stability:

Decomposition Details: Studies of thermal decomposition have been reported [10]. Temp. of initial weight loss 335–350° [10]. Max. rate of weight loss 390–395°, 490–500°, 520–530° [10]
Flammability: Flammability rating HB (bisphenol A:terephthalate: isophthalate 1:0.29:0.06) [2], V2 (bisphenol A:terephthalate: isophthalate 1:0.12:0.28) [2]
Hydrolytic Stability: Has poor resistance to water immersion (96°) and steam sterilisation [8]. Mech. props. are greatly reduced, MW decreases and microcavities are formed [8]
Stability Miscellaneous: Has good resistance to embrittlement on ageing at 120°

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. in soln. in two stages or by interfacial polycondensation in one stage [4,11]. Two stage polymerisation; a mixture of terephthaloyl and isophthaloyl chlorides in CH_2Cl_2 is added to bisphenol A in anhydrous pyridine under N_2 at 25° with *p-tert*-butyl phenol as a chain capping agent- this results in oligomer formation. Phosgenation is then carried out by adding phosgene to the vapour space of the reaction vessel [7,11,12]

Bisphenol A-terephthalic acid polyester carbonate B-13

Synonyms: *Bisphenol A-1,4-benzenedicarboxylic acid polyester carbonate. Poly[4,4′-(1-methylethylidene)bis[phenol]-co-1,4-benzenedicarboxylic acid-co-carbonic acid]. PCT*
Related Polymers: Poly[2,2-propanebis(4-phenyl)carbonate], Polyester carbonates
Monomers: Bisphenol A, 1,4-Benzenedicarboxylic acid, Carbonic acid
Material class: Thermoplastic, Copolymers
Polymer Type: Polyester, Bisphenol A polycarbonate
CAS Number:

CAS Reg. No.	Note
31133-78-5	source: carbonic acid
73951-28-7	source: carbonic dichloride

Molecular Formula: $[(C_{16}H_{14}O_3).(C_{23}H_{18}O_4)]_n$
Fragments: $C_{16}H_{14}O_3$ $C_{23}H_{18}O_4$
General Information: The polymers have both carbonate and ester linkages, which confer props. intermediate between polycarbonate and the polyester. Common usage of the form PCT(X), where T refers to the terephthalate ester moiety and X to the mole fraction of ester (relative to total ester + carbonate). The molar ratio of Bisphenol: (ester + carbonate) residues is 1:1
Morphology: Terephthalate polyester carbonates show some molecular ordering (X-ray analysis; cf. isophthalates) [1]; and are more easily crystallised than isophthalates. [2] At ester levels of PCT (0.82) [ester:carbonate ratio 4.5] and above the cast films are about 15–30% cryst. [2]

1	59.4 MPa	0.5 mol terephthalate [3]	
2	56 MPa	23°, 40% relative humidity, ester: carbonate 1.8, 0.64 mol terephthalate [2]	30%
3	56 MPa	23°, 40% relative humidity, ester: carbonate 4.5, 0.82 mol terephthalate [2]	60%
4	60 MPa	23°, 40% relative humidity, ester: carbonate 8.3, 0.89 mol terephthalate [2]	60%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	63.5 MPa		0.5 mol terephthalate [3]
2	55.5–56.5 MPa	14%	23°, 40% relative humidity, ester: carbonate 1.8, 0.64 mol terephthalate [2]
3	56–57 MPa	14%	23°, 40% relative humidity, ester: carbonate 4.5, 0.82 mol terephthalate [2]
4	55.5–56.5 MPa	14%	23°, 40% relative humidity, ester: carbonate 8.3, 0.89 mol terephthalate [2]

Complex Moduli: The variations of tensile storage and loss moduli and tan δ with temp. (-150–200°, 1 Hz) have been reported [5,7,8]
Impact Strength: Impact strength decreases on thermal ageing
Viscoelastic Behaviour: Tensile stress-strain curves have been reported for ester/carbonate ratios of >1.8. There is a viscoelastic region up to the yield point, followed by a stress drop, and then necking behaviour (depending on the ester/carbonate ratio) until the break point is reached [2]
Failure Properties General: Polyester carbonate (PCT 0.5) displays ductile failure [9]

Optical Properties:

Refractive Index:

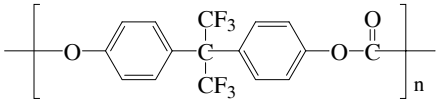
No.	Value	Note
1	1.601	0.5 mol terephthalate [3]

Transmission and Spectra: Ir spectral data have been reported [1]
Volume Properties/Surface Properties: Ester:carbonate ratios above 4.2 cause whitening of the polymer due to increasing crystallinity [2]

Polymer Stability:

Decomposition Details: Decomposition curves in N_2 have been reported [10]. Above 70% wt loss some stabilisation occurs. Initial wt loss temp. increases with increase in terephthalate content 280° (ester:carbonate 1.8, 0.64 mol terephthalate) [10]; 350° (ester:carbonate 5.6, 0.85 mol terephthalate) [10]. Max wt loss 400–450° (0.64 mol terephthalate); 475° (0.85 mol terephthalate) [10]
Environmental Stress: Shows good resistance to embrittlement at 120° [5]

Applications/Commercial Products:



Processing & Manufacturing Routes: Polyester carbonates may be synth. in soln. in two stages or by interfacial polycondensation in one stage [4,11]. Terephthaloyl chloride in CH_2Cl_2 is added to bisphenol A in anhydrous pyridine under N_2 at 25° with *p-tert*-butyl phenol as a chain capping agent: this results in oligomer formation. Phosgenation is then carried out by adding phosgene to the vapour space of the reaction vessel [2,4,12]. Interfacial polycondensation route; bisphenol A is dissolved in aq. NaOH soln., to which is added a mixture of terephthaloyl chloride and phosgene in an organic solvent (e.g. CCl_4) at room temp. [1,11]. Tertiary amines, quaternary ammonium or phosphonium salts are used as catalysts; phenols, phenyl chlorocarbonates and aromatic carbonyl halides are used as chain terminators [11]
Applications: Lighting engineering, electronics and electrical engineering applications

Bisphenol AF polycarbonate B-14

Synonyms: *Poly[1,1-(2,2,2-trifluoro-1-(trifluoromethyl)ethane bis(4-phenyl)carbonate]. Poly[oxycarbonyloxy-1,4-phenylene[2,2,2-trifluoro-1-(trifluoromethyl)ethylidene]-1,4-phenylene]. Poly(4,4′-[2,2,2-trifluoro-1-(trifluoromethyl)ethylidene]bisphenol-co-carbonic dichloride)*
Monomers: Bisphenol AF, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: Polycarbonates (miscellaneous)
CAS Number:

CAS Reg. No.
32291-26-2

Molecular Formula: $(C_{16}H_8F_6O_3)_n$
Fragments: $C_{16}H_8F_6O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.478 g/cm^3	[4,5,6,7]

Equation of State: Flory/Van der Waals equation of state information for polymer melt has been reported [8]. Tait, information and Sanchez-Lacombe equation of state information has been reported [1]
Glass-Transition Temperature:

No.	Value	Note
1	158°C	[9]
2	148°C	[2]
3	172°C	[4]
4	171°C	[11]
5	172–176°C	[6,8,10]
6	169°C	[1]

Surface Properties & Solubility:

Solubility Properties General: Forms miscible blends with poly methyl methacrylate, and immiscible blends with Bisphenol A polycarbonate, and dichloroethylene polycarbonate
Cohesive Energy Density Solubility Parameters: Solubility parameter 20.5 J$^{1/2}$ cm$^{3/2}$ (10 cal$^{1/2}$ cm$^{3/2}$, calc.) [1]
Solvents/Non-solvents: Very sol. Me_2CO, THF, *N*-methylpyrrolidinone, DMSO, pyridine [2,3], chlorinated hydrocarbons, C_6H_6, *m*-cresol, cyclohexanone, dioxane, EtOAc, polar aprotic solvents [3]. Sol. on heating to 60° DMF, $CHCl_3$, 1,4-dioxane, phenol [2]. Insol. MeOH [2]
Wettability/Surface Energy and Interfacial Tension: Contact angle 93° (H_2O in air, 25°, 65% relative humidity) [2]; 91° (H_2O in air, 25°) [3]
Surface Tension:

No.	Value	Note
1	20 mN/m	20 dyne cm^{-1}, 25° [3]

Transport Properties:

Permeability of Gases: The permeability of CO_2 decreases with pressure up to 20 atm [4,6,7] after which plasticisation occurs and permeability increases; the permeability-pressure curve shows hysteresis [7]. Conditioning at 450 psi (30 atm) for 7 days leads to an increase in permeability [7]. Gas selectivity and diffusivity have been reported [6,12]
Gas Permeability:

No.	Gas	Value	Note
1	CO_2	1838 cm^3 mm/(m^2 day atm)	2.1 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 5 atm [4]
2	CO_2	1575 cm^3 mm/(m^2 day atm)	1.8 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [6]
3	CO_2	1488 cm^3 mm/(m^2 day atm)	1.7 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 20 atm [4,6]
4	CH_4	788 cm^3 mm/(m^2 day atm)	9 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 3.5 atm [4]
5	CH_2	68 cm^3 mm/(m^2 day atm)	7.77 × 10^{-14} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [6,7]
6	O_2	414 cm^3 mm/(m^2 day atm)	4.72 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25°, 1 atm [9]
7	O_2	455 cm^3 mm/(m^2 day atm)	5.2 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [6,12]
8	N_2	113.8 cm^3 mm/(m^2 day atm)	1.3 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 2 atm [6]
9	N_2	105 cm^3 mm/(m^2 day atm)	1.2 × 10^{-13} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [6]
10	He	3939 cm^3 mm/(m^2 day atm)	4.5 × 10^{-12} cm^2 (s Pa)$^{-1}$, 35°, 10 atm [6]

Mechanical Properties:

Complex Moduli: The variations of E′, E″ and tan δ with temp. (-150–200°, 110 Hz) have been reported [14]

Optical Properties:

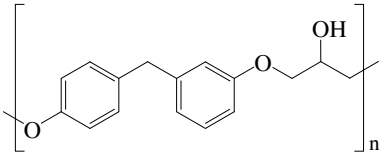
Refractive Index:

No.	Value	Note
1	1.426	[4]
2	1.539	calc. [12]

Transmission and Spectra: Ir spectral data has been reported [3]
Volume Properties/Surface Properties: Colourless and transparent film [1,4]

Polymer Stability:

Thermal Stability General: Hexafluoropolycarbonate has good thermal stability , aided by the presence of fluorine
Decomposition Details: Temp. for 10% weight loss 443° (N_2) [2]. Temp. for 10% weight loss 460° (air) [3]. Residual mass at 500° 45.1% (N_2) [2]. Residual mass at 500° 57% (air) [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by transesterification, in which hexafluorobisphenol A and hexafluorodiphenyl dicarbonate are mixed in the melt (150–300°) in the absence of O_2 with elimination of phenol. Reaction rate is increased by catalysts (*e.g.* zinc acetate) and the use of a medium-high vacuum in the final stages [3]. Can also be synth. by interfacial polycondensation where trichloromethylchloroformate is introduced into a soln. or suspension of hexafluorobisphenol A in aq. NaOH at 20° in an inert solvent (*e.g.* 1,2-dichloroethane). Quaternary ammonium salt catalysts are used to achieve high MW [3]

Bisphenol F diglycidyl ether resin B-15

Synonyms: *Poly(bisphenol F bis(oxiranylmethyl) ether)*
Monomers: Bisphenol F, (Chloromethyl)oxirane
Material class: Thermosetting resin
Polymer Type: Epoxy

CAS Number:

CAS Reg. No.	Note
96141-20-7	(homopolymer)
28064-14-4	

Molecular Formula: $(C_{16}H_{16}O_3)_n$
General Information: Blended with Bisphenol A diglycidyl ether resin to reduce viscosity and improve crystallisation resistance

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.987 g/cm^3	9.9 lb gal^{-1}, EPON 862 [1]
2	d 1.23 g/cm^3	15% triethylenetetramine cured, 25°, ASTM D792 [1]
3	d 1.22 g/cm^3	4% 2-ethyl-4-methylimidazole cured, 25°, ASTM D792 [1]

Glass-Transition Temperature:

No.	Value	Note
1	121°C	15% triethylenetetramine cured, rheometrics dynamical tester [1]
2	105°C	15% triethylenetetramine cured, TMA [1]
3	151°C	4% 2-ethyl-4-methylimidazole cured, rheometrics peak [1]
4	125°C	4% 2-ethyl-4-methylimidazole cured, TMA [1]

Deflection Temperature:

No.	Value	Note
1	107°C	15% triethylenetetramine cured, ASTM D648
2	134°C	4% 2-ethyl-4-methylimidazole cured, ASTM D648 [1]

Transport Properties:

Polymer Solutions Dilute: Viscosity 5000–7000 cP (250°, uncured); 775 cP (25°, 15% triethylenetetramine cured, 25°) [1]; 3670 cP (4% 2-ethyl-4-methylimidazole cured, 25°) [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3240 MPa	470 kpsi, 15% triethylenetetramine cured, 23° [1]
2	3033 MPa	440 kpsi, 2-ethyl-4-methylimidazole cured, 23° [1]

Flexural Modulus:

No.	Value	Note
1	3433 MPa	498 kpsi, 15% triethylenetetramine cured, 23° [1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	82 MPa	11.9 kpsi, 15% triethylenetetramine cured, 23° [1]	7.5%
2	60 MPa	8.7 kpsi, 4% 2-ethyl-4-methylimidazole cured, 23° [1]	2.9%

Flexural Strength at Break:

No.	Value	Note
1	127.8 MPa	15% triethylenetetramine cured, 23°, ASTM D790
2	166.6 MPa	5% elongation, 16.9 kpsi, 4% 2-ethyl-4-methylimidazole cured, 23°, ASTM D790 [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	82.7 MPa	6.6% elongation	12 kpsi, 15% triethylenetetramine cured, 23°, ASTM D638 [1]

Compressive Strength:

No.	Value	Note
1	105.5 MPa	18.3 kpsi, 8%, 15% triethylenetetramine cured, 23°, ASTM D695 [1]
2	111 MPa	16.1 kpsi, 8.9%, 4% triethylenetetramine cured, 23°, ASTM D690 [1]

Fracture Mechanical Properties: Fracture toughness 2.64 $MPa^{1/2}$ (1015 $psi^{1/2}$, 15% triethylenetetramine cured, 23°, ASTM D399) [1]; 2.03 $MPa^{1/2}$ (600 $psi^{1/2}$, 4% 2-ethyl-4-methylimidazole cured, 23°, ASTM D399) [1]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
2	1.6×10^{15} Ω.cm	15% triethylenetetramine cured, 23°, ASTM D257 [1]	S

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3.57	1 MHz	15% triethylenetetramine cured, 23°, ASTM D150 [1]
2	3.35	1 MHz	4% 2-ethyl-4-methylimidazole cured, 23°, ASTM D150 [1]

Dielectric Strength:

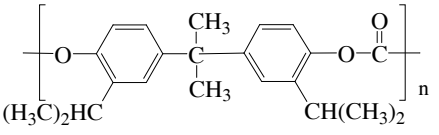
No.	Value	Note
1	22.87 $kV.mm^{-1}$	581 V mil^{-1}, 15% triethylenetetramine cured, 23°, ASTM D149 [1]
2	22.88 $kV.mm^{-1}$	582 V mil^{-1}, 4% 2-ethyl-4-methylimidazole cured, 23°, ASTM D149 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.028	1 MHz	15% triethylenetetramine cured, 23°, ASTM D150 [1]
2	0.022	1 MHz	4% 2-ethyl-4-methylimidazole cured, 23°, ASTM D150 [1]

Polymer Stability:

Chemical Stability: Has good resistance to chemicals. [1] Similar resistance to bisphenol A diglycidyl ether resins. Methyl tetrahydrophthalic anhydride cured material absorbs 1.25% MeOH after 180d exposure, and a similar amount of fuel oil at 25°. Unstable to Me_2CO at -25°
Hydrolytic Stability: Stable to inorganic acids. Large weight loss in NaOH at 80°



Applications/Commercial Products:

BPDA-*p*PDA B-20

Synonyms: *Poly(3,3′,4,4′-biphenyltetracarboxylic dianhydride-alt-p-phenylenediamine). Poly(p-phenylene biphenyltetracarboximide). Poly[(1,1′,3,3′-tetraoxo[5,5′-bi-2H-isoindole]-2,2′-diyl)-1,4-phenylene]. Poly(1,4-benzenediamine-alt-[5,5′-biisobenzofuran]-1,1′,3,3′-tetrone). Poly([5,5′-biisobenzofuran]-1,1′,3,3′-tetrone-alt-1,4-benzenediamine)*
Monomers: [5,5′-Biisobenzofuran]-1,1′,3,3′-tetrone, 1,4-Benzenediamine
Material class: Semithermoplastic
Polymer Type: Polyimide
CAS Number:

CAS Reg. No.	Note
32197-39-0	
29319-22-0	source base

Molecular Formula: $(C_{22}H_{10}N_2O_4)_n$
Fragments: $C_{22}H_{10}N_2O_4$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.488 g/cm^3	Upilex S film [9]
2	d^{30} 1.391 g/cm^3	[1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3×10^{-6}–2.4×10^{-5} K^{-1}	in plane, parallel to optic axis, 50–250°, depends on orientation [9]	L
2	3×10^{-6}–2.5×10^{-5} K^{-1}	in plane, perpendicular to optic axis, 50–250°, depends on orientation [9]	L
3	8.4×10^{-5}–0.000148 K^{-1}	out of plane, 50–250°	L
4	0.000125–0.000154 K^{-1}	50–250° [9]	V

Equation of State: Tait equation of state parameters have been reported [9]
Glass-Transition Temperature:

No.	Value	Note
1	352°C	broad transition, 320–470°, spin cast film
2	>500°C	min., Upilex S film

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: CED 930 J cm^{-3} [3]

Transport Properties:

Permeability and Diffusion General: Permeability of water 0.86-7.5 $\times$ 10^{-10} cm^2 s^{-1} (25°) [4]. Permeability is dependent on relative humidity and sample
Water Absorption:

No.	Value	Note
1	1.37 %	50h, 25°, 75% relative humidity [1]
2	0.12–2.4 %	saturation, 25°, depends on relative humidity, film thickness and sample preparation [4]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	5300 MPa	[10]
2	5900 MPa	25° [8]
3	10200 MPa	25° [8]
4	4000–55000 MPa	depends on orientation [3]
5	59100 MPa	cold drawn film, parallel to drawing direction [10]
6	2400 MPa	cold drawn film, perpendicular to drawing direction [10]

Tensile Strength Break:

No.	Value	Note	Elongation
1	210 MPa	25°	32%
2	240 MPa	[10]	
3	570 MPa	[5]	45%
4	1220 MPa	cold drawn film, parallel to drawing direction [10]	
5	90 MPa	cold drawn film, perpendicular to drawing direction [10]	

Tensile Strength Yield:

No.	Value	Elongation	Note
1	170 MPa	4%	25° [8]
2	280 MPa	8%	

Viscoelastic Behaviour: Dynamic mech. props. have been reported [5,8]. Residual stress 6.7 MPa (room temp., film cast and cured on Si) [5]

Electrical Properties:

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2.98–3.05	100 Hz–1 MHz	room temp., out-of-plane
2	3.4	12000 GHz	approx., in plane [7]

Optical Properties:

Total Internal Reflection: Δ_n 0.2333–0.1776 (632.8 nm, room temp., depends on thickness) [4]. Δ_n 0.262–0.217 (543.5–1064.2 nm, room temp.) [7]

Polymer Stability:

Environmental Stress: Good resistance to γ radiation, low gas evolution for doses up to 25 MGy [6]. Good resistance to ionising radiation in air for doses over 50 MGy. In oxygen, deterioration of mech. props. occurs at 10–20% of that in air [2]

Applications/Commercial Products:

Trade name	Details	Supplier
Pyralin	P1-2610, P1-2611, PI-581D	DuPont
Upilex S		Ube Industries Ltd.

Bromobutyl rubber B-21

Synonyms: *Brominated isobutylene-isoprene elastomer. BIIR. Butyl rubber brominated*
Related Polymers: Butyl rubber
Monomers: Isobutylene, Isoprene
Material class: Synthetic Elastomers
Polymer Type: Polydienes

Additives: Stabiliser 1.5% epoxidised soybean oil
General Information: 2% Bromine. Brominated butyl rubber can be vulcanised more quickly than butyl rubber, and is more compatible with other rubbers
Morphology: Mainly composed of 1,4 linked isoprene units [7]

Volumetric & Calorimetric Properties:

Transition Temperature General: Thermal characteristics of blends of bromobutyl rubber with SBR, natural rubber and EPM in N_2 and O_2 for pure gum and sulfur vulcanisates by DSC and DTG have been reported [9,10]

Surface Properties & Solubility:

Solubility Properties General: Solubility props. of bromobutyl rubber are very similar to those of butyl rubber, see butyl rubber. Bromination improves compatibility with other rubbers [16]

Transport Properties:

Permeability of Gases: Has low permeability to gases
Permeability of Liquids: Water permeation data have been reported for bromobutyl rubber with different loadings of carbon black and for blends of bromobutyl rubber with natural rubber [13]

Mechanical Properties:

Mechanical Properties General: Bromination of butyl rubber speeds up the rate of curing and improves adhesion to metals. [16] Addition of bromobutyl rubber to natural rubber causes a decrease in tensile strength, storage modulus and loss factor [2]. Blends of bromobutyl rubber, natural rubber and polyisobutylene have also been reported [3,6]
Tensile Strength Break:

No.	Value	Note
1	14 MPa	50% natural rubber [2]

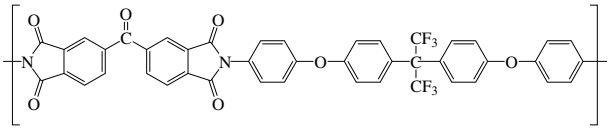
Failure Properties General: Blending with natural rubber reduces tear strength, 26 kN m^{-1} (50% natural rubber). Fatigue life 88000 cycles (70% natural rubber). [2]. Heat ageing also decreases mechanical props. [2]
Fracture Mechanical Properties: The rate of fatigue crack growth for bromobutyl rubber has been reported as similar to natural rubber under most conditions, though bromobutyl rubber does not undergo strain crystallisation. [8] Fatigue crack propagation measurements have been reported for blends of bromobutyl rubber with natural rubber and EPDM over a range of tear energies [8]. Propagation is lower by a factor of 15 compared with natural rubber

Optical Properties:

Transmission and Spectra: Nmr studies have identified the structure of brominated groups in the polymer [1]

Polymer Stability:

Thermal Stability General: Heat resistance data have been reported [4]
Decomposition Details: Bromobutyl rubber has been found to cross-link extensively under thermo-oxidative conditions [17]. Max. weight loss at 386°. [11] Weight loss studies for bromobutyl rubber blends have been reported [10]
Flammability: Flammability rating 5.6 (Match test); 1.4 (Mol 417 test) [15]
Environmental Stress: More resistant to ozone than are hydrocarbon diene rubbers [14]
Stability Miscellaneous: High energy radiation causes cross-linking rather than chain scission [12]



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by bromination of butyl rubber
Applications: Used in tyres

Trade name	Supplier
Bromobutyl	Exxon Chemical
Polysar bromobutyl	Polysar

1	5.04×10^{-5} K^{-1}	Matrimid 5218 [1]	L
2	8.2×10^{-6} K^{-1}	approx., Probimide 293 [4]	L
3	5×10^{-5} K^{-1}	XU-218 [5]	L
4	8×10^{-6} K^{-1}	Probimide 293 [6]	L

Glass-Transition Temperature:

No.	Value	Note
1	320°C	Matrimid 5218 [3]
2	320–330°C	XU-218 [5]
3	280°C	dry, XU-218 [8]
4	265°C	wet, XU-218 [8]
5	320°C	[9]

Surface Properties & Solubility:

Solubility Properties General: Blends with poly(ether sulfone) have been reported [2]. Matrimid 5218 forms miscible blends with poly(ether sulfone) when cast as films or precipitated from soln. [3]
Solvents/Non-solvents: XU-218 sol. *N,N*-dimethylacetamide [5,8,9], DMF, *N*-methylpyrrolidone [5,8,9], DMSO [5], CH_2Cl_2, ethylene chloride, $CHCl_3$ [9] tetrachloroethane, THF [9] dioxane, [9] acetophenone, cyclohexanone, [9] *m*-cresol [9], γ-butyrolactone [8]. Insol. 2-methoxyethyl acetate, glyme, diglyme, isophorone, 2-butanone, cellosolve, xylene [9]

Transport Properties:

Polymer Solutions Dilute: η 75 P (γ-butyrolactone, Probimide 298) [4]. $[\eta]_{inh}$ 0.55 dl g^{-1} (*N*-methylpyrrolidone, 25°)
Permeability and Diffusion General: Highly porous membranes may be formed from low concentration casting solns. [5]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2893 MPa	29500 kg cm^{-1}, Matrimid 5218 [1]
2	13400 MPa	Probimide 293 [4]
3	2900 MPa	25°, XU-218 [5]
4	13000 MPa	55–215°, Probimide 293 [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	85.4 MPa	871 kg cm^{-2}, Matrimid 5218 [1]	48%
2	87 MPa	25°, XU-218 [9]	48.6%

Failure Properties General: Short beam shear strength 75.8 MPa (11 kpsi, XU-218) [8]
Fracture Mechanical Properties: G_{Ic} 4.1 in in in^{-2} [8]

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	220 $kV.mm^{-1}$	Matrimid 5218 [1]

Optical Properties:

Total Internal Reflection: dn/dc 0.189 (Matrimid 5218), 0.194 (XU-218 HP) [7]

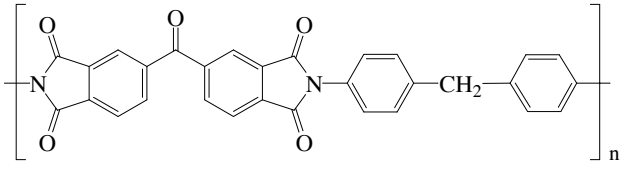
Polymer Stability:

Thermal Stability General: XU-218 has good stability up to 315° and is more stable than its graphite fibre composite [8]
Upper Use Temperature:

No.	Value	Note
1	285°C	XU-218, compression moulded [8]

Decomposition Details: Probimide 293 films (prebaked in N_2) show a 15–18% weight loss between 80° and 230° and decompose above 500° [4]. XU-218 shows a max. weight loss of 0.4% after heating in air for 13 weeks at 232° [8]. Shows 10% weight loss at 485° in air and 492° in N_2 [9]
Chemical Stability: Resistance to solvents may be improved by heating XU-218 composites at 315° for more than 16 h followed by heating at 371° for 30–40 mins. [8] Resistant to hexane, xylene, Freon 113, diacetone alcohol, butyl cellosolve, amyl ethyl ketone. Attacked by methyl cellosolve, 2-butanone, Me_2CO, acetonitrile [9]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by addition of benzophenonetetracarboxylic acid dianhydride to a 15–20% soln. of diaminophenylindane in *N*-methylpyrrolidone. The mixture is reacted at room temp. for 18 h, with imidisation achieved by addition of Ac_2O/pyridine. The polymer is insol. by precipitation into H_2O [9]. Soln. casting may be used for production of ultrafiltration membranes
Applications: Coatings for high temp. applications. Potential application as an ultrafiltration membrane

3	d 1.332 g/cm^3	[5]
4	d 1.36991 g/cm^3	film, bifix cured [14]
5	d 1.36904 g/cm^3	film, free cured [14]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4.5×10^{-5} K^{-1}	[8,14]	L
2	4.9×10^{-5} K^{-1}	film, free cured [14]	L

Glass-Transition Temperature:

No.	Value	Note
1	296°C	[5]
2	240°C	[7]
3	270°C	imidised, in air, 200° [17]
4	306°C	imidised, in air, 300° [17]
5	290°C	imidised *in vacuo*, 300° [17]
6	290°C	imidised in N_2, 300° [17]
7	284°C	[19]
8	285–300°C	imidised sample heated to 350° [20]

Transition Temperature:

No.	Value	Note	Type
1	105°C	[19]	Tβ

Surface Properties & Solubility:

Solubility Properties General: The relationship between struct. and solubility has been reported [11]

Solvents/Non-solvents: V. sol. sulfuric acid, fuming nitric acid [13]. Insol. DMF, C_6H_6, $CHCl_3$, Et_2O, EtOH, Me_2CO [13], fuming nitric acid (air-imidised film) [17]

Transport Properties:

Polymer Solutions Dilute: η 1.1–2.6 Pa s (Skybond 705) [1], 1.15–1.18 (Skybond 703) [1], 0.65 dl g^{-1} (dimethylacetamide, 30°) [15], $[\eta]_{inh}$ 0.629 dl g^{-1} (conc. sulfuric acid, 30°) [13], 1.1768 dl g^{-1} (conc. sulfuric acid, 30°) [13], 0.6324 dl g^{-1} (conc. sulfuric acid, 30°) [16], 0.96 dl g^{-1} (dimethylacetamide, 35°, 24 h) [17]
Permeability of Liquids: Diffusion of DMF has been reported [10]. Permeability of water 96.6 g (cm s cmHg)$^{-1}$ (25°, 75% humidity) [14], 178.3 g (m^2 atm)$^{-1}$ (37°, 100% relative humidity, 25 μm thick) [9]
Water Absorption:

No.	Value	Note
1	3.25 %	50 h, 25°, 75% relative humidity [14]

Gas Permeability:

No.	Gas	Value	Note
1	H_2	236.4 cm^3 mm/(m^2 day atm)	3.6×10^{-10} cm^2 (s cm Hg)$^{-1}$, 30°, 10 atm
2	H_2	682.9 cm^3 mm/(m^2 day atm)	10.4×10^{-10} cm^2 (s cm Hg)$^{-1}$, 100°, 10 atm,
3	O_2	11 cm^3 mm/(m^2 day atm)	0.168×10^{-10} cm^2 (s cm Hg)$^{-1}$, 30°, 10 atm,
4	O_2	38.8 cm^3 mm/(m^2 day atm)	0.591×10^{-10} cm^2 (s cm Hg)$^{-1}$, 100°, 10 atm,
5	N_2	0.92 cm^3 mm/(m^2 day atm)	0.014×10^{-10} cm^2 (s cm Hg)$^{-1}$, 30°, 10 atm,
6	N_2	5.45 cm^3 mm/(m^2 day atm)	0.0834×10^{-10} cm^2 (s cm Hg)$^{-1}$, 100°, 10 atm,
7	O_2	19400 cm^3 mm/(m^2 day atm)	485.5 cm^3 m^{-2} d^{-1} atm^{-1}, room temp., 0.0025 cm thick [9]
8	CO_2	44840 cm^3 mm/(m^2 day atm)	1121 cm^3 m^{-2} d^{-1} atm^{-1}, room temp, 0.0025 cm thick [9]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1194 MPa	cast film [4]
2	2516 MPa	365 ksi, 1 mil film, N_2 imidised [17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	113.4 MPa	cast film [4]	9.2%
2	0.09 MPa	13.3 psi, 1 mil film, N_2 imidised [17]	

Tensile Strength Yield:

No.	Value	Note
1	0.05 MPa	7.3 psi, 1 mil film, N_2 imidised [17]

Mechanical Properties Miscellaneous: Adhesion to steel and to PA7 aluminium alloy has been reported [3]

Friction Abrasion and Resistance: Dynamic coefficient of friction μ_{dyn}, 0.26 (steel, 2000 cycles, 5 N load, 22°), 0.32 (steel, 16000 cycles, 5 N load, 22°), 0.19 (steel, 2000 cycles, 10 N load, 22°)[4]. Wear rate 171 μm^2 (1000 cycles)$^{-1}$ [4]

Electrical Properties:

Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	3	1 kHz	[13]
2	2.95	10 kHz	[13]

Strong Field Phenomena General: Ac field breakdown strength 370 V m^{-1} (26–60 μm film); dc field breakdown strength 534 V m^{-1} (55 μm film) [6]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002	1 kHz	[13]
2	0.011	10 kHz	[13]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [18]
Volume Properties/Surface Properties: Opaque (film) [13]

Polymer Stability:

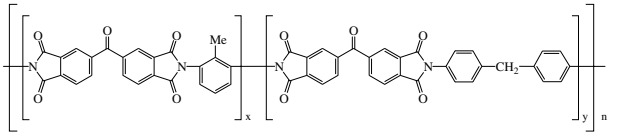
Polymer Stability General: Skybond has a shelf life of 3 months at 5° [1]
Thermal Stability General: Details of thermal stability have been reported [2,12]
Upper Use Temperature:

No.	Value	Note
1	340°C	max., Skybond 703 [1]

Decomposition Details: Degradation temp. 500° (min., N_2) [7]. 1.25% Weight loss in air at 100°, 57.5% weight loss in air at 700°, 50% weight loss in air at 800° [13]
Flammability: Non-flammable [13]
Environmental Stress: Is stable to sunlight [13]
Chemical Stability: Is resistant to organic solvents [13]. Attacked by alkali and strong acids [13]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by reaction of benzophenonetetracarboxylic acid dianhydride with diaminophenylmethane [13,15] in 10% dimethylacetamide at 0° for 3 h under a N_2 atmosphere. The poly(amic acid) is then imidised at up to 250° over 4 h [7]. Also synth. by reacting benzophenonetetracarboxylic acid with bis(4-isocyanophenyl)methane in dimethylacetamide at 0°, followed by heating up to 130° over a 6.5 h period [13,16]
Applications: Used in high-temp. applications; in coatings for wires, as an adhesive for high performance composites in the aerospace industry



Trade name	Details	Supplier
Skybond	703, 705	Monsanto Chemical

BTDA-MPD/MDA B-25

where x : y = 1 : 4

Synonyms: *Poly(3,3′,4,4′-benzophenonetetracarboxylic dianhydride-co-2-methyl-1,3-phenylenediamine-co-4,4′-methylenedianiline). Poly[4,4′-carbonylbis-1,2-benzenedicarboxylic acid-co-1,3-diisocyanatomethylbenzene-co-1,1′-methylenebis(4-isocyanatobenzene)]. Poly[5,5′-carbonylbis(1,3-isobenzofurandione)-co-1,3-diisocyanatomethylbenzene-co-1,1′-methylenebis(4-isocyanatobenzene)]*
Monomers: 5,5′-Carbonylbis[1,3-isobenzofurandione], 4,4′-Carbonylbis[1,2-benzenedicarboxylic acid], 1,3-Diisocyanato-2-methylbenzene, 1,1′-Methylenebis[4-isocyanatobenzene]
Material class: Thermoplastic
Polymer Type: Polyimide
CAS Number:

CAS Reg. No.	Note
9046-51-9	source based: dianhydride and diisocyanates
62181-46-8	source based: tetraacid and diisocyanates

Molecular Formula: $[(C_{24}H_{12}N_2O_5).(C_{30}H_{16}N_2O_5)]_n$
Fragments: $C_{24}H_{12}N_2O_5$ $C_{30}H_{16}N_2O_5$
Molecular Weight: MW 30100-47100 (increasing with increasing annealing temp.). M_n 9900-11100 (decreases with increasing annealing temp.)
Additives: Silica to improve mouldability
Morphology: Annealing of PI2080 at temps. close to T_g gives a homogeneous, amorph. polymer [9]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3507 g/cm^3	film, PI2080 [5]
2	d 1.337 g/cm^3	PI2080 [9]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.9×10^{-5} K^{-1}	PI2080 [10]	L

Volumetric Properties General: Density is relatively unaffected by annealing [9]
Glass-Transition Temperature:

No.	Value	Note
1	315°C	[5]
2	310°C	[7]
3	303°C	PI2080, DSC method [8,9]
4	307°C	PI2080, TMA method [8]
5	310–315°C	PI2080 [10]

Transition Temperature General: T_g of PI2080 increases with increasing annealing temp.
Deflection Temperature:

No.	Value	Note
1	270–280°C	PI2080 [10]
2	292°C	PI2080 [9]

Surface Properties & Solubility:

Solubility Properties General: PI2080 is miscible with poly(2,2′-(*m*-phenylene)-5,5′-bibenzimidazole) in all proportions [7]. PI2080 forms blends with *N,N′*-(methylenedi-*p*-phenylene)bismaleimide which may be polymerised above 180° to give hard films [13]
Plasticisers: *N*-Cyclohexyl-2-pyrrolidone [3]
Solvents/Non-solvents: PI2080 sol. dimethylacetamide [7,10], DMF [8,10], *N*-methylpyrrolidone [10], DMSO [10]

Transport Properties:

Polymer Solutions Dilute: η 0.5 dl g^{-1} (approx., PI2080 film) [9]
Permeability of Gases: The separation factor of cast PI2080 membranes increases with increasing annealing time and shows optimal performance when the casting solution is composed of 25 wt% PI2080, 37.5 wt% DMF and 37.5 wt% dioxane [4].
Permeability of Liquids: Permeability: MeOH 5.02×10^{-8}; 1.07×10^{-8}; EtOH 6.73×10^{-8}; C_6H_6 1.15×10^{-8}; $CHCl_3$ 4.79×10^{-9} mol (m^2 Pa)$^{-1}$ [6]. Other permeability values have been reported [6]
Permeability and Diffusion General: Long-time diffusion coefficients have been reported [5,8]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1300 MPa	25°, PI2080 [10]
2	660 MPa	285°, PI2080 [10]
3	6200 MPa	6.2×10^{10} dyne cm^{-2} PI2080) [9]

Flexural Modulus:

No.	Value	Note
1	3300 MPa	25°, PI2080 [10]
2	1100 MPa	285°, PI2080 [10]

Tensile Strength Break:

No.	Value	Note	Elongation
1	120 MPa	25°, PI2080 [10]	10%
2	29 MPa	285°, PI2080 [10]	
3	170 MPa	1.7×10^9 dyne cm^{-2}, PI2080 [9]	7%

Flexural Strength at Break:

No.	Value	Note
1	200 MPa	25°, PI2080 [10]
2	34 MPa	285°, PI2080 [10]

Compressive Modulus:

No.	Value	Note
1	2000 MPa	25°, PI2080 [10]

Compressive Strength:

No.	Value	Note
1	200 MPa	25°, PI2080 [10]

Viscoelastic Behaviour: Compression creep 0.04% (24 h, 25°, 1.87 GPa), 0.47% (24 h, 312°) [10]

Optical Properties:

Optical Properties General: The effect of curing on optical props. has been reported [12]
Molar Refraction: dn/dc 0.208 (PI2080) [11]

Polymer Stability:

Thermal Stability General: Thermal stability in a flow of N_2 has been reported [2]. PI2080 undergoes thermal and thermooxidative degradation causing cross-linking which is initiated by the formation of radicals from cleavage of methylene-phenyl bond [8]
Decomposition Details: Decomposition temp. 523–534° (annealed sample) [1]
Flammability: Oxygen index 44% (PI2080) [10]

Applications/Commercial Products:

Trade name	Supplier
Lenzing P84	Lenzing AG
PI2080	Dow
PI2080	Mitsubishi Kasei
Upjohn Polyimide 2080	Upjohn

Mechanical Properties:

Mechanical Properties General: Films retain their strength and flexibility after annealing at 300° [3]
Mechanical Properties Miscellaneous: Bonds aluminium to aluminium with a lap shear strength of 3.51 MPa (510 psi, ASTM D1002-72). Commercial Skybond resin bonds aluminium to aluminium with a lap shear strength of 2.83 MPa (410 psi) [4]

Electrical Properties:

Electrical Properties General: The effect of moisture on electrical props. has been reported [12]

Optical Properties:

Volume Properties/Surface Properties: Colour light yellow (freshly cast film) [3]

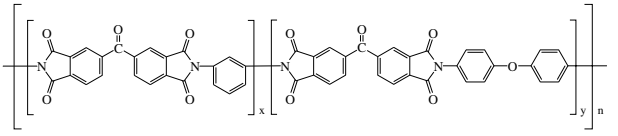
Polymer Stability:

Polymer Stability General: Skybond has a shelf life of 3 months at 5° [1]
Thermal Stability General: Thermal stability may be decreased upon addition of aromatic phosphorus compounds used as fire retarding agents [10]
Upper Use Temperature:

No.	Value	Note
1	370°C	max., Skybond 700 [1]

Decomposition Details: Decomposition temp. 550° (in N_2) [3]. 10% weight loss 475°; 50% weight loss 790° (N_2) [4]. Char yield 49% (in N_2) [4]; 63% (700, N2) [10] 1% (700°, air) [10]. Activation energy of decomposition 124 kJ mol^{-1} (N_2) [4].The major products of decomposition are CO and CO_2. Shows approx. 40% weight loss after heating in air at 400° for approx. 30 h. The max. rate of weight loss is 1.74% h^{-1} which occurs after 14 h heating in air at 400° [7]. Max. decomposition temp. 631° (in N_2) [10]
Flammability: Limiting oxygen index 43.9% (ASTM D2863-74) [10]
Hydrolytic Stability: Effect of hot geothermal brine has been reported [2]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by reaction of benzophenonetetracarboxylic acid and *m*-phenylenediamine in dry DMF below 30°, followed by thermal imidisation [7] or chemical imidisation using an Ac_2O/pyridine mixture [10]
Applications: Used in high temp. applications and as an adhesive for high performance composites in the aerospace industry

Trade name	Supplier
Skybond 700	Monsanto Chemical

107194-69-4	block

Butadiene-styrene-vinylidene chloride terpolymer B-31

Synonyms: *Poly(1,3-butadiene-co-1,1-dichloroethene-co-ethenylbenzene). Poly[(1,1-dichloroethene)-co-(1,4-butadiene)-co-ethenylbenzene]*
Related Polymers: Poly(vinylidene chloride), Vinylidene chloride copolymers, Polybutadiene, Polystyrene
Monomers: 1,3-Butadiene, Styrene, Vinylidene chloride
Material class: Copolymers, Synthetic Elastomers
Polymer Type: Polybutadiene, Polystyrenepolyvinylidene chloridepolyhaloolefins
CAS Number:

CAS Reg. No.
31669-55-3

Molecular Formula: $[(C_2H_2Cl_2)_x.(C_4H_6)_y.(C_8H_8)_z]_n$
Fragments: $C_2H_2Cl_2$ C_4H_6 C_8H_8
General Information: Typical compositions vinylidene chloride:-butadiene:styrene, 5:70:25-35:36:27. Some commercial products are carboxylated
Miscellaneous: Sulfur-free vulcanised materials can be produced by using metal oxides, amines and thiuram. [1] Binder saturant formulations of carboxylated terpolymer (52–53% total solids) are available commercially. [10] Formulations containing ≤40% vinylidene chloride are acceptable under US Federal Food, Drug, and Cosmetic Act in certain food-contact applications [3]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d_1 0.928 g/cm^3	9.1–9.3 lb gal^{-1}, binder saturant formulation of carboxylated terpolymer; 52–53% total solids [10]

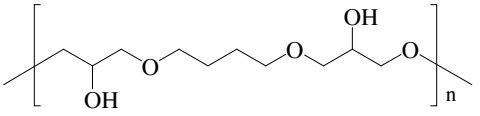
Surface Properties & Solubility:
Surface Tension:

No.	Value	Note
1	40 mN/m	binder saturant formulation of carboxylated terpolymer; 52–53% total solids [10]

Transport Properties:
Transport Properties General: High-solids latex formulations display good high-shear rheology and good low-shear viscosity [4]
Polymer Solutions Dilute: Viscosity 40–50 cP (binder saturant formulation of carboxylated terpolymer; 52–53% total solids) [10]

Mechanical Properties:
Mechanical Properties General: Physicomechanical props. of terpolymer vulcanisates are similar to those of styrene/butadiene copolymer rubbers. Inferior tear strength and superior cold resistance have been reported [1]
Friction Abrasion and Resistance: Carboxylated terpolymer displays good abrasion resistance [10]

Polymer Stability:
Flammability: Carboxylated terpolymer displays good flame resistance [10]
Chemical Stability: Vulcanised material has similar resistance to petroleum as styrene/butadiene copolymer rubbers



Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by emulsion polymerisation of mixture of corresponding monomers (free-radical initiated) [1]; can be vulcanised in presence of metal oxides, amines and thiuram [1]
Applications: Bindings in textile coverings (e.g. nylon carpets); smoulder-resistant back coatings to cotton fabrics; paper coatings (high-solids latexes); industrial microbiocide research (as latex); quick-set latex adhesive compositions; indirect food additives, e.g. as components of paper/paperboard coatings for aq. and fatty food contact

Trade name	Details	Supplier
Darex	529 L, 535 L non-exclusive; carboxylated binder saturant formulations (52–53% total solids)	W R Grace
Gen Flo 8520	non-exclusive	General Tyre and Rubber Co.
SKS-25KhV-5ARK	5/70/25 (VDC/butadiene/styrene) terpolymer	AB Svensk Konstsilke

1,4-Butanediol diglycidyl ether resin B-32

Synonyms: *Poly(butylene glycol diglycidyl ether). Poly(2,2′-[1,4-butanediylbis(oxymethylene)]bisoxirane). PDGEBD*
Monomers: 1,4-Butanediol diglycidyl ether
Material class: Thermosetting resin
Polymer Type: Epoxy
CAS Number:

CAS Reg. No.	Note
29611-97-0	homopolymer
69777-27-1	copolymer with 1,2-ethanediamine
69777-29-3	copolymer with diaminodiphenylmethane
104559-45-7	copolymer with 4-ethylpyridine
105692-42-0	copolymer with butylamine and 1,8-octanediamine
105692-54-4	copolymer with 1,10-decanediamine

Molecular Formula: $(C_{10}H_{18}O_4)_n$
Fragments: $C_{10}H_{18}O_4$
Molecular Weight: M_n 220
General Information: Props. of cured resin depend on curing agent, stoichiometry, cure time and cure temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.05 g/cm^3	uncured [4]
2	d 1.2863 g/cm^3	diaminodiphenylsulfone cured [5]
3	d 1.073 g/cm^3	butylamine/1,8-octanediamine cured, zero cross-linking density [6]
4	d 1.182 g/cm^3	1,10-decanediamine cured, cross-linking density 4.27 mol kg^{-1} [6]

Volumetric Properties General: Density of diaminodiphenylsulfone cured resin increases with ageing below T_g [5]. Density of resin cured with butylamine and 1,8-octanediamine, or with 1,10-decanediamine, increases with increasing cross-linking density [6]
Glass-Transition Temperature:

No.	Value	Note
1	78°C	diaminodiphenylsulfone cured [1]
2	82°C	diaminodiphenylmethane cured [1]
3	7°C	1,2-ethanediamine cured [1]
4	77°C	diaminodiphenylsulfone cured [5]
5	-33°C	butylamine/1,8-octanediamine cured [6]
6	0°C	1,10-decanediamine cured, cross-linking density 4.27 mol kg^{-1} [6]
7	76°C	diaminodiphenylmethane cured [7]

Transition Temperature General: T_α of diaminodiphenylsulfone cured resin, but not T_β or T_γ, is affected by ageing below T_g [5]. T_g of resin cured with butylamine and 1,8-octanediamine increases with increasing cross-linking density [6]
Transition Temperature:

No.	Value	Note	Type
1	-55°C	approx., 1,2-ethanediamine, diaminodiphenylmethane cured [3]	T_β
2	64°C	diaminodiphenylsulfone cured [5]	T_α

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 22.2 MPa$^{1/2}$ (uncured) [4]
Surface Tension:

No.	Value	Note
1	28.7 mN/m	50°, uncured [4]

Mechanical Properties:

Mechanical Properties General: Dynamic loss tangent is halved, at temps. between 60° and 80°, by ageing below T_g in resin cured by diaminodiphenylsulfone [5]
Viscoelastic Behaviour: Resin cured with diaminodiphenylsulfone shows a yield point at 6.2% strain. Specimens compressed to half their original length may be recovered by heating. Yield point may be improved by ageing below T_g [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: A rubber-like solid may be obtained by heating 4-ethylpyridine with 1,4-butanediol diglycidyl ether for 5 min. at 140°. The aromaticity of the pyridine ring is lost [2]
Applications: Reactive diluent for epoxy resins. Used in adhesives, coatings

Trade name	Supplier
RD-2	Ciba-Geigy Corp.

para-tert-Butyl Phenolic resins B-34

Synonyms: *4-(1,1-Dimethylethyl)phenol based resins*
Monomers: 4-*tert*-Butylphenol, Formaldehyde
Material class: Thermoplastic
Polymer Type: Phenolic
CAS Number:

CAS Reg. No.	Note
25085-50-1	
28963-94-2	copolymer with formaldehyde and hexa

Molecular Formula: $[(C_{10}H_{14}O).(CH_2O)]_n$
Fragments: $C_{10}H_{14}O$ CH_2O
Molecular Weight: MW 530-542 (novolak, uncured), 1260 (novolak, uncured); M_n 1050 (novolak, uncured); MW 460 (Yarresin B), 520 (101 K); M_n 1085 (all-*ortho*-novolak, uncured)
General Information: The resins do not crosslink as the phenol is difunctional (the *para*-position is blocked)
Morphology: Adopts a cyclic conformn. in non-polar solvents [2]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.2 g/cm^3	novolak, uncured film [14]

Equation of State: Mark-Houwink-Sakurada equation of state information has been reported [9]
Melting Temperature:

No.	Value	Note
1	400–401°C	recrystallised cyclic resole, uncured [6]
2	60–95°C	all-*ortho* novolak, uncured, dependent on synth. [7]
3	84–86°C	novolak, uncured [10]
4	80–100°C	Yarresin B [15]
5	101°C	novolak, uncured [20]
6	157–171°C	all-*ortho* novolak, uncured [21]

Glass-Transition Temperature:

No.	Value	Note
1	51°C	novolak, uncured [8]
2	65°C	Bakelite 92370 [16]
3	85°C	PN430 [16]

Vicat Softening Point:

No.	Value	Note
1	120°C	novolak, uncured [20]

Surface Properties & Solubility:
Solubility Properties General: Low MW novolak resin forms miscible blends with atactic poly(methyl methacrylate) and bisphenol A polycarbonate [11]
Solvents/Non-solvents: Uncured novolak sol. Me_2CO, EtOH, $CHCl_3$, C_6H_6, petrol, turpentine, linseed oil, tung oil, 2-butanone, toluene, CCl_4, EtOAc [10,20]

Transport Properties:
Water Absorption:

No.	Value	Note
1	1.43–1.52 %	24h, 100% relative humidity, novolak, uncured [10]
2	4.12–4.3 %	144h, 100% relative humidity, novolak, uncured [10]

Electrical Properties:
Electrical Properties General: Has semiconductor props.; conduction dependency on temp. has been reported [5]

Optical Properties:
Transmission and Spectra: Mass [1], C-13 nmr [3,18] and H-1 nmr [18] spectral data have been reported
Volume Properties/Surface Properties: Colour 6 (Gardner, novolak, uncured) [20]

Polymer Stability:
Chemical Stability: Uncured novolak has excellent compatibility at 250° with linseed oil, tung oil, castor oil and double-boiled linseed oil [20]
Stability Miscellaneous: Electron beam irradiation *in vacuo* causes cross-linking [14]

Applications/Commercial Products:
Processing & Manufacturing Routes: May be synth. by a continuous process involving reaction of hexa and *p-tert*-butylphenol in a melt at 110-120° followed by addition of paraformaldehyde; optimum paraformaldehyde: *p-tert*-butylphenol 0.7:1 [4]. Reaction of p-*tert*-butylphenol with formaldehyde in the presence of aq. base produces a mixture of cyclic oligomers, ie. with calixarene struct. [6,13,15]. The solid resole is compounded with neoprene rubber and metallic oxides in solvent to make a contact adhesive. The solid novolak is compounded with kaolin and styrene-butadiene rubber latex with minor amounts of calcium carbonate, colloidal silica and hydroxyethyl starch to make a coating for carbonless paper. All-*ortho*novolak resin may be synth. by reaction of paraformaldehyde with 4-*tert*-butylphenoxymagnesium bromide in C_6H_6 or toluene [7,19,21]. Other synth. by acetal reaction has been reported [17]
Applications: All-*ortho* novolaks have potential applications as antioxidants in lard and as antimicrobial agents. Other uses include contact adhesives for electrical insulation varnishes, as coatings for metals, ceramics and some plastic surfaces. The resole tackifier is compounded to make a Neoprene rubber-phenolic contact adhesive. This finds application in the furniture, automotive, construction and footware industries as a rubber adhesive. The Novolak is part of the coated front (CF) sheet formulation which receives the image in the pressure-sensitive record sheet of the carbonless paper system. All-*ortho* novolaks have potential applications as antioxidants in lard and as antimicrobial agents. Other uses include contact adhesives for electrical insulation varnishes, as coatings for metals ceramics and some plastic surfaces

Butyl rubber B-35

Synonyms: *GR-I. Poly(isobutylene-co-isoprene). IIR*
Related Polymers: Bromobutyl rubber, Chlorobutyl rubber
Monomers: Isobutylene, Isoprene
Material class: Synthetic Elastomers
Polymer Type: Polydienes
CAS Number:

CAS Reg. No.
9006-49-9

Additives: Can be vulcanised by sulfur, zinc oxide and thiazole. Zinc dibutyl dithiocarbamate added as stabiliser, zinc stearate as an antioxidant. Carbon black added as a filler
Morphology: Is a random copolymer containing 1–3% isoprene. Methyl substituents create steric hindrance to rotation about the polymer backbone

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.917 g/cm^3	unvulcanised [1]
2	d 0.933 g/cm^3	pure gum vulcanisate [2]
3	d 0.93–0.97 g/cm^3	pure gum vulcanisate
4	d 1.13 g/cm^3	vulcanisate, 50 phv carbon black [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00075 K^{-1}	unvulcanised [3]	V
2	0.00056 K^{-1}	pure gum vulcanisate [4]	V
3	0.00046 K^{-1}	vulcanisate, 50 phv carbon black	V
4	0.000194 K^{-1}	[48]	L

Thermodynamic Properties General: Studies of thermophysical props. of butyl rubber loaded with 100 phv of different types of carbon black and also barium titanate have been reported at temps. ranging from 30 to 150°C. The props. include thermal conductivity, thermal diffusivity and specific heat capacity [67]

Thermal Conductivity:

No.	Value	Note
1	0.13 W/mK	pure gum vulcanisate [9]
2	0.23 W/mK	vulcanisate, 50 phv carbon black [9]

Thermal Diffusivity: 7×10^{-8} m^2 s^{-1} [85]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.95 kJ/kg.C	unvulcanised [6,7,8]	P
2	1.85 kJ/kg.C	pure gum vulcanisate [7]	P

Melting Temperature:

No.	Value	Note
1	1.5°C	equilibrium, unvulcanised [3]

Glass-Transition Temperature:

No.	Value	Note
1	-71°C	unvulcanised [3]
2	-63°C	pure gum vulcanisate [5]
3	-75–-67°C	[61]

Surface Properties & Solubility:

Solubility Properties General: The compatibility of butyl rubber with other elastomers, cured and uncured, with and without carbon black has been reported [56,88]
Cohesive Energy Density Solubility Parameters: Solubility parameter δ 31.4 $J^{1/2}$ $cm^{-3/2}$ [26]
Solvents/Non-solvents: Sol. cyclohexane, C_6H_6. Insol. dioxane
Surface and Interfacial Properties General: Adhesion is affected by amount of carbon black filler [65]
Surface Tension:

No.	Value	Note
1	35.6 mN/m	24° [30,31]
2	27 mN/m	critical surface tension of spreading [82]

Transport Properties:

Polymer Solutions Dilute: θ Temp. 21° (isoamyl isovalerate); 22° (C_6H_6); 23.7° (isoamyl benzyl ether); 46.2° (butyl butyrate); 55.5° (3-methyl-5-heptanone). [84] Bulk viscosity at zero shear has been reported. [26] Mark-Houwink parameters have been reported. [26] MW determinations have been reported [56]
Polymer Melts: Relationships between melt viscosity and limiting viscosity have been reported [33]
Permeability of Gases: Relative gas permeabilities and diffusivities have been reported for a range of gases. [22,24] Permeability (O_2) 0.44 mol (m s Pa)$^{-1}$ [23]. Diffusion coefficients for H_2 and N_2 in butyl rubber have been reported over a range of temps. and compared with other elastomers. [49] The coefficients for butyl rubber are lower than those of other hydrocarbon elastomers by an order of magnitude
Permeability of Liquids: Water permeability is low
Volatile Loss and Diffusion of Polymers: Self-diffusion constants over a range of MW have been reported for butyl rubber and other elastomers [81]
Permeability and Diffusion General: Has low permeability as steric hindrance of methyl groups on the polymer backbone slows chain motion. [32] Diffusion coefficients have been reported for aliphatic and aromatic hydrocarbons at concentrations up to 2.4% in butyl rubber and compared with SBR and BR [87]

Gas Permeability:

No.	Gas	Value	Note
1	air	36.4 cm^3 mm/(m^2 day atm)	24° [94]
2	N_2	21.6 cm^3 mm/(m^2 day atm)	21° [94]

Mechanical Properties:

Mechanical Properties General: Steric hindrance between the methyl groups in butyl rubber gives it low resilience (and high damping) at low or ambient temp. but high resilience at 100° [26,32]. Hydrostatic pressure increases ultimate props. [51]. Has similar tensile props. to styrene-butadiene rubber, but with poorer resistance to abrasion and tearing. Carbon black improves tear resistance but not tensile props. [32,37,75,83] and its effect on cure has been reported [94]. Poisson's ratio has been measured for butyl rubber with different types of carbon black [91]

Tensile (Young's) Modulus:

No.	Value	Note
1	1 MPa	pure gum vulcanisate [5,17]
2	3–4 MPa	vulcanisate, 50 phv carbon black [16]
3	7.7 MPa	25° [78]
4	1.2 MPa	190° [78]
5	0.74 MPa	[53]

Tensile Strength Break:

No.	Value	Note	Elongation
1	18–21 MPa	pure gum vulcanisate [15,16]	750–950%
2	18 MPa	atmospheric pressure, 22° [51]	
3	24 MPa	200 MPa pressure, 22° [51]	310%
4	18–21 MPa	vulcanisate, 50 phv carbon black [15,16]	650–850%
5	10 MPa	pure gum vulcanisate [32]	800%
6	12–20 MPa	vulcanisate, 50 phv carbon black [43]	490–700%

Elastic Modulus:

No.	Value	Note
1	1970 MPa	pure gum vulcanisate [13]
2	2170 MPa	vulcanisate, 50 phv carbon black [12]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.33 MPa	pure gum vulcanisate [5,17]	shear modulus
2	1.8 MPa	vulcanisate, 50 phv carbon black [18]	shear modulus
3	2.1–8.6 MPa	vulcanisate, 50 phv carbon black [43]	300% modulus

Complex Moduli: Storage and loss moduli have been reported for vulcanised and unvulcanised rubber [20,25,45,64]
Mechanical Properties Miscellaneous: Compressibility 508 MPa^{-1} (pure gum vulcanisate) [4]; 460 MPa^{-1} (vulcanisate, 50 phv carbon black) [12]. Longitudinal bulk wave velocity 1485 m s^{-1} (pure gum vulcanisate) [12]; 1510 m s^{-1} (vulcanisate, 50 phv carbon black)

[12]; longitudinal strip wave velocity 100 m s^{-1} (1 kHz, pure gum vulcanisate); 210 m s^{-1} (1 kHz, vulcanisate, 50 phv carbon black) [14]. Oxidised carbon black gives enhanced adhesion, lower tan δ, improved ultimate props. and abrasion resistance. [43] Peak longitudinal absorption 450 dB cm^{-1} (10 MHz) [27]. Resilience 13–16% (pure gum vulcanisate) [16,21]; 14% (vulcanisate, 50 phv carbon black) [16]. The effect of carbon black loading on dynamic mech. props. has been reported. [37,44,45,64,89] Interaction with carbon black is weaker than for other elastomers. [52] Heat build up and resilience are affected by curing temp. and system and carbon black fillers [94]
Hardness: Shore A40-A80 [32]; A53-A64 (vulcanisate, 50 phv carbon black) [43]
Fracture Mechanical Properties: Tearing energy has been reported for blends of butyl rubber with polyisobutylene over a range of composition from -30 to 100° [46]
Friction Abrasion and Resistance: Unlike other rubbers, butyl rubber causes more wear by sliding on stainless steel in air than in an inert atmosphere, owing to the stability of the peroxy radical. [47] Has poor abrasion resistance. Abrasion props., flex cracking, fatigue and cut-growth rate with respect to other elastomers have been reported. [86] Carbon black fillers affect these props. [92]

Electrical Properties:

Electrical Properties General: Has excellent electrical insulation props. [78] Resistivity, dielectric props. and current-voltage relationships are affected by amount of carbon black filler [37,72,73,74,76]
Dielectric Permittivity (constant):

No.	Value	Frequency	Note
1	2.38	1 kHz	unvulcanised [11]
2	2.42	1 kHz	pure gum vulcanisate [11]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.003	1 kHz	unvulcanised [11]
2	0.0054	1 kHz	pure gum vulcanisate [11]

Optical Properties:

Optical Properties General: FTIR and nmr spectral data show that isoprene units have 1,4 structure [41,54]
Refractive Index:

No.	Value	Note
1	1.5081	unvulcanised [10]
2	1.5105	[88]

Volume Properties/Surface Properties: SIMS characterisation shows saturated hydrocarbon with no significant evidence of oxidation [55]

Polymer Stability:

Polymer Stability General: Butyl rubber is more resistant to attack by oxygen and ozone than diene rubbers because it has no tertiary hydrogen atoms in the isobutene segments and only has a small proportion of unsaturated monomer segments
Thermal Stability General: Phenol formaldehyde (resole) resins give thermally stable cross-links for butyl rubber. [57] Stability depends on such factors as thermal and oxidative conditions, mechanical stresses, catalyst residues, ozone and radiation [68]
Upper Use Temperature:

No.	Value	Note
1	120°C	[89]
2	200°C	[33]

Decomposition Details: Maximum weight loss temp. at 386°. [62] Pyrolysis begins at approx. 300° and becomes very rapid at 400°. The main product is isobutylene. [38,70] The photochemical breakdown of butyl rubber has been reported. [38] Under vacuum no breakdown occurred at any wavelength. Breakdown in air occurs only at wavelengths shorter than 460 nm. [34] Volatilisation within 30 min: 0% (280°), 50% (340°), 100% (370°). [63] Monomer yield 35–38% (500°), 65–73% (800°), 11–15% (1200°). [63] Butyl rubber degrades under thermo-oxidative conditions mainly by chain scission [90]
Flammability: Release of flammable isobutylene occurs at 500-600°. [58] Heat of combustion ΔH 47 kJ g^{-1} [63]
Environmental Stress: Has good resistance to vegetable oils and ester based lubricants. [32] Surprisingly low radiation stability, useful props. are destroyed at 10^5 Gy [28]. High energy radiation gives chain scission [40,60] and cross-linking. [71] Good weathering and ozone resistance [32], much more resistant to ozone cracking than other diene rubbers [80]. Crack propagation critical stress 12 MPa, slower than for natural rubber [53]
Chemical Stability: Suitable for use with inorganic chemicals such as metal salts, acids and alkalis up to 100°. [32] Useful life for butyl rubber (resin cured) with 50 phv carbon black and 5 phv oil at 170° is 280 h [32]
Hydrolytic Stability: The effect of steam ageing on the mechanical properties of butyl and chlorobutyl rubbers has been compared. [32]
Stability Miscellaneous: The resistance of butyl rubber to thermo-oxidation and to gas permeation has been confirmed in accelerated reacting as a coating to improve the stability of natural rubber. [59] The effect of silane coupling agent on the thermo-oxidative stability of butyl rubber has been investigated [66]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by a slurry process using $AlCl_3$ as catalyst at low temp. (-90–-98°). Mixture is isobutene with a small amount of diolefin, usually isoprene (1–3%). Butyl rubber does not have vulcanisable groups in the monomer, so the curable isoprene is incorporated. Curing rate is slow
Mould Shrinkage (%):

No.	Value	Note
1	2.36%	cured, without filler [48]
2	1.6%	cured, 20 phv filler [48]

Applications: Used in applications where low air permeability is important, such as tyre inner linings and pneumatic devices. Also used in adhesives, caulks, sealants, lining material, electrical cable sheathing for its good durability. Used in high temp. hoses, conveyor belts and in load bearing and mounting structures due to good damping props.

Butyl Rubber Chlorinated B-36

Synonyms: *CIIR. Chlorobutyl rubber. Chlorinated isobutylene-isoprene copolymer/elastomer*
Related Polymers: Butyl rubber
Monomers: Isobutylene, Isoprene
Material class: Synthetic Elastomers
Polymer Type: Polydienes
Additives: Sulfur and zinc oxide as vulcanising agents
General Information: 1% Chlorine. Chlorinated butyl rubber can be vulcanised more quickly than butyl rubber, and is more compatible with other rubbers

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.043 g/cm^3	pure gum vulcanisate [4]
2	d 1.132–1.253 g/cm^3	vulcanisate, carbon black filled [4]

Thermal Conductivity:

No.	Value	Note
1	0.136 W/mK	40° [8]

Surface Properties & Solubility:

Solubility Properties General: The compatibility of cured and uncured rubber with other elastomers has been reported. [18] Compatibility is increased compared to butyl rubber. Partially miscible with EPDM, immiscible with styrene-butadiene rubber, natural rubber, polybutadiene and polychloroprene [12]

Wettability/Surface Energy and Interfacial Tension: Chlorobutyl rubber gives good adhesion to fillers and highly unsaturated elastomers. This alleviates the difficulty of vulcanising butyl rubber blends with diene rubbers. [11] Chlorination of butyl rubber improves the rate of curing, and adhesion to metals [3]

Transport Properties:

Transport Properties General: Transport props. are very similar to those of butyl rubber

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	1.26 MPa	pure gum vulcanisate [4]	290%
2	4–11.5 MPa	vulcanisate, carbon black filled [4]	290%

Mechanical Properties Miscellaneous: Energy loss is higher than that of other polymers. Storage and loss moduli and tan δ over a range of frequencies for pure gum vulcanisate and for carbon black filled vulcanisate over a range of loadings have been reported [4, 9]
Hardness: Shore A24; A44-A56 (carbon black filled) [4]
Failure Properties General: The phase behaviour of chlorobutyl rubber blends with other elastomers and its relationship to tread wear, skid resistance, flex cracking, fatigue and cut-growth rate has been reported. [11] Tear strength 8.75 kN m^{-1} (pure gum vulcanisate); 23–43 kN m^{-1} (vulcanisate, carbon black filled) [4]
Fracture Mechanical Properties: Fatigue crack propagation has been reported over a range of strain rates (1–20 s^{-1}) and temps. (0–75°) in N_2, air and 0.5 ppm O_2. The rate of crack propagation does not increase abruptly at high tearing energy unlike butyl rubber and natural rubber [7]
Friction Abrasion and Resistance: Has higher skid resistance on wet ice than other rubbers [14]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5105	[18]

Transmission and Spectra: Nmr spectral data have identified the structure of chlorinated groups in the polymer [2]

Polymer Stability:

Thermal Stability General: Thermal characteristics of a range of chlorobutyl rubber blends have been reported [6,9]
Decomposition Details: High temp. degradation is similar to butyl rubber, the main decomposition product being isobutylene. [1,9] Wt. loss onset at 352°; 50% wt. loss at 395° [6]; max. wt. loss at 386° [10]. Cross-linking is extensive under thermo-oxidative conditions [19]
Flammability: Flammability rating 5.4 (filled match test); 2 (MIL 417 test) [17]
Environmental Stress: Has better ozone resistance than other diene rubbers. [15] Useful life 230h (50 phv carbon black, 5 phv oil, 170°). [16]
Hydrolytic Stability: Steam ageing effects have been reported [16]
Stability Miscellaneous: High energy radiation causes cross-linking rather than chain scission. [13]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by chlorination of butyl rubber
Applications: Used in tyres

Trade name	Supplier
Chlorobutyl	Exxon Chemical
Polysar Chlorobutyl	Polysar

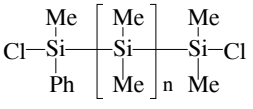
Deoxyribonucleic acid D-1



Synonyms: *DNA. Thymus nucleic acid*
Material class: Polynucleotides
Molecular Weight: DNA from viruses have molecular weights *ca.* $1-130 \times 10^6$ whereas bacterial and animal DNA has much higher molecular weights with chains easily severed during isoln.
General Information: A polynucleotide constructed from chains of 2-deoxy-D-ribose purine and pyrimidine units linked by phosphate diester bonds between the 3′- and 5′-hydroxyls of adjacent sugars.
Morphology: The adenine and thymine contents are equal and the guanine and cytosine contents also equal, regardless of source. In the secondary structure two polymer chains form right-handed helices about a common axis, with the sequence of atoms running in opposite directions in each strand. The bases are inside the helix and the adenine of one chain is hydrogen bonded to the thymine of the other and similarly with the guanine and cytosine
Miscellaneous: Present in all life forms except some viruses. An essential component of chromosomes in cell nuclei which carries genetic information by containing a chemical code in its structure, which is exactly reproducible. The linear sequence of bases in one strand determines the sequence in the other. Thus each strand can serve as a template for replication of the original DNA molecule. DNA also serves as a template for the formation of ribonucleic acids

Optical Properties:
Transmission and Spectra: nmr [9], ir [8], Raman [8] and ms [7] have been reported

Dichloropoly(methylphenylsilane) D-2

Synonyms: α,ω-*Dichloropolymethylphenylsilane. Dichloropolyphenylmethylsilane. Dichloropolyphenylmethylsilylene*
Related Polymers: Poly(methylphenylsilane), More general information (polysilanes)
Monomers: Dichloromethylphenylsilane
Material class: Thermoplastic
Polymer Type: Polysilanes
CAS Number:

CAS Reg. No.	Note
76188-55-1	polymethylphenylsilane

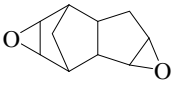
Molecular Formula: $(C_7H_8Si)_n$
Fragments: C_7H_8Si
Molecular Weight: MW 20000; M_n 6000

Volumetric & Calorimetric Properties:
Melting Temperature:

No.	Value	Note
1	220°C	[5]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, THF. Mod. sol. ethers, aliphatic hydrocarbons. Slightly sol. acetonitrile. Insol. alcohols [1,2,3,7]

Optical Properties:
Transmission and Spectra: Strong absorption 338–341 nm [4,6,8]. Fluorescence 360 nm



Polymer Stability:
Polymer Stability General: Functional end groups react readily with other chemicals [2,9]
Hydrolytic Stability: The SiCl end groups are hydrolysed to SiOH see polymethylphenylsilane [1,2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by Wurtz coupling of dichloromethylphenylsilane using metallic sodium in toluene at around 110°. Water must be excluded to prevent hydrol. of ClSi end groups to hydroxyl groups [1,2,7]
Applications: Precursor to polysilane-polystyrene block copolymers. Potentially useful electronic and non-linear optical props [9,10,11,12,13,14,15,16]

Dicyclopentadiene dioxide resin D-3

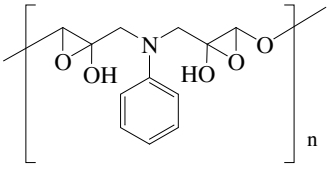
Synonyms: *Poly(octahydro-2,4-methano-2H-indeno[1,2-b:5,6-b′]bisoxirene). Poly(1,2:5,6-diepoxyhexahydro-4,7-methanoindan)*
Monomers: Dicyclopentadiene dioxide
Material class: Thermosetting resin

Polymer Type: epoxy
CAS Number:

CAS Reg. No.	Note
29987-76-6	homopolymer
71855-14-6	copolymer with phenylphosphonic dichloride

Molecular Formula: $(C_{10}H_{12}O_2)_n$
Fragments: $C_{10}H_{12}O_2$
Additives: Glass fibre

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. of the resin from unsaturated precursor by the action of peroxyacetic acid has been reported [2]
Applications: Uncured resin (in presence of Ba/Ca ions) has potential application as stabiliser for PVC. Resin cured with phenylphosphonic dichloride has potential application as a fireproofing agent for polyester fibres. May also be used as a reactive diluent for epoxy resin compositions

Trade name	Details	Supplier
EP	207	Union Carbide

Diglycidyl aniline resin D-4

Synonyms: *Poly[N-(oxiranylmethyl)-N-phenyloxiranemethanamine]*
Monomers: Diglycidyl aniline
Material class: Thermosetting resin
Polymer Type: Epoxy
CAS Number:

CAS Reg. No.	Note
30999-33-8	
119391-54-7	copolymer with aniline
129888-35-3	copolymer with 1,3-diaminobenzene
120468-21-5	copolymer with tetrahydro-5-methylisophthalic acid anhydride
110430-27-8	copolymer with diaminodiphenylmethane
120468-22-6	copolymer with 1,3-benzenedimethanamine

Molecular Formula: $(C_{12}H_{15}NO_2)_n$
Fragments: $C_{12}H_{15}NO_2$
Miscellaneous: The props. of the cured resin depend on hardener, stoichiometry, cure time and cure temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.24 g/cm^3	tetrahydro-5-methylisophthalic acid anhydride cured [5]
2	d 1.21 g/cm^3	diaminodiphenylmethane cured [5]
3	d 1.22 g/cm^3	1,3-benzenedimethanamine [5]

Glass-Transition Temperature:

No.	Value	Note
1	155°C	1,3-diaminobenzene cured [2]
2	105°C	tetrahydro-5-methylisophthalic acid anhydride cured [5]
3	123°C	diaminodiphenylmethane cured [5]
4	74°C	1,3-benzenedimethanamine cured [5]

Transport Properties:

Permeability of Liquids: Average diffusion coefficient [H_2O] 0.32×10^{-9} cm^2 s^{-1} (20°, 1,3-diaminobenzene cured, water-aged, 70°) [2]
Water Content: Polymer only partially cured may be fully cured by immersion in H_2O at 70° [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: The mechanism and kinetics of cure with aniline have been reported [1]. Diglycidyl aniline undergoes anionic polymerisation with 10% potassium *tert*-butoxide to give a soluble polymer. The polymer is a mixture of six and seven-membered rings [3]. The influence of cyclisation and functional group reactivity on the formation of networks in diaminodiphenylmethane cured systems has been reported [4]

Trade name	Supplier
STF-5	Reichhold Chemie

Dimethiconol D-5

Synonyms: *α-Hydro-w-hydroxypoly[oxy(dimethylsilylene)]. Poly(dimethylsiloxane)diol. Dimethicone polyol*
Related Polymers: Polydimethylsiloxane, Methylsilicone rubber, Room temp. vulcanised
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Fluids
Polymer Type: Dimethylsilicones
CAS Number:

CAS Reg. No.	Note
31692-79-2	Dimethiconol
63394-02-5	elastomer
9006-65-9	PDMS fluid
9016-00-6	PDMS fluid
63148-62-9	PDMS fluid

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi
Molecular Weight: MW 300–100000

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.96 g/cm^3	[6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.001 K^{-1}	[10,11]	V

Specific Heat Capacity:

No.	Value	Note	Type
1	1.5 kJ/kg.C	0.36 cal (g°C)$^{-1}$ [7,9,10]	P

Transition Temperature General: Transition temps. have been reported [1,3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 J$^{1/2}$ cm$^{-3/2}$ (7.5–7.6 cal$^{1/2}$ cm$^{-3/2}$) [4,5]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [4,5,6]
Surface and Interfacial Properties General: The mixture of polar hydrophilic end groups and the non-polar hydrophobic repeat sequence gives dimethiconol valuable surfactant props.

Transport Properties:

Polymer Melts: Viscosity has been reported [2,7]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.4	[11]

Transmission and Spectra: Transparent above 280 nm [8]

Polymer Stability:

Polymer Stability General: The reactive SiOH groups make dimethiconol less stable than PDMS fluid [9]
Chemical Stability: Liable to undergo condensation reactions in acid conditions [9]
Hydrolytic Stability: More liable to undergo condensation reactions than depolymerisation in H_2O and aq. solns. at room temp.
Biological Stability: Non-biodegradable

Applications/Commercial Products:

Processing & Manufacturing Routes: Short chain polysiloxanes are produced by the hydrol. of dichlorodimethylsilane in weak acid. In the absence of chain terminating groups dimethiconol is formed. High MW dimethiconol is formed by polymerisation of cyclic dimethysiloxanes at 150–200° with alkaline catalysis in the presence of small quantities of water
Applications: Used as a wetting agent and surfactant. High MW dimethiconol is used to manufacture methylsilicone rubber

E-Bonite E-1

Synonyms: *Hard rubber. Vulcanite*
Related Polymers: Natural rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Thermosetting resin
Polymer Type: polybutadiene
Additives: Additives include vulcanising sulfur, plasticisers, amines. Typical rubber-sulfur ratio 68:32
General Information: Obtained by vulcanising natural rubber with sulfur. One of the earliest synthetic polymers

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note

2	4100 MPa	[3]	Bulk modulus

Impact Strength: Impact strength 1–7 kJ m^{-2} (ebonite) [1], 25 kJ m^{-2} (hard resin rubber) [1]
Hardness: Shore A100 [1]; Shore D70–D85 [2]
Izod Notch:

No.	Value	Notch	Note
1	26.6 J/m	Y	0.5 ft lb in^{-1} [4]

Electrical Properties:

Electrical Properties General: Resistivity decreases on exposure to light
Surface/Volume Resistance:

No.	Value	Note	Type
1	1000 × 10^{15} Ω.cm	[4]	S

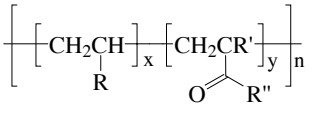
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.7	1 kHz	25–75° [4]
2	3	1 MHz	25–75° [4]

Optical Properties:
Refractive Index:

No.	Value
1	1.6–1.66

Polymer Stability:
Polymer Stability General: Stability depends on composition and processing
Thermal Stability General: Prolonged exposure to temps. above 70° increases rigidity and lowers impact strength [1]
Chemical Stability: Has good chemical resistance
Hydrolytic Stability: Has high resistance to acid and to other inorganic liquids



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by vulcanising with high levels of sulfur to increase cross-linking. May also contain thermoplastic resins or is compounded with anthracite
Applications: Uses include car battery cases (with anthracite), water meters, water pipes, shoe heels

Trade name	Supplier
Dexonite	Dexine Rubber Co. Ltd

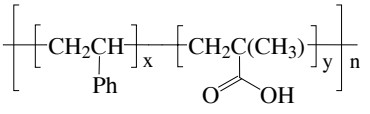
Ecolyte E-2

R = aryl
R' = R" = alkyl

Related Polymers: Ecolyte PS
Monomers: Ethylene, Propylene, Styrene
Material class: Copolymers
Polymer Type: polyethylene, polypropylenepolyolefins
CAS Number:

CAS Reg. No.	Note
52682-94-7	Ecolyte PS
25191-48-4	Ecolyte PS102, Ecolyte PS108
36343-62-1	3-methyl-3-buten-2-one polymer with ethene
53859-04-4	Ecolyte P
53801-30-2	Ecolyte PP
86403-35-2	Ecolyte E
53801-29-9	Ecolyte PT
27340-61-0	Ecolyte S

General Information: The ecolyte process imparts photodegradable props. to the base polymers by copolymerisation with 3-methyl-3-buten-2-one. The ecolyte compositions contain less than 1% by weight of carbonyl groups. The physical props. are essentially identical to those of the base polymers, e.g. polyethylene, polypropylene, and polystyrene



Applications/Commercial Products:

Trade name	Supplier

Ecolyte PS E-3

Synonyms: *Poly(3-methyl-3-buten-2-one-co-ethenylbenzene). Poly(methyl isopropenyl ketone-co-styrene). PSE. SMiPK*
Related Polymers: Ecolyte
Monomers: Styrene, 3-Methyl-3-buten-2-one
Material class: Copolymers
Polymer Type: polyolefins, polystyrene
CAS Number:

CAS Reg. No.	Note
52682-94-7	Ecolyte PS
25191-48-4	3-methyl-3-buten-2-one polymer with styrene

Molecular Formula: $(C_5H_8O.C_8H_8)_n$
Fragments: C_5H_8O C_8H_8
Additives: Ecolyte E, Ecolyte PE added to polystyrene to assist photodegradability
General Information: A photodegradable polymer prod. by the Ecolyte process
Miscellaneous: Copolymerisation constants for styrene-methyl isopropenyl ketone r_1 0.32, r_2 0.66 [5]

Volumetric & Calorimetric Properties:
Transition Temperature General: Transition temp. and activation energy of phenyl group motion have been reported [8]
Transition Temperature:

No.	Value	Note
1	-90°C	phenyl group motion

Transport Properties:
Polymer Solutions Dilute: Viscosity values have been reported [4] in the study of polymer blends and copolymers

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note
1	63 MPa	approx., 1.5 mm thick [1]
2	38 MPa	approx., 3.2 mm thick [1]

Optical Properties:
Transmission and Spectra: Phosphorescence, [8] ir [3,6], emission [6] and absorbance [3] spectral data have been reported

Polymer Stability:
Polymer Stability General: Ecolyte PE and Ecolyte E degrade readily in uv light. [4] Ecolyte is used as a prodegradant when added to polystyrene. 10% Ecolyte E added to polystyrene increases the photodegradability of polystyrene 2.5 fold [12]
Environmental Stress: Weathering studies have been reported (ASTM D1435-85; ASTM D638-87b) [1]. Degradation depends on level of Ecolyte in sample. Embrittlement times have been reported [9]
Biological Stability: Degrades in approx. one year in natural soils [10,11]
Stability Miscellaneous: Stability to synchroton radiation is similar to the polymer's stability to uv radiation [2,3]

ECTFE E-4

Synonyms: *Poly(chlorotrifluoroethene-co-ethylene). Chlorotrifluoroethylene-ethylene copolymer*
Related Polymers: Polychlorotrifluoroethylene, Polyethylene
Monomers: Chlorotrifluoroethylene, Ethylene
Material class: Thermoplastic, Copolymers
Polymer Type: polyethylene, PCTFEpolyhaloolefins

CAS Number:

CAS Reg. No.	Note
25101-45-5	
110872-65-6	alternating

Molecular Formula: $[(C_2H_4).(C_2ClF_3)]_n$
Fragments: C_2H_4 C_2ClF_3
Additives: Stabilisers, glassfibre
General Information: Copolymers are typically 1:1 alternating with an extended zig-zag chain. Crystallinity is typically 50–55% depending on the method of preparation
Morphology: Chain repeat distance 0.502 nm (approx.). Unit cell contains three molecules and occupies a volume of 0.324 m^3 [1]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.7 g/cm^3	[3]

2	140°C	motion in cryst. phase	α transition
3	-65°C	motion in cryst. phase	γ transition

Surface Properties & Solubility:

Plasticisers: None
Solvents/Non-solvents: Insol. all solvents. Some hot polar solvents are absorbed
Surface and Interfacial Properties General: Coefficient of friction 0.7 (ASTM D1894) [7]

Transport Properties:

Transport Properties General: Has excellent barrier props. against water vapour and other gases
Polymer Melts: Heat seal temp. 246–260° [7]
Water Absorption:

No.	Value	Note
1	0.01 %	max., 24h, 3 mm thick [5]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.00135 cm^3 mm/(m^2 day atm)	3278 m mm (h MPa)$^{-1}$, 25° [1]

3	H_2O	0.061 cm^3 mm/(m^2 day atm)	148310 m mm (h MPa)$^{-1}$, 25° [1]
4	Cl_2	0.00019 cm^3 mm/(m^2 day atm)	468 m mm (h MPa)$^{-1}$, 25° [1]
5	HCl	0.00086 cm^3 mm/(m^2 day atm)	2100 m mm (h MPa)$^{-1}$, 25° [1]
6	H_2S	0.00128 cm^3 mm/(m^2 day atm)	3120 m mm (h MPa)$^{-1}$, 25° [1]

Mechanical Properties:

Mechanical Properties General: Shows mechanical props. similar to nylon. Has good impact resistance and is tougher than PTFE. Shows very good retention of props. after heat ageing up to 175°
Flexural Modulus:

No.	Value	Note
1	2000 MPa	[1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	46–47 MPa	[1]	110–160%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	32–35 MPa	6–10%	[1]

Flexural Strength Yield:

No.	Value	Note
1	48 MPa	Flexural stress [2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	620 MPa	10 MPa, 250h [2]	Creep modulus

Impact Strength: Impact strength no break (room temp.) [2]
Hardness: Rockwell R93 [2]
Friction Abrasion and Resistance: Armstrong abrasion volume loss 0.3 cm^3 [2]. Coefficient of friction 0.7 (ASTM D1894) [7]
Izod Notch:

No.	Value	Notch	Note
1	1060 J/m	Y	min., room temp. [3]
2	64.1 J/m	Y	[6]

Electrical Properties:

Electrical Properties General: Widely used in wire and cable insulation due to good electrical props.
Surface/Volume Resistance:

No.	Value	Note	Type
1	$14–20 \times 10^{15}$ Ω.cm	ASTM D257 [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.52	100 Hz	ASTM D150 [1]
2	2.56	1 kHz	ASTM D150 [1]
3	2.6	1 MHz	ASTM D150 [1]

Dielectric Strength:

No.	Value	Note
1	18.9 kV.mm^{-1}	480 V mil^{-1}, 3 mm, short time, ASTM D149 [4]

Arc Resistance:

No.	Value	Note
1	124s	[1]

Complex Permittivity and Electroactive Polymers: Insulation resistance $>10^{15}$ Ω [2]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	100 Hz	ASTM D150, Halar 300 [1]
2	0.004	1 kHz	ASTM D150, Halar 300 [1]
3	0.012	100 kHz	ASTM D150, Halar 300 [1]
4	0.016	1 MHz	ASTM D150, Halar 300 [1]

Optical Properties:

Transmission and Spectra: Light transmittance 94–96% (ASTM E424, 1 mil) [7]
Volume Properties/Surface Properties: Gloss 70–90% (ASTM D2457) [7]. Haze 2% (ASTM D1003) [7]

Polymer Stability:

Polymer Stability General: Has good thermal and oxidative stability, non-flammability and good weatherability
Thermal Stability General: No significant deterioration in props. up to 1000h between 150–175° [1]

Upper Use Temperature:

No.	Value	Note
1	140–180°C	Halar grades [2]
2	180–200°C	[1]
3	165–180°C	[1]

Decomposition Details: Decomposes at 350° in N_2 and at lower temps. in air [1]
Flammability: Passes the UL Steiner tunnel (UL910) smoke and flame spread test [1]. Flammability rating V0 (UL94, vertical, 0.18mm thick) vertical, 0.18 mm thick = 94 V-O (SE-O) Chars, but does not melt or drip) [1,2]. Oxygen index 48–60% (ASTM D2863) [1,7].
Environmental Stress: Subject to stress cracking above 150–170° (Federal specification L-P-390C, class H) [1]
Chemical Stability: Inert to acids and most bases, strong oxidising agents and other chemicals. May absorb small amounts of hot polar organic solvents [1,2]
Hydrolytic Stability: Has excellent dimensional stability in H2O and salt solns. [1,2]
Stability Miscellaneous: Resistance to radiation is excellent. Useful props. are maintained when exposed to dosages as high as 5 MGy (500 Mrad) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by aq. suspension, low temp. polymerisation and radiation induced polymerisation. Processed by powder coating, roto moulding, roto lining, injection moulding and extrusion
Mould Shrinkage (%):

No.	Value	Note
1	0.05%	[6]

Applications: Wire coating, film, tubing, fibres, pumps, valves, pipe coating, linings

Epoxidised natural rubber E-7

Synonyms: *ENR*
Related Polymers: Natural rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Natural elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.	Note
9006-04-6	Rubber

Additives: Phosphorus-containing compounds to improve flame retardancy. Carbon black, silica, wood flour and rice husk ash
General Information: Is an elastic material with a higher density and T_g than natural rubber. Epoxidation allows improvement of some props. of natural rubber (e.g. oil resistance, gas permeability) and hence widens the range of applications. it also provides potential for further chemical modification. Commercial products are available with varying levels of epoxidation (25% or 50%)
Morphology: Will strain crystallise at epoxidation levels up to 95%. The degree of crystallinity diminishes at epoxidation levels above 50%. The lattice parameters vary with level of epoxidation [8]. (25 mol% epoxidation). a 1.254nm, b 0.950nm, c 0.827nm; a 1.172nm, b 1.038nm, c 0.852nm (95 mol% epoxidation) [8]
Miscellaneous: Can be vulcanised by conventional methods and can also be cross-linked by other means, e.g. peroxides or dibasic acids

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.907 g/cm^3	approx., 10% epoxidation [4]
2	d 0.94 g/cm^3	10% epoxidation [22]
3	d 0.97 g/cm^3	25% epoxidation [22]
4	d 1.03 g/cm^3	50% epoxidation [22]
5	d 0.99 g/cm^3	approx., 50% epoxidation [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.46 kJ/kg.C	0.111 cal g$'^{-1}$°C^{-1} [4]	P

Glass-Transition Temperature:

No.	Value	Note
1	-60°C	10% epoxidation [22]
2	-48–-45°C	25% epoxidation [8,22]
3	-25.7°C	47% epoxidation [4]
4	-20°C	50% epoxidation [22]
5	-9°C	75% epoxidation [8]
6	18°C	fully epoxidsed [4]
7	26°C	50% epoxidation; amine-cured; 30% carbon filled [5]
8	16°C	50% epoxidation; sulfur-cured; 30% carbon filled [5]

Transition Temperature General: T_g is increased by epoxidation, rising linearly by approx. 1° for each mol% epoxidation. Only one T_g is reported for all epoxidation levels [1,4]. Curing raises the T_g; amine-cured polymer has higher T_g than the sulfur-cured polymers [5]

Surface Properties & Solubility:

Solubility Properties General: Compatible with chlorinated polyolefins and phenolic resins (Novolaks). Is semi-compatible with resoles and incompatible with cured epoxy resins on Bisphenol A [3]
Cohesive Energy Density Solubility Parameters: 18 J$^{1/2}$ cm$^{-3/2}$ [20]
Plasticisers: Aromatic oils, phthalate esters, paraffinic oil [19]

Transport Properties:

Polymer Solutions Dilute: Mooney viscosity has been reported [22]
Permeability of Gases: Gas permeability is decreased by epoxidation [1,4,10,11]. CO_2 29.1 $\times 10^{-4}$ cm^2 (s cm Hg) $^{-1}$, 25% epoxidation; CO_2 998 $\times 10^{-4}$ cm^2 (s cm Hg)$^{-1}$, 50% epoxidation; CH_4

Transport Properties:

Permeability of Liquids: The permeability of vulcanised polymer to a solvent varies with the solvent, the temp. and the vulcanisation method. The variation has been ascribed to differences in cross-link density and, to a lesser extent, the flexibility of cross-link bonds. Permeability to C_6H_6, toluene, xylene and mesitylene has been reported [12]

Mechanical Properties:

Mechanical Properties General: Tensile strength and elongation increase with epoxidation levels of 10–15% and then decrease significantly [4]. Amine-cured polymer is more rigid, less stretchable and has lower tensile strength than sulfur-cured polymer [5]. For diamine-cured rubbers the tensile strength and 100% modulus increase, and the elongation decreases, with increasing amine concentration (at same curing conditions). A similar trend is observed for increasing cure time [5]. The presence of fillers generally improves the mechanical props. of cured polymer, the improvement depending on the type and level of filler used [15]. Dunlop resilience 81.1% (5.5% epoxidation; cross-linked), 79.6% (10.5% epoxidation; cross-linked), 79.5% (15.4% epoxidation; cross-linked), 74.3% (20.4% epoxidation; cross-linked) [4]
Tensile Strength Break:

No.	Value	Note	Elongation
1	7.6 MPa	5.5% epoxidation; cross-linked [4]	380%
2	8 MPa	15.4% epoxidation; cross-linked [4]	380%
3	2 MPa	20.4% epoxidation; cross-linked [4]	180%
4	1 MPa	30% epoxidation; cross-linked [4]	200%
5	15.5–16.7 MPa	158–170 kg cm^{-2}, 28.31% epoxidation; cured and filled [7]	600–650%

Hardness: Shore A46–A48 (28–31% epoxidation, cured and filled) [7]. Other hardness values have been reported [4,15]

Failure Properties General: The addition of fillers reduces the failure life of vulcanised polymers. At a constant filler level the fatigue life decreases in the order silica > white rice husk ash > carbon black. The use of a coupling agent improves interfacial props. and dispersion of filler particles thus improving the fatigue life. Failure mode in filled vulcanised polymers has a dual nature [16]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [2,4,6]

Polymer Stability:

Polymer Stability General: Hydrogenation can improve ageing resistance [21]
Thermal Stability General: Thermal degradation occurs in a single stage in nitrogen and multi-stages in air [9]
Chemical Stability: Swollen by petrol, C_6H_6, butanol and DMF. Degree of swelling is dependent upon the level of epoxidation [4]. Degraded by phenylhydrazine/O_2 [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Natural rubber can be epoxidised in the latex state or in soln. Peracids are commonly used either preformed or generated *in situ*. Methods employing a bromohydrin intermediate and also hydrogen peroxide-catalysed reactions have been reported but are not as efficient as peracetic acid epoxidation. The latex concentration, up to 40–50%, has little effect on the epoxidation and product. Epoxidation in acid soln. can lead to the formation of by-products by side reactions. Reaction of a latex stabilised using a nonionic surfactant such as Vulcastab LW and neutralised with AcOH prior to the addition of peracetic acid gives efficient epoxidation with reduced side reactions. [4,7]. Can be cross-linked using *p*-phenylenediamine or dicumyl peroxide but the conventional method is based on sulfur. The curing temp. for sulfur reactions is generally higher (180° compared to 150° for amine-cure) and other components added to the vulcanisation mixture include: activators (e.g. zinc oxide and stearic acid), antioxidant, and accelerator e.g. 2-morpholinobenzothiazole. [5,8,12]. May be cured with uv in the presence of a cationic initiator (e.g. triaryl sulfonium salts) [6]
Applications: Applications include engineering components, oil seals, inner lining of tubeless tyres, tyre treads and adhesives

Trade name	Supplier
ENR	Gutherie Latex

Epoxidised SBS E-8

Synonyms: *Epoxidised styrene-butadiene-styrene block copolymer. Styrene-epoxidised butadiene-styrene block copolymers. Epoxidised poly(styrene-block-butadiene-block-styrene) triblock copolymer. ESBS*
Related Polymers: SBS
Monomers: Styrene, 1,3-Butadiene
Material class: Copolymers
Polymer Type: polybutadiene, polystyrene
Additives: Carbon black, zinc oxide, stearic acid
General Information: A chemically modified form of SBS which is suitable for specific applications. Such modifications are possible because of the presence of unsaturated polybutadiene units. Polystyrene is more resistant to oxidation than is polybutadiene, so oxidation (epoxidation) largely results in degradation of polybutadiene
Morphology: The physical props. and mech. props. of block copolymers are not adversely affected by epoxidation, indicating that such chemical modification does not interfere with specific domain morphology which is of such importance to these thermoplastic elastomers [5,6]. Even at extreme (80%) levels of epoxy group content, the microphase separated struct. is still preserved; epoxidised polybutadienes are essentially incompatible with the polystyrene segments [5]. Conformational changes of polymer chains, including chain extension, occurs during epoxidation. Hydrodynamic volume of polymer chain depends on solvent used and epoxy group content of polymer [5,10]
Identification: Oxirane content of epoxidised copolymers can be determined by direct titration with tetraethylammonium bromide or tetrabutylammonium iodide, using crystal violet as indicator [6,11]. Total oxygen content can be determined by neutron activation anal. [6]
Miscellaneous: Detailed studies of the kinetics and mechanism of the epoxidation reaction have been reported for systems using *o*-monoperoxyphthalic acid [5,10] and peracetic acid [8,9] as oxidation agents: epoxidation reaction in dilute soln. follows elementary second order kinetics [8,10]. Rates depend on composition and microstruct. of block copolymers and experimental conditions such as concentration of oxidant, reaction temp. and solvent [5,8,9,10]. The solvent chosen influences conformn. which in turn influences reaction rate [5,10]. The rate of epoxidation is reduced as styrene content of block copolymer increases [9]. Epoxidised copolymers can be further modified by reaction with dicarboxylic acids or aldehydes to give thermosetting epoxy resins which are suitable for coatings and castings [7]. Hydrol. with perchloric acid removes approx. 50% of epoxide groups to give a material that may swell in H_2O or other hydrogen-bonding solvents, but which retains its tensile strength even after prolonged contact with solvents [12]. Epoxidation of linear and tapered block copolymers with MWs greater than 60 000 using *in-situ* peroxyformic acid as oxidising agent can lead to gelation when carried out in certain solvents, e.g. cyclohexane. Such problems can be alleviated by use of mixed epoxidation agents, i.e. peroxyformic/peroxyacetic acid(s); there are no adverse effects on tensile props. or oil resistance of the resulting polymers [6]

Volumetric & Calorimetric Properties:

Transition Temperature General: T_g increases with epoxidation by approx. 8° per 10% increase in epoxy-group content [5]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. toluene, cyclohexane, $CHCl_3$, dioxane. Insol. 2-propanol, EtOH. Swollen by H_2O or other hydrogen-bonding solvents (50% epoxidised polymer, after hydrol. with $HClO_4$) [12]

Transport Properties:

Transport Properties General: Epoxidised SBS (20/60/60) displays higher melt flow than parent copolymer [6]

Melt Flow Index:

No.	Value	Note
1	5.6 g/10 min	180°, 5 kg, uncompounded SBS (20/60/20) [6]

Polymer Solutions Dilute: Reduced and intrinsic viscosities in dioxane and in $CHCl_3$ (plus corresponding mixed solvent system) have been reported [5,10]

Mechanical Properties:

Mechanical Properties General: Tensile storage modulus and loss tangent have been reported [5]. Part epoxidised material (approx. 50% conversion) after hydrol. with $HClO_4$ gives polymer which swells in H_2O or other hydrogen-bonding solvents. Tensile strength is retained even in presence of H_2O, with only approx. 10% of initial tensile strength lost after approx. 14 days [12]. Mech. props of epoxidised SBS (20/60/20) block copolymers (using *in-situ* peroxyformic acid as oxidant) have been reported for both uncompounded and compounded (containing carbon black, zinc oxide and stearic acid) materials. Uncompounded systems show only slight differences in tensile props. when compared to parent copolymers, but epoxidised polymers display lower set at break, lower shore hardness and higher melt flow [6]. Improvements in tensile props. of epoxidised polymers are observed for compounded systems [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	34.3 MPa	epoxidised SBS (20/60/20) [6]	690%
2	23.4 MPa	epoxidised SBS (20/60/20) carbon black filled [6]	240%

Miscellaneous Moduli:

No.	Value	Note
1	3 MPa	300% Modulus, epoxidised SBS (20/60/20) [6]
2	19 MPa	200% Modulus, epoxidised SBS (20/60/20) carbon black filled [6]

Viscoelastic Behaviour: Set at break 17% (epoxidised SBS (20/60/20) [6]

Hardness: Shore A86 (epoxidised SBS (20/60/20); A88 (epoxidised SBS (20/60/20) carbon black filled) [6]

Fracture Mechanical Properties: Crescent tear strength 51.8 kg cm^{-1} (290 lb in^{-1}, epoxidised SBS (20/60/20) carbon black filled) [6]

Electrical Properties:

Electrical Properties General: Dielectric constant and dielectric dissipation factor have been reported [5]

Optical Properties:

Transmission and Spectra: H-1 nmr spectral data have been reported [5]

Polymer Stability:

Chemical Stability: Resistant to chemical degradation during epoxidation up to approx. 54% epoxy group content [1,7]. At higher levels of epoxidation, or after prolonged storage with epoxidising agent (*o*-monopereoxyphthalic acid) and its residue (phthalic acid), degradation occurs by chain scission process involving polybutadiene units [1]; which is accelerated by increasing temp. Epoxidised polymer (using *in situ* peroxyformic acid as oxidant) displays increased resistance to ASTM oils nos. 1,2 and 3 and to ASTM fuel A. Resistance to ASTM fuels B and C is poor [2]. Epoxidised copolymer (using *in situ* peroxyformic acid as oxidant) compound woth carbon black, zinc oxide and stearic acid exhibits low swelling in vinegar, brake fluid, ASTM oils nos. 1,2, MeOH and mineral oil but relatively high swelling in 2-butanone and dibutyl phthalate. Resistance to swelling by ASTM fuel A, vegetable oil and ASTM oil is improved relative to parent copolymer [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Epoxidation can be carried out by using either preformed peroxy acids or by *in situ* methods using H_2O_2 and lower aliphatic acids. The most efficient conversion of double bonds to oxirane groups, with fewer unwanted side reactions is achieved using preformed peroxy acids including peracetic acid [3,4,5], perbenzoic acid [6] and *o*-monoperoxyphthalic acid [1,7]. The use of peroxyformic acid (produced *in situ* from formic acid and H_2O_2) has also been reported [2,3,4]. Mixed formic acid/AcOH/peroxide systems also used for epoxidation of high MW (above 60000) block copolymers (*in situ* method) [2]

Applications: Potential applications in electronic industry, e.g. as components in circuit board fabrications

Epoxy Resins E-9

Synonyms: *Epoxy Resins, General Information*

Material class: Thermosetting resin

Polymer Type: epoxy

General Information: Epoxy resins first appeared in the 1940s, having been developed for moulding and coating applications. Since then these materials have been widely developed, though coatings remain the major application. The structure of the resins is based around the chemistry of the epoxy group, with the 'cured' resin consisting of a pre-polymer which is cross-linked with a curing agent. The pre-polymers are usually molecules with 2 epoxy groups spaced with an aromatic or aliphatic backbone. The first reported, and still most widely used resin is that formed when epichlorohydrin is treated with Bisphenol A under basic conditions to give a diglycidyl ether. The reaction may continue with several additions of Bisphenol A units opening the epoxy rings, to give short chains of up to 20 repeat units , terminated with epoxy groups. For commercial resins, the number of repeat units is often only slightly greater than 0, e.g. EPON 828, n=0.13 Other phenol derivatives are commonly used to form the aromatic backbone, such as Bisphenol F, resorcinol, brominated bisphenols, and more highly functionalised molecules such as tetrakisphenylolethane.

Other alcohols, amines and carboxylic acids may also be combined with epichlorohydrin to give a range of diglycidyl ether based epoxy resins. Non aromatic, commercially available epoxies are produced by peracid epoxidation of alkenes and dienes, such as vinyl cyclohexene and esters of cyclohexane carboxylic acids While the composition of the prepolymer and number of repeat units have an effect on properties, the prepolymers do not in themselves have useful properties until they are cured. Curing occurs when the prepolymer is treated with a suitable multi-functional cross linking agent such as a polyamine. These react with the epoxy end-groups of several short chains, linking them together, ultimately to form a 3 dimensional network of polymer chains. The curing process is complicated, beginning in most cases with a liquid resin and hardener, passing through a gel phase and continuing until virtually all the initial components have been combined in the solid cross linked network. The properties of the cured resin depend on a number of factors; the structure of the prepolymer, the curing agent, stoichiometry of resin and hardener, cure time and cure temperature. Subtle variation of any of these factors can have a profound effect on the props. of the cured resin. In some cases prepolymer resins have high viscosities which are detrimental for certain applications and processing techniques. Certain diluents may be added, such as hydrocarbon solvents, to reduce viscosity, but these can adversely affect props of the cured resin as they are not incorporated into the polymer network during cure. Reactive diluents are more often used, which are mainly low MW mono- or difunctional epoxy compounds. Both of these types of diluent are incorporated into the polymer network, though monofunctional diluents effectively terminate the chain, and so reduce cross linking and thus physical and mechanical props. Difunctional epoxies, which may be cured as epoxy resins in their own right, maybe completely incorporated into the polymer network and offer other advantages over non-reactive diluents and props are little affected, especially at elevated temp where other diluents often fail, and may even cause enhancement of certain props. In general, not withstanding the dependence of the props of cured epoxy resins on type and amount of hardener, cure time and temp., epoxy resins display high strength and modulus, wear resistance and cracking resistance. Electrical properties are also good, with high resistivity, good dielectric strength and track resistance especially at high humidity. High temp. stability and ageing props are good. Epoxy resins may be processed by a range of thermosetting processing techniques, with low cure shrinkage and low evolution of volatiles on cure. Cure, however, may be highly exothermic especially on a large scale. Many of these props. may be enhanced using suitable fillers, e.g. metals and carbon black to improve conductivity, minerals, glass and fire retardants to modify thermal and electrical props. Epoxy resins, in general have good resistance to chemicals and good dimensional stability; however aromatic based resins are susceptible to degradation in UV light and other weathering conditions and so cycloaliphatic resins are preferred for outdoor applications. The reactions to form the epoxy prepolymer chains and in the curing process give rise to highly hydroxyl functionalised polymers which display excellent adhesion to all but the most non-polar surfaces, thus the widespread usage as coating materials and adhesives and in composites.

Applications/Commercial Products:

Processing & Manufacturing Routes: Epoxy resins are produced by mixing the prepolymer with a defined quantity of curing agent and then allowing reaction to take place between epoxy and curing agent for a set time at a set temp. Despite a relatively short pot life, the mixtures can be injection moulded (easily handleable moulding powders are available) and cast. No volatiles are produced on cure, so curing can be carried out at normal pressures, though the process is exothermic, especially on a large scale. Cure shrinkage is also generally low, especially for filled grades. Laminates are produced by drawing the material through a solution of epoxy and curing agent, cure begins as the solvent begins to evaporate. Solid powder coatings consisting of a mixture of resin and hardener are applied by spraying directly onto a heated surface, rapid cure begins as the solids melt. Coatings are also applied by spraying and dipping.

Applications: Major use for Epoxy resins is as a surface coating, due to high chemical resistance, mechanical strength and adhesion. Variation of the prepolymer and cure agent gives a huge range of coatings which may be applied as liquids or solids. Used in household appliances such as washing machines, furniture, tools, pipes, food cans, tubing, as marine coatings, in chemical plant pipelines, automotive parts. Coatings are also applied to many surfaces for excellent wear and chemical resistance, such as laboratory benches, bridge and road surfaces. Electronic components, resistors, transistors, capacitors etc. are encapsulated with epoxy coatings, for insulation and protection, also used for fibre optics and printed circuit boards. Moulded resins can be used for pump housings and impellers, pipe fittings, valves, tools and tooling patterns and fixtures. Cast products include tools, insulation, electrical components, switchgear, work surfaces . Used as an adhesive capable of bonding most surfaces, effective at high temp. Used in aircraft for bonding wing and fuselage parts, stiffeners for rudders, helicopter rotors. Also used extensively in car parts, and also for repair to cracks in bridges, dams as well as in domestic usage. Laminates and other composite materials are used for printed circuit boards, in electronic equipment, tubes and panels in aircraft.

2-(3,4-Epoxycyclohexyl-5,5-spiro-3,4-epoxy)cyclohexane metadioxide resin E-10

Synonyms: *Poly[2-(7-oxabicyclo[4.1.0]hept-3-yl)spiro[1,3-dioxane-5,3′-[7]oxabicyclo[4.1.0]heptane]]*
Monomers: 2-(3,4-Epoxycyclohexyl-5,5-spiro-3,4-epoxy)cyclohexane metadioxide
Material class: Thermosetting resin
Polymer Type: Epoxy
CAS Number:

CAS Reg. No.	Note
26616-47-7	homopolymer

Molecular Formula: $(C_{14}H_{20}O_4)_n$
Fragments: $C_{14}H_{20}O_4$
General Information: Props. of cured resin depend on curing agent, stoichiometry, cure time and cure temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 1.18 g/cm^3	ERL-4234, uncured [8]

Transition Temperature General: Bp 250° (min., ERL-4234, uncured) [8]

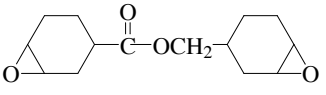
Transport Properties:
Polymer Solutions Dilute: Viscosity 7000–17000 cP (38°, ERL-4234, uncured) [8]
Water Content: Water sorption can be modified by altering the amount of cross-linking agent and/or modifier added to the resin [3]

Electrical Properties:
Electrical Properties General: Volume resistivity of an aromatic triamine cured sample decreases upon heating or exposure to 95% relative humidity [1]. Decreasing the amount of isomethyltetrahydrophthalic anhydride curing agent in UP 612 resin decreases the dielectric loss tangent and the dielectric constant [5]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.36	UP 612, aromatic triamine cured, aged, 230°, 100h [1]

Optical Properties:
Volume Properties/Surface Properties: Colour 2 (max., 1933 Gardner, ERL-4234, uncured) [8]

Polymer Stability:
Polymer Stability General: Improved heat resistance may be obtained by curing with Leucoparafuchsine (an aromatic amine) [4]
Thermal Stability General: UP 612 cured with aromatic triamine is stable up to 320° [1]. Details of thermal ageing in air of cross-linked resin have been reported [6]
Decomposition Details: The kinetics and mechanism of thermal decomposition have been reported [7]
Environmental Stress: Uv irradiation causes cross-linking of free epoxy groups, oxidation and polymerisation [2]



Applications/Commercial Products:

Trade name	Details	Supplier
Araldite	CY 175	Ciba-Geigy Corp.

3	2.22 %	5h, 100°, benzyltetramethylene sulfonium hexafluoroarsenate cured [9]
4	1.31 %	5h, 100°, benzyltetramethylene sulfonium hexafluoroantimonate cured [9]
5	0.4 %	1h, 100°, hexahydrophthalic anhydride cured [14]

Mechanical Properties:

Mechanical Properties General: The dependence of bending strength and impact strength on struct. of polymer cured with tetrahydromethylisobenzofurandione has been reported [2]. The effect of method of synth. on tensile strength of tetrahydromethylisobenzofurandione cured material has been reported [3]. Elastic modulus of ceramic filled material shows a gradual decrease with temp. [7]. Storage modulus shows a gradual decrease with increasing temp. until 100°, when the decrease is more pronounced. Dynamic mechanical props. are affected by the method of cure [8]

Tensile (Young's) Modulus:

No.	Value	Note
1	3300 MPa	25°, hexahydrophthalic anhydride cured [14]

Flexural Modulus:

No.	Value	Note
1	3000 MPa	25°, hexahydrophthalic anhydride cured [14]

Tensile Strength Break:

No.	Value	Note
1	68 MPa	25°, hexahydrophthalic anhydride cured [14]

Flexural Strength at Break:

No.	Value	Note
1	89 MPa	25°, hexahydrophthalic anhydride cured [14]

Compressive Strength:

No.	Value	Note
1	151 MPa	25°, hexahydrophthalic anhydride cured [14]
2	163 MPa	tetrahydro-5-methylisophthalic anhydride cured [16]

Impact Strength: Falling-ball impact resistance 5 cm (1.8 kg ball, uv and heat cured, triphenylsulfonium hexafluoroantimonate initiator, ASTM D3451), 40 cm (1.8 kg ball, heat cured, aliphatic sulfonium initiator, ASTM D3451) [8]

Electrical Properties:

Electrical Properties General: Electrical props. may be improved by curing with Al-alkoxysilane complex [5]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	9.33	10 MHz	23°, ERL 4221 [15]
2	6.23	100 MHz	23°, ERL 4221 [15]
3	4.72	200 MHz	23°, ERL 4221 [15]
4	3.3	60 Hz	hexahydrophthalic anhydride cured [14]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.005	60 Hz	hexahydrophthalic anhydride cured [14]

Optical Properties:

Transmission and Spectra: C-13 nmr [1,8] and H-1 nmr [1] spectral data have been reported

Polymer Stability:

Chemical Stability: Details of chemical stability have been reported [4]. Polymer cured with tetrafluoroborate or hexafluorophosphate salts of benzyltetramethylene sulfonium is decomposed by 2-butanone whereas polymer cured with hexafluoroarsenate or antimonate salts is merely swollen [9]
Hydrolytic Stability: Details of irradiation at low temps. have been reported [12]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be cured [5] with uv [7] or by electron beam irradiation in the presence of inorganic salts [10]. May be synth. by cationic polymerisation using silver hexafluoroantimonate [13] or benzyl sulfonium salts. Depending on the nature of the counterion, improvements in shelf-life and gel time can be achieved [9]. Synth. comly by epoxidation of 3′-cyclohexenylmethyl-3-cyclohexenecarboxylate with 25.5% peracetic acid in Me_2CO for 2h at room temp. The mixture is cooled to -11° for 16h, followed by addition to ethylbenzene at 40–45° to allow for removal of by-products. Product yield is typically 86% [14]
Applications: Used in the manufacture of electrical insulators; in adhesives and coatings; in printing inks. Potential application as an encapsulant for electroluminescent devices. Used as a general purpose casting resin, as a plasticiser acid scavenger and in filament winding

ETFE E-12

Synonyms: *Tetrafluoroethylene-ethylene copolymer. ETFE copolymer. Poly(tetrafluoroethylene-co-ethylene). Poly(ethylene-co-tetrafluoroethylene)*
Related Polymers: Polytetrafluoroethylene, Poly(tetrafluoroethylene-*co*-ethylene), Glass fibre filled, Polyethylene
Monomers: Tetrafluoroethylene, Ethylene
Material class: Thermoplastic, Copolymers
Polymer Type: PTFE, ETFE copolymers
CAS Number:

CAS Reg. No.	Note
25038-71-5	
111939-51-6	alternating
132201-85-5	block

Molecular Formula: $[(C_2F_4).(C_2H_4).(C_4H_4F_4)]_n$
Fragments: C_2F_4 C_2H_4 $C_4H_4F_4$
Additives: Glass fibre, thermally stable pigments, stabiliser and antioxidants
General Information: The two monomers combine readily into a 1:1 alternating struct. The copolymers are sometimes modified with a third monomer such as perfluoroalkylvinyl or vinylidene compds., perfluoroalkyl ethylenes and perfluoroalkoxy vinyl compds. to improve high temp. props. Commercial material is usually 50–60% crystalline

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.7 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00055 K^{-1}	ASTM D864-52 [7]	V
2	4.2×10^{-5} K^{-1}	[3]	L
3	7.9×10^{-5}–0.000141 K^{-1}	[6]	L

Thermodynamic Properties General: Heat of combustion 3507.2 kJ mol^{-1} (13.7 MJ kg^{-1}) [6]
Thermal Conductivity:

No.	Value	Note
1	0.238 W/mK	[1]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.05 kJ/kg.C	[8]	P

Melting Temperature:

No.	Value	Note
1	275°C	ASTM D2117-64 [7]

Glass-Transition Temperature:

No.	Value	Note
1	110°C	cubic thermal expansion [7]

Deflection Temperature:

No.	Value	Note
1	150–180°C	0.45 MPa, ASTM D648 [3]
2	70°C	1.8 MPa, ASTM D648 [3]

Brittleness Temperature:

No.	Value	Note
1	-80°C	ASTM D746-64T [7]
2	-100°C	ASTM D746 [1]

Transition Temperature:

No.	Value	Note	Type
1	110–135°C	[1,9]	α relaxation
2	-25°C	[1,9]	β relaxation
3	-120°C	[1,9]	γ relaxation

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. most organic and inorganic solvents, including acids and bases

Transport Properties:

Transport Properties General: Permeability characteristics, with respect to oxygen, nitrogen, carbon dioxide and moisture, are similar to those of high-density polyethylene
Melt Flow Index:

No.	Value	Note
1	7 g/10 min	ASTM D1238-15T [8]
2	8–45 g/10 min	ASTM D1238-15T [1]

Polymer Melts: Melt viscosity 7000-100000 Poise (700-10000 Pa s, ASTM D3159, capillary rheometer) [6]. Critical shear rate 12000 s^{-1} (Tefzel 210), 4800 s^{-1} (Tefzel 200), 4500 s^{-1} (Tefzel 280) [1]
Water Absorption:

No.	Value	Note
1	<0.02 %	max., ASTM D570 [2]
2	0.03 %	[3]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	7000 cm^3 mm/(m^2 day atm)	
2	N_2	2000 cm^3 mm/(m^2 day atm)	
3	CO_2	34000 cm^3 mm/(m^2 day atm)	flat film, 20µm thick, ASTM D1434-66 [7]

Mechanical Properties:

Mechanical Properties General: Excellent mech. props., at both low and high temps. ETFE is tougher, stiffer and has a higher tensile strength and creep resistance than PTFE. Flexural strength no break (ASTM D790) [10]

Tensile (Young's) Modulus:

No.	Value	Note
1	830 MPa	23° [6]

Flexural Modulus:

No.	Value	Note
1	1380 MPa	[3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	49 MPa	500 kg cm^{-2}, 23°, ASTM D1708-59T [7]	100–300%

Compressive Modulus:

No.	Value	Note
1	860 MPa	[6]

Elastic Modulus:

No.	Value	Note
1	1370 MPa	14000 kg cm^{-2}, 23°, ASTM D638-67T [7]
2	1650 MPa	Tensile elastic modulus [3]

Compressive Strength:

No.	Value	Note
1	17 MPa	ASTM D695 [8]
2	48.9 MPa	ASTM D695 [1]

Mechanical Properties Miscellaneous: Creep 0.6% (30 kg cm^{-2}, 100h), 1.75% (60 kg cm^{-2}, 100h), 4.25% (90 kg cm^{-2}, 100h), (ASTM D674-56T, 23°) [7]
Hardness: Shore R50, Shore D75 [3]. Shore D68 (ASTM D676-49T) [7]
Friction Abrasion and Resistance: Abrasion resistance 10 mg $(1000 \text{ cycles})^{-1}$ (1000 g load, Taber abraser, CS-17) [7]. Static coefficient of friction 0.2 (1 mm thick, polished aluminium sheet) [7]. Abrasion resistance 4 (sand, ASTM D968) [6]. Dynamic coefficient of friction 0.4 (689 kPa, >3 m min^{-1}, mating material AISI 1018 steel, Rc 20, 16AA) [1]

Electrical Properties:

Electrical Properties General: Has excellent electrical props. Dielectric constant and loss factor are low and are practically independent of temp. and frequency [7]
Surface/Volume Resistance:

No.	Value	Note	Type
2	0.5×10^{15} Ω.cm	ASTM D257 [1]	S
3	$>0.1 \times 10^{15}$ Ω.cm	min., [6]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	240	50 Hz	23° [7]

Dielectric Strength:

No.	Value	Note
1	25.9 $kV.mm^{-1}$	1.7 mm thick, short time, ASTM D149 [7]

Arc Resistance:

No.	Value	Note
1	72s	ASTM D495 [3]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0002	50 Hz	23° [7]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.4	[3]

Volume Properties/Surface Properties: Clarity: transparent in thin sections [3]

Polymer Stability:

Polymer Stability General: Good thermal stability and resistance to weathering
Thermal Stability General: Ageing at 180° in an air circulating oven has no effect on physical props. after 1500h [7]
Upper Use Temperature:

No.	Value	Note
1	148–198°C	[3]
2	>200°C	min. [1]

Decomposition Details: Weight loss in air 0.3% (330°) [7]
Flammability: Burning rate self extinguishing (ASTM D635-63) [7]. Oxygen index 30–32% (ASTM D2863) [8]. Flammability rating V0 (UL 94) [1]. Average time of burning 5 s (max.), average length of burn 10 mm (ASTM D635, bar thickness 2.9 mm) [1]
Environmental Stress: Shows no change in tensile props. after 2000h simulated weathering [7]
Chemical Stability: Excellent chemical resistance with no significant changes in weight or physical props. [7] after exposure to a range of organic and inorganic solvents. Sensitive to attack from amines [6]
Hydrolytic Stability: Stable to boiling water over long periods [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Copolymerised in aq. and non-aq. media with free radical initiators using emulsion and suspension techniques. Processed by injection moulding, compression moulding, blow moulding, transfer moulding, rotational moulding, extrusion and coating. Films can be thermoformed and heat sealed. Articles can be formed below the melting temp. using conventional metal-forming techniques. Articles can be readily machined

Mould Shrinkage (%):

No.	Value	Note
1	3–4%	[3]

Applications: Cable coating, wiring for chemical plants, sockets, connectors, switch components, seals, corrugated tubing, fasteners, pump vanes, linings, coatings, valve components and injection moulded articles

Ethylcellulose E-15

Synonyms: *Perethylcellulose*
Related Polymers: Cellulose II
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: Cellulosics
CAS Number:

CAS Reg. No.
9004-57-3

General Information: Approx 2.3 ethyl groups per monomer for films; 2.4–25 for lacquer

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.14 g/cm^3	[1,3]
2	d 1.09–1.17 g/cm^3	[6]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001–0.0002 K^{-1}	[6]	L

Thermal Conductivity:

No.	Value	Note
1	0.16–0.3 W/mK	[6]

Melting Temperature:

No.	Value	Note
1	135°C	crystalline [6]

Glass-Transition Temperature:

No.	Value	Note
1	316°C	[11,13]

Deflection Temperature:

No.	Value	Note
1	45–88°C	1.82 MPa [6]

Vicat Softening Point:

No.	Value	Note
1	152–162°C	[1,3]

Surface Properties & Solubility:

Solubility Properties General: Solubility 4–8% NaOH 0.5–0.7 [4]. Cold water 0.8–1.3 [4]. Organic solvents 2.3–2.6 [4]
Solvents/Non-solvents: Liq. crystals sol. $CHCl_3$ [9], dioxan [11], AcOH [10], DMSO [8]
Surface Tension:

No.	Value	Note
1	32 mN/m	20° [11,12]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 11 dl g^{-1} (MW 625000, DP 2650); 7.75 dl g^{-1} (MW 335000, DP 1420); 3.95 dl g^{-1} (MW 190000, DP 805) [5]
Water Absorption:

No.	Value	Note
1	2 %	[1]
2	0.8–1.8 %	24h [6]

Gas Permeability:

No.	Gas	Value	Note
1	H_2O	0.06675 cm^3 mm/(m^2 day atm)	890 g m^{-2} day^{-1}, 75 µm film, ASTM E96-66 [1]
2	He	26266 cm^3 mm/(m^2 day atm)	400 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 30°
3	SO_2	13396 cm^3 mm/(m^2 day atm)	204 × 10^{-10} cm^2 (s cmHg)$^{-1}$
4	N_2	5516 cm^3 mm/(m^2 day atm)	84 × 10^{-10}, 30°
5	Ethylene oxide	27580 cm^3 mm/(m^2 day atm)	420 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 0°
6	H_2	5713 cm^3 mm/(m^2 day atm)	87 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20°
7	NH_3	46294 cm^3 mm/(m^2 day atm)	705 × 10^{-10} cm^2 (s cmHg)$^{-1}$ [6]
8	O_2	1740 cm^3 mm/(m^2 day atm)	26.5 × 10^{-10}, 30°
9	CO_2	2692 cm^3 mm/(m^2 day atm)	41 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 30°
10	H_2O	787992 cm^3 mm/(m^2 day atm)	12000 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 20°

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	46–72 MPa	dry, 75 µm film [2]

Mechanical Properties Miscellaneous: Wet tensile strength is 80–85% of dry film value [1,3]. Flexibility, folding endurance 160–2000 (dry, 75 µm film) [1,3]
Hardness: Sward 52–61 (75 µm film) [1,3]. Rockwell R50–R115 [6]
Izod Notch:

No.	Value	Notch	Note
1	21 J/m	N	23° [6]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.8–3.9	1 MHz	25° [1,3]
2	3–4.1	1 kHz	25° [1,3]
3	2.5–4	60 Hz	25° [1,3]

Dielectric Strength:

No.	Value	Note
1	600 $kV.mm^{-1}$	1500 V in^{-1}, ASTM D149-64 [1,3]
2	13.8–19.7 $kV.mm^{-1}$	[6]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.002–0.02	1 kHz	25° [1,3]
2	0.005–0.02	60 Hz	25° [1,3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.47	cast film [2]

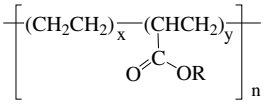
Volume Properties/Surface Properties: Light transmission at 310–400 nm is practically complete [1,3] and at 280-310 nm it is >50% complete [1,3]. Discolouration by sunlight is very slight [1,3]

Polymer Stability:

Decomposition Details: Decomposes at 306°. Products mainly gases; other products include acetaldehyde, aliphatic compounds and furans

Applications/Commercial Products:

Processing & Manufacturing Routes: Reaction of alkali cellulose with ethyl chloride at high pressure and temp.
Applications: Lacquers and varnishes, printing inks and adhesives. Also used in food and food packaging applications



Supplier
Dow
Aqualon

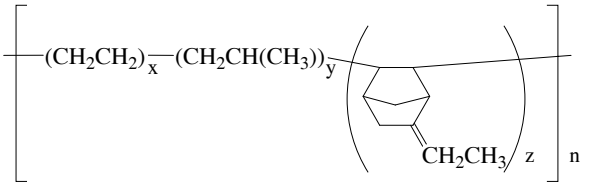
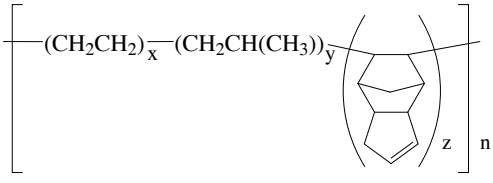
Ethylene copolymers with acrylates **E-16**





R = CH_3 methyl acrylate copolymer
= C_2H_5 ethyl acrylate copolymer
= C_4H_9 butyl acrylate copolymer

Polymer Stability:

Thermal Stability General: Has good low temp. props. down to -65°
Environmental Stress: Excellent environmental stress crack resistance
Biological Stability: FDA approved grades available

Ethylene-propylene elastomers **E-17**

Synonyms: *EPR. EPM. EPDM. Ethylene-propylene rubber. EPM Rubber. EPDM Rubber. Poly(ethylene-propylene monomer) rubber. Poly(ethylene-propylene-diene monomer). Polyolefin rubber, synthetic. Ethylene-propylene terpolymer. Poly(ethylene-ethylidenenorbornene-propene) rubber. Poly(ethylene-methylidenenorbornene-propene) rubber. Poly(dicyclopentadiene-ethylene-propene) rubber. Poly(ethylene-hexadiene-propene) rubber. EPT. Ethylene-propylene copolymer. Ethylene-propylene-diene polymer. Ethylene-propylene-diene rubber*
Related Polymers: Propylene ethylene copolymer, Blends with polypropylene, Blends with polyethylene, Polypropylene copolymers, Polypropylene oxide elastomers, Polypropylene/rubber blends
Monomers: Ethylene, Propylene, 5-Ethylidene-2-norbornene, Methylidenenorbornene, Dicyclopentadiene, 1,4-Hexadiene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: polyethylene, polypropylenepolyolefins
CAS Number:

CAS Reg. No.
25038-36-2
25034-71-3
25038-37-3
9010-79-1
25189-22-4

Molecular Formula: $[(C_2H_4).(C_3H_6)]_n$
Fragments: C_2H_4 C_3H_6
Molecular Weight: Most probable distribution MZ:MW:MN 3:2:1; $M_w/M_n \leq 50$; MZ/MW ≤ 20. MV/MW can be as low as 0.85
Additives: Fillers include carbon black, also calcined clay and calcium carbonate. Plasticisers - usually paraffinic oils with addition of naphthalenic oil for high temp. usage
Morphology: Most commercial grades amorph. at 20°, some grades may attain up to 30% crystallinity. If ethylene content >40 mol. % crystallinity will develop below ambient temp. if annealed for several hours. If ethylene content ≤40 mol. % polymer remains amorph. at all temps. Crystallinity observed is the polyethylene orthorhombic cell, polypropylene crystallinity is not a controlling factor [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.854 g/cm^3	40-60% ethylene, amorph. [2]
2	d 0.86–0.87 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00018 K^{-1}	[3]	L
2	0.00075 K^{-1}	40-60% ethylene, 23°	L
3	0.00088 K^{-1}	[2]	V
4	0.00025 K^{-1}	40-60% ethylene, 23° [2]	L

Thermal Conductivity:

No.	Value	Note
1	0.335 W/mK	[3]

Thermal Diffusivity: 1.9×10^{-5} m^2 s^{-1} [3]
Specific Heat Capacity:

No.	Value	Note	Type
1	2.22 kJ/kg.C	40-60% ethylene, 23°, amorph. [2]	P

Glass-Transition Temperature:

No.	Value	Note
1	-60–-45°C	[3]

Brittleness Temperature:

No.	Value	Note
1	-60°C	[2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16 J$^{1/2}$ cm$^{-3/2}$ [2]
Internal Pressure Heat Solution and Miscellaneous: Heats of mixing at infinite dilution have been reported for a range of polymer ratios in aliphatic solvents [7]

Plasticisers: Paraffinic oil is most widely used, esp. of low volatility. May be blended with naphthenic oils but these interfere with peroxide curing. Aromatic oils are not recommended [3]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons (C_5 and above), low polarity halogenated and non-halogenated aromatic and naphthenic hydrocarbons, THF. Insol. aldehydes, ketones, carboxylic acids, esters, dioxane [2]

Transport Properties:

Polymer Solutions Dilute: Theta temp. θ 80° (approx., ethyl phenyl ether) [3,5]; θ 40° (approx., 1-chloronaphthalene) [3]. Polymer-solvent interaction parameters have been reported [2,5]. Mark-Houwink relationships have been reported [2]. Specific refractive index increment 0.104 $cm^3\ g^{-1}$ (1,2,4-trichlorobenzene, 135°, 633 nm) [2]
Permeability of Liquids: Permeability of liquids has been reported [2]. D_o 6.1 × 10^{-8} (23°, C_6H_6); 2.8 × 10^{-7} $cm^2\ s^{-1}$ (30°, CH_2Cl_2)
Water Content: Water content <1% [3]

Mechanical Properties:

Mechanical Properties General: Mech. props. depend considerably on structural characteristics and the type and amount of filler. Elastic props. are comparable to most synthetic rubbers but not as good as NR, or SBR
Tensile Strength Break:

No.	Value	Note	Elongation
1	10 MPa	[2]	500%

Tensile Strength Yield:

No.	Value	Note
1	20 MPa	reinforced [2]
2	>50 MPa	min. 20°, uncured gum elastomer [2]
3	10 MPa	20°, amorph.

Mechanical Properties Miscellaneous: Tear strength 15–45 kN m^{-1} (vulcanised) [2]
Hardness: Shore A35–A90 (vulcanised)

Electrical Properties:

Electrical Properties General: Electrical props. are generally excellent, especially at high temp., after heat ageing or in water submersion. They are however strongly dependant on the fillers used [3]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.5	10 kHz	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.2	10 kHz	[2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.474	23°
2	1.4524	90°
3	1.4423	125° [2]

Transmission and Spectra: H-1 nmr [6], C-13 nmr [7,8] and ir [1,2] (ASTM D3900) spectral data have been reported
Volume Properties/Surface Properties: Glassy white in appearance

Polymer Stability:

Thermal Stability General: Decomposes at or above 300° [2]
Upper Use Temperature:

No.	Value	Note
1	150°C	no significant hardening after 1000h, better than NR or SBR [3]
2	150–175°C	[2]

Flammability: Flammable only above thermal decomposition temp. [2]
Environmental Stress: More resistant to oxidation than other rubbers, natural rubber and styrene-butadiene rubber
Chemical Stability: Resistant to ozone, dilute acids, alkalis and alcohols. Swollen considerably by aliphatic, aromatic or chlorinated hydrocarbons [3]
Hydrolytic Stability: Has good stability

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufacture is highly proprietary, many variations from large number of patents. Soln. or slurry processes are used; hexane soln. is the most common. Catalyst has two components: transition metal halide ($TiCl_4$, VCl_4, $VOCl_3$, etc., - $VOCl_3$ most widely used), and an alkyl component ($(C_2H_5)_2AlCl$, $C_2H_5AlCl_2$, or a mixture of these). After reaction the catalyst is destroyed/removed by water washing. Resulting polymer crumb is dewatered and dried. Unreacted monomer is recycled (except ethylene where initial reaction rate is very high). A similar Ziegler-Natta process is used for Polypropylene [2,3]. MW affects filler dispersion (especially Carbon black). A narrow MW distribution for average dispersion, broad MW distribution [2] for excellent dispersion. If ethylene content is high, form should be chosen to avoid excessive mixing times. Generally, extrusion, calendering, curing and injection moulding are carried out on common, commercial rubber factory equipment [2,3]
Applications: Due to good chemical resistance, especially to ozone, and good toleration of high concentrations of filler and oil whilst retaining good physical props., ethylene-propylene elastomers are widely used in cost effective rubber compounding. Over 150 grades are available. Main applications are automotive profiles, hoses, seals; building and construction profiles, roofing foil, seals; electrical cable insulation and jacketing; general moulded articles; as blends in ozone resistant tyre side walls, and as an impact modifier for polypropylene, polyamides, polystyrenes. In lubrication used as an additive to oil. Potential use in biomedical applications (heart-valve leaflets)

Eucommia ulmodia gum E-19

Synonyms: *trans-1,4-Polyisoprene*
Monomers: 2-Methyl-1,3-butadiene
Material class: Thermoplastic, Natural elastomers
Polymer Type: polybutadiene
Molecular Formula: $[C_5H_8]_n$
Fragments: C_5H_8
General Information: Isol. from *Eucommia ulmodia* olive tree, found in China, N. America and Europe. Has similar props. and struct. to gutta-percha, and balcita. Cross-linking disrupts crystallinity to give rubbery props.

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 0.93–0.97 g/cm^3

Melting Temperature:

No.	Value
1	64°C

Glass-Transition Temperature:

No.	Value
1	-70°C

Brittleness Temperature:

No.	Value
1	-54°C

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. aromatic hydrocarbons, halohydrocarbons at low temp., aliphatic hydrocarbons at high temp. Insol. alcohols, ketones

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	16.1–33 MPa	
2	20 MPa	cross-linked

Tensile Strength Yield:

No.	Elongation	Note
1	335–450%	
2	500%	cross-linked

Impact Strength: Yield strength 120 MPa
Hardness: Shore A97-A98. Shore A70-A100 (cross-linked)

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Type
1	0.001×10^{15} Ω.cm	S

Dielectric Permittivity (Constant):

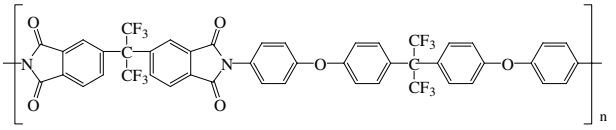
No.	Value
1	3.034

Dielectric Strength:

No.	Value
1	27.2 $kV.mm^{-1}$

Polymer Stability:

Chemical Stability: Stable in HF and conc. HCl, unstable in nitric acid and hot, conc. sulfuric acid



Applications/Commercial Products:

Processing & Manufacturing Routes: Isol. by solvent extraction of leaves of *Eucommia ulmodia*, although present throughout the tree. Not isol. by bark slashing. Low energy requirements for processing due to low softening temp.
Applications: Has a range of potential applications due to rubbery props.

9	CO	99.2 cm^3 mm/(m^2 day atm)	1.51 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35°, 10 atm. [6]
10	N_2	64.4 cm^3 mm/(m^2 day atm)	0.981 × 10^{-10} cm^2 (s cmHg)$^{-1}$, 35°, 10 atm. [6]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	1900 MPa	[1]

Tensile Strength Break:

No.	Value	Note	Elongation
1	98 MPa	[1]	6%

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.96	100 Hz	room temp. [4]
2	2.9–2.99	100 Hz	100-300° [4]

Optical Properties:

Transmission and Spectra: Uv spectral data have been reported [2]

Polymer Stability:

Decomposition Details: Under N_2 atmosphere, single step decomposition occurs; initial decomposition at 511°; 10% wt. loss occurs at 532° at heat rate of 10° min^{-1} [1]. Extrapolated end of wt. loss at 635°; residue at 600° 66% [4]

Applications/Commercial Products:

Trade name	Supplier
Eymyd HP40	Ethyl Corporation

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2200 MPa	room temp., 1 mm min^{-1} [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	101 MPa	20.7%	room temp., 1 mm min^{-1} [1]

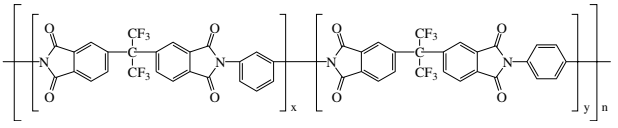
Viscoelastic Behaviour: Dynamic mech. props. have been reported [1]

Optical Properties:

Total Internal Reflection: n_{TE} 1.5949, n_{TM} 1.5870, birefringence Δ_n (n_{TE}- n_{TM}) 0.0079 (film cured at 500°, depends on cure temp.) [8]

Polymer Stability:

Decomposition Details: 5% Wt. loss occurs at 505°; 10% wt. loss occurs at 524° [1]
Environmental Stress: Uv photolabile. Chain cleavage occurs above 300 nm; below 300 nm in air, photooxidative ablation occurs with liberation of gases. In the absence of oxygen there is little cleavage and no ablation [3,4]



Applications/Commercial Products:

Trade name	Details	Supplier
NR 150A2	Series	DuPont
Pyralin Pl-2566		DuPont

Monomers: 4,4′-[2,2,2-Trifluoro-1-(trifluoromethyl)ethylidene]-bis[1,2-benzenedicarboxylic acid], 1,3-Benzenediamine, 1,4-Benzenediamine
Material class: Thermoplastic
Polymer Type: polyimide
CAS Number:

CAS Reg. No.	Note
63849-68-3	CRU, phenylene bonding unspecified
70850-07-6	source based

Molecular Formula: $(C_{25}H_{10}F_6N_2O_4)_n$
Fragments: $C_{25}H_{10}F_6N_2O_4$
Additives: Carbon fibre, glass fibre
Miscellaneous: A review of applications as an adhesive has been reported [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.44 g/cm^3	Avimid N [2,4]
2	d 1.53 g/cm^3	Avimid N, ½" graphite fibre [5]
3	d 1.58 g/cm^3	Avimid N, ¼" Celion G-40 fibre
4	d 1.57 g/cm^3	Avimid N, ⅛" Celion G-40 fibre [5]
5	d 1.4 g/cm^3	NR-150B2 [7]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.6×10^{-5} K^{-1}	Avimid N [2]	L

Glass-Transition Temperature:

No.	Value	Note
1	370°C	Avimid N [2]
2	333°C	dry, carbon fibre laminate [3]
3	340–370°C	Avimid N [4]
4	332–352°C	Avimid N, fibre length dependent [5]
5	340°C	NR-150B2 [7]

Transition Temperature General: T_g decreases in carbon fibre laminates containing 1.6% H_2O when cycled under hot/wet conditions. There is no change in T_g in dry samples under the same conditions [3]. T_g decreases with increasing fibre length in laminates [5]

Surface Properties & Solubility:

Plasticisers: H_2O [3]

Transport Properties:

Water Content: Water absorption increases with an increase in T_g [3]. Water absorption in carbon fibre laminates is greater when the fibres are aligned perpendicular to the longest edge [6]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	4000 MPa	Avimid N [4]
2	42053 MPa	6100 kpsi, Avimid N, ½" Magnamite graphite fibre [5]
3	4137 MPa	600 kpsi, NR-150B2 [7]
4	53773 MPa	7800 kpsi, Avimid N, ¼" Celion G-40 fibre [5]
5	46879 MPa	6800 kpsi, Avimid N, ⅛" Celion G-40 fibre [5]

Flexural Modulus:

No.	Value	Note
1	4130 MPa	Avimid N [2]

Tensile Strength Break:

No.	Value	Note
1	110 MPa	Avimid N [2,4]
2	213 MPa	31 kpsi, Avimid N, ½" Magnamite graphite fibre [5]
3	134 MPa	19.5 kpsi, Avimid N, ¼" Celion G-40 fibre [5]
4	169 MPa	24.5 kpsi, Avimid N, ⅛" Celion G-40 fibres [5]
5	110 MPa	16 kpsi, NR-150B2 [7]

Mechanical Properties Miscellaneous: Interlaminar shear strength of a carbon fibre laminate decreases by 80% upon heating from room temp. to 315°. This loss of strength may be minimised by post-curing to high T_gs [3]. Yield stress 61 MPa (0.2% offset method, Avimid N) [4]
Failure Properties General: NR-150B2 reinforced with Celion 6000 fibres retains 47% of its shear strength and 57% of its flex strength after ageing at 316° [7]
Fracture Mechanical Properties: Avimid N and its composites have excellent fracture toughness props. [4] G_{Ic} 2 kJ m^{-2} [4]. Stress intensity factor 3.05 MPa m (3.2 mm thick), 2.98 MPa m (6.2 mm thick) [4]

Izod Notch:

No.	Value	Notch	Note
1	42 J/m	Y	Avimid N [2]
2	42.7 J/m	Y	0.8 ft Ib in^{-1}, NR-150B2 [7]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.7	1 kHz	Avimid N [2]

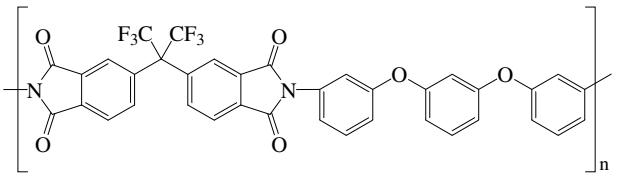
Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	316°C	NR-150B2 [7]

Decomposition Details: Weight loss at 343° of carbon fibre laminates is independent of fibre length up to 580 h. After this time, laminates containing Celion G-40 fibres are more stable with only 1.9% weight loss after 1243 h [5]. NR-150B2 shows a max. 10.7% weight loss after heating in air at 316° for 4122 h [7]

Applications/Commercial Products:



Processing & Manufacturing Routes: Synth. by treating 2,2′-bis (3,4-dicarboxyphenyl)hexafluoropropane dianhydride with *m*- and *p*- phenylenediamine at 150° for 1.25 h in a solvent such as dimethylacetamide or EtOH. The poly(amic acid) precursor is then imidised in an autoclave at 360° for 16 h [7]
Applications: Adhesive. Potential applications in jet engines; in ablative heat shields; in syntactic foams and honeycomb sandwich constructions. Applications due to electromagnetic transparency and good electrical props. as insulators and in radar domes

Trade name	Supplier
Avimid N	DuPont
NR-150B2 Series	DuPont

6FDA-TPE Addition cured (acetylenic end-caps) F-7

Synonyms: *Poly(2,2′-bis(3,4-dicarboxyphenyl)hexafluoropropane dianhydride-alt-1,3-bis(3-aminophenoxy)benzene) Addition cured (acetylenic end-caps). Poly(5,5′-[2,2,2-trifluoro-1-(trifluoromethyl)ethylidene]bis-1,3-isobenzofurandione-alt-1,3-bis(3-aminophenoxy)benzene) Addition cured (acetylenic end-caps). Poly(4,4′-(hexafluoroisopropylidene)bis(phthalic anhydride)-1,3-isobenzofurandione-alt-1,3-bis(3-aminophenoxy)benzene) Addition cured (acetylenic end-caps). α-(3-Ethynylphenyl)-ω-[5-[1-[2-(3-ethynylphenyl)-2,3-dihydro-1,3-dioxo-1H-isoindol-5-yl]-2,2,2-trifluoro-1-(trifluoromethyl)ethylidene]-1,3-dihydro-1,3-dioxo-2H-isoindol-2-yl]poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)[2,2,2-trifluoro-1-(trifluoromethyl)ethylidene](1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,3-phenyleneoxy-1,3-phenyleneoxy-1,3-phenylene]*
Monomers: 1,3-Bis(3-aminophenoxy)benzene, 2,2′-Bis(3,4-dicarboxyphenyl)hexafluoropropane dianhydride
Material class: Thermosetting resin
Polymer Type: polyimide (end capped)
CAS Number:

CAS Reg. No.	Note
67297-78-3	CRU with end-groups

Molecular Formula: $(C_{37}H_{18}F_6N_2O_6)_n$
Fragments: $C_{37}H_{18}F_6N_2O_6$
Molecular Weight: MW 1343 M_n 1329, 1500, 2600
General Information: Isol. as an amorph. beige powder [9]

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	160–180°C	[5]

Glass-Transition Temperature:

No.	Value	Note
1	105°C	[6]
2	205°C	after heating at 275° for 20 min. [6]

Transition Temperature General: T_g increases with an increase in either curing time or curing temp. but increases with increasing amounts of plasticiser [6]
Vicat Softening Point:

No.	Value	Note
1	175°C	[9]

Surface Properties & Solubility:

Solubility Properties General: Forms optically transparent blends with poly(diethyl 4,4′-oxydiphenylene pyromellitamate) provided the soln. composition is not a 50:50 mixture or a 30:70 blend (70% 6FDA-TPE) [3]. Addition of 10% (w/w) of Ultem 1000 to Thermid FA-700 causes an increase in the peak exotherm temp. whereas further addition results in a decrease in this temp. [4]
Plasticisers: Bis(2-(4-ethynylphenoxy)ethyl) ether [6]
Solvents/Non-solvents: Uncured oligomer sol. CH_2Cl_2, Me_2CO, THF, 2-butanone, glyme, DMF, cyclohexanone, 1-cyclohexyl-2-pyrrolidone (28 wt% or lower), diglyme (44 wt% or lower), *N,N*-dimethylacetamide, DMSO (44 wt% or lower), *N*-methylpyrrolidone, butyrolactone. Insol. cyclohexane, 2-propanol, ethyl glyme, 2-methoxyethanol, xylene, ethyl diglyme [9]

Transport Properties:
Polymer Solutions Dilute: [η] 0.21 Pa s (diglyme, 22°, 53% solids) [9]
Permeability of Liquids: Diffusion coefficient [H_2O] 2.8×10^{-8} cm^2 s^{-1} (1.5 μm film, cured) [7]. Films absorb water rapidly at greater than 10% relative humidity [7]

Mechanical Properties:
Mechanical Properties Miscellaneous: Peel strength decreases with increasing temp. [2]
Fracture Mechanical Properties: Inherently brittle owing to high degree of cross-linking. Brittleness may be overcome by forming a semi-interpenetrating network with high performance thermoplastic polyimides [8]

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Frequency
1	2.902	100 Hz, cold compacted [9]
2	2.8	30 MHz, cold compacted [9]
3	2.93	30 MHz, cured and post-cured [9]
4	2.983	100 Hz, cured [9]
5	2.9	30 MHz, cured [9]
6	3.071	100 Hz, cured and post-cured [9]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00176	100 Hz	cold compacted [9]
2	0.0048	30 MHz	cold compacted [9]
3	0.00373	100 Hz	cured [9]
4	0.0041	30 MHz	cured [9]
5	0.00191	100 Hz	cured and post-cured [9]
6	0.0044	30 MHz	cured and post-cured [9]

Optical Properties:
Transmission and Spectra: Ir spectral data have been reported [5]

Polymer Stability:
Thermal Stability General: May be cross-linked upon heating with a max. conversion of 81.49% after heating for 1 h at 215° [5]
Upper Use Temperature:

No.	Value	Note
1	316°C	[1]

Decomposition Details: Decomposition temp. 510° (in N_2) 549° (in air). The max. rate of weight loss at 560° (in N_2), 583.5° (in air). Char yield 61.7% (750°, in N_2) [4]. 5% Weight loss in moist air occurs at 535°; 50% weight loss at 608° [6]. Heating in circulating air at 316° causes a max. weight loss of 21.6% after 723 h [6]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by treating 4,4′-hexafluoroisopropylidene(phthalic anhydride) with 1,3-bis(3-aminophenoxy)benzene and 3-ethynylaniline in the mole ratio 2:1:2 followed by thermal imidisation in a toluene/*N*-methylpyrrolidone mixture [9]
Applications: Potential application in adhesives, in the aerospace industry; in electrical and electronic applications. Possible use as encapsulants for *in vitro* biosensors

Fluoroalkoxyphosphazene elastomers F-12

Synonyms: *Alkylfluoroalkoxyphosphazene elastomers. Arylfluoroalkoxyphosphazene elastomers*
Monomers: Cyclic phosphazene trimers, Cyclic phosphazene tetramers
Material class: Synthetic Elastomers
Polymer Type: polyphosphazenes
Molecular Formula: $[(C_4H_4F_6NOP)(C_3H_5F_3NOP)]_n$
Fragments: $C_4H_4F_6NOP$ $C_3H_5F_3NOP$
Molecular Weight: MW 300000-1200000; M_n 30000-200000

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	-65–-44°C	depends on exact polymer [1]

Transition Temperature General: No crystalline melting transition temp. [1]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. Me_2CO, ketones, aldehydes. Insol. H_2O, aliphatic hydrocarbons [1]
Surface and Interfacial Properties General: Good adhesive props. [1]

Mechanical Properties:
Mechanical Properties General: Good elastomeric props. [1]
Viscoelastic Behaviour: Very slow viscous flow at room. temp. [1]

Polymer Stability:
Thermal Stability General: Good low temp. props. [1]
Flammability: Non-flammable [1]
Environmental Stress: Resistant to oxidation [1]
Chemical Stability: Resistant to oil and many organic solvents [1]
Recyclability: Not recyclable

Applications/Commercial Products:
Processing & Manufacturing Routes: Phosphazene cyclic trimers and tetramers with halogen, alkyl or aryl side groups are heated at 250–300°, either alone or with $(NPCl_2)_3$ for a day or more to prod. long-chain polymers. These polymers are treated with excess sodium trifluoroethoxide in THF at over 65° for several hours [1]
Applications: Possible uses as rubbers with good solvent and oxidation resistance and for non-burning foam insulation

Fluoromethyl silicone rubber, Heat vulcanised F-13

Synonyms: *Fluorosilicone rubber*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Fluorosilicone oil
Monomers: Dichloroethenylmethylsilane, Dichloromethyl(3,3,3-trifluoropropyl)silane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones
CAS Number:

CAS Reg. No.
152425-27-9

Molecular Formula: $[(C_4H_7F_3OSi).(C_3H_6OSi)]_n$
Fragments: $C_4H_7F_3OSi$ C_3H_6OSi
Additives: Finely divided silica is incorporated as a reinforcer to improve mech. props.
General Information: Vinyl groups are present at less than 1%. They cause the gum to cure more readily with lower activity peroxides

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.45 g/cm^3	[10]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0008 K^{-1}	[8]	V

Glass-Transition Temperature:

No.	Value	Note
1	-75°C	[12]

Brittleness Temperature:

No.	Value	Note
1	-68°C	-90°F [3]

Transition Temperature:

No.	Value	Note	Type
1	-61°C	-78°F [3]	Stiffening

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 19.6 $J^{1/2}$ $cm^{-3/2}$ (9.6 $cal^{1/2}$ $cm^{-3/2}$) [6,7,8], δ_d 15.8, δ_p 6.6, δ_h 5.6 $J^{1/2}$ $cm^{-3/2}$
Solvents/Non-solvents: Vulcanised rubber is swollen by common organic solvents rather than dissolved, e.g. ketones prod. high volume swell (2-butanone Volume Swell 760) [8]. Sol. ketones, esters, ethers [4,6,8]. Mod. sol. chlorinated hydrocarbons, aromatic hydrocarbons. Insol. aliphatic hydrocarbons, alcohols, H_2O
Surface and Interfacial Properties General: Exhibits generally low surface adhesion [5]

Transport Properties:

Transport Properties General: The substitution of trifluoropropyl for methyl substantially reduces gas permeability [2]
Polymer Melts: Kinematic viscosity 100000 St (approx., pre-cure gum) [4]
Permeability of Gases: [O_2] 0.0085 (25°); [N_2] 0.0036 cm^2 s^{-1} GPa^{-1} (25°)

Mechanical Properties:

Mechanical Properties General: Requires vulcanisation with a reinforcing filler (usually silica) in order to possess acceptable mech. props. [3]
Tensile Strength Break:

No.	Value	Note	Elongation
1	6.9 MPa	1000 psi, 25°, filled [3]	120%

Viscoelastic Behaviour: Compression set 22% (22h, 150°, filled) [9]
Hardness: Durometer 45–70 (25°) [10]
Fracture Mechanical Properties: Tear strength 1.3 J cm^{-2} (filled) [9]

Electrical Properties:

Electrical Properties General: Fluorosilicone rubber is not as good an insulator as normal silicone rubber [6]
Dielectric Permittivity (Constant):

No.	Value	Note
1	6–7	[6,13]

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	[6]

Polymer Stability:

Polymer Stability General: Very resistant material used where resistance to chemicals is important. Commercially the most important, solvent resistant, low temp. material [1,9]
Thermal Stability General: Usable from -68° to 232° [1,9]
Upper Use Temperature:

No.	Value	Note
1	232°C	[9]

Decomposition Details: Decomposes at temps. of over 300° with emission of toxic vapour [5]
Environmental Stress: Resistant to oxidative degradation, water, weathering, ozone and corona. Uv radiation has no effect [4,5]
Chemical Stability: Not swollen by non-polar organic solvents, H_2O and alcohols. Swollen by organic solvents such as esters, ethers and ketones. Damaged by strong acids and alkalis [4,11]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam or acid catalysis [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Methyl trifluoropropyl and methylvinyl cyclic polysiloxanes are polymerised and equilibrated together at 150–200° with an alkaline catalyst. There is a large excess of fluorosiloxane producing a linear polymer with less than 1% of methyl vinylsiloxane. Traces of hexamethyldisiloxane are added to terminate the siloxane chains. Elastomer is readily cured by organic peroxides (typically 1-2 parts per 100 rubber) at temps. of over 110°. Several hours post cure treatment is required to remove residual peroxide
Applications: Used as an encapsulant and coating; used for diaphragms and O-rings. It is preferred where solvent resistance is particularly important and is especially valuable where a solvent resistant material with good low temp. props. is required

Fluoromethyl silicone rubber, Room temp. vulcanised F-14

Synonyms: *Methyltrifluoropropyl silicone rubber, Room temp. vulcanised. Fluorosilicone rubber, Room temp. vulcanised*
Related Polymers: Methylsilicone rubber, Room temp. vulcanised
Monomers: Dichlorodimethylsilane, Dichloromethyl(3,3,3-trifluoropropyl)silane, Hexamethylcyclotrisiloxane, Cyclic methyltrifluoropropylsiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
156395-52-7

Molecular Formula: $[(C_4H_7F_3OSi).(C_2H_6OSi)]_n$

Fragments: $C_4H_7F_3OSi$ C_2H_6OSi
Additives: Finely divided silica is usually incorporated as a reinforcer to improve mech. props.
General Information: Silanol groups are present in the pre-cure gum. During cure they form cross links through condensation. Fully cured elastomer has few free silanol groups

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	[8]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0009 K^{-1}	[5]	V

Glass-Transition Temperature:

No.	Value	Note
1	-100°C	20% trifluoropropyl, 80% methyl; increases with increase in trifluoropropyl substitution [6]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 17–18 J$^{1/2}$ cm$^{-3/2}$ (8.3–8.8 cal$^{1/2}$ cm$^{-3/2}$) (increases with trifluoropropyl substitution) [3,4,5]
Solvents/Non-solvents: Sol. ethers, esters, ketones. Mod. sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons. Insol. alcohols, H_2O [4,5,7]. Vulcanised rubber swollen by solvents rather than dissolved
Surface and Interfacial Properties General: Exhibits generally low surface adhesion [2]

Transport Properties:

Permeability of Gases: Permeability of gases has been reported. [1] Gas permeability depends on composition; it decreases as trifluoropropyl substitution increases

Mechanical Properties:

Mechanical Properties General: Requires reinforcing filler to possess acceptable mech. props. [12,13]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	4–5	increases with increase in trifluoropropyl substitution [4,11]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	[4]

Polymer Stability:

Polymer Stability General: A solvent resistant, room temp. vulcanising rubber
Thermal Stability General: Usable from -68–200° [9,10]
Upper Use Temperature:

No.	Value	Note
1	200°C	[9]

Environmental Stress: Resistant to oxidative degradation, H_2O, weathering and ozone. Unaffected by uv radiation [2]
Chemical Stability: Swollen by esters, ethers and ketones; relatively unaffected by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. sulfuric acid. Relatively unaffected by weak alkalis, weak acids and alcohols [2,7]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam [2]
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethyl- and methyl trifluoropropyl-cyclic polysiloxanes are polymerised together at 150–200° with alkaline catalysis in the presence of small quantities of water. The gum cures at room temp. with alkoxysilane cross-linking agents and metal salt catalyst. Cross-linking requires moisture
Applications: Potential applications due to good solvent resistance as a sealant and coating

Fluorosilicone oil F-15

Synonyms: *Fluoromethylsilicone fluid. Trifluoropropylmethyl silicone fluid. Poly[oxy(methyl(3,3,3-trifluoropropyl)silylene)]*
Related Polymers: PDMS fluid
Monomers: Dichloromethyl(3,3,3-trifluoropropyl)silane, Cyclic methyltrifluoropropylsiloxane
Material class: Fluids
Polymer Type: silicones
CAS Number:

CAS Reg. No.
25791-89-3
156395-51-6

Molecular Formula: $[C_4H_7F_3OSi]_n$
Fragments: $C_4H_7F_3OSi$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0008 K^{-1}	[4]	V

Transition Temperature:

No.	Value	Note
1	-48°C	Pour Point [2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 19.5 $J^{1/2}$ $cm^{-3/2}$ (9.6 $cal^{1/2}$ $cm^{-3/2}$); δ_d 15.8; δ_p 6.6; δ_h 5.6 $J^{1/2}cm^{-3/2}$ [3,4]
Solvents/Non-solvents: Sol. ethers, esters, ketones. Insol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons, alcohols, H_2O [2,4,5]
Surface and Interfacial Properties General: Better lubricating props. than dimethyl silicone fluid [9,10,12]
Wettability/Surface Energy and Interfacial Tension: γ_c 24 mJ m^{-2} (24 mN m^{-1}) [1]

Transport Properties:

Polymer Melts: Viscosity 3 St (25°) [2,11]. Viscosity is very pressure dependent due to the bulky alkyl chain as well as the fluorine substitution. A rise in pressure of 1–1000 atm. increases viscosity by a factor of 15. Viscosity temp. coefficient 0.85 [4,9]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	6.8	[5,11]

Dielectric Strength:

No.	Value	Note
1	15 $kV.mm^{-1}$	[15]

Dissipation (Power) Factor:

No.	Value	Note
1	0.001	[5]

Polymer Stability:

Polymer Stability General: Stable material which is particularly resistant to solvents
Thermal Stability General: Usable from -48–170° [2,7]
Upper Use Temperature:

No.	Value
1	170°C

Flammability: Fl. p. 200° [9]. Fire point 315°
Environmental Stress: Stable to H_2O, air, oxygen and other substances. Props. deteriorate due to cross-linking when exposed to radiation [8]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. Very thin films liable to degradation [2,5,8]
Hydrolytic Stability: Stable to H_2O and aq. solns. Very thin films spread on water; liable to hydrolytic degradation [2,5,8]
Biological Stability: Non-biodegradable [2,5]
Recyclability: Can be reused. No large scale recycling

Applications/Commercial Products:

Processing & Manufacturing Routes: For low viscosity fluids methyltrifluoropropyldichlorosilane is hydrolysed and the hydrolysate equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane. For high viscosity fluids cyclic methyltrifluoropropylsiloxanes are polymerised together under alkaline catalysis with traces of chain terminator at 150°
Applications: Used in lubrication where chemical solvents may be encountered

Furan resins, Foundry applications F-16

Related Polymers: Furan Resins, Phenolic Resoles, Phenolic Novolaks
Monomers: Furfuryl alcohol, Urea, Formaldehyde
Material class: Thermosetting resin
Polymer Type: furan
Additives: Addivtives depend on the foundry moulding process. Latent curing agents are needed for heat cure materials and sulfonic acids are needed for cure at lower temps.
General Information: Furan resins cover a wide range of chemical compositions. Some are well-condensed materials with little or no free furfuryl alcohol while other resins are urea-formaldehyde condensates with furfuryl alcohol

Applications/Commercial Products:

Processing & Manufacturing Routes: In the hot box process, quartz sand is batch mixed with phenolic resole or urea-modified furan resin (1.4–2%) and a latent curing agent such as ammonium nitrate (0.3–0.5%). The mix is shaped and precured at 200–260° for up to 2 min in core boxes. Use of modified furan resins (0.9–1.2%) with curing agents (0.2–0.4%, usually sulfonic acids) enables a warm-box process for binding sand at 140–200°. Furan and phenolic resins with special curing agent may be employed in a vacuum warm box process where the corebox is heated at 70–100°. For a no-bake process, sand and phenolic resole or furan resin (0.7–1.3%) and an acidic curing agent (0.2–0.6%) are cured at ambient temps. for 20 mins to several hours
Applications: The processing and manufacturing routes are all used to prepare sand-based moulds for casting of various metals in the foundry environment

Gelatin G-1

Synonyms: *Hydrolysed collagen*
Related Polymers: More general information, Source of Gelatin, Collagen
Monomers: Amino acids
Material class: Proteins and polynucleotides
CAS Number:

CAS Reg. No.
9000-70-8

Molecular Weight: 65000–300000, 100000–500000, 90000
General Information: Vitreous solid obtained by hydrol. of collagen. Acid hydrol. gives type A gelatin, alkaline hydrol. gives type B gelatin. Both are largely amorph. solids, though they can contain up to 17% crystalline regions [13]. Gelatin is a mixture of proteins, and is pale-coloured, odourless and tasteless

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.34 g/cm^3	dry [3]

Melting Temperature:

No.	Value	Note
1	230°C	dry [7]

Glass-Transition Temperature:

No.	Value	Note
1	217°C	dry [6]
2	200°C	[15]

Surface Properties & Solubility:

Solubility Properties General: Polymer granules are hydrated in cold water, dissolving fully in hot water [1]. Gels are formed at concentrations $\geq$0.5%, below 35° [2]
Solvents/Non-solvents: Sol. ethylene glycol, glycerol, DMSO, trifluoroacetic acid [4,9], warm H_2O [11]. Spar. sol. EtOH, Me_2CO [8]. Insol. EtOH, CCl_4, Me_2CO, C_6H_6, petrol [1]
Wettability/Surface Energy and Interfacial Tension: Contact angle 120–126° (H_2O, 15% gel) [11]
Surface Tension:

No.	Value	Note
1	44–48 mN/m	10% soln., 50° [11]

Transport Properties:

Polymer Solutions Concentrated : Viscosity 20–70 mP (Type A) [2], 20–75 mP (Type B) [2], 5–10 mPa s (6.67 wt%, 60°) [4], 3–10 mPa s (40°) [4], 7.3–8.46 mPa s [14]
Water Content: 9–13% [1], 9–15% (50% relative humidity) [4], 44% (90% relative humidity, pH 6.10, 25°) [10]. Absorbs less than ten times its weight of water [1]

Electrical Properties:

Electrical Properties General: Amphoteric isoelectric points for type A pH 7–9 and for type B pH 4.7–5.4 [2]

Optical Properties:

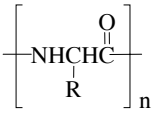
Refractive Index:

No.	Value	Note
1	1.54	dry [5]

Total Internal Reflection: $[\alpha]_D$ -350–-120 (0–40°) [11]. $[\alpha]_D$ -130–-140 [4]

Polymer Stability:

Polymer Stability General: Amorph. solid formed if dried above T_m



Applications/Commercial Products:

Supplier
Eastman Chemical Company

Groundnut protein fibre G-2

Synonyms: *Peanut protein fibre*
Related Polymers: Proteins, Zein
Material class: Amino acid
Polymer Type: protein
General Information: Composed of various amino acids

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.31 g/cm^3

Surface Properties & Solubility:

Internal Pressure Heat Solution and Miscellaneous: Heat of wetting 111.4 J g^{-1} (26.6 cal g^{-1}) [1], 114.7 J g^{-1} (27.4 cal g^{-1}) [2]
Solvents/Non-solvents: Sol. NaOH. Insol. organic solvents, acid soln.

Transport Properties:

Water Absorption:

No.	Value	Note
1	12–15 %	moisture regain; expands slightly when wet [1]

Mechanical Properties:

Mechanical Properties General: Tenacity 6.2–8 cN tex^{-1} [1]
Tensile Strength Break:

No.	Value	Note
1	78.5–117.7 MPa	8–12 kg mm^{-2} [1]

Tensile Strength Yield:

No.	Value	Note
1	40–60 MPa	dry
2	80 MPa	wet [1]

Complex Moduli: Modulus of torsional rigidity 1300 MPa (1.3×10^{10} dynes cm^{-2}) [1]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.53	[1]

Polymer Stability:
Thermal Stability General: Does not soften or melt [1]
Flammability: Is less flammable than wool [1]
Chemical Stability: Is resistant to organic solvents [1]
Hydrolytic Stability: Is insol. acidic sols. Degrades in alkali [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: The hexane extract of groundnut (peanut) meal is dissolved in dilute sodium hydroxide, allowed to mature (uncoiling the globular protein chains) and is then spun into dilute acid soln. The fibre is hardened by treatment with formaldehyde [2]
Applications: Used in fabrics as a blend with wool, cotton or rayon

Trade name	Details	Supplier
Ardil	discontinued	ICI, UK
Fibrolane C	discontinued	Courtaulds

Bibliographic References

Guayule rubber G-3

Synonyms: *Polyisoprene. cis-1,4-Polyisoprene*
Related Polymers: Natural rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Natural elastomers
Polymer Type: polydienes
Molecular Formula: $(C_5H_8)_n$
Fragments: C_5H_8
Molecular Weight: MW 200000, MW 100000–2500000, M_n 60000–800000, MW 2200000, M_n 920000, MZ/MN 1.8
Additives: Antioxidants, vulcanising agents, carbon black, normally added in practical applications
General Information: Rubber from *Guayule* shrubs differs from rubber from *Hevea* trees mainly with respect to non-rubber components. Guayule rubber contains less non-rubber and is more linear and gel-free; gives better processing characteristics [1]. Contains 100% *cis*-1,4-polyisoprene, with resins, rubber sol. triglycerides and higher terpenes. Has little or no branching and contains no natural oxidant. Evidence for bimodality when grown in wet conditions [5], normally unimodal

Volumetric & Calorimetric Properties:
Specific Heat Capacity:

No.	Value	Note	Type
1	1.67 kJ/kg.C	13° [3]	P

Melting Temperature:

No.	Value	Note
1	3°C	[3]

Glass-Transition Temperature:

No.	Value	Note
1	-68°C	[3]

Surface Properties & Solubility:
Solubility Properties General: Swelling index 3.44 (C_6H_6) [3], 3 (toluene) [6]
Solvents/Non-solvents: Swollen by C_6H_6, toluene

Transport Properties:
Polymer Solutions Dilute: Critical MW for entanglement 13000 [3]

Mechanical Properties:
Mechanical Properties General: Is slower to vulcanise than *Hevea* natural rubber and has lower moduli and tensile props. [2]
Tensile Strength Break:

No.	Value	Note	Elongation
1	11–21 MPa	[2]	640–850%
2	7.24 MPa	[3]	635%
3	18.89 MPa	vulcanised [6]	435%

Miscellaneous Moduli:

No.	Value	Note	Type
1	1.93 MPa	[6]	100% Modulus

Hardness: Shore A54 [3]. Other hardness values have been reported [6]
Failure Properties General: Tear strength 31.2 kN m^{-1} (vulcanised) [8]
Friction Abrasion and Resistance: Abrasion resistance has been reported [3]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.5205	25°
2	1.5415	25°

Transmission and Spectra: Ir spectrophotometric data have been reported [8]

Polymer Stability:
Polymer Stability General: Storage of *Guayule* plants results in partial degradation of the rubber [7]
Thermal Stability General: Degradation behaviour of guayule rubber, hevea rubber and synthetic, isoprene rubber is very similar. Natural antioxidants in hevea rubber give it slightly better stability. Unsaturated fatty acids (15% w/w) in guayule accelerate degradation [1]
Decomposition Details: Accelerated thermal and uv oxidative degradation cause changes in surface composition with the appearance of new functional groups, including hydroxyl, ether, carbonyl and carboxyl. Polynuclear aromatics are formed under extreme conditions [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Isol. from *Guayule* shrub by maceration and solvent extraction

Gutta-percha G-4

Synonyms: *Gutta. trans-1,4-Polyisoprene. trans-Polyisoprene*
Related Polymers: *trans*-1,4-Polyisoprene, Chicle, Balata, Jelutong, Guayule rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Natural elastomers, Gums and resins
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9000-32-2

Molecular Weight: MW 30000. MW determination has been reported
Additives: Contains large quantities of resin (esters of phytosterols)
General Information: Exists in several cryst. forms. α Crystalline form is stable, β-form is metastable [19]. First described in 1845. Isol. from *Palaquim, Isonandra* and *Payana* spp. (*Sapotacea* family) in S.E. Asia. Isol. has been reviewed [25]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 0.945–0.955 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.3×10^{-5} K^{-1}	unstressed, 5–23° [10]	V
2	3.3×10^{-5} K^{-1}	stressed by quenching [10]	V

Thermodynamic Properties General: Heat of fusion 12.9 kJ mol^{-1} (α-form), 6.5 kJ mol^{-1} (β-form) [4]
Melting Temperature:

No.	Value	Note
1	65°C	α-form [3]
2	56°C	β-form [3]

Glass-Transition Temperature:

No.	Value	Note
1	-68°C	midpoint [1]
2	-71°C	[11]
3	-58°C	[9]

Transition Temperature General: α and β transitions depend on rate of cooling and thermal history [8]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hot petrol, C_6H_6, $CHCl_3$, carbon disulfide [2]. Insol. EtOH, H_2O [2]

Transport Properties:

Permeability of Gases: Rate of gas permeation and diffusion increases sharply at 45° [14]. 1.3×10^{-8} g (h cm mmHg)$^{-1}$ (25°, H_2O) [13]

Mechanical Properties:

Mechanical Properties General: Mech. props. of gutta-percha have been reported in a study of semicrystalline polymers [5]
Tensile Strength Break:

No.	Value	Note
1	20 MPa	[3]
2	1 MPa	90% *trans* isomer [3]

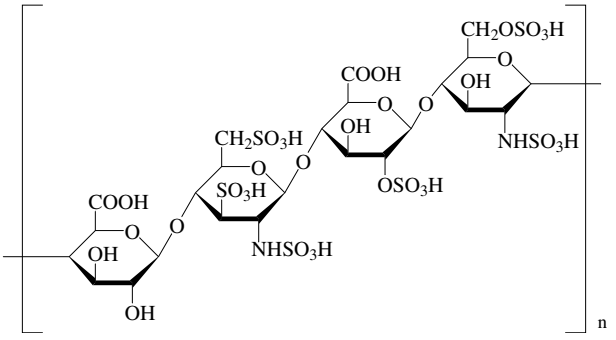
Mechanical Properties Miscellaneous: The resilience of gutta-percha and balata has been measured from -70–200°. A rapid decrease occurs above 30° [21]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [3,15,22,23,24]

Polymer Stability:

Decomposition Details: Pyrolysis under vacuum yields 96% isoprenes and pentenes [6]. From 50–400° isoprene, dipentene and mixed large molecules are the main pyrolysis products [12]
Environmental Stress: Degrades rapidly on exposure to ozone, air and light



Applications/Commercial Products:

Processing & Manufacturing Routes: Produced from isolates of *Palaquium* and *Payena* spp. by extraction into warm petroleum. Moulding temp. must be 60–100° to avoid degradation. Softens in hot water to allow processing [18]. Must not dry out completely
Applications: Previously been used for cable insulation, including underwater cables, golf ball covers and dental applications. No longer of commercial significance, has been superseded by wholly synthetic materials

Heparin H-1

Synonyms: *Heparinic acid*
Monomers: Base monomer units include glucose, Base monomer units include L-iduronic acid, Base monomer units include glucosamine, Base monomer units include glucuronic acid
Material class: Polysaccharides
Polymer Type: Carbohyrate
CAS Number:

CAS Reg. No.
9005-49-6

Molecular Formula: $(C_{12}H_{19}NS_2)_n$ (average for free acid form)
Fragments: $C_{12}H_{19}NS_2$
Molecular Weight: Isolated MW 5000–25000; natural source MW in proteoglycan 600000–1000000 [1,4]
General Information: Heparin is a complex polysaccharide from mammalian tissues consisting of derivatives of glucosamine, glucuronic acid and other sugars, carrying sulfonic acid, sulfate and sulfonamide residues. It is isol. as an amorph. powder. Occurs in the blood, skin, aorta, umbilical cord and most tissues, supposedly manufactured by the most cells. Possesses anticoagulant and antithrombolytic props. Some heparin chains are linked to serine or small peptides and contain the linkage → GIcUA → Gal → Gal → Xyl → Ser, as found in other connective tissue polysaccharides, suggesting *in vivo* synth. as a proteoglycan [5]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. H_2O; insol. EtOH, $CHCl_3$, Me_2CO, C_6H_6

Transport Properties:
Polymer Solutions Concentrated : Mark Houwink viscosity relationships have been reported [2,3]

Optical Properties:
Total Internal Reflection: $[\alpha]_D$ +44–+70 (H_2O)

Polymer Stability:
Chemical Stability: Stable in soln. of pH 5.0–7.5

High-impact polystyrene H-2

Synonyms: *HIPS. Impact polystyrene. Impact resistant polystyrene. Rubber modified polystyrene. Rubber reinforced polystyrene. Polystyrene, High impact*
Related Polymers: Polystyrene - General Information, Polybutadiene, Styrene-butadiene block copolymer, Noryl (HIPS/PPO blend)
Monomers: Styrene, 1,3-Butadiene
Material class: Composites, Thermoplastic
Polymer Type: polystyrene
CAS Number:

CAS Reg. No.	Note
9003-53-6	high impact
9003-55-8	rubber modified

Molecular Formula: $(C_8H_8O)_n$
Fragments: C_8H_8O
Additives: A uv stabiliser is usually added to commercial products to prevent photooxidation of the rubber phase. Examples of uv stabilisers used are carbon black, zinc oxide, benzophenones and benzotriazoles (Tinuvin P). A fire retardant is usually added and similar compds. to those that are efficient for types of polystyrene are used. Typically a halogen bearing organic compd. e.g. decabromodiphenyl oxide (11–13%) is combined with antimony oxide (3–4%) [3,4]. Processing aids (plasticisers) and mould-release agents are often added for extrusion and injection-moulding applications
General Information: High-Impact Polystyrene polymer products are opaque and not transparent. High-impact polystyrene has the following improved physical props. compared to unmodified polystyrene polymer: increased elongation, ductility and environmental stress crack resistance and increased impact resistance. The physical props. of HIPS depend strongly on the type of rubber used and its props., the concentration ratio of styrene and butadiene, as well as the polymerisation and processing conditions, including the additives used. HIPS is a composite material consisting of discrete rubber particles (3–10 wt%) dispersed in a polystyrene matrix. The rubber used is usually grafted to the polystyrene to improve compatibility of the polystyrene and rubber phases at the phase interface. Rubbers used include pure polybutadiene (this is the most important commercially); styrene-butadiene copolymers (particularly those of 1,4-polybutadiene) and ethylene-propylene-diene terpolymer (EPDM rubber) which may be used to impart better thermal and uv light stability leading to impact resistant polymers with more resistance to outdoor ageing. Other rubbers which have been reported in the literature include acrylates, polyisoprene and polyethylene but these have had limited commercial success because of their low chemical reactivity. The rubber phase volume can be increased to 10-40% (w/v) by filling the rubber particles with polystyrene occlusions. Most commercial HIPS resins have particle sizes ranging from about 1 to 10 μm. However if the particle diameters are much larger than 5–10 μm, the toughness decreases and the finished part has a low surface gloss. The rubber particle size distribution does not have to be monodisperse. A bimodal particle size distribution containing some particles of rubbers with a diameter less than 1 μm has increased toughness props.
Rubber Cross-Linking Cross-linking of the rubber phase is important in forming a stable rubber particle during the polymerisation process. The vinyl content (pendant vinyl group formed by 1.2 polymerisation) of the rubber is important in determining the final cross-link density. The physical props. of HIPS are affected by the cross-link density. Grafting occurs during the polymerisation of styrene when some of the free radicals react with the rubber. Grafting is important because the graft copolymer concentrates at the interface of the polystyrene and rubber phases and strongly affects its particle size, morphology and toughness
Morphology: The morphology of high-impact polystyrene has been studied by electron microscopy [9,11,12]. Differences in morphology among the high-impact polystyrene resins are a result of different production processes, types of rubber and rubber concentrations. For high-impact polystyrene prod. using pure polybutadiene rubber, the soln. polymerisation process forms

spherical, cellular particles. This struct. has been called a "salami" or "honeycomb" struct. The mass suspension polymerisation process poduces a similar morphology, however blending yields irregularly shaped particles. Other morphologies can be obtained when styrene-butadiene block copolymers are used including cylindrical core-shell, lamellar and cellular structs. The morphology of HIPS is a non-equilibrium morphology because it depends on the shear rate applied during its synthesis [13]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.98–1.1 g/cm^3	[5]
2	d 1.05 g/cm^3	ASTM D792 [1,2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	3.4×10^{-5}–0.00021 K^{-1}	[5]	L

Volumetric Properties General: Density may be affected by additives *e.g.* fire retardants and uv stabilisers [2,5]
Thermodynamic Properties General: The ratio of the change in specific heat at T_g for one component in the blend to the change in specific heat for the pure material gives the relative amount of that component in the blend [43]
Thermal Conductivity:

No.	Value	Note
1	0.04–0.12 W/mK	[5]

Transition Temperature General: The Vicat softening point, deflection temp. under load, and service temp. are all lower than those of polystyrene [2,5]. Two T_g values are observed: one for the rubber phase and the other for the polystyrene phase. As the rubber and polystyrene phases are immiscible, there is generally no interaction and the presence of one phase does not greatly affect the T_g of the other [2]. The T_g of the rubber phase [2] can be affected by the degree of cross-linking of the rubber [67] and the presence of additives [3]. The T_g of the rubber phase may be used to identify the type of rubber in the polymer [73]. An additional transition may be observed just above the T_g of the rubber phase which corresponds to the T_g of the styrene-rubber copolymer [73]. T_m is lower than that of polystyrene due to the lack of a regular struct. [87]. Heat distortion temp. decreases with increasing rubber concentration and decreases sharply with increasing plasticiser concentration. It is relatively unaffected by rubber particle size, cross-link density and grafting. There is a small increase with increasing MW [2]. It is similar to that of polystyrene [68,73]
Deflection Temperature:

No.	Value	Note
1	81–96°C	1.8 MPa, ASTM D648 [2]
2	64–93°C	1.8 MPa [23]

Vicat Softening Point:

No.	Value	Note
1	78–100°C	[5]
2	94–104°C	ASTM D1525 [2]
3	95°C	[1]
4	100°C	[60]

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	3–13.5 g/10 min	ASTM D1238, test condition G [2]
2	1 g/10 min	190°, 21.6 kg [11]
3	13 g/10 min	190°, 21.6 kg, rubber phase modified by copolymer [11]

Polymer Solutions Concentrated : Rheological behaviour during polymerisation has been reported [2,15,94]
Polymer Melts: The melt flow index decreases with increasing rubber concentration and MW; it decreases slightly as the amount of grafting increases. Melt flow index increases with increasing rubber particle size (up to a limiting value) and with increasing plasticiser concentration. It is relatively unaffected by cross-link density. The introduction of rubber particles into polystyrene causes only minor changes in the melt rheological behaviour [2]. Melt viscosity and melt elasticity and their comparison to those of polystyrene have been reported [88]. Viscosity-shear rate dependence and the melt elasticity have been reported [2]. High-impact polystyrene samples have slightly higher melt viscosities but lower melt elasticity than does general purpose polystyrene [89]. The temp. and MW dependence of melt viscosity are identical to those of polystyrene unmodified [88,90]. Melt rheology props. [91] are non-Newtonian [88]; pseudoplastic behaviour occurs at 220°. The melt viscosity and primary normal stress coefficients of mineral oil plasticised material as a function of shear rate and mineral oil concentration have been reported [93]. The concentration dependence is lower than expected because of the higher solubility of mineral oil in the rubber phase [2]. Shear viscosity and primary normal stress as a function of shear rate for various temps. have been reported [98]
Water Absorption:

No.	Value	Note
1	0.1–0.6 %	24h [5]

Mechanical Properties:

Mechanical Properties General: Modification by rubber reduces both the tensile strength and the modulus compared with polystyrene [2,5,68] but impact strength and elongation at break are both significantly increased [2,5,68]. Higher tensile props. are achieved by reduced rubber concentration, decreased rubber particle size, increased rubber cross-link density, increased matrix MW, reduced plasticiser concentration and low amount of grafting [2]. Elongation is increased by increased rubber particle size, increased percentage of rubber, decreased rubber cross-link density, or by the addition of plasticiser [2]. The addition of plasticisers can increase impact strength and processability [2,3]. The mechanical props. are strongly affected by the nature of the rubber phase including the rubber composition and concentration, rubber phase volume, particle size distribution, degree of grafting and cross-linking, and the MW and MW distribution of the matrix polystyrene [68]. Antioxidants, plasticisers, flame retardants and other additives also affect the mechanical props. [68,74]. The variables that affect the mechanical props. are not independent and the optimisation of one prop. may be detrimental to other props. [2]. Elongation at rupture 58% [1]. The tensile yield decreases with increasing particle size for a given particle type [60]. The loss modulus and storage modulus decrease with increasing temp. [98].Plateau modulus 0.04 40000 N m^{-2} [98]

Tensile (Young's) Modulus:

No.	Value	Note
1	900–3500 MPa	[5]
2	1500–2500 MPa	rubber phase, styrene-butadiene copolymer [69]

3	2140 MPa	[1]
4	1500 MPa	[75]
5	1655–2241 MPa	ASTM D638 [2]
6	1600 MPa	ASTM D638 [68,73]
7	1300–3200 MPa	40–0% volume fraction rubber [59,60]

Flexural Modulus:

No.	Value	Note
1	1930 MPa	[60]
2	1793–2276 MPa	ASTM D790 [2]
3	1000–3400 MPa	20° [5]

Tensile Strength Break:

No.	Value	Note	Elongation
1	12–62 MPa	20° [5]	7–60%
2	15.9–23 MPa	ASTM D638 [2]	20–30%
3	21 MPa	[68,73]	40%
4	15–40 MPa	styrene-butadiene rubber [69]	15–60%
5	18 MPa	[60]	40%
6	17.35–18.63 MPa	177–190 kg cm^{-2}, copolymer modified rubber phase [11]	37–48%
7	17.35–18.24 MPa	177–186 kg cm^{-2}, copolymer modified rubber phase [11]	14–63%

Flexural Strength at Break:

No.	Value	Note
1	27–69 MPa	20° [5]
2	32.4–51.7 MPa	ASTM D790 [2]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	13.8–25.5 MPa		ASTM D638 [2]
2	29.6 MPa		[1]
3	17.5 MPa	2%	[68,73]
4	20 MPa		[75]
5	10–40 MPa		40.0% volume fraction rubber [59,60]

Compressive Strength:

No.	Value	Note
1	27–62 MPa	[5]

Miscellaneous Moduli:

No.	Value	Note
1	0.04 MPa	Plateau modulus 0.04 40000 N m^{-2} [98]

Complex Moduli: The dynamic storage modulus decreases as the rubber particle volume fraction increases; values of the dynamic storage modulus converge at temps. below the T_g of the rubber [59]

Impact Strength: Impact strength generally increases with rubber phase volume. However, the rubber content is limited to 14% (w/w) for commercial resins owing to the high viscosity of the feed solns. in the soln. polymerisation process [2]. The rubber phase volume can be increased to 10–40% (w/v) by filling the rubber particles with polystyrene occlusions. At a constant rubber level, increasing the rubber particle size improves the impact strength with a similar effect observed when the polystyrene occlusion content is increased [2,71,72]. For particle sizes greater than 5–10 μm the impact strength decreases [2]. The particle size distribution also affects impact strength, with impact strength improved by the use of a bimodal distribution [2,17]. Gardner impact strength 29–173 cm kg (5 × 0.32 cm sample) [2]. Dart-drop impact strength medium to high [1]. Izod impact values may also be affected by processing conditions, *e.g.* temp. [2,11,75]. The notched Charpy impact strength depends strongly on the testing temp. [58,59]. Charpy impact strength 26–36 kg cm^2 cm^{-2} (unnotched) [11], 16–30 kg cm^2 cm^{-2} (unnotched [11]. At temps. above the T_g of the rubber the notched Charpy impact strength increases with increasing rubber volume fraction [58,59]
Viscoelastic Behaviour: Viscoelastic behaviour has been reported [88,90,96]. The compliance of the rubber-modified melt is slightly lower than that of the polystyrene matrix [2]. The hard-elastic behaviour of high-impact polystyrene is similar to that of crystalline polymers [97]. The recovery process of elastic high-impact polystyrene includes an instantaneous component and a time-dependent mechanism [97]
Hardness: Rockwell M35–M70 [5], L65–L88 [2], M25–M65 (ASTM D785) [2]. Hardness is lower than that of polystyrene [5]
Failure Properties General: Crazing is the dominant mechanism in fatigue [68] and causes large increases in hysteresis and a decrease in modulus [68,80,81]. Although high-impact polystyrene is more fatigue resistant than polystyrene, it fails in a brittle fashion under cyclic loading [2]. Fatigue resistance is inferior to that of ABS [82]. The effect of stress and strain history upon mechanical props. and creep testing and repeated tensile tests has been reported [83,84]. Fatigue and creep response is affected by environment and solvents which do not show any effect on unstressed polymer do affect the stressed polymer [57]. High-impact polystyrene protected from the environment exhibits ductile behaviour at all pressures. However, specimens exposed to silicone oil exhibit two transitions as the pressure is increased: ductile-to-brittle transition followed by a brittle-to-ductile transition [85]. Is brittle at temps. below the T_g of the rubber phase [58,59]
Fracture Mechanical Properties: Fracture toughness K_{Ic} 1–2 J cm^{-3} $m^{1/2}$ [69]. The role of rubber particles in the toughening of polystyrene has been reported [2,6,9,17,60,68,71,72,73]. Rubber particles both initiate and control the craze growth. In the presence of rubber particles a large number of small crazes are formed prior to failure. Energy is absorbed upon formation of the craze. Provided the stress concentration does not become catastrophic (leading to the formation of a crack) the material will retain its structural integrity. At temps. approaching T_g, the crazed material can recover after the stress is removed [2]. Craze formation [2] is increased by good rubber matrix adhesion [74], large particle diameter (1–6 μm) [71,72], high rubber concentration [9], low rubber T_g [74], spherical rubber particles [74], high testing temp. [74] and high rubber thermal expansion coefficient [74]. The polystyrene MW has a negligible effect on craze formation, but stabilises the crazes once formed [2,76]. The mechanism of craze formation has been reported [2,6,77,78,79]
Izod Notch:

No.	Value	Notch	Note
1	27–400 J/m	Y	20° [5]
2	37.4–122.8 J/m	Y	23°, ASTM D256 [2]
3	134 J/m	Y	[1]
4	96 J/m	Y	[68,73]
5	80 J/m	Y	[60]
6	50–400 J/m	Y	styrene-butadiene rubber [69]

7	130–160 J/m	N	25% w/v polybutadiene rubber [70]
8	370–430 J/m	N	40% w/v polybutadiene rubber melt/styrene-butadiene-styrene [70]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.4–4.8	60 Hz	[5]
2	2.4–4.5	1 kHz	[5]
3	2.4–3.8	1 MHz	[5]
4	2.8	1 kHz	uv stabilised and fire retardant grade [5]

Dielectric Strength:

No.	Value	Note
1	12–24 $kV.mm^{-1}$	[5]
2	15 $kV.mm^{-1}$	uv stabilised and fire retardant grade [5]

Arc Resistance:

No.	Value	Note
1	20–140s	[5]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0004–0.002	60–1 MHz	[5]
2	0.0006	1 kHz	uv stabilised and fire retardant grade [5]

Optical Properties:

Optical Properties General: Optical props. are affected by the discrete rubber particles dispersed in the polystyrene phase. These rubber particles scatter light, with max. scattering at 0.75 μm particle size. The amount of scattering is less for smaller or larger rubber particles [2]. Transparent grades can be prod. by matching the refractive index of the rubber with the polystyrene phase [2,44,45,47]. However, the refractive index of the polystyrene and rubber phases must have the same temp. dependence or the amount of haze will also be temp. dependent [2,46,47]. Optical props. depend on the polystyrene-rubber composition, type of rubber used, rubber particle size, MW, cross-linking and grafting [2]. If the rubber particle size is reduced to less than 0.1 μm, which is shorter than the wavelength of visible light, transparent grades may be prod. [47]

Volume Properties/Surface Properties: Haze 30% (min.) (opaque/translucent). Gloss high or low depending on the rubber particles [2]. The gloss decreases with increasing rubber concentration, particle size, MW and grafting [2]. The gloss increases with increasing cross-link density and is little affected by plasticiser [2]. Gloss 91–99% (0.6–1 μm rubber particles) [2,48]. The gloss in bimodal rubber particle size systems is reduced by the larger-sized particles [2,48]. Transparency translucent-opaque [5]

Polymer Stability:

Thermal Stability General: The thermal degradation of blends of polybutadiene and polyisoprene rubbers with polystyrene in the absence of O_2 has been reported [2,49,50]. Thermal degradation of the polystyrene phase is dramatically slowed by the presence of the rubber phase. This is shown by the total weight loss and the appearance of volatile products [49]. The degradation products of rubber that can readily donate hydrogen, such as 4-vinylcyclohexene from polybutadiene and dipentene from polyisoprene, deactivate polystyryl radicals as they form, inhibiting the formation of volatile degradation products from polystyrene [2,49]. The presence of rubber particles, however, accelerates property loss on thermal ageing [2], compared to polystyrene. The polybutadiene component breaks down first [49]. The heat stability and softening temp. of high-impact polystyrene are inferior to those of polystyrene [5]

Upper Use Temperature:

No.	Value	Note
1	<90°C	max. continuous service [5]

Decomposition Details: Volatile decomposition products are evolved at approx. 445–465° [49]. Decomposition products from polybutadiene include butadiene, 4-vinylcyclohexene, propene, pentene, ethane and ethene; polystyrene decomposes to give styrene [49]

Flammability: Flammability rating SB [5]. Rubber-modified polystyrene ignites and burns readily yielding a thick, sooty smoke, with the characteristic odour of burning rubber [51]. Fire retardants may be added [3,4,52,53,54,61,62]. Oxygen index 17.6 (without flame retardants). Data for the percentage of char have been reported [54]

Environmental Stress: Resistance to environmental stress-cracking can be improved by increasing rubber particle size, the rubber cross-link density, the MW of the matrix, or by reducing plasticiser concentration [2,55]. Increasing grafting increases environmental stress-crack resistance initially until a plateau value is reached [2]. Rubber modification also gives improved environmental stress-crack resistance compared to unmodified polystyrene [2]. The environmental stress-cracking caused by hexadecane [56,57], various alcohols, and cottonseed-oleic acid has been reported [55]. Environmental stress-cracking is induced by the same chemicals as cause stress-cracking in polystyrene [5]. Yellows upon exposure to sunlight which also causes brittleness and cracking [2]. The effect of outdoor weathering is accelerated compared to polystyrene because of the degradation of the rubber phase [2,63,64]. Weathering reduces the impact strength dramatically. Unprotected high-impact polystyrene is therefore not suitable for long-term outdoor applications [2]. Improved weatherability may be obtained by using unsaturated rubbers with greater uv resistance, *e.g.* ethylene-propylene-diene rubber [2]. Uv stabilisers may be added [1,2,65,66]

Chemical Stability: Has chemical stability similar to that of polystyrene

Hydrolytic Stability: Has excellent hydrolytic stability

Biological Stability: Has biological stability similar to that polystyrene

Recyclability: Tensile modulus, tensile strength and elongation at yield are unaffected by recycling at 290° [75]. However, rubber particles lose their sphericity and the ratio of weight to M_n of the polystyrene component increases. Impact strength is reduced by recycling at 290°, changes from ductile to brittle and the mode of failure [75]

Applications/Commercial Products:

Processing & Manufacturing Routes: In mass prod. rubber modified PS, the rubber is dissolved in styrene monomer in a prepolymerisation stage [14]. This is followed by free radical polymerisation of the styrene monomer, typically using a peroxide catalyst. As polymerisation of the styrene proceeds two phases are formed; a rubber rich phase and a polystyrene rich phase. At the beginning of the reaction, the rubber rich phase is the continuous phase with the polystyrene rich phase as the dispersed phase. As the polymerisation proceeds the volume fraction of the polystyrene rich phase increases. When the volume fractions of the rubber and polystyrene phases are approx. equal, phase inversion begins to occur and polystyrene becomes the continuous phase containing small domains of rubber. The phase inversion generally occurs when the amount of PS is 2–3 times the initial amount of rubber [2]. Formation of styrene-rubber graft copolymer occurs throughout the polymerisation. This graft copolymer concentrates at the phase boundary between rubber and polystyrene and

stabilises the rubber particles. After phase inversion, the particle boundaries are fixed and polymerisation continues both inside the rubber particles and in the continuous phase. As conversion nears completion the temp. is increased to approx. 200° to cross-link the rubber chain to protect the rubber particles from the very high shear fields during fabrication. Although the manufacturing process for HIPS is similar to that for general purpose polystyrene, the apparatus used needs to be adapted [1,14] to meet additional demands like dissolving approx. 5–10% w/w polybutadiene in styrene which may take 10–20h. (The rubber content of commercial HIPS resins is limited to about 14% w/w). Additionally shear conditions need to be controlled to achieve phase inversion and the desired particle size. If shear agitation is stopped or insufficient, phase inversion does not occur, and the product is a quasi interpenetrating network of cross-linked rubber with polystyrene [2]. The shear agitation rate can also affect the particle morphology formed. A minimum shear rate was found to be required to achieve phase inversion and this was determined for a range of rubber concentrations [15]. HIPS is mostly prepared commercially by a soln. (or bulk soln.) continuous process using a linear flow reactor or a continuous stirred tank reactor. The processability of medium impact PS is similar to that of the homopolymer, general purpose grades. Mould shrinkage and dimensional stability are also similar. The high impact grades may be processed by injection-moulding, extrusion, blow moulding and vacuum forming (thermoforming). No special pretreatment is needed for printing and decorating. In processing these materials it is necessary to avoid overheating or long residence times which cause yellowing. Resins with high melt viscosities are most suitable for extrusion. A similar extrusion process is used for all styrene-based plastics. Most rubber-modified polystyrenes are fabricated into sheet by extrusion primarily for subsequent thermoforming operations. HIPS resins with low melt viscosity are used for injection moulding applications. Processing conditions are similar to those for general purpose polystyrene. Injection moulding can also be used to produce HIPS structural foams. Thermoforming of HIPS extruded sheet is a process of considerable commercial importance. Thermoforming is usually accomplished by heating a thermoplastic sheet above its glass-transition temp. and forcing it against a mould by appling vacuum, air or mechanical pressure. On coding, the contour of the mould is reproduced in detail. Carefully determined conditions for the plastic sheet temp. (heating time and mould temp.) must be maintained. For styrene plastics the normal forming temp. is 149° with an upper processing limit of 182°. Blow moulding is a multistep fabrication process used for manufacturing hollow, symmetrical objects. The granules are melted and a parison is obtained by extrusion or injection moulding. The parison is then enclosed by the mould, and pressure or vacuum is applied to force the material to assume the contour of the mould. After sufficient cooling, the object is ejected. Blow moulding is used for rubber-modified PS and for ABS to form speciality products. Injection blow moulding is used extensively for PS and styrene copolymers. HIPS may be used to form high-density structural foam. This foam is produced by injection moulding or profile extrusion methods. A decomposable chemical blowing agent that releases nitrogen or carbon dioxide is usually used e.g. sodium bicarbonate or azodicarbonamides

Applications: Injection moulded HIPS is used to make thin wall products for food packaging, closures and container lids, toys and novelties. The largest market for impact PS is food packaging . Vacuum forming of extruded HIPS sheet is used to produce refrigerator door liners. food-container liners, containers for dairy products and luggage. Refrigerator parts include large-scale applications as well as domestic freezers and other refrigerator fittings . Typical injection moulded HIPS products are air-conditioner grills, radio and TV cabinets, tape-cartridges and video cassettes. Injection moulded HIPS products are also used for kitchen/bathroom cabinets, toilet seats and tanks, instrument control knobs and housings for electrical appliances. Extruded HIPS products include furniture drawers and extruded panelling. Blow moulded HIPS is used for speciality bottles, containers and furniture parts. Other applications of HIPS include drain pipes, personal care products, lighting features, disposable-service ware, wall coverings, signs, plumbing and bath fixtures. HIPS structural foam parts are used to replace wood, metals or solid plastics. They are widely used in appliances, automobiles, furniture and in the construction industry. HIPS can be coextruded with other polymers to produce containers, dinner-ware, drink cups and packaging materials. Products containing HIPS blended with other polymers are used for many applications including containers for electrophotographic toner, recyclable trash bags, foam cushioning material, table tennis balls, radioactive shielding, wood-free pencils, heat resistant utensils, multilayer containers for microwave cooking, tyre treads. An application of HIPS is the formation of the HIPS/PPO (polypropylene oxide) blend used in the electrical and electronic applications. Applications are described in more detail in a separate entry

Trade name	Details	Supplier
Estyrene	high impact	Nippon Steel Chem. Co.
Kayson	high impact	Polysar
Lacqrene	high impact and general purpose	ATO Chimie
Lustrex	high impact	Monsanto Chemical
Noryl	HIPS-PPO blend	General Electric
Novacor		Novacor Chem. Int.
Shell	high impact	Shell Chemicals
Styron	high impact and general purpose	Dow
Styrowood	imitation wood, high impact	Sordelli
Styvarene	impact resistant	Plastugil
Toporex	high impact	Japan Synthetic
Vestyron	polystyrene and styrene butadiene	Hüls AG
	high impact	Amoco Chemical Company
	high impact	Gulf
	impact polystyrene	BASF
	HIPS containing bimodal styrene-butadiene rubber particles	Asahi Chem. Industry Co.
	fire-proof HIPS	Firestone
	transparent HIPS	Rohm and Haas
	HIPS wood composite	Daicel Chem.
	HIPS	Neste
	HIPS foam	Sumitomo Chem Co
	thermoplastic resin containg HIPS	Nissan Chemical Ind. Ltd.
	HIPS containing bimodal particles	Fina Chemicals (Division of Petrofina SA)
	intumescent HIPS	Polymer Co. Ltd.
	injection moulded HIPS	Showa Denko
	HIPS filled with calcium carbonate	United Sterling Corp. Ltd.
	impact polystyrene	Svenska Polystyren Fabriken AB
	high impact	Huntsman Chemical
	high impact	America Petrofina Inc.
	high impact	Mobil

High-impact polystyrene/poly(phenylene oxide) blends H-3

Synonyms: *HIPS/PPO blends. HIPS/DMPPO blends. PS/PPO blends. Polystyrene/poly(phenylene oxide) blends, High impact. High-impact polystyrene/poly(2,6-dimethyl-1,4-phenylene oxide) blends. High-impact polystyrene/poly(phenylene ether) blends. HIPS/PPE blends. PS/PPE blends. High-impact polystyrene/polyoxyphenylene blend*
Related Polymers: High-impact polystyrene, Poly(phenylene oxide)
Monomers: Styrene, 1,3-Butadiene, 2,6-Dimethylphenol
Material class: Blends, Thermoplastic, Composites
Polymer Type: polyalkylene ether, polystyrene
CAS Number:

CAS Reg. No.	Note
9003-53-6	polystyrene
25134-01-4	PPO

Molecular Weight: It is not possible to give a definite MF due to the variety of rubber compounds which may be used to make high-impact polystyrene. The MW of the HIPS/PPO blend depends on the MW of the PPO, PS and rubber used, the ratio of HIPS to PPO, and the amount of rubber used
Additives: About 1% (w/w) low-density polyethylene is added to commercial HIPS/PPO resins as a processing lubricant [3,10]. Flame retardants may be added if required [3]. As PPO has an inherent flame resistance halogenated additives are not used. HIPS/PPO blends may be glass reinforced for applications requiring greater rigidity and dimensional stability [10]. Coloured HIPS/PPO blends may be prod. by using suitable additives. Other additives which may be used include proprietary stabilisers and impact modifiers
General Information: HIPS and PPO are compatible across the entire range of compositions and therefore the blends each have a single glass-transition temp. and form a clear film [7]. The available blends comprise a large family of products with a wide range of props. [1]. HIPS/PPO blends were designed to fill the significant price/property void between commodity materials such as HIPS or ABS with other engineering plastics [2]. Blending PPO with HIPS lowers the cost and improves some physical props. [3]. HIPS/PPO blends are tough, rigid materials that maintain excellent mechanical props. over a wide range of temps. such as good impact resistance and high tensile modulus. They have good dimensional stability with low creep; high heat distortion temp.; excellent electrical props. that are little affected by temp., humidity and frequency; good hydrolytic props. being resistant to water, detergents, acids, bases and steam; and low density [1,2,3,4]. The addition of HIPS improves the processability by enabling melt processing at lower temps. [3]. The lower melt viscosity of HIPS/PPO blends (compared to that for PPO) means that they can be injection moulded
Miscellaneous: Rubber types used in HIPS/PPO blends include high *cis* and low *cis* polybutadiene, EPDM rubber and styrene-butadiene block copolymers. The most common type is high *cis* polybutadiene. Optimum impact props. occur with an average rubber particle size of approx. 2μm or less. A core-shell morphology and the addition of very small rubber particles (0.3μm) improve the props. Most of the HIPS that is used for PPO blends is designed specifically for this purpose [3]. Typical compositions for HIPS/PPO blends contain 40–85% (w/w) PPO [3,11]. The ratio of PPO to PS in blends may be determined from the intensity of the PPO peak at 854cm^{-1} and the PS peak at 700cm^{-1} in the IR spectrum [22]. Many grades of HIPS/PPO blends are available commercially. Some grades are designed for specific processing conditions such as foaming, profile extrusion and electroplating. Some speciality grades are designed for a single application e.g. electrical connectors (high heat grade) and exterior automotive parts (high-impact mineral-filled grade) [3]. Although HIPS/PPO blends may be prod. as sheet and for vacuum forming, the greatest volume use is in pellets for injection moulding

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.06 g/cm^3	injection moulded/extrusion [1]
2	d 1.1 g/cm^3	foamable-injection moulded [1]
3	d 1.21–1.29 g/cm^3	20–30% glass reinforced, ASTM D792 [23]
4	d 1.29 g/cm^3	solid [44]
5	d 0.91 g/cm^3	[44]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.4×10^{-5}–7.4×10^{-5} K^{-1}	ASTM D696 [1]	L
2	2.5×10^{-5}–3.6×10^{-5} K^{-1}	20–30% glass reinforced blends, ASTM D696 [23]	L
3	6.8×10^{-5} K^{-1}	Foamable, ASTM D696 [1]	L

Volumetric Properties General: The density changes slightly for different polymer grades and processing methods. [1] Fire-retardant additives may increase the density. [23] Glass reinforcement increases the density. [23]
Thermodynamic Properties General: Thermal expansion coefficient varies with grade and composition but it is very low compared with other polymers [23]. Calorimetry has shown a negative heat of mixing across the complete composition range [1,29]. Typically ΔH_{mix} 40 J mol^{-1} (approx.) [3,13]
Thermal Conductivity:

No.	Value	Note
1	0.22–0.23 W/mK	unreinforced, ASTM C177 [23]
2	0.16–0.17 W/mK	glass reinforced, ASTM C177 [23]
3	0.12 W/mK	foamable, ASTM C177 [1]
4	0.26 W/mK	[44]
5	0.24 W/mK	solid [44]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.2 kJ/kg.C	foamable [1]	P
2	2.07 kJ/kg.C	[45]	P
3	1.46 kJ/kg.C	solid [45]	V

Melting Temperature:

No.	Value	Note
1	180°C	[44]

Transition Temperature General: The glass-transition temp. depends upon the composition of the blend. A linear relationship has been demonstrated between Tg and the percentage of PPO in the blend by plotting a graph of results. Each blend composition has a single Tg because PPO and HIPS are compatible polymer systems. Tm and Tg have intermediate values depending on the amount of each of the constituents. Other thermal props. are also dependent on the blend composition. The heat deflection temp. is high and also depends on the blend composition [1,2]. Blends containing large amounts of PPO have the highest heat deflection temp. [24,25]. An equation relating the Tg of the blend and the mass fractions of HIPS and PPO has been reported. [26].

A thermodynamic relationship which relates the Tg of HIPS-PPO blends to composition and heat capacities has also been reported. [27]. A theory has been developed and used to predict the compositional variation of Tg for PPO-HIPS polymer blends [28]

Deflection Temperature:

No.	Value	Note
1	137.2°C	0.455 MPa [5]
2	129.4°C	1.82 MPa [5]
3	96–140°C	0.45 MPa, ASTM D648 [1,23]
4	88–133°C	1.8 MPa, ASTM D648 [1,23]
5	142–150°C	0.45 MPa, 20–30% glass reinforced ASTM D648 [23]
6	135–150°C	1.8 MPa, 20–30% glass reinforced, ASTM D648 [23]
7	82°C	0.46 Mpa, foamable, ASTM D648 [1]
8	96°C	1.82 Mpa, foamable, ASTM D648 [1]

Surface Properties & Solubility:

Solubility Properties General: Studies show that PS and PPO are miscible and form a compatible polymer blend. [1,13,40]. The values for the Flory Huggins interaction parameter for PS-PPO blends have been reported [29,42,43]

Transport Properties:

Polymer Melts: The rheological behaviour of HIPS-PPO blends is intermediate between the behaviour of the separate polymers. The melt viscosity of a particular blend is a function of the MW of PPO and PS, the ratio of PPO to HIPS, the amount of rubber and the rubber particle size in the HIPS, and the amount of plasticizers or fillers [1]. The melting behaviour of one HIPS-PPO commercial blend has been studied in detail and rheological constants have been reported [44]. A plot of log (melt viscosity) against log (shear rate) at 250° shows the zero shear viscosity plateau region. The transition region between the zero shear viscosity and power law asymptotes is broader for PPO-HIPS than for amorph. polymers [44]. Viscosity 11400 kPa s (Tm). The intrinsic viscosity of a HIPS-PPO blend has been measured and is intermediate between the corresponding values for HIPS and PPO [48]. Equation constants have also been reported. [48]. Graphs of the shear viscosity and primary normal stress difference as a function of shear rate have been plotted for this blend at temps. in the range 200–300°. Steady state shear viscosity data was included for graphs at 260° [48]. The intrinsic viscosity of a HIPS-PPO blend has been measured and is intermediate between the corresponding values for HIPS and PPO [48]. Equation constants have also been reported. [48]. Graphs of the shear viscosity and primary normal stress difference as a function of shear rate have been plotted for this blend at temps. in the range 200–300°. Steady state shear viscosity data was included for graphs at 260° [48]

Permeability of Gases: The permeability and diffusivity of He, CH_4 and CO_2 in PS-PPO blends has been found to give concave - upward curves characteristic of a strongly interacting miscible blend. Ne shows more complex behaviour. [36] The transport props. of He, CH_4 and CO_2 in PS-PPO blends at 35° have been studied as a function of pressure and absorption isotherms produced. [37] The permeability of CO_2 in these blends decreases as the pressure increases. [37] The effect of mineral oil plasticizer on the sorption data has been studied [37].The separation factors for He-CH_4 and CO_2-CH_4 are larger than in the pure component polymer

Water Content: Polymer has lowest water absorption rate for engineering thermoplastics [13]

Water Absorption:

No.	Value	Note

8	0.07 %	equilibrium, 23°, foamable [1]

Mechanical Properties:

Mechanical Properties General: HIPS-PPO resins have good mechanical props. over a broad temp. range from -40°–105° [23]. The impact strength is high, which is retained at -40° [23]. HIPS-PPO resins have excellent creep resistance [23] and are tough, rigid materials [2]. Tensile strength and modulus of PPO and PS reach a maximum in a compostion containing 80% w/w PPO, but most props. of blends are close to the weighted average for the two polymers [13]. Blends with HIPS also have intermediate property values [13,17] but the impact strength is higher than either HIPS or PPO alone. [2] The effect of rubber particle concentration on the mechanical props. has been reported in the [45,46,47]. Other flexural modulus values have been reported [4]. The influence of composition, MW and MW distribution on the tensile modulus has been investigated. The tensile modulus decreases with increasing PPO composition.

The modulus at each blend composition is higher than that calculated using a simple rule of mixtures [47]. The effect of rubber particle concentration on the tensile elongation at break has been reported [45]

Tensile (Young's) Modulus:

2	36 MPa	10% deformation foamable, ASTM D695 [1]

Impact Strength: Optimum impact props. occur with an average rubber particle size of 2 μm or less, which is lower than the corresponding particle size for HIPS. [1,34]. The impact strength of PPO-PS blends decreases with increasing PS composition [3,4].The use of HIPS substantially increases the impact strength of the blends [3]. The Izod impact strength is a maximum at compositions near 50% w/w PPO [3]. Gardner impact 15–34 J (23°, ASTM D256) [1]; 28 J (35% rubber phase) [46]; 4–13 J (-40°) [1]; 5.7 J (26% rubber phase) [46]. Puncture impact strength (Dynatup test) 51 J (23°); 40 J (-40°, ASTM D3763) [1]. Falling ball impact 24 J (ASTM GE, foamable). [1] Graphs of the Izod impact strength have been reported [4,34]

Viscoelastic Behaviour: The loss modulus G-q has been measured as a function of frequency for a HIPS-PPO blend at various temps. from 193–300°. G-q decreases as the temp. increases [48]. The viscoelastic response of the blend at 260° is found to be intermediate to the HIPS and PPO values but closer to that of HIPS, the major component in the blend. Similar trends are observed for the storage modulus G-q and the relaxation-time spectra [48]. Plateau modulus G-q 60,000 Nm^{-2} (entanglement molecular weight Me 20.700) [48]. These values are intermediate between those of HIPS and PPO, as above [48]. The viscoelastic response of HIPS-PPO has been studied as a function of composition, frequency and temp. The relaxation processes of a blend exhibit the same temp. dependence but the viscoelastic response is a function of composition. The HIPS-PPO system therefore forms a rheologically compatible blend. Graphs of the loss modulus G-q and relaxation time τ_{12} are plotted as a function of weight fraction PPO and reduced frequency. Graphs of the storage modulus G-q as a function of reduced frequency and weight fraction of PPO have been reported [49]

Mechanical Properties Miscellaneous: Deformation under load 0.3% (13.8 MPa, 50°) [5]

Hardness: Rockwell R115–R119 (injection moulded) [1,23]. Rockwell R113 (extrusion) [1]. Rockwell L106–L109 (20–30% glass reinforced) [1,23]

Failure Properties General: Shear strength 72.4 MPa [5], 31 MPa (foamable, ASTM D732) [1].The fracture behaviour and morphology of HIPS-PPO polymer blends under monotonic and cyclic loading conditions has been studied [33]. The HIPS particles fail by particle fracture during both fatigue and fast fracture. When PE is used as an additive, this affects the failure mechanism [33]. The effect of rubber particle size and characteristic ratio (chain flexibility) on the toughening mechanism of HIPS-PPO blends has been reported [34]. Shear yielding is enhanced for small (0.2 μm diameter) rubber particles and relatively low characteristic ratio. Larger rubber particles (4.9 μm diameter) rarely induce shear yielding and instead crazing occurs resulting in crack formation [34]. In blends containing less than 50% PPO crazing is the dominant failure mechanism, whereas in blends containing more than 50% PPO shear yielding is dominant [1]. If the tensile strength of PPO-PS blend is plotted as a function of blend composition, two maxima in tensile or yield strength are noted at both high and low PPO compositions [3,7]. The transition from ductile to brittle modes of deformation depends on the blend composition [3,45]. These failure mechanisms have been widely reported [6,7,8,9,31,32,33,34,35]

Fracture Mechanical Properties: Flexural fatigue endurance limit 2–17 Mpa, (23° 2500 MHz); 27–32 MPa (20–30% w/w glass reinforced). Creep 0.75% (300h, 23°, 13.8 MPa) [1,5]. Creep 0.6–0.8% (300h, 13.8 MPa) [13]. Creep 0.275% (1000h, 23°, 3.4 MPa foamable) [1]. Creep curves showing the apparent modulus of HIPS-PPO resins at various temps., initial stress levels and times have been reported [23]

Friction Abrasion and Resistance: Taber abrasion resistance 20 mg (1000 cycles) $^{-1}$ CS-17, 20–30% glass reinforced, ASTM D1044). 35 mg (1000 cycles)$^{-1}$ (CS-17, 20–30% glass reinforced, ASTM D1044) [24]

Strong Field Phenomena General: High voltage arc tracking rate 22 cm min^{-1} (foamable) (UL746A) [1]. High ampere arc ignition 43 arcs (foamable) (UL746A) [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0004–0.0007	60 Hz	20°, ASTM D150 [23]
2	0.0004–0.003	60 Hz	23°, ASTM D150 [1]
3	0.0047	100 Hz	23°, foamable, ASTM D150 [1]
4	0.0008–0.002	60 Hz	20°, ASTM D150 glass reinforced [23]
5	0.0009–0.0024	1MHz	20°, ASTM D150 [23]
6	0.0039	1MHz	23°, foamable, ASTM D150 [1]
7	0.0014–0.0021	1MHz	20°, 20–30%, glass reinforced, ASTM D150 [23]

Optical Properties:

Optical Properties General: The optical props. of HIPS-PPO blends are not reported in the literature as these props. are not significant commercially. Light scattering from the rubber particles affects the refractive index and other optical props.

Transmission and Spectra: C-13 nmr spectral data have been obtained for HIPS-PPO blends. [38] Ir spectral data have also been used to determine the blend composition [22]. Other nmr spectral data have been reported [41].

Volume Properties/Surface Properties: Gloss 65.7% (35% rubber phase, rubber particle size 0.3 μm) [39]; 52.9% (26% rubber phase, rubber particle diameter 0.3μm) [39].

Polymer Stability:

Polymer Stability General: The stability of HIPS-PPO blends is expected to be intermediate between the stability of high-impact polystyrene and polyphenylene oxide, depending on the blend composition and processing conditions.

Upper Use Temperature:

No.	Value	Note
1	85–110°C	mechanical and electrical without impact, UL746B [1,23]
2	85–105°C	mechanical with impact, UL746B [1,23]
3	90–110°C	mechanical and electrical without impact, 20–30% glass reinforced [23]
4	90–105°C	mechanical with impact, 20–30% glass reinforced [23]

Flammability: HIPS-PPO are classified as slow burning materials and fire retardant additives may be used for self-extinguishing grades. [23] As the PPO component has inherent fire resistance, blends can be made flame retardant without the use of halogenated additives that tend to lower impact strength and melt stability in other polymers. [12] Flammability rating V0-V1 (UL94) [1,23]; SE1 (UL94) [23]; V0/5V (foamable, UL94) [1].

Environmental Stress: Prone to environmental stress cracking. [23] Prolonged outdoor exposure will cause parts made in standard grade to discolour, craze and lose props; can be protected by organic or metal coatings. [23]

Chemical Stability: HIPS-PPO resins have good resistance to some organic solvents, but are attacked by aromatic or chlorinated aliphatic compds. [13,23]

Hydrolytic Stability: HIPS-PPO resins are completely stable to hydrolysis. [13] Unaffected by aq. media including detergents, weak or strong acids and bases [5,23] and have good resistance to steam [4]

Stability Miscellaneous: Has good resistance to wear [23] and outstanding dimensional stability, particularly under stress at elevated temps. and in humid conditions. [23]

Applications/Commercial Products:

Processing & Manufacturing Routes: HIPS/PPO blends can be processed by injection moulding, foam moulding, blow moulding, extrusion and thermoforming. In Injection Moulding [1,12] conventional injection moulding machines are used. The melt temp. varies for different grades of product (blend composition) but approximates to the heat deflection temp. under load plus 127°. The melt temp. may also be affected by the length of melt flow, part configuration, mould temp. and other factors. The most commonly used melt temps. are in the range 77–95°. Temps. below 65° may cause edge cracking and excessive stresses in the moulded part. Typical clamping pressures are in the range 41–69 MPa. The low moisture absorption of HIPS/PPO blends means that for many applications, the pellets can be moulded without drying. For optimum surface appearance, the material must be dried for 2–4h at 100–120°. In foam moulding HIPS/PPO blends can occur via several different processes. HIPS/PPO blends are used in blow moulding [1,21] because of their high melt strength, excellent melt elasticity, and high blow ratio capacity. The blow moulding process requires different equipment than that used for blow moulding polyolefin-based resins. Pressures for shaping the

part are in the vicinity of 0.4 MPa and the melt temp. used is approximately 21–27° below that employed for injection moulding of similar blends. Blow moulding is useful for the production of large, low volume parts, since tooling costs are relatively low and complex designs can be incorporated in the parts. HIPS/PPO blends are used for extrusion because of their excellent melt strength, good melt stability and wide processing range. The extrusion melt temp. can be approximated by adding 82° to the heat deflection temp. under load of the resin being processed. Drying the resin improves surface appearance and prevents porosity, particularly in parts over 0.2cm thick. Drying temps. vary from 88° to 115° depending on the resin grade. Extruded shapes are cooled and shaped in water (minimum temp. 38°) or air. Using the latter minimises stresses and reduces warping. Most extruded HIPS/PPO blend sheet material is thermoformed into large, complex shapes with draw ratios in normal parts of 1:4. Deeper draw ratios are feasible, because of the excellent melt strength of HIPS/PPO blends. The heating temp. depends on the grade of material. Spray mist cooling is not recommended for thermoforming HIPS/PPO resins. A draft angle of 3° is commonly used, but this angle may have to be increased for very complex shapes. HIPS/PPO resin parts may be finished by common techniques such as painting, hot-stamping, sputtering or plating. Articles can be bonded by adhesives or ultrasonic welding. The precise details of how the HIPS and PPO polymers are blended are protected by patents [11,20]. The conditions used may be varied for different polymer blend compositions and when different additives are used. However HIPS/PPO polyblends are generally formed by a melt-blending process

Mould Shrinkage (%):

No.	Value	Note
0	5–7%	injection moulding [1,12]
1	0.0006–0.008%	foam moulding [1]

Applications: HIPS/PPO blends are used in many industrial applications such as in computer housings, television components (e.g. housings, deflection yoke parts, sockets, tuner strips, high voltage cups and connectors), keyboard frames, interface boxes and structural parts for telecommunication applications. Special HIPS/PPO composites are replacing metal in chassis or frames of electrical and electronic equipment because of the high stiffness and dimensional stability of these materials and the reduced weight of the product Foam-moulded HIPS/PPO blends are used for large housings and panels (air conditioner and business computers). They are also used for sound-deadening applications (office partitions) and for other large articles such as hospital and office furniture and storm doors. Blow moulded instrument panels permit functionalised assemblies, wire and cable management, integrated ductwork and structural ribbing. HIPS/PPO blends are used in automobile/automotive applications including instrument panels, interior trim, speaker grilles, consoles, glove compartments, exterior trim, cowl tops, wheel covers, headlight housings, mirror cases, electrical connectors and fuse boxes. These materials are used because their low specific gravity reduces the total vehicle weight without sacrificing the cost-performance ratio or the ease of processing. Large exterior automotive parts such as doors and fenders are being developed. HIPS/PPO blends are used for fluid handling applications because of their low water absorption props. and dimensional stability. These applications include pump housings, pump impellers, valves and pipes and other cold and warm water applications including shower heads and water sprinklers. HIPS/PPO resins are used in small and large home appliances. The excellent electrical props. of these materials permit functional parts to serve also as electrical insulators. Injection moulded HIPS/PPO may be used in small home appliances such as hair dryers, coffee makers and steam irons. HIPS/PPO materials may also be used in larger home appliances e.g. refrigerators and ranges, in control panels, door liners, handles, and freezer parts. Other applications of HIPS/PPO resins include electrical construction such as lighting, outlet boxes and smoke detectors and they are also used as electrical insulators in electrical connectors, wiring and cable covers, wiring ducts and protective devices. These blends are also used for electrical applications in automobiles as well as for domestic and industrial appliances. Speciality applications of HIPS/PPO materials include aircraft, material handling trays, recreational equipment, heat-resistant utensils and polymer electret films. The polymer film acts as an electret because its dielectric props. allow the film to have a stable charge.

Trade name	Details	Supplier
Laril	unfilled, fire-retardant and glass filled HIPS/PPO blends	Freeman
Luranyl	HIPS/PPO blends for injection moulding	BASF
Luranyl	HIPS/PPO blends (coatings for wires)	Hitachi Cable Co Ltd
Luranyl	HIPS/PPO automobile parts	General Electric Plastics
Luranyl	HIPS/PPO injection mouldings	Mitsubishi Rayon Co Ltd
Luranyl	HIPS/PPO compounds	Idemitsu Kosan Co Ltd
Noryl	family of HIPS/PPO blends with many different grades of material	General Electric
Noryl	HIPS/PPO blends	Asahi Chem. Industry Co.
Prevex	unfilled, fire-retardant and glass filled HIPS/PPO blends	Borg Warner
Thermocomp	various grades of HIPS/PPO blends unfilled, glass filled, glass bead filled, mineral filled and PTFE filled	LNP Engineering

High styrene resins H-4

Synonyms: *High styrene rubbers. Poly(styrene-butadiene). Poly(-ethenylbenzene-co-1,3-butadiene)*
Related Polymers: Styrene-butadiene copolymers, Styrene-butadiene rubber, K-resins
Monomers: Styrene, 1,3-Butadiene
Material class: Copolymers, Synthetic Elastomers
Polymer Type: polybutadiene, polystyrene
CAS Number:

CAS Reg. No.
9003-55-8

Additives: Vulcanised by sulfur
General Information: Around 51%–85% styrene to 49%–15% butadiene. Are white, essentially odourless, free-flowing powders or granular solids [1]. They are random copolymers of styrene and butadiene containing relatively higher levels (greater than 40%) of styrene compared with conventional SBR (approx. 23.5%) (see styrene-butadiene rubber). They are leather- like in behaviour and appearance for 50% styrene level but rigid thermoplastics at 70% styrene level [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.04 g/cm^3	commercial resins, 82.5 wt% styrene [1]

Melting Temperature:

No.	Value	Note
1	42–52°C	commercial resins, 82.5 wt% styrene [1]

Glass Transition Temperature:

No.	Value	Note
1	<50°C	max.

Transition Temperature General: Copolymers containing approx. 70% styrene have low softening points (behave like rigid thermoplastics) [2]

Mechanical Properties:

Mechanical Properties General: A high styrene content results in improved hardness, stiffness and abrasion resistance [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Usually prepared by emulsion polymerisation, using similar process to that used for SBR
Applications: Used as reinforcing agents, e.g. for rubbers (increase in hardness, stiffness and abrasion resistance); often blended with hydrocarbon rubbers such as NR or SBR. Have found applications in shoe soles and various mouldings (although in competition with both conventional thermoplastics and thermoplastic elastomers). Also used in tyres where increased hardness gives improved road grip

Trade name	Details	Supplier
Arlatex 43 DA	85 wt% styrene	Housemex
Pliolite S	various grades; non-exclusive; also used for other styrene, butadiene, and copolymer rubbers; 82.5 wt % styrene	Goodyear

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.149–1.205 g/cm^3	hydroxymethyl methacrylate-*co*-ethyl methacrylate, 25–67% hydroxyethyl methacrylate [1]
2	d 1.109–1.179 g/cm^3	hydroxymethyl methacrylate-*co*-butyl methacrylate, 31–69% hydroxymethyl methacrylate [1]
3	d 1.271–1.273 g/cm^3	hydroxymethyl methacrylate-*co*-butyl acrylate, 75–95% hydroxymethyl methacrylate [2]
4	d 1.274–1.275 g/cm^3	hydroxymethyl methacrylate-*co*-hydroxypropyl acrylate, 75–95% hydroxymethyl methacrylate [2]

Glass Transition Temperature:

No.	Value	Note
1	90–155°C	hydroxyethyl methacrylate-*co*-methacrylic acid, 10.1–90.1% methacrylic acid [3,5]
2	11–100°C	hydroxyethyl methacrylate-*co*-hydroxyethoxyethyl methacrylate [6]
3	98–145°C	hydroxypropyl methacrylate-*co*-methacrylic acid, 51.3–78.1% methacrylic acid [5]

Transition Temperature General: The presence of H_2O in the hydrogel results in a lowering of the T_g. The reduction in T_g is dependent on the amount of H_2O and the pH [3,4]. The plasticising action of some additives, *e.g.* PEG, also lowers T_g [3]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameters, δ, of (hydroxyethyl methacrylate-*co*-ethyl methacrylate) [1] 22.09 J$^{1/2}$ cm$^{-3/2}$ (25% hydroxyethyl methacrylate), 22.81 J$^{1/2}$ cm$^{-3/2}$ (45% hydroxyethyl methacrylate), 22.4 J$^{1/2}$ cm$^{-3/2}$ (58% hydroxyethyl methacrylate), 23.63 J$^{1/2}$ cm$^{-3/2}$ (56% hydroxyethyl methacrylate), 24.14 J$^{1/2}$ cm$^{-3/2}$ (67% hydroxyethyl methacrylate). Solubility parameters, δ (hydroxyethyl methacrylate-*co*-butyl methacrylate) [1] 21.74 J$^{1/2}$ cm$^{-3/2}$ (31% hydroxyethyl methacrylate), 21.27 J$^{1/2}$ cm$^{-3/2}$ (41% hydroxyethyl methacrylate), 22.61 J$^{1/2}$ cm$^{-3/2}$ (54% hydroxyethyl methacrylate), 22.81 J$^{1/2}$ cm$^{-3/2}$ (66% hydroxyethyl methacrylate), 23.63 J$^{1/2}$ cm$^{-3/2}$ (69% hydroxyethyl methacrylate)
Solvents/Non-solvents: (Hydroxyethyl methacrylate*co*-methyl methacrylate, 0.7-1 mol. fraction methyl methacrylate) [7]. Insol. H_2O, MeOH, EtOH, Me_2CO, $CHCl_3$, CCl_4, CH_2Cl_2, 2-butanone, THF
Wettability/Surface Energy and Interfacial Tension: Hamilton contact angle (hydroxyethyl methacrylate-*co*-methacrylic acid) 135–146° (25–75 mol % hydroxyethyl methacrylate), 131–140° (hydroxyethyl methacrylate-*co*-acrylic acid, 25–75 mol % hydroxyethyl methacrylate), 93–126° (hydroxyethyl methacrylate-*co*-styrene, 25–75 mol % hydroxyethyl methacrylate), 130–154° (hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone, 50–75 mol % hydroxyethyl methacrylate) [8]. Surface energy, γ, (hydroxyethyl methacrylate-*co*-methacrylic acid) [8] 52.6 mN m^{-2} (γ^p 15.9; γ^d 36.7) (75 mol % hydroxyethyl methacrylate), 55.4 mN m^{-2} (γ^p 20.1; γ^d 35.3) (50 mol % hydroxyethyl methacrylate), 56.4 mN m^{-2} (γ^p 21.5; γ^d 35.0) (25 mol % hydroxyethyl methacrylate); (hydroxyethyl methacrylate-*co*-acrylic acid) [8] 51.9 mN m^{-2} (γ^p 14.4; γ^d 37.5) (75 mol % hydroxyethyl methacrylate), 51.8 mN m^{-2} (γ^p 15.4; γ^d 36.4) (50 mol % hydroxyethyl methacrylate), 52.1 mN m^{-2} (γ^p 16.3; γ^d 35.8) (25 mol % hydroxyethyl methacrylate); (hydroxyethyl methacrylate-*co*-methylmethacrylate) [4] 49.4 mN m^{-2} (γ^p 12.7; γ^d 36.7) (75 mol % hydroxyethyl methacrylate), 49.2 mN m^{-2} (γ^p 7.9; γ^d 41.3) (50 mol % hydroxyethyl methacrylate), 46.9 mN m^{-2} (γ^p 6.9; γ^d 39.5) (25 mol % hydroxyethyl methacrylate); (hydroxyethyl methacrylate-*co*-styrene) [4] 50.5 mN m^{-2} (γ^p 18.8; γ^d 31.7) (90 mol % hydroxyethyl methacrylate), 47 mN m^{-2} (γ^p 14.9; γ^d 32.1) (50 mol % hydroxyethyl methacrylate), 45.1 mN m^{-2} (γ^p 12.3; γ^d 32.8) (30 mol % hydroxyethyl methacrylate), 42.6 mN m^{-2} (γ^p 7.3; γ^d 35.3) (10 mol % hydroxyethyl methacrylate); (hydroxypropyl methacrylate-*co*-methacrylic acid) [4] 48.5 mN m^{-2} (γ^p 13.8; γ^d 34.7) (50 mol % hydroxypropyl methacrylate); (hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone) [8] 45.5 mN m^{-2} (γ^p 6.2; γ^d 39.3) (90 mol % hydroxyethyl methacrylate), 43.4 mN m^{-2} (γ^p 3.4; γ^d 40.0) (70 mol % hydroxyethyl methacrylate), 43.9 mN m^{-2} (γ^p 4.1; γ^d 39.8) (50 mol % hydroxyethyl methacrylate); 46.5 mN m^{-2} (γ_p 9.5, γ_d 37.0) (hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone, dry, 95 mol% hydroxyethyl methacrylate); 43.9 mN m^{-2} (γ_p 4.1, γ_d 39.8) (hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone, dry, 50 mol% hydroxyethyl methacrylate)[8,13]; 43.8 mN m^{-2} (γ_p 8.8, γ_d 35.0) (hydroxyethyl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 60 mol% hydroxyethyl methacrylate); 46.3 mN m^{-2} (γ_p 15.6, γ_d 30.7 (hydroxyethyl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 95 mol% hydroxyethyl methacrylate) [13]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity (hydroxyethyl methacrylate-*co*-methacrylic acid) [5] 0.93–2.9 dl g^{-1} (36.8–76.5% methacrylic acid); (hydroxypropyl methacrylate-*co*-methacrylic acid) [5] 0.41–1.09 dl g^{-1} (51.3–78.1% methacrylic acid); (hydroxyethyl methacrylate-*co*-ethyl methacrylate) [1] 0.99–1.96 dl g^{-1} (25–67% hydroxyethyl methacrylate, M_n 151000–304000); (hydroxyethyl methacrylate-*co*-butyl methacrylate) [1] 1.25–1.5 dl g^{-1} (31–69% hydroxyethyl methacrylate, M_n 151000–900000). Theta temps. (hydroxyethyl methacrylate-*co*-ethyl methacrylate) [1]: 29.5° (DMF, 25 mol % hydroxyethyl methacrylate, M_n 151000); (hydroxyethyl methacrylate-*co*-butyl methacrylate) [1]: 29.5° (DMF, 31 mol % hydroxyethyl methacrylate, M_n 181000)
Permeability of Gases: The permeability of the copolymers to gases is dependent on the equilibrium H_2O content as well as the composition [8] The permeability coefficient of O_2 increases with increasing degree of hydration [12]
Water Content: The incorporation of carboxyl and nitrogen-containing monomers into hydroxyalkyl methacrylate copolymers gives hydrogels with equilibrium H_2O contents in the range 30–90% [8]. Thermal anal. of some copolymers suggests that there is both free and bound H_2O in (hydroxyethyl methacrylate-*co*-methacrylic acid) hydrogel. The water may be defined as 'freezing' or 'non-freezing', the former having a plasticising effect on the

polymer and the latter little effect [3,4]. Equilibrium water content (hydroxyethyl methacrylate-*co*-methyl methacrylate) [4] 12.3–32.5% (50–90 mol % hydroxyethyl methacrylate); (hydroxyethyl methacrylate-*co*-butyl acrylate) [2] 19.7–34.4% (75–95 mol % hydroxyethyl methacrylate, value dependent upon amount of cross-linking agent added); (hydroxyethyl methacrylate-*co*-hydroxypropyl acrylate) [2] 33.8–40.9% (75–95 mol % hydroxyethyl methacrylate, value dependent on amount of cross-linking yet added); (hydroxyethyl methacrylate-*co*-styrene) [4] 16.7–25.2% (80–90 mol % hydroxyethyl methacrylate); 40.4–85.4% (hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone, 30–95% hydroxyethyl methacrylate cross-linked) [9]; 64.3–38.7% (*N*-vinylpyrrolidone copolymer, 50–95% hydroxyethyl methacrylate) [13]; 41.3–70.5% (*N*,*N*-dimethylacrylamide copolymer, 95–60% hydroxyethyl methacrylate) [13]

Mechanical Properties:

Mechanical Properties General: The mechanical props. of the copolymers vary tremendously with both composition, degree of cross-linking and equilibrium H_2O content [8]. Tensile modulus of hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone 0.08–2.99 MN m^{-2} depending on amount of hydroxyethyl methacrylate and added cross-linking agent [9] Tensile modulus and tensile strength at break of hydrogels vary with copolymer composition [13]

Tensile (Young's) Modulus:

No.	Value	Note
1	0.22 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 90 mol % hydroxyethyl methacrylate
2	0.33 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 80 mol % hydroxyethyl methacrylate
3	0.33 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 70 mol % hydroxyethyl methacrylate
4	22.71 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 60 mol% hydroxyethyl methacrylate
5	64.14 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 50 mol% hydroxyethyl methacrylate-*co*-methyl methacrylate
6	0.37 MPa	hydroxyethyl methacrylate-*co*-styrene, 90 mol % hydroxyethyl methacrylate
7	2.44 MPa	hydroxyethyl methacrylate-*co*-styrene, 80 mol % hydroxyethyl methacrylate
8	0.2–0.76 MPa	hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone [13]
9	0.16–0.7 MPa	hydroxyethyl methacrylate-*co*-*N*,*N*-dimethylacrylamide [13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.35 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 90 mol % hydroxyethyl methacrylate	160%
2	0.8 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 80 mol % hydroxyethyl methacrylate	241%
3	0.92 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 70 mol % hydroxyethyl methacrylate	282%
4	13.17 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 60 mol % hydroxyethyl methacrylate	58%
5	13.3 MPa	hydroxyethyl methacrylate-*co*-methyl methacrylate, 50 mol % hydroxyethyl methacrylate [4]	21%
6	1.32 MPa	hydroxyethyl methacrylate-*co*-styrene, 90 mol % hydroxyethyl methacrylate	401%
7	7.84 MPa	hydroxyethyl methacrylate-*co*-styrene, 80 mol % hydroxyethyl methacrylate [4]	324%
8	0.2–0.5 MPa	hydroxyethyl methacrylate-*co*-*N*-vinylpyrrolidone [13]	74–198%
9	0.2–0.48 MPa	hydroxyethyl methacrylate-*co*-*N*,*N*-dimethylacrylamide [13]	101–186%

Optical Properties:

Optical Properties General: The refractive index of hydrated copolymers varies markedly with temp., decreasing with increasing temp. [4] Refractive index decreases with increasing degree of hydration [12]

Transmission and Spectra: Ir spectral data have been reported [1]

Polymer Stability:

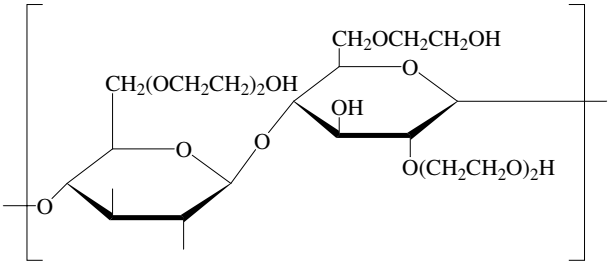
Decomposition Details: Decomposition temp. (for 60% weight loss) of hydroxyethyl methacrylate-*co*-methacrylic acid 402–407° (36.8–76.5% methacrylic acid) [5]. Decomposition temp. (hydroxypropyl methacrylate-*co*-methacrylic acid) 370–390° (51.3–78.1% methacrylic acid) [5]. Decomposition prod. monomers by an unzipping process. Cross-linking competes with the unzipping process and there is more cross-linking with increasing amounts of hydroxyethyl methacrylate [10]

Biological Stability: Poly(hydroxymethyl acrylate) hydrogels adsorb proteins more readily at higher temps. (20° and above) with the rate of adsorption increasing with increasing time. The incorporation of cross-linking agent (*e.g.*, ethylene glycol dimethacrylate) or styrene into the copolymer can have varying effects on the adsorption of proteins: the rate of fibrinogen absorption decreases as the level of cross-linking or amount of styrene increases whereas there is comparatively little effect on the adsorption of albumin [4]

Stability Miscellaneous: The MW of hydroxyethyl methacrylate/methyl methacrylate copolymers decreases with increasing dosage of irradiation [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Acrylic copolymers are synth. by radiation-induced bulk polymerisation [5]. The polypropylene graft copolymer is synth. at 50° in H_2O or aq. MeOH using benzoin ethyl ether as initiator [11]



Applications: Biomedical uses (transdermal drug delivery systems, contact lenses). Hydroxyethyl methacrylate/propylene graft copolymers have improved wettability and dyeing props. compared to polypropylene

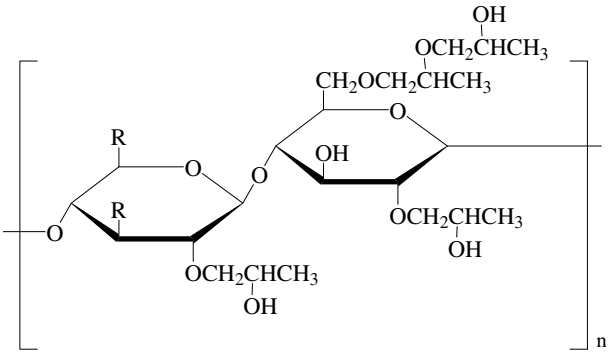
2	1.51	film [1]

Polymer Stability:

Environmental Stress: Non-toxic

Applications/Commercial Products:

Processing & Manufacturing Routes: Reaction of alkali cellulose with ethylene oxide in a stirred autoclave under pressure
Applications: Thickener for coatings and cements, binder for ceramics, stabiliser in foods and health care products



Trade name	Details	Supplier
Cellosize		Union Carbide Corporation
Natrosol	Biostable and pharmaceutical grades	Aqualon
Nexton	Blends of hydrophobically modified hydroxyethyl cellulose	Aqualon
Tylose H		Hoechst Celanese
		Fuji Chemical

Hydroxypropyl cellulose H-7

R = OH / OCH_2CHCH_3

Monomers: Base monomer unit glucose, Propylene oxide
Material class: Polysaccharides, Thermoplastic
Polymer Type: Lyotropic
CAS Number:

CAS Reg. No.
9004-64-2

Molecular Weight: MW 416000 (degree of substitution 4), MW 200000, MW 80000-1150000
General Information: Thermoplastic polymer, showing liq. cryst. props. at very high concentrations in soln.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[1,4]
2	d 1.17 g/cm^3	film [3]
3	d 1.088 g/cm^3	amorph., 24° [3]

Melting Temperature:

No.	Value	Note
1	235–245°C	[3]

Transition Temperature:

No.	Value	Note	Type
1	130°C	[1,4]	Softening temp.
2	100–150°C	[6]	Softening temp.
3	450–500°C	[1,4]	Burn out temp.
4	40–45°C	2% aq. soln. [1]	Cloud point

Surface Properties & Solubility:

Solubility Properties General: Specific gravity 1.01 (2% soln., 30°) [5]. Bulking value in soln. 0.334 l kg^{-1} [5]
Solvents/Non-solvents: Liq. cryst. sol. H_2O, MeOH, DMF [7,8,9]
Surface and Interfacial Properties General: Interfacial tension 12.5 mN m^{-2} (0.1% in H_2O vs refined mineral oil) [5]
Surface Tension:

No.	Value	Note
1	43.6 mN/m	0.1% soln. [5]

Transport Properties:

Polymer Solutions Dilute: Viscosity 1500–3000 cP (1500–3000 mPa s, 1%, Type H, MW 1150000), 150–700 cP (150–700 mPa s, 10%, Type E, MW 80000) (H_2O) [5], 1000–4000 cP (1000–4000 mPa s, 1%, Type H, MW 1150000), 150–700 cP (150–700 mPa s 10%, Type E, MW 80000) (EtOH) [5]
Water Content: Equilibrium moisture content 4% (23°, 50% relative humidity), 12% (23°, 84% relative humidity) [5]
Water Absorption:

No.	Value	Note
1	4 %	film, 23°, 50% relative humidity [1,4]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	9685 cm^3 mm/(m^2 day atm)	0.05 × 10^{-12} mol (m s Pa)$^{-1}$ [1,4]
2	N_2	1162 cm^3 mm/(m^2 day atm)	0.006 × 10^{-12} mol (m s Pa)$^{-1}$ [1,4]
3	CO_2	65857 cm^3 mm/(m^2 day atm)	0.34 × 10^{-12} mol (m s Pa)$^{-1}$ [1,4]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	430 MPa	[2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	13.8 MPa	[1,4]	50%
2	14 MPa	[2]	

Elastic Modulus:

No.	Value	Note
1	414 MPa	film [1,4]

Mechanical Properties Miscellaneous: Folding endurance flexibility 10000 (MIT Double folds (50 µm film)) [1,2]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	9.07	[2]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0706	[2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.337	2% aq. soln. [1,4,5]
2	1.559	film [1,4]
3	1.48	film [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Alkali cellulose is treated with a limiting quantity of propylene oxide in a stirred autoclave
Applications: Polymerisation control (PVC), binder for pharmaceutical tablets, thickener for paints, stabiliser for foods and ceramics

Trade name	Supplier
Klucel	Aqualon
Klucel	Hercules

Isotactic Polypropylene I-1

Synonyms: *PP-isotactic. Polypropene-isotactic. Poly(1-propene) isotactic*
Related Polymers: Polypropylene, Filled polypropylenes, Polypropylene copolymers, Polypropylene Blends, Polypropylene Films, Polypropylene Fibres
Monomers: Propylene
Material class: Thermoplastic
Polymer Type: polypropylene
CAS Number:

CAS Reg. No.
25085-53-4

Molecular Formula: $(C_3H_6)_n$
Fragments: C_3H_6
General Information: The most practically important form of polypropylene. Synth. using a Ziegler-Natta type catalyst, the most common now normally based on $TiCl_4$ supported by $MgCl_2$. Since commercial polypropylene is best described as 'mainly isotactic', cross references to normal variants are included here (in addition to general information). Data given here are known to be specific to isotactic polypropylene. For more general data where details are primarily for commercial, mainly isotactic polypropylene, but reference to other forms is also made.
Tacticity: Isotactic
Morphology: Morphological props. vary a little with MW distribution, and more so with draw temp. In general, as distribution broadens, birefringence may increase and amorph. orientation may increase (>165°), long period spacing decreases slightly; as draw temp. increases, crystalline fraction, crystalline orientation and especially long period spacing increase but birefringence and amorph. orientation decrease [5]
Miscellaneous: By the very nature of blends, great variation in props. occurs as a result of proportions of components, and the exact nature of components, method of mixing, as well as all the usual causes of variation. It follows that where props. are given, ranges may be very wide and not necessarily exhaustive

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.94 g/cm^3	calc.
2	d^{25} 0.939 g/cm^3	calc. [5]
3	d 0.932–0.943 g/cm^3	crystalline [1]
4	d^{25} 0.85 g/cm^3	amorph. [5]

Thermodynamic Properties General: Thermodynamic data including C_v, C_p, H_T^C-H_O^C, S_T^C, G_T^C-H_C^C have been reported [29]
Latent Heat Crystallization: ΔH_{fusion} 8.79 kJ mol^{-1} (209 kJ kg^{-1}) [1]. Entropy of polymerisation $\Delta S°$ 205 J K^{-1} mol^{-1} (25°, monomer gas phase, polymer crystalline/partly crystalline) [26]. $\Delta S°$ 116 J K^{-1} mol^{-1} (25°, monomer liquid phase, polymer condensed amorph. phase) [26,27]. $\Delta S°$ 136 J K^{-1} mol^{-1} (25°, monomer liquid phase, polymer 100% crystalline) [26,27,28]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.8–1.92 kJ/kg.C	[28]	P

Melting Temperature:

No.	Value	Note
1	186°C	crystalline, monoclinic [1]
2	165°C	[7]

Glass-Transition Temperature:

No.	Value	Note
1	-165°C	[9]

Transition Temperature General: T_g varies with increasing M_n if more than 10000 [10]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. hydrocarbons, halogenated hydrocarbons, higher aliphatic esters and ketones, diamyl ether (above 80°). Insol. all common organic solvents (room temp.), polar organic solvents, inorganic solvents [24]

Transport Properties:

Polymer Solutions Dilute: Calculations for dynamic viscosity have been reported [3]. Theta temp. 70° (amyl acetate) [10,11]; 183.2 (dibenzyl ether) [10,12]; 125.0° (biphenyl) [11,13,14]; 142–148° (diphenyl ether) [10,12,13,14]
Permeability and Diffusion General: Effects of ageing on transport props. of cryst. isotactic polymer have been reported [30], leading to a decrease in value of D
Gas Permeability:

No.	Gas	Value	Note
1	He	9849900 cm^3 mm/(m^2 day atm)	1.5 × 10^{-5} cm^2 (s cmHg)$^{-1}$ [3]
2	H_2	2626640 cm^3 mm/(m^2 day atm)	4 × 10^{-6} cm^2 (s cmHg)$^{-1}$ [3]

Mechanical Properties:

Mechanical Properties General: Mech. props. often determined on commercial polypropylene
Hardness: Microhardness 111 MN m^{-2} (α phase, crystallinity 0.721, MW 255000, 97% isotactic). Microhardness 90 MN m^{-2} (β phase, crystallinity 0.619, MW 255000, 97% isotactic) [5]

Optical Properties:

Transmission and Spectra: Ir absorption 790 cm^{-1} (amorph.), 809 cm^{-1} (crystalline) [1,2], 841–842 cm^{-1}
Molar Refraction: Concentration dependence of refractive index has been reported [16,17,18,19,20,21,22,23]

Polymer Stability:

Chemical Stability: Decomposed by sulfuric acid above 100° [7,8]

Applications/Commercial Products:

Jelutong J-1

Related Polymers: *cis*-1,4-Polyisoprene, Gutta-percha, Balata, Chicle
Monomers: 2-Methyl-1,3-butadiene
Material class: Gums and resins, Natural elastomers
Polymer Type: polybutadiene
Additives: Contains resin (75–80%) which is extractable with Me_2CO
General Information: Contains mainly *cis*-1,4-polyisoprene. Physical and chemical props. have been reported [1,2]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data of samples of *Achras* and *Dyera* spp. latex indicate presence of both *cis* and *trans* isomers [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Isol. from latex from *Dyera costulata*
Applications: Used in chewing gum

K-Resin K-1

Synonyms: *Styrene-butadiene polymer. Styrene-butadiene block copolymer*
Related Polymers: Styrene-butadiene block copolymers
Monomers: Styrene, 1,3-Butadiene
Material class: Thermoplastic
Polymer Type: polybutadiene, polystyrene
General Information: Composition generally 75% styrene: 25% butadiene

Applications/Commercial Products:

Trade name	Supplier
K Resin	Phillips 66

LARC-CPI L-1

Synonyms: *Langley Research Center Crystalline Polyimide. BTDA-1,3-BABB. Poly(3,3′,4,4′-benzophenonetetracarboxylic dianhydride-1,3-bis(4-aminophenoxy-4′-benzoyl)benzene. Poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)carbonyl(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,4-phenyleneoxy-1,4-phenylenecarbonyl-1,3-phenylenecarbonyl-1,4-phenyleneoxy-1,4-phenylene]. Poly(5,5′-carbonylbis[1,3-isobenzofurandione]-alt-1,3-phenylenebis[[4-(4-aminophenoxy)phenyl]methanone])*
Monomers: 5,5′-Carbonylbis[1,3-isobenzofurandione], 1,3-Phenylenebis[4-(4-aminophenoxy)phenyl]methanone
Material class: Thermoplastic
Polymer Type: polyimide
CAS Number:

CAS Reg. No.	Note
103320-42-9	
107194-52-5	source based

Molecular Formula: $(C_{49}H_{26}N_2O_9)_n$
Fragments: $C_{49}H_{26}N_2O_9$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.335 g/cm^3	amorph. [1,5]
2	d 1.507 g/cm^3	crystalline [5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.5×10^{-5}–0.000105 K^{-1}	150–300°, bulk [5]	L
2	0.000117 K^{-1}	25–275°, unit cell expansion a axis [1]	L
3	7.5×10^{-5} K^{-1}	25–275°, unit cell expansion b axis [1]	L
4	0.000192 K^{-1}	25–275° [1]	V
5	5.1×10^{-5}–0.000123 K^{-1}	150–300°, amorph. phase [5]	L
6	6.4×10^{-5} K^{-1}	25–275°, crystalline phase [1]	L

Latent Heat Crystallization: ΔH_f 92 J g^{-1}, 125 J g^{-1} (100% crystalline)
Melting Temperature:

No.	Value	Note
1	350°C	[1,2,3]

Glass-Transition Temperature:

No.	Value	Note
1	222°C	[1,2,3]

Surface Properties & Solubility:

Solvents/Non-solvents: Insol. *N*-methyl-2-pyrrolidone, *m*-cresol, $CHCl_3$, *N,N*-dimethylacetamide, ethylene glycol, jet fuel, tricresyl phosphate (hydraulic fluid) [2,3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3000 MPa	25°, 10 kg [1]
2	1450–3630 MPa	526–210 kpsi, 25–232°, ASTM D882 [2]
3	1650–2770 MPa	402–239 kpsi, 25–177°, ASTM D882, quenched film [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	32–137 MPa	20.1–4.6 kpsi, 25–232°, ASTM D882 [2]	6.5–75.1%
2	32–66 MPa	9.6–4.7 kpsi, 25–177°, ASTM D882, quenched film [3]	3.3–9.1%

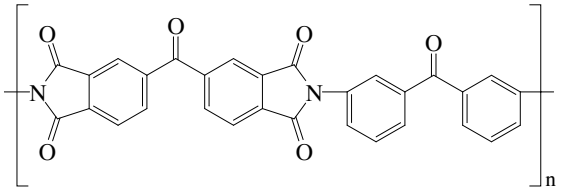
Tensile Strength Yield:

No.	Value	Note
1	21–84 MPa	12.2–3 kpsi, 25–232°, ASTM D882 [2]
2	24.1–28.3 MPa	3.5–4.1 kpsi, 25–177°, ASTM D882, quenched film [3]

Fracture Mechanical Properties: Critical strain energy release rate (G_{Ic}) 5.5 kJ m^{-2} (32.9 in lb in^{-2}), 6.6 kJ m^{-2} (37.8 in lb in^{-2}) (powder moulding samples, 2770 MPa (402 kpsi), ASTM E399) [2,3]

Polymer Stability:

Decomposition Details: Exhibits complex decomposition kinetics. 0.5% Weight loss occurs at 100° (H_2O), then main weight loss occurs at 425°, 5% weight loss at 530°. Residue at 750° 42% [5]. At 300° in air, 1.6% weight loss after 48h, then becomes dark and brittle after 240h (2.4% wt. loss), 5.9% weight loss after 500h [2]



Applications/Commercial Products:

Trade name	Supplier
LARC-CPI	Mitsui Toatsu Chemicals

Transition Temperature:

No.	Value	Note
1	125°C	Tβ Preheated to 350° [24]

Surface Properties & Solubility:

Solubility Properties General: May be blended with PMR-15 to form semi-interpenetrating networks which improve the fracture toughness of PMR-15 [9]. Forms blends with Xydar liq. cryst. polymer to improve processability [10] and with poly(2,2′-(*m*-phenylene)-5,5′-bibenzimidazole [15]
Cohesive Energy Density Solubility Parameters: δ 33.1 $J^{1/2}$ $cm^{-3/2}$ [11]
Solvents/Non-solvents: Insol. *N*-methylpyrrolidone, DMF, dimethylacetamide [9]. Sol. dimethylacetamide [15]

Transport Properties:

Polymer Solutions Dilute: $[\eta]_{inh}$ 0.16 dl g^{-1} (*m*-cresol, 35°, annealed) [13], 0.49 dl g^{-1} (*p*-chlorophenol/phenol (9:1), 35°, amorph.) [18,21], 0.83 dl g^{-1} (dimethylacetamide, 35°) [23], 0.39 dl g^{-1} (*m*-chlorophenol/phenol (95%: 5%), 25°) [25]. Inherent viscosity increases with increasing annealing time [13]. Zero shear viscosity 2000–100000 Pa s (350°) [12]
Gas Permeability:

No.	Gas	Value	Note
1	H_2	131.3 cm^3 mm/(m^2 day atm)	2×10^{-10} cm^2 (s cm Hg)$^{-1}$, 35° [4]
2	H_2O	20356 cm^3 mm/(m^2 day atm)	3.1×10^{-8} cm^2 (s cm Hg)$^{-1}$, 50°, 51 mm thick [11]
3	H_2O	23180 cm^3 mm/(m^2 day atm)	353×10^{-10} cm^2 (s cm Hg)$^{-1}$, 50° [26]
4	O_2	3024 cm^3 mm/(m^2 day atm)	75.6 cm^3 m^{-2} d^{-1} 0.0025 cm thick, room temp [17]
5	CO_2	11152 cm^3 mm/(m^2 day atm)	278.8 cm^3 m^{-2} d^{-1} 0.0025 cm thick, room temp [17]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3520 MPa	[14]
2	3516 MPa	film [19]
3	3450 MPa	Durimid film [20]
4	3723 MPa	540 ksi, 25°, film [22]
5	1476 MPa	214 kpsi, 246°, film [22]
6	3723 MPa	540 kpsi, air cured [23]

Flexural Modulus:

No.	Value	Note
1	4278 MPa	Durimid [20]

Tensile Strength Break:

No.	Value	Note	Elongation
1	114.5 MPa	[19]	
2	138 MPa	Durimid [20],	5%
3	136 MPa	19.7 kpsi, 25°, film [22,23]	

Flexural Strength at Break:

No.	Value	Note
1	158.6 MPa	[19]

Compressive Modulus:

No.	Value	Note
1	3588 MPa	Durimid [20]

Poisson's Ratio:

No.	Value	Note
1	0.36	Durimid [20]

Tensile Strength Yield:

No.	Value	Note
1	119 MPa	17.3 kpsi, 25°, film
2	16.5 MPa	2.4 kpsi, 246°, film [22]

Compressive Strength:

No.	Value	Note
1	236 MPa	Durimid [20]

Complex Moduli: Complex moduli decrease with increasing temp. [13]
Mechanical Properties Miscellaneous: Lap shear strength 12 MPa (titanium alloy, room temp., ASTM D100 amorph.) [18]. Lap shear strength at constant bonding pressure increases with increasing temp. [18]
Fracture Mechanical Properties: G_{Ic} 1800 J M^{-2} [9]. Has good toughness, with crazing apparent in a notched sample when stress is applied [14]. K_c 1.98 MPa $m^{1/2}$ (25 μm thick), 2.79 MPa $m^{1/2}$ (45 μm thick) [14]
Izod Notch:

No.	Value	Notch	Note
1	53 J/m	Y	Durimid [20]
2	770 J/m	N	Durimid [20]
3	200 J/m	N	LaRC-TPI [20]
4	21 J/m	Y	LaRC-TPI [20]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.4	1 kHz	Durimid film, ASTM D150-64T [20]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.003	1 kHz	Durimid film, ASTM D150-64T [20]

Optical Properties:

Transmission and Spectra: Charge-transfer emission [1] and ir [6,9] spectral data have been reported
Volume Properties/Surface Properties: Colour yellow (amorph.) [18]

Polymer Stability:

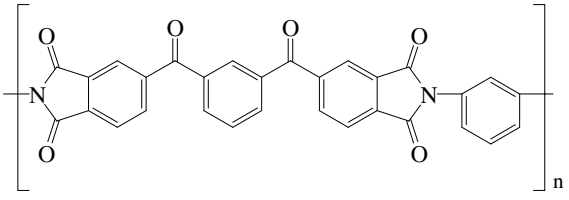
Thermal Stability General: Thermal stability in a N_2 atmosphere has been reported [5]. Oxidative ageing between 300 and 400° causes a colour change from bright yellow to dark brown, and embrittlement. Toughness decreases by 50% after 200 h at 340° [8]
Upper Use Temperature:

No.	Value	Note
1	300°C	[19]

Decomposition Details: Shows 10% weight loss after 600 h and 20% weight loss after 1000 h upon heating in air at 316°. [19] Durimid shows 10% weight loss in air above 550° [20]. Amorph. polymer shows 5% weight loss after 100 h at 350° [21]
Flammability: Flammability rating V0 (Durimid film, UL94) [20]
Chemical Stability: Stability of films to aq. alkali has been reported [3]. Durimid film is resistant to 2-propanol, 2-butanone, Freon TF and toluene [20]. Exposure of moulded Durimid resin to chemicals generally causes deterioration in mech. props. [20]
Stability Miscellaneous: Electron-beam irradiation causes little change in tensile strength or elongation at break. The shear modulus above T_g of LaRC-TPI 1500 increases with increasing radiation dose [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by reaction of 3,3′ 4,4′-benzophenonetetracarboxylic dianhydride with 3,3′-diaminobenzophenone in dimethylacetamide at room temp. The polyamic acid product is then imidised at 300° [17]
Applications: As an adhesive in high temp. environments; in insulating fibres; in composite matrices



Trade name	Details	Supplier
Durimid	100	Rogers Corporation
LaRC-TPI		Mitsui Toatsu Chemicals
LaRC-TPI-1500		Mitsui Toatsu Chemicals

LaRC-I-TPI L-3

Synonyms: *IDPA-mPDA. Poly(4,4′-isophthaloyldiphthalic anhydride-alt-m-phenylenediamine). Langley Research Center Isomeric Thermoplastic Polyimide. Poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,3-phenylene(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)carbonyl-1,3-phenylenecarbonyl]. Poly[5,5′-(1,3-phenylenedicarbonyl)bis-1,3-isobenzofurandione-alt-1,3-benzenediamine]*
Related Polymers: LaRC-TPI
Monomers: 5,5′-(1,3-Phenylenedicarbonyl)bis-1,3-isobenzofurandione, 1,3-Benzenediamine
Material class: Thermoplastic
Polymer Type: polyimide
CAS Number:

CAS Reg. No.	Note
115967-80-1	
115949-39-8	source based

Molecular Formula: $(C_{30}H_{14}N_2O_6)_n$
Fragments: $C_{30}H_{14}N_2O_6$
Additives: Graphite fibre to improve flexural strength
Morphology: Amorph. [4]
Miscellaneous: Calculation of bulk props. has been achieved via computational methods [6]

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	255°C	[1]
2	259°C	[2,4]
3	269°C	[3]

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. refluxing CH_2Cl_2, dimethylacetamide, *m*-cresol [4]

Transport Properties:
Polymer Melts: $[\eta]_{inh}$ 0.5–1.5 dl g^{-1} (*m*-cresol, 35°) [1], 0.45 dl g^{-1} (dimethylacetamide, 35°) [3], 0.47 dl g^{-1} (dimethylacetamide, 35°) [4], 0.52 dl g^{-1} (dimethylacetamide, 35°) [3]. Melt viscosity 2200 Pa s [1]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	3500–4140 MPa	[1]
2	3723.3 MPa	53 mm thick film [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	131 MPa	25° [4]	4.9%
2	58 MPa	200° [4]	13%

Elastic Modulus:

No.	Value	Note
1	1000 MPa	20° [1]
2	50 MPa	350° [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	96.53 MPa	4.9%	25° [4]
2	50.33 MPa	13%	200° [4]

Miscellaneous Moduli:

No.	Value	Note	Type
1	3723.3 MPa	25° [4]	Tan modulus
2	2620.1 MPa	200° [4]	Tan modulus

Mechanical Properties Miscellaneous: Lap shear strength 18.5 MPa (titanium, room temp., bonding strength, 2.07 MPa, ASTM D1002) [3], 33 MPa (titanium, room temp., 204° for 1000 h) [4]
Failure Properties General: Regarded as a creasable film, one that can withstand a 180° fold followed by a reverse 360° fold [2]
Fracture Mechanical Properties: K_{Ic} 3.8–3.9 mPa $m^{1/2}$ (ASTM E399, D5045) [1]; K_c 26.6 MPa cm (53 mm thick film) [4] ; G_{Ic} 3000–3800 J m^2 [1]. G_c 5.2 in-lb in^{-2} (53 mm thick film) [4]

Electrical Properties:
Electrical Properties General: Dielectric props. have been reported [5]

Polymer Stability:
Decomposition Details: Cured film shows max. weight loss of 3.1% after heating for 350 h at 300° [2]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by reaction of 4,4′-isophthaloyldiphthalic anhydride with *m*-phenylenediamine in dimethylacetamide [3], diglyme-dimethylacetamide, or *m*-cresol soln. Imidisation is achieved by heating at 200° for 2 h. Processability may be improved by blending with a bisnadimide [1]
Applications: Has adhesive props.

LDPE L-4

Synonyms: *Low-density polyethylene. PE-LD. High pressure polyethylene. Polyethylene. HPPE. Polythene*
Related Polymers: Polyethylene, Polyethylene films, Polyethylene fibres, Use of comonomers (inc. polar ones) in the high pressure process
Monomers: Ethylene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
Molecular Weight: 500–60000
Additives: Antioxidants (*e.g.* 2,6-di-*tert*-butyl-*p*-cresol (BHT); octadecyl 3,5-di-*tert*-butyl-4-hydroxyhydrocinnamate; tetrakis [methylene(3,5-di-*tert*-butyl-4-hydroxycinnamate)]methane), uv stabilisers (*e.g.* benzophenones), antiblock agents (*e.g.* diatomaceous silica particle size approx. 5–15 μm), slip agents (*e.g.* erucamide; oleamide; steramide), photooxidation inhibitor (carbon black approx. 10 μm particle size, approx. 2–3%)
General Information: Originally referred to homopolymers of density 0.915–0.94 g cm^{-3}. However, use of Ziegler-type catalysts in low pressure processes produces copolymers of density 0.900–0.964 g cm^{-3}, and use of these catalysts in the high pressure processes can achieve densities of 0.870–0.96 g cm^{-3}. The MW, MW distribution and frequency and distribution of long and short chain branching all affect the physical and mech. props.
Morphology: Unbranched PE is 70–90% crystalline with an orthorhombic unit cell; the presence of short chain branches [1] disrupts the chains from folding into the flat zig-zag formation reducing crystallinity to approx. 40–60%. Effects of long-chain branching have been reported [20]
Identification: Can be differentiated from LLDPE, by using DSC to fractionate and then measuring the melt peaks (typically four peaks for LDPE, seven for LLDPE). Temp. range of melt peaks is related to the comonomer [19]
Miscellaneous: Owing to the customisable nature of polyethylenes, and differences between manufacturing processes, data given here tend to be overall ranges. Specific manufacturer's grades will normally have closer tolerances - or, with certain processes, even be available outside the ranges quoted

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d^{25} 0.91–0.955 g/cm^3	[1,2,3,4]
2	d 0.916–0.93 g/cm^3	ASTM D1505 [1,2,3,4]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0001–0.00022 K^{-1}	ASTM D696 [1,4]	L

Volumetric Properties General: Data given here are restricted to more common polymers *e.g.* with melt index 0.2–150 or 100000–20000 Mpa s viscosity range. Greases, waxes, highly cross-linked and other speciality polymers are excluded unless specifically stated
Thermal Conductivity:

No.	Value	Note
1	0.34 W/mK	0.0008 cal (s cm °C)$^{-1}$, ASTM C177 [4]

Melting Temperature:

No.	Value	Note
1	80–115°C	[3,4]
2	105–115°C	45–55% cryst. [1,2]

Glass-Transition Temperature:

No.	Value	Note
1	<-40°C	max. [2]

Transition Temperature General: T_g related to T_β and T_γ [2,34]
Deflection Temperature:

No.	Value	Note
1	40–44°C	104–112°F, 0.455 MPa (66 psi), ASTM D648 [4]
2	40–50°C	0.455 MPa, ASTM D648 [2]

Vicat Softening Point:

No.	Value	Note
1	86–102°C	[11]

Brittleness Temperature:

No.	Value	Note
1	>76°C	min., 50% failure, ASTM D746 [1]

Transition Temperature:

No.	Value	Note	Type
1	20–80°C	molecular motion [2]	T_α
2	-30–-20°C	onset of branch point motion [2]	T_β
3	-125–-120°C	segmental motion [2]	T_g

Surface Properties & Solubility:

Solubility Properties General: Solubility increases with increasing melt flow index but decreases with increasing density and crystallinity [16]
Solvents/Non-solvents: Sol. above 50° hydrocarbons, chlorinated hydrocarbons [16], higher aliphatic esters and aliphatic ketones [17]. Insol. below 50° all common solvents

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.15–150 g/10 min	commercial LDPE excludes waxes, greases, cross-linked speciality polymers

Polymer Solutions Concentrated : Props. are affected by long-chain branching; molecules less extended than those of linear PE. Mark-Houwink equation parameters K 1.05 × 10^{-3}, a 0.63 (high MW); K 1.35 × 10^{-3}, a 0.63 (MW to 76000) have been reported [2]
Polymer Melts: Highly viscous; viscosity depends on MW, MW distribution (chain branching), shear rate and shear stress. Pseudoplastic; apparent viscosity decreases with increasing shear stress. At 200° melt viscosity falls two orders of magnitude for a four order of magnitude increase in shear rate. Under practical extrusion conditions viscosity of LDPE is much lower than that of LLDPE of the same melt flow index [2]. Effects of shear rate, etc. vs. viscosity have been reported [12,13,14,15]. Molten LDPE shows elastic props. *e.g.* die swell which increases with shear rate
Permeability of Gases: Other gas permeability values have been reported [5,9]
Water Content: 12–23 gm^{-2} (24h, 38°, 90% relative humidity, 25 μm) [4,11]
Water Absorption:

No.	Value	Note
1	<0.01 %	max., 24h, $\frac{1}{8}$ in thick, ASTM D570 [4]

Gas Permeability:

No.	Gas	Value	Note
1	H_2	647 cm^3 mm/(m^2 day atm)	7.4 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,6]
2	He	3294 cm^3 mm/(m^2 day atm)	3.7 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,7]
3	Ar	184 cm^3 mm/(m^2 day atm)	2.1 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,7]
4	Xe	350 cm^3 mm/(m^2 day atm)	4.01 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,6]
5	CO	96.3 cm^3 mm/(m^2 day atm)	1.1 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,7]
6	H_2	767 cm^3 mm/(m^2 day atm)	1950 cm^3 mil (100 in^2 day atm)$^{-1}$, 25° [4]
7	O_2	197 cm^3 mm/(m^2 day atm)	500 cm^3 mil (100 in^2 day atm)$^{-1}$, 25° [4,5,7]
8	Ne	42 cm^3 mm/(m^2 day atm)	4.8 × 10^{-14} cm^2 (s Pa)$^{-1}$, 25° [5,6]
9	CO_2	1063 cm^3 mm/(m^2 day atm)	2700 cm^3 mil (100 in^2 day atm)$^{-1}$, 25° [4]
10	N_2	70.8 cm^3 mm/(m^2 day atm)	180 cm^3 mil (100 in^2 day atm)$^{-1}$, 25° [5,7]
11	CH_4	192.6 cm^3 mm/(m^2 day atm)	2.2 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,7]
12	ethane	446 cm^3 mm/(m^2 day atm)	5.1 × 10^{-13} cm^2 (s Pa)$^{-1}$, 25° [5,7]
13	NH_3	1838 cm^3 mm/(m^2 day atm)	2.1 × 10^{-12} cm^2 (s Pa)$^{-1}$, 20° [5,8]
14	H_2O	5953 cm^3 mm/(m^2 day atm)	6.8 × 10^{-12} cm^2 (s Pa)$^{-1}$, 25° [5,10]

Mechanical Properties:

Mechanical Properties General: Data refer to typical commercial polymers with melt index 0.2–150 or viscosity range 100000–20000 Mpa s. Elongation, tear strength and tensile strength compared with LLDPE, have been reported [13]

Tensile (Young's) Modulus:

No.	Value	Note
1	100–300 MPa	25–41 kpsi, ASTM D638, ISO 527, DIN 53457 [4,11]

Flexural Modulus:

No.	Value	Note
1	240–330 MPa	35–38 kpsi, 23° (73°F), ASTM D790 [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	8.3–34 MPa	1200–4550 psi, ASTM D638, ISO 527, ISO 1184 [2,4,11]	100–800%

Elastic Modulus:

No.	Value	Note
1	120–330 MPa	ISO 537, DIN 53445 [11]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	6–15 MPa	100–800%	870–2200 psi, ASTM D638, ISO 1184 [2,4,11]

Impact Strength: Dart drop impact strength 50–300 g (25 μm)$^{-1}$ (38 μm thickness, ASTM D1709) [1,2,11] decreases as density and melt index increase
Hardness: Rockwell D41-D60 (ASTM D785) [1,2]. Shore D44–D54 (ASTM D2240, ISO 868, DIN 53505) [4,11]
Failure Properties General: Failure is ductile except at very low temp. Stress cracking, however, gives brittle failure. Resistance to stress cracking increases as density decreases, MW increases, MW distribution narrows and temp. increases

Electrical Properties:

Electrical Properties General: Outstanding electrical props. make LDPE the dielectric of choice for many applications including high voltage and high, very high and ultra high frequency. Carbon black can be added in sufficient quantity to produce a semiconducting composite
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.3	60 Hz	ASTM D150, IEC 250/VDE 0303 T4 [1,2,11]
2	2.2	1 kHz-1 GHz	ASTM D150 [4]

Dielectric Strength:

No.	Value	Note
1	196 kV.mm^{-1}	5000 V mil^{-1}, 1 mil thick [4]
2	118 kV.mm^{-1}	3000 V mil^{-1}, 5 mil thick [4]
3	17.7–39.4 kV.mm^{-1}	450–1000 V mil^{-1}, $^1/_8$ in thick [4]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0001–0.0003	ASTM D150 [4,11]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.51–1.52	25°, ASTM D542 [1,2]

Transmission and Spectra: C-13 nmr spectral data have been reported [26]
Volume Properties/Surface Properties: Haze 15% (max., ASTM D1003) [11]. Gloss 45–75 (45°, ASTM D2457); 10–100 (20°, DIN 67530) [11]

Polymer Stability:

Polymer Stability General: Generally stable but subject to photooxidation. Low environmental impact because of presence of carbon and hydrogen only
Thermal Stability General: Melts at 70–130°; above 225° fumes may be evolved, decomposition commences about 300° [11]. -2% Change in linear dimensions at 100° (30 min.) [4]
Upper Use Temperature:

No.	Value	Note
1	60°C	max. recommended storage temp. [11]
2	88°C	max. film use temp. [35]

Decomposition Details: Above 300° oxidative pyrolysis gives CO, H_2O and smaller amounts of hydrocarbons, acids and aldehydes [11,25]. Ignition of evolved gases accelerates pyrolysis. Depending on oxygen level, products may contain carbon (soot), CO_2, CO, acrolein, or other aldehydes [11,26]
Flammability: Self ignition temp. 350° (small scale, ASTM D1929-91A). Burning may be accompanied by release of flaming molten droplets. LDPE powder/dust constitutes a dust explosion hazard (Group (a) flammable dust) [11,27,29]
Environmental Stress: Stress in the presence of wetting agents, silicone oils, or polar substances may lead to environmental stress cracking. Resistance (ESCR) increases with decreasing density, decreasing melt flow index and increasing comonomer content [11]. Photooxidation occurs between 260-420 nm. Abiotic degradation may be enhanced by addition of starch and a pro-oxidant (SBS/manganese stearate) [36]
Chemical Stability: Non polar and predominantly inert. May be swollen by some organic solvents (*e.g.* hydrocarbon oils) [4,11]
Biological Stability: Biologically inert. Modification of biological/environmental degradation has been reported [21,30,31,32]
Recyclability: Recycling of sorted waste is no problem and produces high quality parts. Composites may be more problematic but can be suitable for incineration or feedstock recycling [22]
Stability Miscellaneous: Microwave irradiation causes limited cross-linking [37]

Applications/Commercial Products:

Processing & Manufacturing Routes: Polymerisation of ethene in stirred autoclave cylindrical chamber, at 207 MPa and 220–300°. Conversion per pass 22%. In a tubular reactor, at 202 MPa (pulsed periodically to approx. 150–180 MPa) and 300–325° (peak) or 250–275° (during partial cooling). Conversion per pass 35% [1,2]. Model for high pressure polymerisation has been reported [33]. May be blow moulded, injection moulded or rotationally moulded. Films are blown or extruded
Mould Shrinkage (%):

No.	Value	Note
1	1.5–5%	[4]

Applications: Used in household containers, closures, pharmaceutical products, wire and cable insulation (the material of choice for high frequency use), adhesives and sealants [23]. Sheet is blow moulded (for small volume containers - the high purity of LDPE makes it excellent for medical and pharmaceutical use), extrusion (usually cross-linked using peroxides, normally only used where high flexibility is required), compounding with other polyethylenes. Also used in production of EVA (accounts for 50% of PE production) and in blends

Trade name	Details	Supplier
Alcudia	also includes HDPE, MDPE	Repsol Quimica
Bralen	also used for EVA and other products	Slovnaft Joint Stock Company
Cabot PE	masterbatches and compounds in an LDPE carrier	Cabot Plastics Ltd.
Corthene		Royalite Plastics Ltd.
Empee	also HDPE, PP, PS (flame retardant)	Monmouth Plastics
Eucalene	also HDPE	Van Raaijen Kunststoffen
Finathene	also HDPE	Fina Chemicals (Division of Petrofina SA)
LDPE ***		Dow
Lacqtene	aslo HDPE, LLDPE, linear HDPE	Elf Atochem (UK) Ltd.
Lacqtene		Ashland
Lupolen	includes most types of PE as well as several other polymers	BASF
Luwax	wax, also includes those from HDPE, oxidised PE and ethylene copolymers	BASF
Marlex	also HDPE, MDPE, butene-ethene copolymer (inc. films)	Philips Petroleum International
Microthene	also includes a blend with vinyl acetate	Quantum Chemical
Mitsubishi	also HDPE, LLDPE (inc. films)	Mitsubishi Kasei
Novapol	also HDPE, LLDPE, linear MDPE and butene-ethene copolymer	Novacor

Novex	homo and copolymers	BP Chemicals
Novex		KD Thermoplastics
Okiten		Ina-Oki
PE ***	homo and copolymers also EVA, PVC and others	Chevron
PE-25	homo and copolymers, also EVA, PVC and others	Washington Penn
Petrothene	also LLDPE, HDPE, MDPE, EVA, PP, EPR	Quantum Chemical
Plastotrans	film	4P Folie Forchheim GmbH.
Polyethylene LD	others also available	Montell Polyolefins
Polyter	drinking water grade	Meridionale des Plastiques SA
Repsol	also HDPE and PP	Commercial Quimica Insular SA
Rexene	also includes EVA, iPP, EPR	Rexene Products
Riblene	also EVA and ethene-butene copolymer	Enichem
Riblene		Ashland
Sabic	also HDPE	NV Chemach SA
Sarmatene	LDPE based masterbatch	Sandoz Chemicals Ltd.
Stamylan	covers a range of olefin polymers	DSM
Stamylan		Macrodan A/S
Stamylan		Ashland Plastics
Statoil	includes HDPE, also iPP, ethene-propene copolymers and others	Northern Industrial Plastics Ltd.
Sumiplene	includes HDPE	Sumica SA
Suntec	includes HDPE also EVA	Asahi Chem. Co Ltd
Tipolen		Tiszai Vegyi Kombinát

LLDPE L-5

Synonyms: *Linear low-density polyethylene. PE-LLD*
Related Polymers: Polyethylene, Polyethylene film, HDPE, MDPE, ULDPE
Monomers: Ethylene, 1-Butene (co-monomer), 1-Hexene (co-monomer), 1-Octene (co-monomer), 4-Methyl-1-pentene (co-monomer), Cyclopentene (speciality co-monomer), Norbornene (speciality co-monomer)
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types
25087-34-7	1-butene co-monomer
25213-02-9	1-hexene co-monomer
26221-73-8	1-octene co-monomer
25213-96-1	4-methyl, 1-pentene co-monomers
60785-11-7	1-hexene, 1-butene co-monomers
74746-95-5	1-butene, 4-methyl-1-pentene co-monomers
32536-03-1	cyclopentene co-monomer
26007-43-2	norbornene co-monomer
72238-82-5	norbornene, 1-butene co-monomers
172501-09-6	norbornene, 1-decene co-monomers

Molecular Formula: $(C_2H_4)_n$
Molecular Weight: 50000–200000; M_w/M_n 2.5–4.5 (typical commodity grades); 10–35 (chromium oxide catalysed)

Additives: Antislip agents (e.g. erucamide), antiblock agents (e.g. talc), PPA, zinc oxide may be used. Antioxidant normally used
General Information: LLDPE designation is usually applied to ethylene copolymers in the density range 0.915–0.925 g cm^{-3}, with a co-monomer (normally butene, hexene or octene) content of approx. 2.5–3.5 mol%. For lower co-monomer content and for higher co-monomer content. As with LDPE, props. are affected by MW, MW distribution and frequency type, and distribution of branches (co-monomer). The structural regularity and narrow MW distribution achieved by the use of metallocene catalysts is having a major impact, a 'new' non-metallocene LLDPE has also been reported [16]
Morphology: Primarily CH_2CH_2 repeating units with occasional branches derived from a co-monomer such as 1-butene, 1-hexene, 1-octene, 4-methyl-1-pentene, or cyclopentene and norbornene. Normally these branches are short but soln. process, metallocene catalysed LLDPE may contain approx. 0.002 long branches per 100 ethylene units. Chain ends are normally methyl and either methyl (hydrogen as chain transfer agent), vinyl or vinylidene. The resulting chains crystallise principally in the orthorhombic form with cell parameters a 0.77 nm; b 0.5 nm; c (the direction of the polymer chain) 0.2534 nm - cf. Degree of crystallinity depends (primarily) on α-olefin content and is typically less than 45%. Spherulites, 1–5μm diameter, are formed from flat crystallites (lamellae) of folded chains, interconnected by chains passing from one to another and providing mech. strength. The remaining approx. 60% is amorph., giving flexibility. Short chains inhibit chain folding, decreasing lamella thickness and increasing the number of interlamellar tie molecules. High compositional uniformity gives poor crystallisation, very thin lamellae, and high flexibility. Non-uniformity gives more rigidity [1,2]
Identification: DSC can be used to fractionate sample and then measure melt peaks, the number of which (6 or 7 for LLDPE, 4 for LDPE) and temp. range is related to the co-monomer [28]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.9 g/cm^3	uniform [1]
2	d 0.912–0.915 g/cm^3	non-uniform, 4 mol % [1]
3	d 0.908–0.912 g/cm^3	uniform [1]
4	d 0.92–0.922 g/cm^3	non-uniform, 3 mol % [1]
5	d 0.918–0.92 g/cm^3	uniform [1]
6	d 0.927–0.93 g/cm^3	non-uniform, 2 mol % [1]

Volumetric Properties General: Density varies with α-olefin content and branching uniformity [1]
Melting Temperature:

No.	Value	Note
1	146–147°C	equilibrium, linear unbranched [5]
2	133–138°C	
3	100–120°C	commercial uniform LL (or mLL) DPE [1]
4	122–128°C	[1,4]

Transition Temperature General: T_m decreases with increasing branching [1]
Brittleness Temperature:

No.	Value	Note
1	-140–-100°C	[1]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. binary systems comprising carbon disulfide with xylene, cyclohexane, C_6H_6, toluene, CCl_4, THF, or $CHCl_3$, [7] at room temp.; aromatic, aliphatic and halogenated hydrocarbons at elevated temp. (80–100°C) [1,2]. Insol. all known single solvents at room temp. [1,2]. High branching content and low MW fractions sol. hexane (50°)

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	>25 g/10 min	min., cat. 1, ASTM D1248-84
2	10–25 g/10 min	cat. 2, ASTM D1248-84
3	1–10 g/10 min	cat. 3, ASTM D1248-84
4	0.4–1 g/10 min	cat. 4, ASTM D1248-84
5	<0.4 g/10 min	max., cat. 5, ASTM D1248-84 [1]
6	0.1–5 g/10 min	typical commercial [1,2]

Polymer Melts: Melt viscosity 5000–70000 Pa. s. [1] (Effect of MW and temp. described by Arrhenius equation [7]). Shear thinning occurs [8] - strongly MW distribution dependent. Metallocene catalysed LLDPE (narrow MW distribution) has nearly constant melt viscosity [9]. Non-uniform resins can reduce viscosity by approx.. 6-8 times at high processing speeds and resins from chromium oxide based catalysts (very broad MW distribution) by up to 100 times [1]. Processability of mLLDPE can be improved to that of LDPE [9,10,11]

Mechanical Properties:

Mechanical Properties General: Increasing α-olefin content reduces modulus, tensile strength and increases elongation at break. [1,2,13,14] Mech. props. improve with increasing chain length of the α-olefin for a given density and crystallinity. Increasing uniformity of branching increases elasticity and strain recovery and decreases tensile modulus. Increasing MW (including HMW fraction in broad MW distribution resins) improves mech. props. especially dart impact strength of films [1,2,14]. Effect of orientation has been reported [2,15]

Tensile (Young's) Modulus:

No.	Value	Note
1	75–500 MPa	[1,2,4]

Flexural Modulus:

No.	Value	Note
1	276–724 MPa	40–105 kpsi, 23° (73°F), ASTM D790 [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	10–30 MPa	ASTM D638, ISO 527 [1,2,4]	100–970%

Tensile Strength Yield:

No.	Value	Note
1	7–19 MPa	ASTM D638, ISO 527 [4]

Miscellaneous Moduli:

No.	Value	Note	Type
1	50 MPa	ISO 6721-2, mLLDPE, density 0.903 g. cm^{-3}	Torsional

Impact Strength: Dart drop impact strength (film) 65–1500g (ASTM D1709:ISO 7765-1); 65–350g (LLDPE non-uniform branching); 230–1500g (mLLDPE, uniform branching) [1]
Hardness: Shore D55-D56 (LLDPE ASTM D2240); D43 (93A, ISO 868 mLLDPE)
Fracture Mechanical Properties: Nature and extent of morphological changes under shear or crazing have been reported [27]
Friction Abrasion and Resistance: Coefficient of friction 1.1–1.3 (ISO 8295). Good abrasion resistance
Izod Notch:

No.	Value	Notch	Note
1	54 J/m	Y	1 ft lb in^{-1} [4]

Electrical Properties:

Electrical Properties General: Excellent electrical insulator with high resistance to the effects of temp. and mech. damage

Optical Properties:

Optical Properties General: Uniform branching distribution gives high transparency (haze $\geq$3%). Non-uniform branching distribution gives larger crystalline lamellae and hence more opacity (haze 10–15%) [1]
Volume Properties/Surface Properties: Haze 1.3–28% (mLLDPE); 6–14% (LLDPE, ASTM D1003, film). Gloss 35–97 units (45°, ASTM D2457, film). Clarity 33–95% (ASTM D1746, film)

Polymer Stability:

Polymer Stability General: Stability is generally high as expected for a saturated, branched hydrocarbon. Unstable to thermo-oxidation and photo-oxidation
Thermal Stability General: Thermal degradation onset 250°, thermo-oxidative degradation begins above 150° [1]
Upper Use Temperature:

No.	Value	Note
1	60°C	max. recommended storage temp.

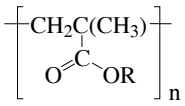
Decomposition Details: At 250°C MW reduction, double bond formation; 450° pyrolysis to isoalkanes and olefins (absence of oxygen). At 150° thermo-oxidation commences with production of hydroxyl and carboxyl groups; above 300° oxidative pyrolysis gives CO, water, hydrocarbons, acids, aldehydes, ketones and alcohols. [1,5] Product toxicity depends on temp., heating rate and sample size [1,22,23,24,25]
Flammability: Self-ignition temp. 350°, (ASTM D1929-91A). At lower temps. decomposition products may ignite, accelerating the process and releasing flaming molten droplets. Resulting smoke contains CO, acrolein and other aldehydes. [18,19] Dust explosion hazard [19,20]
Chemical Stability: Most reactive sites are tertiary CH bonds and chain-end double bonds. Forms sulfo-compounds in 70% H_2SO_4 (elevated temp.), can be nitrated with conc. HNO_3. Stable to alkaline and salt solns. [1]
Biological Stability: Food use grades readily available
Recyclability: Recycled LLDPE can be compatibilised with virgin LLDPE by solid state shear extrusion pulverisation [26]

Applications/Commercial Products:

Processing & Manufacturing Routes: Three catalyst classes used in manufacture [1,2]. Titanium-based (Ziegler) catalysts have the market share, comprising a Ti/organoaluminium/$MgCl_2$ mixture. Used heterogeneously, at 2–0.2% and 70–100°. MW is controlled by hydrogen transfer, diversity of active sites gives broad MW distribution. [10,29,30,31,32,33,34,35,36] Metallocene catalysts include Kaminsky methylaluminoxane Zr metallocenes [30,37,38,39,40,41,42], used at 1–0.1% and give narrow MW distribution. Especially used for speciality resins. [43,44] Exposure to hydrogen leads to large MW reduction. Metallocenes may also be used in combination with perfluorinated aromatic boron compounds, but are highly susceptible to poisoning. [45,46] Constrained geometry (Dow) catalysts are known, where aluminoxanes are used with a monocyclopentadienyl Ti or Zr complex [47,48,49,84]. Produces a highly uniform composition, though long-chain branching can occur. [9] Chromium oxide (Phillips) [50] catalysis produces a broad MW distribution, using allyl boron or aluminium co catalyst. Processes include gas phase [56,57] (economic and flexible), heavy solvent [44,58] (metallocene catalysis), high pressure polymer melt and slurry (oldest) process. [50,82,83] Polymer may be blow moulded [61,65,66,81], rotationally moulded, injection moulded [61,63,65] or extruded [61,65,69] or processed by most other techniques [61,62,63,64,65,88]
Mould Shrinkage (%):

No.	Value	Note
1	2–2.2%	[4]

Applications: Major use (50% of all LLDPE) is for production of film - as a single material/layer, as a blend or as a co-extrusion. LLDPE film can be produced at high rates (because of low strain hardening, low extensional viscosity). LLDPE is tending to replace vinyl acetate and EVA films, especially mLLDPE because of its high clarity and good oxygen barrier prop. - especially important for food and medical use. Appreciable quantities of LLDPE (especially compositionally uniform) are used in to upgrade the mech. props. of largest application (10% of consumption) is injection moulding especially housewares and industrial containers (replacing EVA). Compositionally uniform LLDPE is used for flexible lids, flexible parts for small appliances, disposable oxygen masks. Blow moulded and rotationally moulded articles - for which the ESCR of LLDPE is superior to that of Pipe/tube accounts for approx. 1% LLDPE use where the high flexibility, high burst strength, high ESCR and high heat distortion temp. are superior. Compositionally uniform LLDPE is replacing PVC in medical tubing. LLDPE (espexially mLLDPE) is used for wire and cable insulation



Trade name	Details	Supplier
Alidathene	blended linear PE	Alida Packaging
Dowlex	large MW distribution	Dow
Elite	metallocene catalysed	Dow

Long-chain Poly(alkyl methacrylates) L-6

Synonyms: *Poly(alkyl 2-methyl-2-propenoate). Poly(dodecyl methacrylate). Poly(tetradecyl methacrylate). Poly(hexadecyl methacrylate). Poly(octadecyl methacrylate). Poly(lauryl methacrylate). Poly(myristyl methacrylate). Poly(cetyl methacrylate). Poly(stearyl methacrylate). Poly(palmityl methacrylate). Poly(3,5,5-trimethylhexyl methacrylate). Poly(isodecyl methacrylate). Poly(tridecyl methacrylate). Poly(docosyl methacrylate)*
Related Polymers: Polymethacrylates General
Monomers: 3,5,5-Trimethylhexyl methacrylate, 1-Methylnonyl methacrylate, Dodecyl methacrylate, Tridecyl methacrylate, Tetradecyl methacrylate, Hexadecyl methacrylate, Octadecyl methacrylate, Docosyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
29320-53-4	(decyl)
25719-52-2	(docecyl)
30525-99-6	(tetradecyl)
25986-80-5	(hexadecyl)
25639-21-8	(octadecyl)
116697-32-6	(octadecyl, isotactic)
27252-90-0	(docosyl)

Molecular Formula: $(C_{13}H_{24}O_2)_n$
Morphology: Hexagonal a 4.73, b 4.73, c 30.2, 1 monomer per unit cell (octadecyl, syndiotactic) [1]
Identification: Contains only C, H and O

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.929 g/cm^3	dodecyl [2]
2	d 0.97 g/cm^3	octadecyl [3]

Equation of State: Mark-Houwink constants for the decyl, dodecyl, tridecyl, hexadecyl, octadecyl and docosyl polymers have been reported [16,19,21]
Melting Temperature:

No.	Value	Note
1	-34°C	dodecyl [2,6]
2	-2°C	tetradecyl, side-chain crystallisation [6]
3	22°C	hexadecyl, side-chain crystallisation; bulk polymerisation [7]
4	37.5°C	octadecyl, uv polymerisation [4]
5	36°C	octadecyl [2]
6	34°C	octadecyl, side-chain crystallisation [6]

Glass-Transition Temperature:

No.	Value	Note
1	1°C	trimethylhexyl [8]
2	-70°C	decyl [9]
3	-60°C	decyl [10]
4	-44°C	decyl [10]
5	-41°C	decyl [11]
6	-55°C	dodecyl, bulk polymerisation [7,12]
7	-65°C	dodecyl, uv polymerisation [4]
8	-43°C	dodecyl [8]
9	-43°C	tridecyl [10]
10	-46°C	tridecyl [11]
11	-72°C	tetradecyl, bulk polymerisation [7]
12	-9°C	tetradecyl, birefringent below T_m [5]
13	15°C	hexadecyl [13]
14	-100°C	octadecyl [6,10]

Transition Temperature General: No transitions above -55°, decyl [5]. No T_g for bulk polymerised poly(hexadecyl methacrylate) [7]
Vicat Softening Point:

No.	Value	Note
1	38°C	octadecyl, crystalline melting point [3]

Brittleness Temperature:

No.	Value	Note
1	-30°C	decyl, refractometric method [5]
2	-5°C	tetradecyl, refractometric method [5]
3	36°C	octadecyl [2]

Surface Properties & Solubility:

Solubility Properties General: The phase behaviour of the dodecyl system has been reported [15]
Cohesive Energy Density Solubility Parameters: Cohesive energy 77500 J mol^{-1} (dodecyl) [12]. Solubility parameters δ 16.8 J$^{1/2}$ cm$^{3/2}$ (8.2 cal$^{1/2}$ cm$^{3/2}$, dodecyl), δ 16 J$^{1/2}$ cm$^{3/2}$ (7.8 cal$^{1/2}$ cm$^{3/2}$, octadecyl) [15]
Solvents/Non-solvents: Sol. butanol; CCl_4, 2-butanone (octyl); cyclohexane, propylacetate (stearyl); EtOAc, THF (tridecyl); C_6H_6 (octyl, cetyl), amyl acetate, isooctane (decyl), *n*-pentanol (>29°, isopropyl acetate (dodecyl) [16,20]. Insol. MeOH (dodecyl), EtOAc (dodecyl) [16]
Wettability/Surface Energy and Interfacial Tension: Contact angle 75° (decyl, advancing, H_2O); 89° (decyl, advancing, H_2O); 77° (tridecyl, advancing, H_2O); 84° (octadecyl, advancing, H_2O) [10]. Surface tension 32.8 mN m^{-1} (dodecyl, 20°) [17]; 36.3 mN m^{-1} (octadecyl, 20°) [17]. Critical surface tension 33 mN m^{-1} (33 dyne cm^{-1}, decyl) [18]

Transport Properties:

Polymer Solutions Dilute: Molar volumes at 25° 168.6 cm^3 mol^{-1} (dodecyl, amorph., van der Waal's), 273.8 cm^3 mol^{-1} (dodecyl, amorph., rubbery polymer) [2]. Intrinsic viscosity [19] 1.05 dl g^{-1} (30°, MW 923000, THF, decyl), EtOAc 320 dl g^{-1} (11°, EtOAc, decyl, MW 923000), 1.1 dl g^{-1} (30°, THF, MW 1380000, tridecyl), 0.37 dl g^{-1} (27°, EtOAc, MW 1380000, tridecyl), 0.94 dl g^{-1} (30°, THF, MW 934000, octadecyl), 0.36 dl g^{-1} (36°, propyl acetate, MW 934000, octadecyl), 0.86 dl g^{-1} (30°, THF, MW 1350000,

docosyl), 0.47 dl g^{-1} (31°, amyl acetate, MW 1350000, docosyl). Intrinsic viscosity parameters 0.000357 (g $MW)^{1/2}$, decyl) [19]; 0.032–0.035 $cm^{3/2}$ $mol^{1/2}$ $g^{-1/2}$ (dodecyl) [2,25,27]; 0.0332 (tridecyl) [19]; 0.048–0.075 (hexadecyl) [2,25,27]. Second virial coefficients for the decyl [19], dodecyl [28], tridecyl [19], hexadecyl [28], octadecyl [19] and docosyl [19] polymers have been reported. Theta temps. 11° (EtOAc, decyl); 9.6° (*n*-pentanol, decyl) [19,22]; 29.5° (*n*-amyl alcohol, dodecyl, MW 270000–2400000); 13° (isopropyl acetate, dodecyl, MW 260000–3600000); 29.5° (pentanol, dodecyl, MW 270000–2400000) [23,24,25]; 27° (EtOAc, tridecyl) [19]; 21° (*n*-heptane, hexadecyl) [25]; 10.5° (*n*-butyl acetate, octadecyl) [19,26]; 36° (*n*-propyl acetate, octadecyl)
Permeability of Liquids: Diffusion coefficient [H_2O] 120.4 × 10^{-8} cm^2 s^{-1} (decyl, 37°); 160.8 × 10^{-8} cm^2 s^{-1} (decyl, 37°); 771.1 × 10^{-8} cm^2 s^{-1} (tridecyl, 37°); 529.9 × 10^{-8} cm^2 s^{-1} (octadecyl, 37°) [10]. The diffusion coefficient of hexadecyl polymer in heptane has been reported [28]
Water Absorption:

No.	Value	Note
1	<4.1 %	max., decyl
2	<6.4 %	max., decyl
3	<5.6 %	max., tridecyl [10]

Mechanical Properties:
Viscoelastic Behaviour: Williams-Landel-Ferry constants for temp. superposition of dodecyl polymer have been reported [29].

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.474	30°, dodecyl, bulk polymerisation [2,7]
2	1.4746	30°, tetradecyl bulk polymerisation [7]
3	1.475	30°, hexadecyl, bulk polymerisation [7]

Total Internal Reflection: Intrinsic segmental anisotropy -160 × 10^{-25} cm^3 (hexadecyl, C_6H_6) [30]

Polymer Stability:
Polymer Stability General: The thermal stability of the decyl polymer can be increased by the incorporation of styrene, α-methyl styrene, indene, tetradecene or dicyclopentadiene units [31]

Applications/Commercial Products:

Trade name	Details	Supplier
Standard samples	Dodecyl, octadecyl	Aldrich
Standard samples	Dodecyl	Polysciences Inc
Standard samples	Dodecyl, octadecyl	Scientific Polymer Products Inc.

Low *cis*-1,4-polybutadiene L-7

Synonyms: *Low cis-1,4-poly(1,3-butadiene). Butadiene rubber. BR*
Related Polymers: Polybutadiene, *cis*-1,4-Polybutadiene, 1,2-Polybutadiene
Monomers: 1,3-Butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-17-2

Molecular Formula: $(C_4H_6)_n$
Fragments: C_4H_6
Molecular Weight: MW 10000-840000, 110000
Additives: Reinforced carbon black
General Information: Contains less than 1,4-*cis* isomer. Exhibits high resilience and low hysteresis

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.89 g/cm^3	40% 1,4-*cis*, 33% 1,4-*trans*, 27% 1,2 [1]
2	d 0.895 g/cm^3	44% 1,4-*cis*, 42% 1,4-*trans*, 14% 1,2 [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00075 K^{-1}	43% 1,4-*cis*, 50% 1,4-*trans*, 7% 1,2 [2]	V

Surface Properties & Solubility:
Solubility Properties General: Miscibility with other rubbers has been reported [32]

Solvents/Non-solvents: Sol. hydrocarbons, THF, higher ketones, higher aliphatic esters. Insol. alcohol, lower ketones and esters, nitromethane, propionitrile, H_2O [3,4,5]. Theta solvents dioxane 26.5° (36% 1,4-*cis*, 57% 1,4-*trans*, 7% 1,2) [6]

Transport Properties:

Polymer Solutions Dilute: Williams-Landel-Ferry equation parameters have been reported [18]. Unperturbed dimensions have been reported [8,9,10,11,12,13,14,15,16,17]. [η] 1.32 (toluene, 25°, 46% 1,4-*cis*, 47% 1,4-*trans*, 8% 1,2, MW 110000) [23]. Other viscosity values have been reported for a range of compositions [37]. [η] 1.26-6.51 (toluene, 25°, MW 10000–84000, 40–44% 1,4-*cis*, 31–44% 1,4-*trans*, 9–29% 1,2) [22]

Mechanical Properties:

Mechanical Properties General: A range of mech. props. data for low *cis* mixtures has been reported [11,24,27,28,31,33,] including storage moduli and loss moduli. Mech. props. related to use in tyres has been reported [29,30]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [7]

Polymer Stability:

Polymer Stability General: Oxidative degradation of polybutadiene leads to cross-linking and to hardening of vulcanisates [36]
Decomposition Details: With increasing *trans* content, 1,4-polybutadiene yields much less 4-vinyl-1-cyclohexene dimer, much more cyclopentene, less 1,3-butadiene and more 1,3-cyclohexadiene in the first 15% of weight loss by pyrolysis [25]. Thermal degradation analysis has been reported [38,39,40]
Flammability: Classed as high-volatile-loss, low-char polymers [34]
Biological Stability: 40% Assimilated by *Moraxella* strain isol. from soil (MW 2350). No assimilation at greater MW [26]
Stability Miscellaneous: High energy radiation increases radical concentration linearly with radiation up to 100 Mrad. Unsaturation decreases markedly. *Cis-trans* isomerisation occurs. Some double bonds are formed. The yield of cross-linking is higher for *cis*-1,4 than for *trans*-1,4 but lower than for 1,2. Stress-strain props. of radiation cross-linked polybutadiene have been reported [35]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by anionic polymerisation using lithium initiators. Polar additives increase 1,2 content
Applications: Used in tyres and as toughening agents for polystyrene

MDPE

M-1

Synonyms: *Medium-density polyethylene. PE-MD*
Related Polymers: Polyethylenes, LLDPE, HDPE
Monomers: Ethylene, 1-Butene, 1-Hexene, 1-Octene
Material class: Thermoplastic
Polymer Type: polyethylene, polyolefins
CAS Number:

CAS Reg. No.	Note
9002-88-4	all density types
25087-34-7	1-butene comonomer
25213-02-9	1-hexene comonomer
26221-73-8	1-octene comonomer
60785-11-7	1-hexene 1-butene comonomer

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
General Information: MDPE designation is applied to ethylene polymers containing sufficient comonomer to give a density range of 0.925–0.94 g cm^{-3}. Typical comonomer content is 1–2 mol%. MDPE can be produced by the low pressure process [1] or a modified high pressure process. [2] Props are generally intermediate between those of HDPE and LLDPE, as is the struct.
Morphology: Structural unit consists of polymer backbone interspersed with short branched systems of comonomer. Contains less branched portions than for LLDPE. Due to the customisable nature of polyethylenes and differences in manuf. process, props highly variable.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.925–0.94 g/cm^3	[1,3,4]

Thermal Conductivity:

No.	Value	Note
1	0.35 W/mK	[4]

Melamine formaldehyde resins M-2

Synonyms: *Melamine resins. Melamines*
Related Polymers: Melamine Resins, Wood applications, Urea resins, Wood applications
Monomers: Melamine, Formaldehyde, Paraformaldehyde
Material class: Thermosetting resin
Polymer Type: melamine formaldehyde
Miscellaneous: Melamine is a reactive hexa-functional monomer which readily forms hexa-methylol derivs. This intermediate crosslinks forming methylene ether bridges. Melamine can also be co-condensed with urea to form a range of melamine urea formaldehyde (MUF) resins

Applications/Commercial Products:

Processing & Manufacturing Routes: Melamine-formaldehyde resins are made by the condensation reaction of melamine with formaldehyde, generally 37% aq. soln. The condensation generally proceeds with basic catalyst and a molar excess of formaldehyde. The resins are used in soln. generally aq., but may also be used if alcoholic solvents added. They cure by application of heat or acid. Melamine is co-condensed with urea to form a range of melamine urea formaldehyde resins
Applications: Melamine formaldehyde resins have various applications. See the relevant cross references for further details

Electrical Properties:

Dielectric Strength:

No.	Value	Note
1	0.03–0.083 kV.mm^{-1}	60 Hz, ASTM D149 [1]
2	0.036–0.05 kV.mm^{-1}	1 kHz, ASTM D149 [1]

Arc Resistance:

No.	Value	Note
1	125–136s	ASTM D495 [1]

Polymer Stability:

Upper Use Temperature:

No.	Value
1	99°C

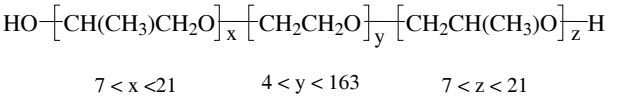
Flammability: Flammability rating V0 (UL 94) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Melamine moulding materials are made from colourless thermosetting resin with cellulose fillers, pigments, catalyst amd other additives. For the compression moulding process preheating of the resin powder pellets or granules is required. Injection moulding grades are preheated efficiently both by the injection machine and by the frictional heat generated as the material flows through the sprue, runner or gate. Resin-impregnated paper foils are used as decorative finishes for melamine items. The process involves partial cure of the moulding, opening the press, inserting a specially made foil and continuing the moulding cycle. Decoration is also achieved by applying special glaze resin to the moulding, by painting, printing or vacuum metallising methods

Mould Shrinkage (%):

No.	Value	Note
1	0.58–0.65%	compression moulding grades
2	0.75%	injection moulding grades



Applications: Melamine materials give mouldings with a superior surface performance to urea-formaldehyde materials. The low formaldehyde emission and excellent stain resistance props. make them suitable for tableware and kitchenware. The heat resistance of melamine materials enables their use as ashtrays. Injection moulded melamine is used where surface appearance is important and especially for electrical accessories

5	76–90°C	80–60% ethyl methacrylate, ethyl methacrylate-*co*-acrylamide [3]

Transition Temperature General: T_g is dependent upon the composition of the copolymer, generally increasing with decreasing content of the methacrylate component

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ (ethyl methacrylate-*co*-acrylamide) [3]: 18.62 $J^{1/2}$ $cm^{-3/2}$ (9.1 $cal^{1/2}$ $cm^{-3/2}$) (THF), 19.01 $J^{1/2}$ $cm^{-3/2}$ (9.3 $cal^{1/2}$ $cm^{-3/2}$) ($CHCl_3$), 19.84 $J^{1/2}$ $cm^{-3/2}$ (9.7 $cal^{1/2}$ $cm^{-3/2}$) (CH_2Cl_2), 20.67 $J^{1/2}$ $cm^{-3/2}$ (10.1 $cal^{1/2}$ $cm^{-3/2}$) (AcOH), 21.06 $J^{1/2}$ $cm^{-3/2}$ (10.3 $cal^{1/2}$ $cm^{-3/2}$) (Ac_2O), 21.69 $J^{1/2}$ $cm^{-3/2}$ (10.6 $cal^{1/2}$ $cm^{-3/2}$) (DMF)
Wettability/Surface Energy and Interfacial Tension: Surface energy 47 mN m^{-2} (γ_p 12.0, γ_d35.0) (methyl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 10 mol% methyl methacrylate) [4]; 46.5 mN m^{-2} (γ_p 9.8, γ_d 36.7) (methyl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 20 mol% methyl methacrylate) [4]; 49 mN m^{-2} (γ_p 15.6, γ_d 33.4) (lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 10 mol% lauryl methacrylate) [4]; 47.1 mN m^{-2} (γ_p 12.8, γ_d 34.3) (lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 20 mol% lauryl methacrylate) [4]; 46.7 mN m^{-2} (γ_p 11.4, γ_d 35.3) (lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 30 mol% lauryl methacrylate) [4]; 46.6 mN m^{-2} (γ_p 10.6, γ_d 36.0) (lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide, dry, 40 mol% lauryl methacrylate)[4]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.53–0.59 dl g^{-1} (ethyl methacrylate-*co*-acrylamide, range of solvents) [3]. η 1.865–2.51 dl g^{-1} (30°, $CHCl_3$, MMA-*co*-*N*-phenylmaleimide, 2.91–9.92% *N*-phenylmaleimide) [1]. η 0.164–0.423 dl g^{-1} (30°, $CHCl_3$, MMA-*co*-*N*-(*o*-tolylmaleimide), 35.3–7.9% maleimide) [1], 0.202–0.41 dl g^{-1} (30°, $CHCl_3$, MMA-*co*-*N*-(*p*-tolylmaleimide), 36.6–13.4% maleimide) [1]
Water Content: The equilib. water content of *N*,*N*-dimethylacrylamide copolymer hydrogels with both methyl and lauryl methacrylate decreases with increasing methacrylate content [4]

Mechanical Properties:

Mechanical Properties General: Tensile stress, tensile modulus, plateau modulus and flexural strength of MMA-*co*-*N*-phenylmaleimide are dependent upon the mole fraction of the maleimide component. Tensile modulus and tensile strength at break of *N*,*N*-dimethylacrylamide copolymer hydrogels with both methyl and lauryl methacrylate increase with decreasing equilib. water content [4]

Tensile (Young's) Modulus:

No.	Value	Note
1	1177–1672 MPa	MMA-*co*-*N*-phenylmaleimide, 0–9.92% maleimide [1]
2	0.09–0.18 MPa	MMA-*co*-*N*,*N*-dimethylacrylamide hydrogel, 5–20% MMA [4]
3	0.17–0.85 MPa	lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide hydrogel, 10–40% lauryl methacrylate [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	48–60 MPa	MMA-*co*-*N*-phenylmaleimide, 0–10% maleimide [1]	4.2–7.2%
2	0.13–0.16 MPa	MMA-*co*-*N*,*N*-dimethylacrylamide hydrogel, 5–20% MMA [4]	130–170%

3	0.21–0.53 MPa	lauryl methacrylate-*co*-*N*,*N*-dimethylacrylamide hydrogel, 10–40% lauryl methacrylate [4]	105–317%

Flexural Strength at Break:

No.	Value	Note
1	96–114 MPa	MMA-*co*-*N*-phenylmaleimide, 0–9.92% maleimide [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.014–0.42 MPa	140000–4200000 dyne cm^{-2}, MMA-*co*-*N*-phenylmaleimide, 100% maleimide [2]	Plateau modulus

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	3.77	butyl methacrylate-*co*-methacrylamide, 61% butyl methacrylate
2	3.89	butyl methacrylate-*co*-methacrylamide, 55% butyl methacrylate
3	3.54	butyl methacrylate-*co*-methacrylamide, 48% butyl methacrylate [3]

Optical Properties:

Transmission and Spectra: Ir and nmr spectra data have been reported [1,3]

Polymer Stability:

Decomposition Details: Initial decomposition temp. 220° (MMA-*co*-methacrylamide, 61% MMA), 230.4° (MMA-*co*-methacrylamide, 55% MMA), 237.1° (MMA-*co*-methacrylamide, 48% MMA) [3]. MMA-*co*-*N*-(*o*-tolylmaleimide) undergoes a two-stage decomposition process. Initial decomposition temps. for the first stage range from 365–380° and for the second stage from 456–480°. Decomposition temps. depend on the mole fraction of maleimide. Initial decomposition temp. (MMA-*co*-*N*-(*p*-tolylmaleimide)) 358–373° depending on mole fraction of maleimide [1]. Decomposition temp. (ethyl methacrylate-*co*-acrylamide) 239–260° depending on the mole fraction of ethyl methacrylate [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by mixing monomers in various ratios with initiator at 60–80° [1,3]

Methacrylate/olefin copolymers M-6

Synonyms: *Poly(alkyl methacrylate-co-ethene). Poly(alkyl methacrylate-co-ethylene). Poly(methyl methacrylate-co-ethylene). Poly(methyl methacrylate-co-butadiene). Poly(methyl methacrylate-graft-natural rubber). Poly(ethyl methacrylate-co-chloroprene). Poly(glycidyl methacrylate-co-chloroprene). Poly(methyl methacrylate-co-tetrafluoroethylene). Poly(methyl methacrylate-co-EPDM-graft-styrene). Poly(methyl methacrylate-co-EPDM-co-acrylonitrile). Poly(methyl methacrylate-co-EPDM-graft-2-vinylnaphthalene). Poly(methyl methacrylate-co-vinylidene fluoride). Poly(butyl methacrylate-co-vinylidene chloride)*
Related Polymers: Poly(*tert*-butyl methacrylate), Polymethacrylates, General, Poly(methyl methacrylate), Poly(ethyl methacrylate), Poly(*sec*-butyl methacrylate), Natural rubber, Polychloroprene, Polybutadiene, EPDM, Poly(vinylidene chloride), Poly(vinylidene fluoride)
Monomers: Methyl methacrylate, Ethyl methacrylate, Butyl methacrylate, Ethylene, Butadiene, Isoprene, Chloroprene, Vinylidene fluoride, Vinylidene chloride
Material class: Thermoplastic
Polymer Type: acrylic copolymers
CAS Number:

CAS Reg. No.	Note
25101-13-7	methyl methacrylate-*co*-ethylene
132076-25-6	methyl methacrylate-*co*-ethylene, block
110807-37-9	methyl methacrylate-*co*-ethylene, graft
25232-40-0	methyl methacrylate-*co*-butadiene
106399-43-3	methyl methacrylate-*co*-butadiene, block
107439-29-2	methyl methacrylate-*co*-butadiene, graft

Molecular Weight: MW 200000–2000000 (methyl methacrylate-*graft*-natural rubber), 200000–330000 (main rubber chains), 2000–5000 (grafted side chains)
General Information: The props. of MMA-*graft*-natural rubber vary with MMA content. The copolymer can be vulcanised to give strong, hard compounds that can be coloured and translucent, or almost transparent. The rubbers are hard and can be blended with natural rubber in all proportions. The periodic A_2B MMA-*co*-ethylene copolymer is a soft, tough, partially crystalline solid with good elasticity [1]. The AB copolymer is a transparent, soft and rubbery material [1]. Generally, the methacrylate-*co*-ethylene periodic A_2B copolymers are amorph., soft and extensible [2]. The MMA-vinylidene fluoride-methyl perfluoroacrylate terpolymer is a translucent solid [3]
Morphology: In MMA-*graft*-natural rubber copolymers the PMMA chains are attached either at the α-methylene carbon of the polyisoprene or at a double bond at a chain end. The ethylene copolymers with alkyl methacrylates can be graft, statistical (unordered or random) or periodic, *i.e.*, sequence ordered, with repeat units (ethylene-ethylene-alkyl methacrylate)$_n$, or (ethylene-alkyl methacrylate)$_n$ denoted as A_2B and AB systems respectively. The random ethylene copolymers are amorph.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.052 g/cm^3	ethylene-ethylene-MMA periodic copolymer [2]
2	d^{20} 1.02 g/cm^3	MMA-*graft*-natural rubber [4]

Melting Temperature:

22	-16.4°C	glycidyl methacrylate-*co*-chloroprene, random, MW 74200 [7]
23	138°C	MMA-*co*-vinylidene fluoride, block [3]
24	15–25°C	butyl methacrylate-*co*-vinylidene chloride [6]

Transition Temperature General: T_g varies with composition [2,5] and synth. method [6]. T_m is not observed for poly(MMA-*co*-ethylene AB system) [1,2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ (MMA-*co*-butadiene) 5.9 $J^{1/2}$ $cm^{-3/2}$ 17.2 $(MPa)^{1/2}$ (30% MMA), 6 $J^{1/2}$ $cm^{-3/2}$ 17.6 $(MPa)^{1/2}$ (50% MMA) [8]. Cohesive energy (MMA-*co*-butadiene) 295.4 J cm^{-3} (70.56 cal cm^{-3}, 30% MMA) [8], 310.7 J cm^{-3} (74.25 cal cm^{-3}, 50% MMA) [8]

Solvents/Non-solvents: MMA-*co*-ethylene AB system sol. $CHCl_3$, C_6H_6, Me_2CO, THF, DMF. Natural rubber graft copolymers are generally sol. solvents which will dissolve both natural rubber and PMMA, *e.g.* C_6H_6, cyclohexanone, CCl_4, amyl acetate. Insol. EtOH, Me_2CO, 2-butanone [4]. MMA-*co*-vinylidene fluoride, sol. *o*-(bistrifluoromethyl)benzene (hot); insol. 2-butanone [3]

Wettability/Surface Energy and Interfacial Tension: Contact angle (MMA-*co*-vinylidene fluoride) 94° (advancing; H_2O), 37° (advancing; hexadecane) [3]

Transport Properties:

Polymer Solutions Dilute: Poly(alkyl methacrylates) with olefin copolymer side chains have excellent low temp. viscosity and good thickening efficiency [9]

Mechanical Properties:

Mechanical Properties General: The presence of diblocks in triblock MMA/butadiene copolymers gives tensile props. that are worse than those of pure triblocks [5]

Tensile (Young's) Modulus:

No.	Value	Note

9	7.23 MPa	syndiotactic MMA-isobutylene-syndiotactic MMA triblock, 20% PMMA [10]	525%
10	6.52 MPa	syndiotactic MMA-isobutylene-syndiotactic MMA triblock, 20% MMA, annealed	550%
11	11.82 MPa	syndiotactic MMA-isobutylene-syndiotactic MMA triblock, 27% PMMA	550%
12	14.52 MPa	syndiotactic MMA-isobutylene-syndiotactic MMA triblock, 34% PMMA	650%
13	7.69 MPa	syndiotactic MMA-isobutylene-syndiotactic MMA triblock, 27% PMMA	25%
14	25.5 MPa	260 kg cm^{-2}, MMA-*co*-ethylene, periodic A_2B	300%
15	0.2 MPa	2 kg cm^{-2}, ethyl methacrylate-*co*-ethylene, A_2B system	500%
16	0.3 MPa	3 kg cm^{-2}, isopropyl methacrylate-*co*-ethylene, A_2B system	1100%
17	4.9 MPa	50 kg cm^{-2}, phenyl methacrylate-*co*-ethylene, A_2B system	600%
18	14.7 MPa	150 kg cm^{-2}, benzyl methacrylate-*co*-ethylene, A_2B system [1,2]	500%
19	27.5 MPa	2.8 kg mm^{-2}, natural rubber graft copolymer, 23% MMA	520–560%
20	17.7 MPa	1.8 kg mm^{-2}, natural rubber graft copolymer, 49% MMA [4]	215%
21	2–35 MPa	MMA-*co*-butadiene, triblock	140–1300%
22	1.4–19 MPa	ethyl methacrylate-*co*-butadiene	580–1280%
23	1.8–24 MPa	*tert*-butyl methacrylate-*co*-butadiene	570–1270%
24	2.2–35 MPa	isobornyl methacrylate-*co*-butadiene [5]	600–1080%
25	6.5–14.5 MPa	MMA-*co*-isobutylene [10]	25–650%
26	21.4–24.8 MPa	vinylidene fluoride-*co*-MMA, 3.1–3.6 kpsi [3]	10–40%
27	1.3–2.9 MPa	butyl methacrylate-*co*-vinylidene chloride, semicontinuous emulsion polymerisation [6]	468–588%
28	7.23 MPa	butyl methacrylate-*co*-vinylidene chloride, batch process [6]	74–87%
29	38.3 MPa	390 kg cm^{-2}, MMA-EPDM-styrene graft copolymer [7]	3.5%
30	33.8 MPa	345 kg cm^{-2}, MMA-EPDM-(2-vinylnaphthalene) graft copolymer [11]	1.8%

Tensile Strength Yield:

No.	Value	Note
1	1.7–4.6 MPa	125–25°, MMA-*co*-butadiene, 38% MMA
2	2.3–4 MPa	70–25°, MMA-*co*-butadiene, 31% MMA
3	2.3 MPa	25°, ethyl methacrylate-*co*-butadiene, 21% ethyl methacrylate
4	1.9–9.6 MPa	150–25°, isobornyl methacrylate-*co*-butadiene, 42% isobornyl methacrylate [5]
5	9.8 MPa	100 kg cm^{-2}, MMA-*co*-ethylene, periodic A_2B [1]
6	0.3 MPa	3.5 kg cm^{-2}, ethyl methacrylate-*co*-ethylene, A_2B system [2]
7	0.3 MPa	3.5 kg cm^{-2}, isopropyl methacrylate-*co*-ethylene, A_2B system [2]
8	0.5 MPa	5 kg cm^{-2}, phenyl methacrylate-*co*-ethylene, A_2B system [2]
9	2.9 MPa	30 kg cm^{-2}, benzyl methacrylate-*co*-ethylene, A_2B system [2]
10	3–42 MPa	syndiotactic MMA-*co*-butadiene
11	2.3–4 MPa	ethyl methacrylate-*co*-butadiene
12	1.9–9.6 MPa	isobornyl methacrylate-*co*-butadiene [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1681 MPa	244 kpsi, 1h [3]	Tensile creep modulus
2	1530 MPa	222 kpsi, 10h [3]	Tensile creep modulus
3	861 MPa	125 kpsi, 300h [3]	Tensile creep modulus

Hardness: IRHD natural rubber graft copolymers 72–75 (23% MMA), 96 (49% MMA) [4]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
2	$>0.0009 \times 10^{15}$ Ω.cm	min., natural rubber graft, vulcanised, 49% MMA [4]	S

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9	natural rubber graft, vulcanised, 49% MMA [4]

Dielectric Strength:

No.	Value	Note
1	16 $kV.mm^{-1}$	natural rubber graft, vulcanised, 49% MMA [4]

Dissipation (Power) Factor:

No.	Value	Note
1	0.02	natural rubber graft, vulcanised, 49% MMA [4]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [1,2,5,6,7,11,12,13,14]

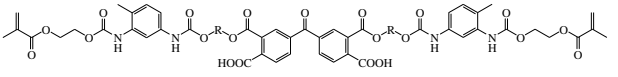
Polymer Stability:

Thermal Stability General: The MMA-*co*-ethylene periodic A_2B copolymer decomposes slowly above 200° in air [1]. The MMA-EPDM-acrylonitrile graft copolymer is more stable than either ABS or poly(acrylonitrile-*co*-MMA). Variations in the method of preparation have little effect on the thermal stability [13]
Upper Use Temperature:

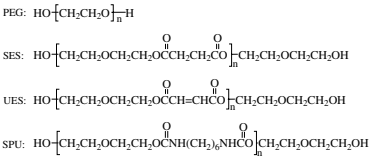
No.	Value	Note
1	160°C	isobornyl methacrylate-*co*-butadiene [5]

Flammability: MMA-*co*-vinylidene fluoride burns slowly, and drips. Limiting oxygen index 17.7% [3]
Environmental Stress: The graft copolymer of MMA-EPDM-acrylonitrile weathers better than ABS [13]. MMA-EPDM-(2-vinylnaphthalene) graft copolymer has better resistance to light than ABS [11]. MMA-EPDM-*graft*-styrene copolymer has good weathering props. and good resistance to light [7]

Applications/Commercial Products:



Processing & Manufacturing Routes: Natural rubber graft copolymers are synth. by transfer of the free-radical followed by monomer polymerisation. The reaction is initiated by γ-radiation (most efficient), uv photosensitisers, redox systems or peroxides. Graft copolymers can be made by the reaction of azodicarboxylate substituted poly(alkyl methacrylates) with natural rubber or synthetic polyisoprenes [15]. The grafting of MMA onto radiation-vulcanised natural rubber by a radiation-induced process has been reported. The thermoplastic elastomer thus produced can be processed satisfactorily but improvements are gained by blending with the graft copolymer of non-vulcanised material [16]. The graft copolymer has been prepared in toluene using benzoyl peroxide at 80°. At a constant level of peroxide the grafting efficiency and level decrease and MW increases as the level of MMA increases. At a constant level of MMA the graft level decreases to a constant level as the amount of peroxide is increased [17]. Processed and vulcanised in a similar manner to natural rubber. MMA-*co*-ethylene periodic AB copolymer is synth. by reduction of poly(MMA-*alt*-vinyl bromide) [1]. The periodic A_2B copolymers may be synth. by the hydrogenation of poly(methacrylate-*alt*-butadiene) [1,2]. A statistical ethylene-MMA copolymer can be synth. by reduction of the corresponding statistical copolymer of MMA and vinyl chloride [14]. Triblock alkyl methacrylate/butadiene copolymers can be synth. by sequential anionic polymerisation using dilithium initiators [5]. Butyl methacrylate/vinylidene chloride copolymer is synth. by batch polymerisation at 25° using a redox catalyst to give crystalline heterogeneous product. Seeded semicontinuous emulsion polymerisations give amorph. polymers with a more uniform composition [6]. MMA-*co*-vinylidene fluoride block copolymer can be synth. by termonomer-induced copolymerisation as the monomers themselves will not copolymerise. A suitable comonomer is methyl perfluoroacrylate [3]
Applications: MMA-*co*-ethylene is used in composite articles and polymer alloys. Poly(alkyl methacrylates) with olefinic copolymer side-chains are used as viscosity modifiers in modern multigrade oils. Natural rubber graft copolymers are used in the manufacture of impact-resistant articles (cutting boards) and rigid mouldings (golf ball covers, roller-skates, castor wheels, electric plugs); as reinforcing agents; as adhesives (in soln. and latex form) to bond rubber to a variety of materials, *e.g.* metal or textiles



Trade name	Details	Supplier
Nucrel	MMA-*co*-ethylene	DuPont
PE	MMA-*co*-ethylene	Chevron

Methacrylate-urethane polymers and copolymers M-7

Synonyms: *Poly(urethane methacrylate). Poly(methacrylourethane)*
Material class: Thermoplastic
Polymer Type: acrylic copolymers
General Information: There is a wide variety of possible methacrylate/urethane polymers and copolymers. This entry contains data on some examples. Poly(urethane methacrylates) designated UMPEG, UMSES, UMUES and UMSPU [1]. Methacrylate-urethane copolymer from 1,4-butanediol/diphenylmethane diisocyanate/poly(tetramethylene ether glycol) with incorporated double bonds and methyl methacrylate designated DP. Methacrylate-urethane copolymer from hexamethane diisocyanate/tetraethylene glycol/hydroxyethyl methacrylate and methyl methacrylate, designated HP. Methacrylate-urethane copolymer from toluene diisocyanate/tetraethylene glycol/hydroxyethyl methacrylate and methyl methacrylate, designated TP

Volumetric & Calorimetric Properties:

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	5.7×10^{-5}–7.5×10^{-5} K^{-1}	TP; $T > T_g$ [2]	1
2	0.000157–0.000181 K^{-1}	TP; $T < T_g$ [2]	1
3	0.000115–0.000126 K^{-1}	HP, $T > T_g$ [2]	1
4	0.000101–0.000166 K^{-1}	HP, $T > T_g$ [2]	1

Glass-Transition Temperature:

No.	Value	Note
1	-10.5°C	UMPEG, cured [1]
2	-0.5°C	UMSES, cured [1]
3	4°C	UMUES, cured [1]
4	5.5°C	UMSPU, cured [1]
5	133–137°C	TP, varying methyl methacrylate content [2]
6	114–136°C	TP, varying tetraethylene glycol/hydroxyethyl methacrylate content [2]
7	64–82°C	HP, varying tetraethylene glycol/hydroxyethyl methacrylate content [2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. Me_2CO, $CHCl_3$, dioxane, THF. Insol. C_6H_6, toluene, xylene, alcohols, cyclohexane, CCl_4 [1]

Transport Properties:

Polymer Solutions Dilute: Viscosity 232.5 P (40°, UMPEG, M_n 2060), 257 P (40°, UMSES, M_n 2470), 281 P (40°, UMUES, M_n 2610), 355 P (40°, UMSPU, M_n 2210) [1]

Water Absorption:

No.	Value	Note
1	0.17 %	TP [2]
2	0.87 %	HP [2]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	250–390 MPa	DP, MW 43500000 [3]
2	210–370 MPa	DP, 21% unreacted polyurethane [3]
3	120–260 MPa	DP, MW 13000000 [3]
4	360–420 MPa	DP, 21% unreacted polyurethane [3]
5	260–264 MPa	DP, MW 414500 [3]
6	370–450 MPa	DP, MW 2850000 [3]
7	580–640 MPa	DP, 12% unreacted polyurethane [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	3–11 MPa	MW 43500000 [3]	30–36%
2	8.4–9.8 MPa	DP, 21% unreacted polyurethane [3]	10–14%
3	6–12 MPa	DP, MW 13000000 [3]	7–11%
4	8–12 MPa	DP, 21% unreacted polyurethane [3]	8–12%
5	9–13 MPa	DP, MW 414500 [3]	5–7%
6	11–13 MPa	DP, MW 2850000 [3]	16.8–17.8%
7	9–11 MPa	DP, 12% unreacted polyurethane [3]	43–47%

Tensile Strength Yield:

No.	Value	Note
1	12–18 MPa	DP, MW 43500000 [3]
2	8.4–9.8 MPa	DP, 21% unreacted polyurethane [3]
3	15–19 MPa	DP, MW 2850000 [3]
4	16.6–17 MPa	DP, 12% unreacted polyurethane [3]

Impact Strength: Falling dart impact strength 0.417 m s^{-1} (DP, MW 43500000); 0.427 m s^{-1} (DP, MW 13000000); 0.428 m s^{-1} (DP, MW 2850000). Isolated graft copolymers of DP have not been tested by the falling dart technique only those polymers with unreacted PU present [3]. Impact strength of TP and HP increases (11.2–16.4 N m^{-2}) increases with the number of hydroxyl groups contributed by tetraethylene glycol/hydroxyethyl methacrylate. Increasing methyl methacrylate content increases with strength of TP whereas in HP it causes a decrease

Hardness: Pencil hardness B (UMPEG, 91.7% gel content) , HB (UMSES, 94.0% gel content), 2H (UMUES, 90.4% gel content), H (UMSPU, 90.0% gel content) [1]. Surface hardness of TP generally increases with tetraethylene glycol/hydroxyethyl methacrylate mole ratio whereas little change is observed for HP. Surface hardness of TP generally decreases with increasing methyl methacrylate content whereas it increases for HP [2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.55	TP [2]

Transmission and Spectra: Ir and uv spectral data have been reported [1,2,4]

Volume Properties/Surface Properties: Colour: transparent to yellowish-brown

Polymer Stability:

Thermal Stability General: All copolymers are stable at 120°; UMUES gels at 140° and all copolymers gel to various degrees at 160° and above

Stability Miscellaneous: Exposure to uv causes rapid cure of all copolymers. Irradiation of UMPEG, UMSES, UMUES and UMSPU generally increases tensile modulus and strength [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: DP may be synth. by reacting polyurethane, 1,4-butanediol/4,4′-diphenylmethane diisocyanate and polyethylene ether glycol with glyceryl monomethacrylate or α,α-dimethyl*m*-isopropenyl benzyl isocyanate to give incorporated unsaturated diol or unsaturated isocyanate groups. This product is then copolymerised with methyl methacrylate by a radical mechanism. Typical conditions may be mole ratio polyurethane/glycerol monomethacrylate:methyl methacrylate 1.5:4 by weight in DMF at 80°. The type and level of initiator is varied along with the reaction time. The product contains a mixture of polyurethane and DP depending on the reaction conditions [3,4]. Poly(methacrylate) methyl/polyurethane inter-penetrating networks can be synth. by γ-irradiation [5] Oligomers can be thermally cured (above 140°) or cured by uv photolysis, electron-beam irradiation or γ-irradiation [1]

Applications: Used in photoimaging, and as interfacial agents in blending

Methacrylates, General M-8

Synonyms: *Acrylics*
Related Polymers: Poly(ethyl methacrylate), Poly(propyl methacrylate), Poly(isopropyl methacrylate), Poly(octyl methacrylate), Poly(pentyl methacrylate), Poly(aryl methacrylate), Poly(hydroxyalkyl methacrylate), Poly methacrylates with side-chains containing heteroatoms, Poly(methyl methacrylate) General, Poly(butyl methacrylate), Poly(isobutyl methacrylate), Poly(*sec*-butyl methacrylate), Poly(*tert*-butyl methacrylate), Hexyl methacrylates, Long-chain poly(alkyl methacrylates), Poly(haloalkyl methacrylate), Poly(glycol methacrylates)
Material class: Thermoplastic
Polymer Type: acrylic
General Information: There is a tremendous range of methacrylate homopolymers, copolymers and polymer blends; the principal commercial product is poly(methyl methacrylate). The products are available as sheets, rods, tubes, moulding and extrusion products, emulsions, dispersions and solns. Generally, the methacrylates are harder and have a higher tensile strength and lower elongation than the corresponding polyacrylates. Poly(-methyl methacrylate) is a hard rigid polymer whereas *n*-hexyl methacrylate and polymers with longer side-chains are rubber-like. *n*-Dodecyl methacrylate is brittle owing to crystallisation of the side-chain. Fragments of polymerisation reagents such as initiators, solvents and chain-transfer reagents can be incorporated into the polymer chain as end-groups during manufacture. These groups, although at a low concentration, can have an effect on some polymer props., *e.g.* thermal stability [1]. Cross-linked methacrylate polymers and copolymers have important applications as hydrogels. Perhaps the most important is poly(2-hydroxyethyl methacrylate) which when cross-linked with, *e.g.* ethylene diacrylate, gives pliable, soft hydrogels which have a wide variety of applications, particularly in medicine
Tacticity: Normally atactic. Syndiotactic and isotactic forms are known
Morphology: There is some local order in the amorph. polymers although the behaviour of poly(methyl methacrylate) is atypical [2]
Identification: Fragments of polymerisation reagents that have been incorporated into the polymer struct. as end groups during manufacture may be identified by pyrolysis [1,3]. Soln. polymers are usually characterised by solids' content, viscosity and solvent as well as resin composition and MW. Emulsion polymers are classified on the basis of the type of surfactant used in their preparation: anionic, cationic or nonionic. Emulsion polymers are then characterised in a similar way to soln. polymers with the additional parameter of particle size

Volumetric & Calorimetric Properties:

Volumetric Properties General: For a series of linear alkyl methacrylates the density decreases with the length of the alkyl chain
Transition Temperature General: T_g decreases as the length of the alkyl side-chain increases (disregarding tacticity). T_g increases with increasing branching of the alkyl chain. T_g varies markedly with thermal history and residual solvent [5]. Methacrylate polymers show side-chain transitions at about 20° and below -150° due to the relaxation of the carbomethoxy side-chains and the aliphatic ester group respectively [6]. A T_β transition occurs owing to rotation of the ester group about its bond to the backbone chain. The length of the side group has no effect on the steric hindrance to the rotation. However, when the group is closer to the backbone both the rigidity of the backbone and the hindrance to the rotation can increase [7,8,9]. A γ-relaxation for larger alkyl methacrylates (*e.g.* butyl) at low temps. and a δ-transition for ethyl and propyl methacrylates have been reported [8]

Surface Properties & Solubility:

Solubility Properties General: The nature of the side-chain affects the solubility. Short side-chain polymers tend to be sol. polar solvents but as the length of the side-chain increases the polymers become more sol. non-polar solvents
Surface and Interfacial Properties General: The monolayer behaviour of the polymethacrylates depends on tacticity. Isotactic polymers form expanded monolayers whereas syndiotactic polymers give more condensed layers [12]
Wettability/Surface Energy and Interfacial Tension: For linear alkyl methacrylates the receding contact angle increases from methyl to butyl but decreases from hexyl to dodecyl. The advancing contact angles, however, increase with the length of the alkyl group [13]. There is a linear relationship between the wt % oxygen content of the linear alkyl methacrylates and the advancing contact angle between the polymer and H_2O [14]. The receding contact angles of methyl methacrylate copolymers containing hydrophilic or charged groups decrease relative to the homopolymer whereas the advancing angles are virtually the same. In the case of hydroxyethyl copolymers, however, the receding contact angles are similar to those of the homopolymer and the advancing angles are larger [13]

Mechanical Properties:

Mechanical Properties General: The mechanical props. of the methacrylates tend to improve with increasing MW. However, above a certain value (the critical MW) the rate of change of improvement tends to level off. The critical MW for an amorph. polymer is typically 100000–200000. The impact resistance of methacrylic polymers may be improved by the incorporation of modifiers such as butadiene or other acrylic materials
Viscoelastic Behaviour: The sound velocity of methacrylates shows dispersion when the temp. is greater than T_g [16]

Optical Properties:

Optical Properties General: The refractive index changes with the bulk of the side-chain. Refractive index measurements have been used to monitor extent of reaction in the polymerisation of methyl methacrylate polymers and copolymers [21]
Transmission and Spectra: Ir and nmr spectral data have been reported [3]

Polymer Stability:

Polymer Stability General: Polymethacrylates are more stable to photodegradation than are acrylics. Large doses of ionising radiation can cause brittleness, loss of strength and loss of desirable props. Polymethacrylates exhibit predominantly main-chain fracture during irradiation and deterioration of props. is due to lowering of MW. Irradiation of dodecyl, octadecyl and other long-chain esters causes cross-linking in preference to scission and yields infinite networks. The effect of γ-irradiation on polymethacrylates depends on the alkyl substituent. Side-chain scission is the predominant mechanism. Long-chain alkyl methacrylates undergo both scission and cross-linking. Addition of the benzyl group stabilises the polymer against radiation damage [17]
Decomposition Details: Methacrylates generally decompose readily above 300° to give the monomer at a yield of greater than 90%
Flammability: Flame resistance of polymethacrylates can be improved by copolymerisation with bromoethyl methacrylate
Hydrolytic Stability: Methacrylic polymers are more stable to hydrolysis in both acidic and alkaline media than are polyacrylates
Stability Miscellaneous: Electron beam and γ-irradiation cause such rapid polymer degradation that poly(alkyl methacrylates) can be used as positive-working electron beam photoresists. Some silicon-containing methacrylates undergo both scission and cross-linking when irradiated [18]. Poly(methacrylates) undergo shear-induced degradation in soln., particularly in poor solvents. The degradation is minimal for long-chain alkyl methacrylate polymers, however [19]

Applications/Commercial Products:

Processing & Manufacturing Routes: Free-radical polymerisation is the primary commercial method. Also synth. by bulk (main commercial route to sheet, rod, tube and moulding products), soln. (important for polymers to be used in coatings, adhesives and laminates), suspension (moulding powders), emulsion (paint, textile and leather applications) or anionic polymerisation. Initiators such as azo compounds, diacyl peroxides and *tert*-alkyl peroxides are used, with water-sol. persulfates and redox initiators and oxidants used particularly in emulsion polymerisation. Radiation curing is used for coating and thin film systems and oxygen inhibitors are used in these and most other acrylic systems

Applications: Polymethacrylate sheet has applications in glazing (windscreens, diffusers, mirrors, aircraft canopies); in meter cases, furniture, sanitary ware and in protective casing. Rods, tubes and fibres have uses in medical instruments, optics, and in electrical parts. Other uses of soln., and emulsion polymerised products include coatings; as a modifier (oils, impact modifier, to improve flow); in inks and in coating and processing applications. Many methacrylic homo- and copolymers have applications in the imaging industry, *e.g.*, in litho coatings and other photoresists. A major use for methacrylic polymers is the medical industry (manufacture of contact lenses, artificial joints, dental products, bone cements; and in instrument and equipment parts). Long-chain methacrylates are used as performance-improving additives to lubricating oils and hydraulic fuels. Solns. of methacrylic polymers are used in ceramic transfer lacquers; in coatings (for concrete, fibrous cement, household appliances, non-ferrous metals, plastics, rubber, wood); in coil coatings, heat sealing, masonry paints, primers for building structs., corrosion protective coatings, PVC finishing, sterilisable coatings, stoving lacquers. Also used in the production of enstatite-free forsterite for the laser industry

Methacrylic acid copolymers M-9

Synonyms: *Methacrylic acid ionomers. Poly(methacrylic acid-co-styrene). Poly(methacrylic acid-co-N-vinylpyrrolidone). Poly (methacrylic acid-co-urethane)*
Related Polymers: Polymethacrylates-General, Poly(methacrylic acid), Poly(methacrylic acid salts), Polystyrene, Poly(*N*-vinylpyrrolidone), Polyurethane, Poly(methacrylic acid salt-*co*-ethylene), Poly(methacrylate ionomers)
Monomers: Methacrylic acid, Styrene, *N*-Vinylpyrrolidone
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
88215-93-4	methacrylic acid-*co*-styrene, ammonium salt
37382-81-3	methacrylic acid-*co*-styrene, lead salt
33970-45-5	methacrylic acid-*co*-styrene, Na salt
174204-73-0	methacrylic acid-*co*-styrene, europium salt
174204-74-1	methacrylic acid-*co*-styrene, holmium salt
131151-50-3	methacrylic acid-co-styrene, neodymium salt
174204-72-9	methacrylic acid-*co*-styrene, samarium salt
174204-75-2	methacrylic acid-*co*-styrene, strontium salt

General Information: This entry combines data on the methacrylic acid copolymers other than those with ethylene and methacrylates.
Morphology: Ionomers generally behave according to a multiple-cluster model with ionic groups aggregating to form multiplets which are surrounded by regions of restricted mobility. At very low ion contents only multiplets are present; as the ion content increases the areas of restricted mobility begin to overlap and form contiguous regions of restricted mobility. These areas are called clusters but do not appear when the degree of neutralisation is less than 50% [1,2,3]
Miscellaneous: Forms complexes with basic polymers, e.g. poly (4-vinylpyridine) [11]

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	121°C	methacrylic acid-*co*-styrene
2	132–211°C	methacrylic acid-*co*-styrene, 5.5% Na ion
3	142–218°C	methacrylic acid-*co*-styrene, 8.2% Na ion [1,3]
4	127°C	methacrylic acid-*co*-styrene, 0.04% H_2O [3]
5	129°C	methacrylic acid-*co*-styrene, 0.16% H_2O [3]
6	100°C	methacrylic acid-*co*-*N*-vinylpyrrolidone, 65% methacrylic acid
7	122°C	methacrylic acid-*co*-*N*-vinylpyrrolidone, 81.4% methacrylic acid
8	-0.6–45.2°C	methacrylic acid-*co*-urethane, 10% Li salt
9	12.7°C	methacrylic acid-*co*-urethane, 10% methacrylic acid, lithium salt
10	29.8°C	methacrylic acid-*co*-urethane, 30% methacrylic acid, lithium salt [5]

Transition Temperature General: Some ionomer systems (8-14 mol % ions) show two glass transitions which correspond to an ion-poor matrix and an ion-rich cluster. Water plasticises the ionic cores but very small amounts do not affect the cluster glass transition mechanism [1,2,3]

Surface Properties & Solubility:

Solubility Properties General: In aq. media the styrene segments form the core and the methacrylic segments form the shell of each micelle. In aq. dioxan the copolymers form micelles whose props. depend on the ratio of dioxan:H_2O when the amount of H_2O is greater then 5% [5]
Wettability/Surface Energy and Interfacial Tension: γ_t 48.6; γ_p 11.0; γ_d 37.6 (methacrylic acid-*co*-*N*-vinylpyrrolidone, 100% *N*-vinylpyrrolidone). γ_t 49.4; γ_p9.9; γ_d 39.5 (methacrylic acid-*co*-*N*-vinylpyrrolidone, 75% *N*-vinylpyrrolidone). γ_t 47.9; γ_p 11.3; γ_d36.6 (methacrylic acid-*co*-*N*-vinylpyrrolidone, 50% *N*-vinylpyrrolidone). γ_t 53.0; l_p 14.5; γ_d 38.5 (methacrylic acid-*co*-*N*-vinylpyrrolidone, 25% *N*-vinylpyrrolidone) [7]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 2.06 dl g^{-1} (methacrylic acid-*co*-*N*-vinylpyrrolidone, 65.8% methacrylic acid); 3.85 dl g^{-1} (methacrylic acid-*co*-*N*-vinylpyrrolidone, 81.4% methacrylic acid) [4]

Water Content: 58.5% (methacrylic acid-*co*-*N*-vinylpyrrolidone 75% wt. methacrylic acid); 56.5% (methacrylic acid-*co*-*N*-vinylpyrrolidone 25% wt. methacrylic acid); 50.0% (methacrylic acid-*co*-*N*-vinylpyrrolidone 50% wt. methacrylic acid)

Mechanical Properties:

Mechanical Properties General: Rigidity modulus of methacrylic acid [7]: 4.2 $\times$ 10^{-7} mN m^{-2} (75% wt. methacrylic acid), 5.5 $\times$ 10^{-7} mN $^{-2}$ (25% wt. methacrylic acid), 10 $\times$ 10^{-7} mN m^{-2} (min.) (50% wt. methacrylic acid)
Viscoelastic Behaviour: Williams-Landel-Ferry constants for the methacrylic acid-*co*-styrene diblock copolymer have been reported [8]

Electrical Properties:

Electrical Properties General: Conductivity increases linearly with salt concentration [9]
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.7–3.2	room temp., methacrylic acid-*co*-styrene, 2–9% Na salt [9]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0014–0.0126	high temp., methacrylic acid-*co*-styrene, 2–9% salt content [9]
2	0.0025–0.0051	low temp., methacrylic acid-*co*-styrene, 2–9% salt content [9]

Polymer Stability:

Decomposition Details: 60% weight loss for methacrylic acid-*co*-*N*-vinylpyrrolidone occurs at 452° (81.4% methacrylic acid) and at 457° (65.8% methacrylic acid) [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Methacrylic acid-*co*-styrene copolymer salts (random and block) are synth. by hydrolysing the corresponding esters to give acids which are then neutralised to produce Na, K, Cu, and Zn salts [10] Methacrylic acid/*N*-vinylpyrrolidone copolymers are synth. by radiation-induced bulk-polymerisation [4]

Methyl hydrogen rubber, Heat vulcanised M-10

Synonyms: *Methyl hydrogen based silicone elastomer*
Related Polymers: Methylsilicone rubber, Heat vulcanised
Monomers: Dichlorodimethylsilane, Dichloromethylsilane, Hexamethylcyclotrisiloxane, Cyclic methylhydrogensiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones

Molecular Formula: $[(C_2H_6OSi).(CH_4OSi)]_n$
Fragments: C_2H_6OSi CH_4OSi
Additives: Finely divided silica incorporated as a reinforcer to improve mech. props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[3]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu $lb^{-1}°F^{-1}$ [3]	P

Glass-Transition Temperature:

No.	Value	Note
1	-130°C	[2,10]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 $J^{1/2}$ $cm^{-3/2}$ (7.5–7.6 $cal^{1/2}$ $cm^{-3/2}$) [6,7]. For more details see [methyl silicone rubber (heat vulcanised)]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [6,7,8]
Surface and Interfacial Properties General: Strong adhesion to surfaces, particularly metals [1,5]

Transport Properties:

Polymer Melts: Viscosity 100000 St (approx., pre-cure gum) [8]

Mechanical Properties:

Mechanical Properties General: Requires silica filler for acceptable mech. props. [1]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	3	[4,9]

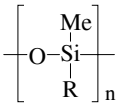
Dielectric Strength:

No.	Value	Note
1	15–20 kV.mm^{-1}	[4]

Polymer Stability:

Polymer Stability General: See [methylsilicone rubber (heat vulcanised)]. The presence of Si-H bonds reduces stability, particularly in the presence of water

Applications/Commercial Products:



Processing & Manufacturing Routes: Dimethyl- and methyl hydrogen-cyclic polysiloxanes are equilibrated together under acid catalysis at 100–110° with a large excess of dimethylsiloxanes and trace amounts of hexamethyldisiloxane to terminate the siloxane chains. Alkaline conditions or temps. much over 110° must be avoided due to the reactivity of the Si-K bond. Organic peroxides, typically benzoyl peroxide, are used at 1–2 parts per 100 rubber to cure the gum. The rubber is cured at 110° under pressure for less than an hour
Applications: Used where tight adhesion to metals is important

Methyl phenyl silicone resin M-11

R = Me, Ph

Synonyms: *Methyl phenyl siloxane resin*
Related Polymers: Methyl silicone resin, Glass reinforced silicone resin, Room temp. vulcanised flexible silicone resin
Monomers: Trichloromethylsilane, Trichlorophenylsilane, Dichlorodimethylsilane, Dichloromethylphenylsilane
Material class: Gums and resins, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
159968-66-8

Molecular Formula: $[(C_2H_6OSi)(C_7H_8OSi)]_n$
Fragments: C_2H_6OSi C_7H_8OSi
General Information: The functionality of a silicone resin is the ratio of oxygen to silicon atoms. For commercial resins it varies from 1.2 to 1.6. High functionality resins are highly crosslinked

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[6]

Thermal Conductivity:

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters, ethers. Mod. sol. alcohols, aliphatic hydrocarbons. Insol. H_2O [1]. (Solubility data refers to pre-cure resin)
Surface and Interfacial Properties General: Adhesive power 4 MPa (40 kg cm^{-2}, 18°). Adhesive power, 0.1 MPa (1 kg cm^{-2}, 150°) [1]

Transport Properties:

Polymer Solutions Concentrated : Viscosity values have been reported 0.5–2.5 Poise (pre-cure resin, toluene) [10]

Mechanical Properties:

Mechanical Properties General: Below 30° resin is much stiffer. High functionality resins are hard and stiff over whole temp. range. Methyl phenyl resins are softer and more flexible than methyl resins of the same functionality

Tensile (Young's) Modulus:

No.	Value	Note
1	3.5 MPa	0.35 kgf mm^{-2}, low functionality resin [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	6 MPa	0.6 kgf mm^{-2}, low functionality resin [6]	125%

Hardness: Shore A35–A40 (low functionality resin; hardness decreases as temp. increases) [1,6]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9	[2,3]

Dielectric Strength:

No.	Value	Note
1	30 kV.mm^{-1}	800 V mil^{-1}, 0.13 mm thick [3,4,5]

Dissipation (Power) Factor:

No.	Value	Note
1	0.005	[2,3]

Polymer Stability:

Thermal Stability General: Usable from -100–250° [1,3,6]
Upper Use Temperature:

No.	Value
1	250°C

Decomposition Details: At high temp. decomposition to C_6H_6 and cyclic siloxanes occurs [9]
Environmental Stress: Outstanding weather resistance. Unaffected by sunlight or water; excellent radiation resistance [1,8]
Chemical Stability: Attacked by strong acids; unaffected by alkali or weak acid. Degraded by chlorinated hydrocarbons, aromatic hydrocarbons, ketones and esters. Mod. effect of alcohols and aliphatic hydrocarbons [1,8]
Hydrolytic Stability: Fully stable to cold water; poor resistance to steam [1]
Biological Stability: Non-biodegradable [6]
Recyclability: Not recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Dichlorodimethylsilane, trichloromethylsilane [6,7], trichlorophenylsilane and dichloromethylphenylsilane are dissolved in toluene and hydrolysed to form a branched copolymer which remains dissolved. Further polym. occurs on heating with zinc octanoate at 120–200°. After application of the resin, cure occurs with a catalyst such as zinc octanoate usually at elevated temp.
Applications: Silicone resins can be copolymerised with other polymers, particularly polyesters, to prod. resins with improved hardness, adhesive props. and solvent resistance, but which maintain the heat resistance and water repellency of silicones. Used in heat resistant coatings, its miscibility with paint makes it important in the paint industry. Mixed with glass fibre it can be used in moulding compds. or as a laminate with thin glass sheets. It can be modified and cured with acyloxy silanes to form room temp. vulcanising flexible resins. Has important use as an insulator and dielectric in electric industry

Methyl silicone resin M-12

Synonyms: *Methyl siloxane resin*
Related Polymers: Methyl phenyl silicone resin, Glass reinforced silicone resin, Flexible silicone resin, Room temp. vulcanised
Monomers: Dichlorodimethylsilane, Trichloromethylsilane
Material class: Gums and resins, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
159011-85-5

Molecular Formula: $(C_2H_6OSi)_x$
Fragments: C_2H_6OSi
General Information: The functionality of a silicone resin is the ratio of oxygen to silicon atoms. For commercial resins it varies from 1.2 to 1.6. High functionality resins are highly crosslinked. Silicone resins can be copolymerised with other polymers, particularly polyesters, to prod. resins with improved hardness, adhesive props. and solvent resistance but which maintain the heat resistance and water repellency of silicones

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.06 g/cm^3	low functionality
2	d 1.2 g/cm^3	high functionality [1,2,3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00011 K^{-1}	[4,10]	L

Thermal Conductivity:

No.	Value	Note
1	0.15 W/mK	0.00035 cal cm^{-1} S^{-1} °C^{-1} [4]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.5 kJ/kg.C	0.36-0.37 cal^{-1} g °$^{-1}$ [4]	P

Brittleness Temperature:

No.	Value	Note
1	-70°C	low functionality [4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters. Mod. sol. ethers, alcohols. Insol. H_2O, aliphatic hydrocarbons [6] (solubility data refers to pre-cure resin)

Transport Properties:

Polymer Solutions Concentrated : Viscosity 0.5–2.5P (toluene, pre-cure gum) [9]
Water Absorption:

No.	Value	Note
1	0.2 %	24h [4]

Mechanical Properties:

Mechanical Properties General: High functionality resins are hard and stiff. Resins become much softer and elastic as functionality falls. Methyl resins are harder and stiffer than methyl phenyl resins of the same functionality

Tensile (Young's) Modulus:

No.	Value	Note
1	400 MPa	40 kgf.mm^{-2}, high functionality [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	30 MPa	3 kgf.mm^{-2}, high functionality [4]	7.5%

Flexural Strength at Break:

No.	Value	Note
1	600 MPa	60 kgf.mm^{-2}, high functionality [4]

Compressive Strength:

No.	Value	Note
1	800 MPa	80 kgf.mm^{-2}, high functionality [4]

Impact Strength: 7.5 J/25.4 mm (5 ftlb.in^{-1}, high functionality [4]

Electrical Properties:

Electrical Properties General: Very good insulator
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.9	[5,7]

Dielectric Strength:

No.	Value	Note
1	60 kV.mm^{-1}	1500 Vmil^{-1}, 0.25 mm thickness [5,7]

Dissipation Power Factor: tan δ 0.002 [5,7]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.418	low functionality
2	1.425	high functionality [1,2,3]

Polymer Stability:

Polymer Stability General: Stable at high temps.
Thermal Stability General: Usable from -100–250° [6,10]
Upper Use Temperature:

No.	Value
1	250°C

Flammability: Inherently self-extinguishing
Environmental Stress: Outstanding weather resistance. Unaffected by sunlight or H_2O. Excellent radiation resistance [6,10]
Chemical Stability: Attacked by strong acids. Unaffected by alkali or weak acid. Degraded by chlorinated hydrocarbons, aromatic hydrocarbons, ketones and esters. Alcohols and aliphatic hydrocarbons have little effect [6,10]
Hydrolytic Stability: Fully stable to cold H_2O; poor resistance to steam [6]
Biological Stability: Non-biodegradable [9]
Recyclability: Not recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Dichlorodimethylsilane and trichloromethylsilane in toluene are hydrolysed to form a branched copolymer which remains dissolved. Further polym. occurs on heating with zinc octoate at 150–200°. After application of the resin, cure occurs, with a catalyst such as zinc octoate, usually at elevated temp. [4,8]
Applications: Used for heat resistant enamels, varnishes and coatings. Mixed with glass fibre it can be used in moulding compds. or as a laminate with thin glass sheets. It can be modified and cured with acyloxysilanes to form room temp. vulcanising flexible resins. Important use as insulator and dielectric in electric industry

Methyl silicone rubber, One part room temp. vulcanised M-13

Synonyms: *Silicone elastomer, One part room temp. vulcanised. One part room temp. vulcanised methyl silicone rubber*
Related Polymers: Methylsilicone rubber, Room temp. vulcanised, Methylsilicone rubber, Two part room temp. vulcanised, Dimethiconol
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
63394-02-5	elastomer
31900-57-9	PDMS
31692-79-2	dimethiconol

Molecular Formula: [C_2H_6OSi]
Fragments: C_2H_6OSi
Additives: Finely divided silica is usually incorporated as a reinforcer to improve mech. props.
General Information: Silanol groups are present in pre-cure gum. During cure they form cross links through condensation. Fully cured elastomer has few free silanol groups

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18–1.48 g/cm^3	filler dependent [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00035 K^{-1}	[5]	L
2	0.0008 K^{-1}	[2]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal (cm s °C)$^{-1}$ [2]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu (lb °F)$^{-1}$ [4]	P

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 $J^{1/2}$ $cm^{-3/2}$ (7.5–7.6 $cal^{1/2}$ $cm^{-3/2}$) [6,7]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [6,7,8]. Vulcanised rubber swollen by solvents rather than dissolved
Surface and Interfacial Properties General: Good adhesion to many surfaces. Can be used as adhesive peel; adhesion can be as high as 2.5 J cm^{-2} (140 ppi) [1,5,9]

Mechanical Properties:

Mechanical Properties General: Mech. props. are inferior to those of heat vulcanised methyl silicone rubber see methyl silicone rubber, heat vulcanised
Tensile Strength Break:

No.	Value	Note	Elongation
1	2.4 MPa	350 psi, 25° [1]	400

Hardness: Shore A33 [1]
Fracture Mechanical Properties: Tear strength 0.9 J cm^{-2} (50 ppi, 25°) [1]

Electrical Properties:

Electrical Properties General: See methyl silicone rubber, room temp. vulcanised

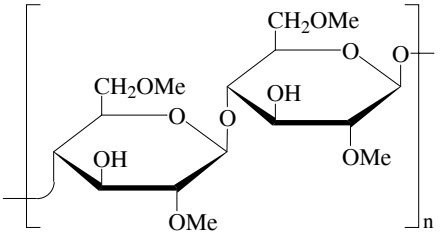
Optical Properties:

Optical Properties General: See methyl silicone rubber, room temp. vulcanised

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethiconol gum is cured at room temp. with alkoxysilane cross-linking agent and metal salt catalyst. It is supplied mixed with cross-linking agent and catalyst and undergoes cure only when exposed to atmospheric moisture
Mould Shrinkage (%):

No.	Value
1	0.6%



Applications: Used as sealant, encapsulant, coating and adhesive valued for the ease of vulcanisation. It is important in the construction and electronics industries

Methylcellulose M-14

Synonyms: *Permethylcellulose*
Related Polymers: Cellulose II
Monomers: Base monomer unit glucose
Material class: Polysaccharides
Polymer Type: cellulosics
CAS Number:

CAS Reg. No.
9004-67-5

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.39 g/cm^3	film [1,2]

Melting Temperature:

No.	Value	Note
1	290–305°C	film [1,2]

Glass-Transition Temperature:

No.	Value	Note
1	150°C	[7]

Transition Temperature:

No.	Value	Note	Type
1	48°C	soln. [1,2]	Gelation temp.

Surface Properties & Solubility:

Solubility Properties General: Solubility - cold 4–8% NaOH: 0.1–0.4 [4]; hot 4–8% NaOH: 0.4–0.6 [4]; cold water: 1.3–2.6 [4]; organic solvents: 2.5–3 [4]
Surface and Interfacial Properties General: Interfacial tension 19–23 mN m^{-1} (25°, 1% soln.) [1,2]
Surface Tension:

No.	Value	Note
1	47–53 mN/m	(25°, 1% soln.) [1,2]

Transport Properties:

Polymer Solutions Dilute: Viscosity 10000–15000 MPa s (soln.) [6]
Permeability of Gases: Transmission rate (film) [H_2O 540 nmol m^{-2} s^{-1} (37°, 90–100% relative humidity) [1,2]; [O_2] 200 nmol m^{-2} s^{-1} (24°) [1,2]
Water Absorption:

No.	Value	Note
1	2–6.5 %	24h, ASTM D570 [1,2]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	3300 MPa	3.3 × 10^{10} dyn cm^{-2} [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	58.7–78.6 MPa	24°, 50% relative humidity, film [1,2]	10–15%

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.49	film [1,2]

Transmission and Spectra: 55% transmission (400 nm), 49% transmission (290 nm), 26% transmission (210 nm) [1,2]

Polymer Stability:

Flammability: Charring temp. 290–305° (film) [1,2]
Environmental Stress: The film is stable to uv after 500h exposure [1,2]
Chemical Stability: Excellent resistance to oils and solvents [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Alkali cellulose is alkylated with methyl chloride
Applications: Thickener for cements, foods, cosmetics, and coatings. Binder and emulsifier for pharmaceutical preps., adhesives and binder for ceramics

Methylphenylsilicone rubber, Heat vulcanised M-15

Synonyms: *Phenyl methyl silicone rubber, Heat vulcanised. Methyl phenyl based silicone elastomer*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Vinyl methyl phenyl silicone rubber, Heat vulcanised
Monomers: Dichlorodimethylsilane, Dichloromethylphenylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones

CAS Number:

CAS Reg. No.
156048-35-0

Molecular Formula: $[(C_2H_6OSi).(C_7H_8OSi)]_n$
Fragments: C_2H_6OSi C_7H_8OSi
Additives: Finely divided silica is incorporated as a reinforcer to improve mech. props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15 g/cm^3	[5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0009 K^{-1}	90% dimethyl siloxane, 10% methyl phenyl siloxane [1]	V
2	0.00075 K^{-1}	60% dimethyl siloxane, 40% methyl phenyl siloxane	V

Thermal Conductivity:

No.	Value	Note
1	0.25–0.3 W/mK	0.0006–0.0007 cal (cm s °C)$^{-1}$ [12,13]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu $lb^{-1}°F^{-1}$ [5]	P

Melting Temperature:

No.	Value	Note
1	-77°C	60% dimethyl siloxane, 40% methyl phenyl siloxane [1,10]

Glass-Transition Temperature:

No.	Value	Note
1	-112°C	90% dimethyl siloxane, 10% methyl phenyl siloxane [1]
2	-96°C	60% dimethyl siloxane, 40% methyl phenyl siloxane [1]
3	-84°C	60% dimethyl siloxane, 40% methyl phenyl siloxane [10]

Transition Temperature General: The addition of small amounts of methyl phenyl siloxane as a copolymer with dimethyl siloxane sharply lowers the stiffening temp. and improves low temp. elastic props. This involves loss of a clearly defined T_m. Increases in methyl phenyl siloxane content cause a deterioration of low temp. props. either by restoration of T_m or sharp rise in T_g [1,10]. For transitions of high phenyl content silicone rubber see phenyl silicone rubber (HV)
Transition Temperature:

No.	Value	Note	Type
1	-109°C	90% dimethyl siloxane, 10% methyl phenyl siloxane [1]	Stiffening

2	-70°C	60% dimethyl siloxane, 40% methyl phenyl siloxane [1]	Stiffening

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16–17 $J^{1/2}$ $cm^{-3/2}$ (7.7–8.2 $cal^{1/2}$ $cm^{-3/2}$) [7]. Value increases with amount of phenyl substitution
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters, ethers. Insol. alcohols, H_2O
Surface and Interfacial Properties General: Exhibits generally low surface adhesion [4]

Transport Properties:

Transport Properties General: Gas permeability falls sharply as amount of phenyl substitution rises [2]
Polymer Melts: Kinematic viscosity 100000 St (approx. pre-cure gum) [9]
Permeability of Gases: [O_2] 0.034 (25°, 5% phenyl); [N_2] 0.15 (25°, 5% phenyl); [O_2] 0.0095 (25°, 20% phenyl); [CO_2] 0.055 cm^2 s^{-1} GPa^{-1} (25°, 20% phenyl) [2]

Mechanical Properties:

Mechanical Properties General: Mech. props. deteriorate at high temp. Silicone rubber [4] containing phenyl for use at high temps. must incorporate some methyl vinyl groups see vinyl methyl phenyl silicone rubber (HV)
Tensile Strength Break:

No.	Value	Note	Elongation
1	6.9 MPa	1000 psi, 25°, filled [3,5]	500%

Viscoelastic Behaviour: Compression set at 150° and 22h may be as high as 50% for filled high phenyl rubber [6]
Hardness: Shore A50 [5]
Fracture Mechanical Properties: Tear strength 2 J cm^{-2} (110 psi, 25°, filled) [5]

Electrical Properties:

Electrical Properties General: Exhibits excellent insulating props. but is inferior to dimethyl silicone rubber
Dielectric Permittivity (Constant):

No.	Value	Note
1	3	approx. [8,11]

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	500 V mil^{-1} [5]

Optical Properties:

Transmission and Spectra: No transmission below 290 nm [4,6]

Polymer Stability:

Polymer Stability General: Retains elastic props. down to low temp. [6]
Thermal Stability General: Usable from -100° to 260°
Upper Use Temperature:

No.	Value
1	260°C

Decomposition Details: Oxidation temp. in dry air 300–350° (rises with rise in phenyl substitution) [6]
Environmental Stress: Resistant to oxidative degradation, water, weathering, ozone and corona. Uv radiation has no effect. Very resistant to high energy radiation (radioactivity) [4]
Chemical Stability: Vulcanised rubber is swollen rather than dissolved e.g. swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. sulfuric acid. Relatively unaffected by weak alkali, weak acids and alcohols [9]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam or acid catalysis [4]
Stability Miscellaneous: Stability to solvents reduced by phenyl incorporation [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethyl- and methylphenyl-cyclic polysiloxanes are polymerised together at 150–200° with an alkaline catalyst and traces of hexamethyldisiloxane. Organic peroxide, typically benzoyl peroxide, is used at 1–2 parts per 100 rubber to cure the gum to an elastomer. The rubber is cured at 110–200° under pressure, typically for less than an hour. It is often post cured for several hours at temps. of 200–250°
Applications: Used for low temp. applications. Used for coatings, pads and belts

Trade name	Details	Supplier

CAS Reg. No.	Note
9016-00-6	
63394-02-5	elastomer

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi

Additives: Usually filled with finely divided silica incorporated as a reinforcer to improve mech. props.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[17]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0003 K^{-1}	[8]	L
2	0.00095 K^{-1}	[14]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal (cm s °C)$^{-1}$ [8]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu (lb °F)$^{-1}$ [17]	P

Melting Temperature:

No.	Value	Note
1	-54°C	[14]

Glass-Transition Temperature:

No.	Value	Note
1	-123°C	[14,21]

Brittleness Temperature:

No.	Value	Note
1	-65°C	-85°F [6]

Transition Temperature:

No.	Value	Note
1	-38°C	Stiffening temp. related to T_m rather than T_g [14]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 J$^{1/2}$ cm$^{-3/2}$ (7.5–7.6 cal$^{1/2}$ cm $^{-3/2}$; δ_d 15.9; δ_p 0.0; δ_h 4.1 J$^{1/2}$ cm$^{-3/2}$ [2,10,12,15]
Solvents/Non-solvents: Sol. chlorinated hydrocarbons, aromatic hydrocarbons, aliphatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [2,10,11,12]. Vulcanised rubber swollen by solvents rather than dissolved [12]
Surface and Interfacial Properties General: Generally low surface adhesion [3]

Transport Properties:

Transport Properties General: Silicone rubber is ten times more permeable to gases than other rubbers. The solubility of gases in polysiloxanes is similar to that for other polymers but the diffusion coefficients are much higher [13,16,22]
Polymer Melts: Viscosity 100000 St (approx., pre-cure gum) [2]
Permeability of Gases: Other gas permeability values have been reported [13]

Water Absorption:

No.	Value	Note
1	35 %	7 days, 25° [2,3]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	61266 cm^3 mm/(m^2 day atm)	9.33 × 10^{-8} cm^2 (s cmHg)$^{-1}$ [24]
2	CO_2	298977 cm^3 mm/(m^2 day atm)	45.53 × 10^{-8} cm^2 (s cmHg)$^{-1}$ [24]

Mechanical Properties:

Mechanical Properties General: Silicone rubber displays commercially acceptable tensile strength only when vulcanised and mixed with a reinforcing filler (usually finely divided silica). The mech. props. of silicone rubber are generally inferior to those of other rubbers. Silicone elastomers are used when their other advantages outweigh this [4,8,9]

Tensile (Young's) Modulus:

No.	Value	Note
1	1 MPa	25°, 150 psi, filled [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.35 MPa	0.035 kgf mm^{-2}, unfilled [2]	
2	6.2 MPa	25°, 900 psi, filled [5,8,18]	500%

Viscoelastic Behaviour: Compression set 40% at 175° and 22h compression (filled). Compression set at room temp. <10%. Compression set 20% at 175° and 22h compression (filled low shrinkage rubber) [4]
Hardness: Shore A50–A60 [17]
Fracture Mechanical Properties: Tear strength 1.6 J cm^{-2} (90 psi, 25°, filled) [6]

Electrical Properties:

Electrical Properties General: Silicone rubber has excellent insulating props. [3,7]
Surface/Volume Resistance:

No.	Value	Note	Type
1	0.1 × 10^{15} Ω.cm	dry, filled [8]	S

Dielectric Permittivity (Constant):

No.	Value	Note
1	3	filled [3]
2	2.7	unfilled [2]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	500 V mil^{-1} [7,11]

Arc Resistance:

No.	Value	Note
1	200–250s	[18]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.003	60 Hz	filled [7,8]
2	0.00024	60 Hz	unfilled [2]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.404	[2]

Transmission and Spectra: Absorption maximum at 290 nm [3]

Polymer Stability:

Polymer Stability General: Stable material [1]
Thermal Stability General: Usable from -60–260°
Upper Use Temperature:

No.	Value
1	260°C

Decomposition Details: Oxidation temp. 290° (dry air), CO produced [1,23]
Flammability: Limiting oxygen index 20% (approx.) [1]
Environmental Stress: Resistant to oxidative degradation, H_2O, weathering, ozone and corona. Unaffected by uv radiation
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. H_2SO_4. Relatively unaffected by weak alkali, weak acids, alcohols and oils (except silicone oil)
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam [3]
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam or by acid catalysis [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: An organic peroxide, typically benzoyl peroxide, is used at 1–2 parts per 100 rubber to cure the gum to an elastomer. The rubber is cured at 100–200° under pressure, typically for less than an hour, often post-cured for several hours at temps. of 200–250°. Cyclic dimethylpolysiloxanes are polymerised at 150–200° with an alkaline catalyst. Small quantities of hexamethyldisiloxane are added to terminate the siloxane chains. Siloxane rubbers can be cured by exposure to high energy electrons (e.g. from a β-radiation source, *ca.* 10 Mrep). Curing will occur at room temp. leaving no residual catalyst. To reduce mould shrinkage, low MW siloxanes can be removed by solvent extraction or thermal treatment. In solvent extraction volatile siloxanes are removed by washing in MeOH. In thermal treatment the gum is steam or air stripped at 250°, reducing the volatile fraction from around 10% by weight to less than 2%
Mould Shrinkage (%):

No.	Value	Note
1	2–4%	standard
2	0.5%	low shrinkage

Applications: Used where good temp. props. and stability are important. Used as encapsulants, coatings, electrical cable insulation, pads and belts, in electronic and plastic fabrication and in insulating tapes. Used in aircraft engines, gas turbines, autoclaves, irons and ovens. Important use as electrical insulant. Used in medical tubing and for vacuum seals. Important in aircraft and aerospace industry. Used in cosmetic surgery but there are doubts over safety. Radiation curing produces more stable cross links than peroxide vulcanisation and a product free from peroxide residues. The process has not been widely adopted commercially and is used in the laboratory to vulcanise PDMS without chemicals. Low shrinkage gums are used in the manufacture of precision gaskets and other applications where low shrinkage is important.

Methylsilicone rubber, Room temp. vulcanised M-17

Synonyms: *Silicone elastomer, Room temp. vulcanised. α-Hydro-w-hydroxy-poly[oxy(dimethylsilylene)]*
Related Polymers: Dimethiconol, Methylsilicone rubber, Two part room temp. vulcanised, Methylsilicone rubber, One part room temp. vulcanised, Nitrilemethylsilicone rubber, Room temp. vulcanised, Fluoromethylsilicone rubber, Room temp. vulcanised
Monomers: Hexamethylcyclotrisiloxane, Dichlorodimethylsilane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones

CAS Number:

CAS Reg. No.	Note
63394-02-5	elastomer
31900-57-9	PDMS
31692-79-2	dimethiconol

Molecular Formula: $[C_2H_6OSi]$
Fragments: C_2H_6OSi
Molecular Weight: MW 10000–100000 (pre-cure gum)
Additives: Finely divided silica is usually incorporated as a reinforcer to improve mech. props.
General Information: Silanol groups are present in the pre-cure gum. During cure they form cross links through condensation and fully cured elastomer has few free silanol groups

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18–1.48 g/cm^3	filler dependent [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00035 K^{-1}	[9]	L
2	0.00018 K^{-1}	[11]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal (cm s °C)$^{-1}$ [9,11,14]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu (lb °F)$^{-1}$ [8]	P

Melting Temperature:

No.	Value	Note
1	-54°C	[10]

Glass-Transition Temperature:

No.	Value	Note
1	-123°C	[10]

Transition Temperature General: T_m and T_g are nearly constant for dimethylsilicone rubbers. Brittleness and stiffening temps. vary with precise mech. props.
Brittleness Temperature:

No.	Value	Note
1	-65°C	-85°F [12]

Transition Temperature:

No.	Value	Note	Type
1	-38°C	[10]	S

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 J$^{1/2}$ cm$^{-3/2}$ (7.5–7.6 cal$^{1/2}$ cm$^{-3/2}$); δ_d 15.9; δ_p 0.0; δ_h 4.1 J$^{1/2}$ cm$^{-3/2}$
Internal Pressure Heat Solution and Miscellaneous: Swelling agents have been reported [2]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [4,5,7]. Vulcanised rubber swollen by solvents rather than dissolved

Transport Properties:

Transport Properties General: Silicone rubber is ten times more permeable than other rubbers to gases. The solubility of gases in polysiloxanes is similar to that for other polymers but the diffusion coefficients are much higher [3]
Polymer Melts: Viscosity has been reported [1]
Permeability of Gases: Permeability of gases has been reported [3]

Mechanical Properties:

Mechanical Properties General: As with heat vulcanised silicone rubber, good mech. props. depend on a reinforcing filler (usually silica) [1]. Under laboratory conditions room temp. vulcanised silicone rubber can have a tensile strength comparable to heat vulcanised silicone rubber. Commercial room temp. vulcanised silicone rubber, particularly one component room temp. vulcanised, has a lower strength [1]
Tensile Strength Break:

No.	Value	Note	Elongation
1	0.08 MPa	0.8 kg cm^{-2}, 30°, unfilled [2]	320%
2	4 MPa	40 kg cm^{-2}, high filler loading [2]	120%

Electrical Properties:

Electrical Properties General: Room temp. vulcanised silicone rubber has excellent insulating props. nearly as good as heat vulcanised rubber see methylsilicone rubber (heat vulcanised)
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.6	[1,12,13]

Dielectric Strength:

No.	Value	Note
1	20 kV.mm^{-1}	500 V mil^{-1} [1,8,12,13]

Arc Resistance:

No.	Value	Note
1	90–125s	[11]

Dissipation (Power) Factor:

No.	Value	Note
1	0.015	[1,12]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.404	[7]

Transmission and Spectra: Absorption maximum at 290 nm [1]

Polymer Stability:

Polymer Stability General: Stable, but less so than heat vulcanised silicone rubber
Thermal Stability General: Usable from -60–260° [8,9]
Upper Use Temperature:

No.	Value
1	200°C
2	260°C

Decomposition Details: Oxidation temp. 290° (dry air), CO is produced [9,14]
Flammability: Limiting oxygen index 20% (approx.) [9]
Environmental Stress: Resistant to oxidative degradation, H_2O, weathering, ozone and corona. Unaffected by uv radiation
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. sulfuric acid. Relatively unaffected by weak alkali, weak acids, alcohols and oils (except silicone oil) [7]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Reclaimable in theory by depolymerisation; not reclaimed in practice [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethiconol chains are formed by polymerisation of cyclic dimethyl siloxane at 150–200° with alkaline catalysis in the presence of small quantities of water. Dimethiconol gum cures at room temp. with alkoxysilane cross-linking agent and metal salt catalysis. Cross-linking requires moisture
Mould Shrinkage (%):

No.	Value
1	0.6%

Applications: Used as a sealant, encapsulant and coating. Important as flexible rubber mould. Of use in construction, aerospace and automobile industries. Valued for ease of vulcanisation. Important in electronics industry

2	-96°C	60% dimethylsiloxane, 40% methylphenylsiloxane [2]
3	-84°C	60% dimethylsiloxane, 40% methylphenylsiloxane [8]

Transition Temperature General: For transitions of low phenyl content silicone rubber see methylphenylsilicone rubber (heat vulcanised). For transitions of high phenyl content silicone rubber see phenylsilicone rubber heat vulcanised
Transition Temperature:

No.	Value	Note
1	-109°C	Stiffening temp. (90% dimethylsiloxane, 10% methylphenylsiloxane) [2]
2	-70°C	Stiffening temp. (60% dimethylsiloxane, 40% methylphenylsiloxane) [2]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 16–17 J $^{1/2}$ cm$^{-3/2}$ (7.7–8.2 cal$^{1/2}$ cm$^{-3/2}$ (increases with phenyl substitution) [7]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters, ethers [5]. Insol. alcohols, H_2O [6]. Vulcanised rubber swollen by solvents rather than dissolved [7]
Surface and Interfacial Properties General: Exhibits generally low surface adhesion [4]

Transport Properties:

Polymer Melts: Viscosity has been reported [3]
Permeability of Gases: Gas permeability falls sharply as phenyl substitution rises [1]
Gas Permeability:

No.	Gas	Value	Note
1	H_2	12256 cm^3 mm/(m^2 day atm)	0.014 cm^2 (s GPa)$^{-1}$, 25°, 20% methylphenylsiloxane, 80% dimethylsiloxane [1]
2	O_2	8317 cm^3 mm/(m^2 day atm)	0.0095 cm^2 (s GPa)$^{-1}$, 25°, 20% methylphenylsiloxane, 80% dimethylsiloxane [1]
3	N_2	3239 cm^3 mm/(m^2 day atm)	0.0037 cm^2 (s GPa)$^{-1}$, 25°, 20% methylphenylsiloxane, 80% dimethylsiloxane [1]
4	O_2	2977 cm^3 mm/(m^2 day atm)	0.034 cm^2 (s GPa)$^{-1}$, 25°, 5% methylphenylsiloxane, 95% dimethylsiloxane [1]
5	N_2	13131 cm^3 mm/(m^2 day atm)	0.015 cm^2 (s GPa)$^{-1}$, 25°, 5% methylphenylsiloxane, 95% dimethylsiloxane [1]

Mechanical Properties:

Mechanical Properties General: Soft elastomer, when used for protecting delicate instruments, requires reinforcing filler to possess acceptable mech. props. [3]
Tensile Strength Break:

No.	Value	Note	Elongation
1	6.2 MPa	63 kg cm^{-2} [3]	150%

Hardness: Shore A45 [3]
Fracture Mechanical Properties: Tear strength 0.4 J cm^{-2} (4 kg cm^{-1}) [3]

Electrical Properties:

Electrical Properties General: Has excellent insulating props.
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.8–3.1	1 kHz	[3,9,10]

Dielectric Strength:

No.	Value	Note
1	19.7 kV.mm^{-1}	[3,9]

Optical Properties:

Transmission and Spectra: No transmission below 290 nm [4,6]

Polymer Stability:

Polymer Stability General: Has good low temp. props.
Thermal Stability General: Usable from -100–260° [6]
Upper Use Temperature:

No.	Value
1	260°C

Decomposition Details: Oxidation temp. 300–350° (dry air; increases with increase in phenyl substitution) [6]
Environmental Stress: Resistant to oxidative degradation, H_2O, weathering, ozone and corona. Unaffected by uv radiation. Very resistant to high energy radiation (radioactivity) [4]
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. H_2SO_4. Relatively unaffected by weak alkali, weak acids and alcohols [4,5]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam [5]
Biological Stability: Non biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Reclaimable in theory by depolymerisation. Not reclaimed in practice [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethyl- and methylphenyl-cyclic polysiloxanes are polymerised together at 150–200° with alkaline catalysis in the presence of small quantities of water. Phenyl dimethiconol gum cures at room temp. with alkoxysilane cross-linking agent and metal salt catalysts. Cross-linking requires moisture
Applications: Used as an encapsulant particularly in low temp. applications. Used particularly in the electronics industry

Synonyms: *Silicone elastomer, Two part room temp. vulcanised. Two part room temp. vulcanised methylsilicone rubber. α-Hydro-w-hydroxypoly[oxy(dimethylsilylene)]*

Related Polymers: Methylsilicone rubber, Room temp. vulcanised, Methylsilicone rubber, One part room temp. vulcanised, Dimethiconol, Methylsilicone rubber, Heat vulcanised
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Synthetic Elastomers
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.	Note
63394-02-5	elastomer
31900-57-9	PDMS
31692-79-2	dimethiconol

Molecular Formula: $[C_2H_6OSi)_n$
Fragments: C_2H_6OSi
Additives: Finely divided silica is usually incorporated as a reinforcer to improve mech. props.
General Information: Silanol groups are present in the pre-cure gum. During cure cross links are formed through condensation. Fully cured elastomer has few free silanol groups

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.18–1.48 g/cm^3	filler dependent [5]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00035 K^{-1}	[3]	L
2	0.0008 K^{-1}	[4]	V

Thermal Conductivity:

No.	Value	Note
1	0.3 W/mK	0.0007 cal (cm s °C)$^{-1}$

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu (lb °F)$^{-1}$ [6]	P

Transition Temperature General: See methylsilicone rubber, room temp. vulcanised

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 15.5 J $^{1/2}$ cm$^{-3/2}$ (7.5–7.6 cal $^{1/2}$ cm$^{-3/2}$) [1,2]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons. Mod. sol. ketones, esters, ethers. Insol. alcohols, H_2O [1,2,8]. Vulcanised rubber swollen by solvents rather than dissolved
Surface and Interfacial Properties General: Low adhesion to most surfaces. Some commercial forms have primer added to increase adhesion [3,9]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	4.2 MPa	42.2 kg cm^{-2}, 25° [3,7]	400%

Hardness: Shore A30–A60 [3,7]
Fracture Mechanical Properties: Tear strength 0.3–2.5 J cm^{-2} (3–26 kg cm^{-1}) [3,7]

Electrical Properties:

Electrical Properties General: See methyl silicone ruuber, room temp. vulcanised

Optical Properties:

Optical Properties General: See methyl silicone rubber, room temp. vulcanised

Applications/Commercial Products:

Processing & Manufacturing Routes: Dimethiconol gum is cured at room temp. with alkoxysilane cross-linking agent and metal salt catalyst. It is supplied lacking cross-linking agent and/or catalyst. Undergoes cure when missing ingredients are added
Mould Shrinkage (%):

No.	Value
1	0.6%

Applications: Used as sealant, encapsulant and coating. It is important in the construction industry and as a flexible rubber mould

Modacrylic fibres M-20

Related Polymers: Polyacrylonitrile, Acrylic fibres
Monomers: Vinylidene chloride, Acrylonitrile, Vinyl chloride, Vinyl bromide
Material class: Fibres and Films, Thermoplastic, Copolymers
Polymer Type: acrylic, acrylonitrile and copolymers
Additives: Antimony compounds, tin halides and phosphorus compounds as flame retardants.
General Information: Modacrylic fibres are manufactured using 35–85% acrylonitrile monomer. The commonest comonomers include vinyl chloride, vinylidene chloride and vinyl bromide
Morphology: Crystallinity and crystal size vary with copolymer composition and also with spinning method and conditions [5,6]
Miscellaneous: Modacrylic fibres are soft, resilient, easily dyed, abrasion resistant, flame resistant, resistant to acid/alkali attack, shape retentive and quick drying

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.28–1.37 g/cm^3	[2]

Transition Temperature General: The presence of moisture lowers T_g [2]

Transport Properties:

Water Absorption:

No.	Value	Note
1	1.5–3.5 %	[2]

Mechanical Properties:

Mechanical Properties General: Wet conditions do not severely affect mech. props. The effect of drawing rate, polymer content, and composition on mech. props. of wet-spun acrylonitrile/vinylidene chloride copolymers has been reported. [3,5,6] Tenacity 0.13–0.25 N tex^{-1} (45–60% elongation, dry), 0.11–0.23 N tex^{-1} (45–65% elongation, wet), 0.11–0.19 N tex^{-1} (loopknot), [2] 0.13–0.32 N tex^{-1} (acrylonitrile/vinylidene chloride (50/50), 13.7–14.2% elongation), 0.17–0.3 N tex^{-1} (acrylonitrile/vinylidene chloride (50/50), 7% antimony oxide, 13.5–19.7% elongation) [3], 0.13–0.33 N tex^{-1} (acrylonitrile/vinylidene chloride), 27% chlorine content, MW 640000, 13–18.2% elongation). [5] Average modulus 0.34 N tex^{-1} (dry) [2]
Viscoelastic Behaviour: Elastic recovery 99–100% (2% stretch); 95% (10% stretch)
Failure Properties General: Crease recovery is an important factor for fibres with a flat or rectangular cross-section. Flat fibres generally have the best crease recovery but this is a difficult property to control for modacrylic fibres and so variation of denier is used to give the required crease recovery [6]

Electrical Properties:

Electrical Properties General: Fibres have high electrical resistance [2]
Static Electrification: Fibres have moderate static build-up [2]

Polymer Stability:

Decomposition Details: The first weight loss, occurring at 285–308°, is due to dehydrohalogenation [4]
Flammability: Has low flammability [2]. The halogenated copolymers generally used for modacrylic fibre have good flame-retardant props. When burnt modacrylic fibres melt to give a dark, hard material. Some burning takes place but ceases when the applied flame is removed. [1,3,5] Finer fibres have a higher limiting oxygen index. The incorporation of antimony oxide can improve the limiting oxygen index. Limiting oxygen index 27% [2], 43.8% (acrylonitrile/vinylidene chloride (50/50)) 44.7–50.0% (acrylonitrile/vinylidene chloride (50/50), 7% antimony oxide) [3], 49–50% (acrylonitrile/vinylidene chloride, 33% chlorine content), 41–42% (acrylonitrile/vinylidene chloride, 22.1% chlorine content), 37–38% (acrylonitrile/vinylidene chloride, 8.6% chlorine content) [5]
Environmental Stress: Has excellent resistance to sunlight [2]
Chemical Stability: Has excellent resistance to chemical attack [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: The polymers or copolymers used for modacrylic fibre production can be made by anionic methods but radical polymerisation is more commonly used. Modacrylic fibres can be dry spun or wet spun and can be used in staple or tow form. The effect of polymer content, MW and composition on the selection of spinneret has been investigated for wet-spun acrylonitrile/vinylidene chloride copolymers. Their low softening temp. permits them to be stretched, moulded or embossed. Modacrylic fibres can lose lustre on heating in a moist atmosphere, perhaps during dyeing. Improvements in spinning and aftertreatment have helped lustre stability and lustre stabilisers can be added. Relustering can be achieved by dry heat treatment [1,5,6]
Applications: Applications due to low flammability in clothing (simulated fur, deep-pile coats), in trims and linings, wigs, knitwear, children's wear; in furnishings (blankets, carpets, awnings), in filters, fabrics, paint rollers and stuffed toys

Natural balata N-1

Synonyms: *trans-1,4-Polyisoprene. trans-Polyisoprene. Balata rubber*
Related Polymers: *trans*-1,4-Polyisoprene, Chicle, Jelutong, Gutta percha
Monomers: 2-Methyl-1,3-butadiene
Material class: Thermoplastic, Gums and resins
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9005-99-6

Molecular Weight: MW and MW distribution have been determined for balata and related polymers
Additives: Contains 35–50% resin
General Information: Isol. from S. American trees, *Mimusop* and *Eulinisu* sp. Produced as a substitute for gutta-percha. Has inferior props. to pure *trans*-1,4-polyisoprene, due to larger quantities of resin contaminants. Isol., production and usage have been reported [4,5,6,9]
Morphology: Two cryst. forms known, α and β

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	64°C	β-form
2	74°C	α-form

Glass-Transition Temperature:

No.	Value	Note
1	-70°C	[1]
2	-58°C	raw polymer [15]
3	-55°C	vulcanised [15]

Transition Temperature General: α and β transition temps. depend on rate of cooling and sample thermal history [8]

Transport Properties:

Polymer Solutions Dilute: Limiting viscosity number 1.1 (100 ml g^{-1} toluene) [10]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note
1	24.6 MPa	3580 psi [10]

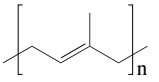
Failure Properties General: Resilience has been reported from -70–200°; decreases rapidly above 30° [11]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [2,15]

Polymer Stability:

Decomposition Details: Pyrolysis under vacuum yields 50% isoprene, 13% dipentene, 13% methane, 6% cyclopentadiene, 4% propene, 4% ethane and 7% cyclopentadiene [7]. Other pyrolysis studies have been reported [12]



Applications/Commercial Products:

Processing & Manufacturing Routes: Isol. from latex taken by bark slashing of *Mimusop balata* or *Eulinisa* sp.
Applications: Used for golf ball covers

Natural rubber N-2

Synonyms: *cis-1,4-Polyisoprene. Hevea guianensis. Tree rubber. Poly(2-methyl-1,3-butadiene). Poly(1,3-butadiene-2-methyl). Rubber*
Related Polymers: *cis*-1,4-Polyisoprene, Epoxidized natural rubber, Ebonite, Rubber hydrochloride, Guayule rubber
Monomers: 2-Methyl-1,3-butadiene
Material class: Natural elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9006-04-6

Additives: Vulcanised by sulfur, organic peroxides, urethane
General Information: Natural rubber has nearly 100% *cis*-1,4 microstruct. can be isomerised, cyclised, hydrogenated, halogenated and alkylhalogenated. Contains antioxidants, carbohydrates, triglycerides, proteins and resins
Morphology: Typically 30–35% cryst. [70]. Effects of cross-linking on crystallisation have been reported [72]. Faster crystallisation rate, increased by presence of additives such as stearic acid [92]
Miscellaneous: Bimodal

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.913 g/cm^3	unvulcanised [1]
2	d 0.95 g/cm^3	0°, unvulcanised [33]
3	d 0.934 g/cm^3	20°, unvulcanised [33]
4	d 0.95 g/cm^3	vulcanised [48]
5	d 0.97 g/cm^3	vulcanised [17]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00067 K^{-1}	unvulcanised [1]	V
2	0.00062 K^{-1}	unvulcanised [33]	V
3	0.0066 K^{-1}	vulcanised [1]	V
4	0.0067 K^{-1}	vulcanised [48]	V

Volumetric Properties General: Density values have been calculated [9]
Equation of State: Tait equation of state parameters have been reported [9]
Thermodynamic Properties General: Heat of combustion 45.2 kJ g^{-1} (unvulcanised) [1,33]; ΔH_{fusion} 4.64 kJ mol^{-1} (unvulcanised) [6]; 44.4 kJ g^{-1} (vulcanised) [1]
Thermal Conductivity:

No.	Value	Note
1	0.134 W/mK	unvulcanised [1]
2	0.13 W/mK	unvulcanised
3	0.151 W/mK	vulcanised [113]
4	0.153 W/mK	vulcanised [20,21]
5	0.15 W/mK	vulcanised [48]

Thermal Diffusivity: 7×10^{-8} m^2 s^{-1} (vulcanised) [22]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.905 kJ/kg.C	unvulcanised [34]	P
2	0.502 kJ/kg.C	unvulcanised [33]	P
3	1.828 kJ/kg.C	vulcanised [19,48]	P

Melting Temperature:

No.	Value	Note
1	35°C	unvulcanised, cryst. [5]
2	40°C	vulcanised [23]

Glass-Transition Temperature:

No.	Value	Note
1	-72°C	unvulcanised [2,34]
2	-70°C	unvulcanised [32]
3	-70°C	vulcanised [48]
4	-63°C	unvulcanised [48]
5	-68°C	dry, vulcanised [78]
6	-78°C	swollen, vulcanised [78]

Transition Temperature General: Melting temp. for unvulcanised rubber varies with crystallisation temp. [68,69]. 1% Cross-linking depresses melt temp. by 20° [71]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy density 266.5 J cm^{-3} (unvulcanised) [35]. Solubility parameter δ 15.2 $J^{1/2}$ $cm^{-3/2}$ (calc., unvulcanised) [36], 16.2 $J^{1/2}$ $cm^{-3/2}$ (unvulcanised) [37], 16.6-16.7 $J^{1/2}$ $cm^{-3/2}$ (unvulcanised) [38,39], 17.1 $J^{1/2}$ $cm^{-3/2}$ (unvulcanised) [40]. Swelling of vulcanisates has been reported [98]
Solvents/Non-solvents: Unvulcanised sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, esters, ketones, Et_2O, carbon disulfide [66]; insol. aniline, phenol, H_2O, lower esters, alcohols [66]
Wettability/Surface Energy and Interfacial Tension: Contact angles have been reported [88] for ethylene glycol 59.5° (unvulcanised, cut); 63.7° (unvulcanised, cast); 61° (vulcanised); 45.7° (vulcanised, peroxide cure); 81.5° (carbon black)
Adhesion General: Has good adhesion to metals and fabrics [67]

Surface Tension:

No.	Value	Note
1	35 mN/m	unvulcanised, calc. [62]
2	31 mN/m	unvulcanised, Zisman critical surface tension [62]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink constants have been reported [41,42,43,51,52]
Polymer Melts: Melt viscosity 20 MPa s, higher than synthetic polyisoprene, attributed to long-chain branching [115]
Permeability of Gases: Other gas permeability values have been reported [63,64,65]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	1540 cm^3 mm/(m^2 day atm)	1.76×10^{-12} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
2	Ar	1505 cm^3 mm/(m^2 day atm)	1.72×10^{-12} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
3	CO_2	10067 cm^3 mm/(m^2 day atm)	1.15×10^{-11} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
4	CO	1033 cm^3 mm/(m^2 day atm)	1.18×10^{-12} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
5	N_2	622 cm^3 mm/(m^2 day atm)	7.11×10^{-13} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
6	CH_4	1987 cm^3 mm/(m^2 day atm)	2.27×10^{-12} cm^2 (s Pa)$^{-1}$, unvulcanised [24]
7	H_2O	150577 cm^3 mm/(m^2 day atm)	1.72×10^{-10} cm^2 (s Pa)$^{-1}$, unvulcanised [24]

Mechanical Properties:

Mechanical Properties General: Compressibility has been reported [9]. Storage and loss moduli have been reported [14]. Props. of filled, vulcanised materials have been reported [34]. Hysteresis props. have been reported [74,93]. Has good green strength [111]

Tensile (Young's) Modulus:

No.	Value	Note
1	1.3 MPa	vulcanised [26,27]
2	2 MPa	vulcanised [48]

Tensile Strength Break:

No.	Value	Note	Elongation
1	30 MPa	20°, vulcanised [114]	
2	5 MPa	140°, vulcanised [114]	
3	17–25 MPa	vulcanised [25,64]	750-850% elongation
4	20 MPa	vulcanised [67]	
5	18.8 MPa	vulcanised [110]	550% elongation

Flexural Strength at Break:

No.	Value	Note
1	17–30 MPa	650–900% elongation, vulcanised [50]
2	14–28 MPa	450–600% elongation, vulcanised, 50 phv carbon black [50]

Elastic Modulus:

No.	Value	Note
1	0.43 MPa	vulcanised [18,27]
2	2000 MPa	vulcanised [48]

Poisson's Ratio:

No.	Value	Note
1	0.4999	vulcanised [9,28,29,48,80]

Miscellaneous Moduli:

No.	Value	Note	Type
1	1.94 MPa	[9]	Isothermal bulk modulus
2	2.27 MPa	[9]	Adiabatic bulk modulus

Viscoelastic Behaviour: Viscoelastic response behaviour by the Williams-Landel-Ferry equation has been reported [55,56,57,58,59]. Creep 2% (vulcanised) [18,26,108]. Velocity of sound 54 m s^{-1} (vulcanised) [48].
Mechanical Properties Miscellaneous: Stress relaxation moduli have been reported [106]. Resilience 75–77% (unvulcanised) [15,16]; 75–84% (vulcanised) [16,31]. Dynamic mech. props. have been reported for filled and blends [76,97,102]. Tear strength 58 kN m^{-1} (vulcanised) [73]
Hardness: Shore A30–A90 (vulcanised) [67]
Failure Properties General: Stress relaxation has been reported (50–115°) [86]
Friction Abrasion and Resistance: Coefficient of friction 2.3–3.5 (vulcanised, smooth glass) [77,79], 0.53 (chlorinated, vulcanised) [79]. Wear and crack resistance have been reported [103]. Abrasion resistance 29 mg (1000 cycles)$^{-1}$ (Tabor CS-17, ASTM D1044, vulcanised) [17]. Fatigue life in air is improved by antioxidants [81]. Annealing, and other fatigue factors have been reported [85,100]. Wet skid resistance is related to chain flexibility [87]

Electrical Properties:

Electrical Properties General: Addition of carbon black decreases resistivity to 0.02 Ω [94]
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	0.14–0.2		unvulcanised [33]
2	2.37–2.45	1 kHz	unvulcanised [1,8]
3	2.5–3	1 kHz	vulcanised [1,8,98]

Dielectric Strength:

No.	Value	Note
1	0.0039 kV.mm^{-1}	unvulcanised [33]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.001–0.003	1 kHz	unvulcanised [8]
2	0.002–0.004	1 kHz	vulcanised [8]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5191	unvulcanised [7]
2	1.5264	vulcanised [1]

Transmission and Spectra: Ir spectral data have been reported [49,54]

Polymer Stability:

Thermal Stability General: Slightly more resistant to degradation than guayule rubber, and synthetic, isoprene rubber due to the presence of natural antioxidants [83]
Upper Use Temperature:

No.	Value	Note
1	100°C	vulcanised [67]
2	80°C	[61]

Decomposition Details: Undergoes thermo-oxidative degradation by free-radical processes to give main chain scission and low MW products [84]. Accelerated thermal and uv oxidative degradation causes changes in surface composition with the appearance of functional groups, including hydroxyl, ether, carbonyl and carboxyl. Polynuclear aromatics are formed under extreme conditions [83]
Flammability: Limiting oxygen index 17.2% (vulcanised, foam) [60]
Environmental Stress: Has good resistance to oxidation and radiation
Chemical Stability: Is stable to oxygenated hydrocarbons
Hydrolytic Stability: Has good resistance to water and dilute acids (vulcanised). Has fair resistance to steam and conc. base (vulcanised)
Stability Miscellaneous: Intermittent stress relaxation measurements at elevated temps. in oxygen correlate with conventional ageing [109]

Applications/Commercial Products:

Processing & Manufacturing Routes: Isol. as latex from *Hevea brasiliensis* by bark tapping. Coagulated to produce solid material. Hardens during storage and may 'freeze' at low temp. Used either as latex, or dried and smoked to produce sheet, or wasted and milled to produce crepe
Applications: Latex used in adhesives, gloves, contraceptives, carpet backing and tubing. Sheet and crepe used in tyres, belts, flexible mountings, footwear, hoses, seals, matting. May also be blended with other elastomers

Natural rubber/poly(methyl methacrylate) inter-penetrating network N-3

Synonyms: *Natural rubber/PMMA blend. Natural rubber/PMMA/graft-natural rubber blend*
Related Polymers: Natural rubber, Poly(methyl methacrylate), General
Material class: Blends
Polymer Type: polydienes, acrylicpolyisoprene
Morphology: The two polymers are immiscible but blends can be compatibilised by the addition of a natural rubber-MMA graft copolymer. The effect of the added graft copolymer on the blend morphology varies with copolymer concentration, MW, mode of addition and processing conditions [1,2]

Mechanical Properties:

Mechanical Properties General: Tensile strength, tear strength and modulus increase with increasing PMMA content and degree of methacrylate cross-linking whereas elongation at break decreases. Toughness increases with increasing PMMA content up to a max. of approx. 50% PMMA before decreasing. Toughness decreases with increasing methacrylate cross-linking. [3] Blends of graft copolymer prepared by melt mixing rather than soln. casting have lower tensile strength and elongation at break [1,2]

Tensile (Young's) Modulus:

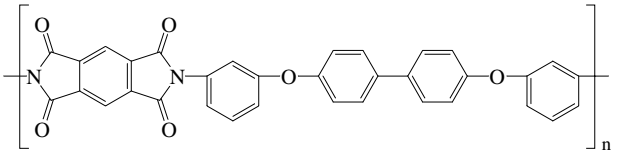
No.	Value	Note
1	10.2–167 MPa	30–70% wt PMMA [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	2.65–6.5 MPa	30–70% wt. PMMA, ASTM D638 [2]	365–12%
2	4.6–13.8 MPa	soln. cast, 2.5–12.5% graft copolymer, ASTM D638 [1,2]	120%

Mechanical Properties Miscellaneous: Tear strength 6.12–16.5 MPa (30–70% wt. PMMA, ASTM D624-81) [2]; 20.21–23.47 MPa (5–15% graft copolymer, 50:50 blend, ASTM D624-81) [2]
Fracture Mechanical Properties: Blends give fracture surfaces showing an elastic deformation with discontinuous fracture paths. Addition of graft copolymer reduces the size of the dispersed domains and improves interfacial adhesion
Izod Notch:

No.	Value	Notch	Note
1	0.81–1.18 J/m	Y	5–15% graft copolymer, 50:50 blend, ASTM D256 [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Inter-penetrating networks are synth. by swelling of masticated natural rubber, cross-linked with dicumyl peroxide, in methyl methacrylate. Benzoyl peroxide and divinylbenzene are used to cross-link methyl methacrylate. [3] Blends may be synth. by soln. casting from toluene or melt mixing. In soln. casting a blend of PMMA and natural rubber is cast after 10h immersion at room temp. In melt mixing, melted PMMA is blended with natural rubber then compression moulded [2]

NEW-TPI N-4

Synonyms: *PMDA-3,3′-BAPB. Poly(pyromellitic dianhydride-alt-3,3′-bis(4-aminophenoxy)biphenyldiamine). Poly[3,3′-(4,4′-dioxyphenyl)diphenylene pyromellitimide]. Poly[(5,7-dihydro-1,3,5,7-tetraoxobenzo[1,2-c:4,5-c′]dipyrrole-2,6(1H,3H)-diyl)-1,3-phenyleneoxy[1,1′-biphenyl]-4,4′-diyloxy-1,3-phenylene]. Poly(1H,3H-benzo[1,2-c:4,5-c′]difuran-1,3,5,7-tetrone-alt-3,3′-bis(4-aminophenoxy)biphenyldiamine)*
Monomers: 1*H*,3*H*-Benzo[1,2-*c*:4,5-*c*′]difuran-1,3,5,7-tetrone
Material class: Thermoplastic
Polymer Type: polyimide
CAS Number:

CAS Reg. No.	Note
105359-94-2	
105218-97-1	source based

Molecular Formula: $(C_{34}H_{18}N_2O_6)_n$
Fragments: $C_{34}H_{18}N_2O_6$
Morphology: Orthorhombic, a 0.789, b 0.629, c (chain axis) 2.511. Space group P2. Unit cell has 2 chains of 1/1-helical symmetry (zigzag conformn.) [3]. Crystallinity <0.3 depends on crystallisation temp. [4]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.32 g/cm^3	non-cryst. [3]
2	d 1.47 g/cm^3	cryst. [3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9.3×10^{-5} K^{-1}	25–275°, unit cell expansion, a axis [2]	L
2	6×10^{-5} K^{-1}	25–275°, unit cell expansion, b axis [2]	L
3	0.000153 K^{-1}	25–275° [2]	V

Latent Heat Crystallization: ΔH_f 6.38 kJ mol^{-1} (116 J g^{-1}, 100% crystalline) [3]
Melting Temperature:

No.	Value	Note
1	388°C	
2	383°C	[1]
3	381–389°C	depends on cryst. temp. [4]

Glass-Transition Temperature:

No.	Value	Note
1	244°C	amorph. [4]
2	249°C	amorph. [4]
3	255°C	semicryst. [3]
4	244–253°C	semicryst., depends on cryst. temp. [1,2,4]

Transition Temperature General: $T°_m$ 406° (equilib. melting temp.) [3]
Transition Temperature:

No.	Value	Note	Type
1	312–319°C	depends on cryst. temp. [4]	Second melting temp.

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	1950 MPa	23°, 5 mm min^{-1}, injection moulded [6]
2	750 MPa	240°, 5 mm min^{-1}, injection moulded [6]

Complex Moduli: Dynamic tensile modulus 2200 MPa (T <Tg, 10 Hz, semicrystalline) [5], 150 MPa (T >Tg, 10 Hz, semicrystalline) [5], 2000 MPa (T <Tg, 10 Hz, amorph.) [5], 20 MPa (T >Tg, 10 Hz, amorph.) [5]

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.21	10 kHz	150°, semicryst. and amorph. [5]
2	3.33	10 kHz	T >Tg, semicryst. [5]
3	3.44	10 kHz	T >Tg, amorph. [5]

Applications/Commercial Products:

Trade name	Supplier
Aurum	Mitsui Toatsu Chemicals
Regulus	Mitsui Toatsu Chemicals

Nitrile rubber N-5

Synonyms: *NBR. Nitrile butadiene rubber. Acrylonitrile-butadiene copolymer. Poly(acrylonitrile-co-butadiene). Poly(2-propenenitrile-co-1,3-butadiene). Poly(butadiene-co-acrylonitrile). Poly(1-butenylene-co-1-cyanoethylene)*
Related Polymers: Nitrile rubber - general purpose, Nitrile rubber - extrusion unfilled, Nitrile rubber - modifier, Nitrile rubber - injection moulding unfilled, Polyacrylonitrile, Hydrogenated nitrile rubber, Carboxylated nitrile rubber, Nitrile rubber and PVC blends, Butadiene-acrylonitrile copolymer, Hydrogenated nitrile rubbers, Blends of PVC and nitrile rubber, Carbon black filled nitrile rubber
Monomers: 1,3-Butadiene, Acrylonitrile
Material class: Synthetic Elastomers, Copolymers
Polymer Type: acrylonitrile and copolymers, polybutadiene
CAS Number:

CAS Reg. No.	Note
9003-18-3	
106974-60-1	alternating
106974-61-2	block

Additives: Can be vulcanised by sulfur, cadmium and peroxides
General Information: Acrylonitrile content 25–50% (18–22% low, 24–28% medium low, 28–34% medium high, 38–42% high). Different processing routes lead to 'hot' and 'cold' NBR

Applications/Commercial Products:

Trade name	Supplier
Chemigum	Goodyear
Chemigum N	Goodyear
Europrene N	Enichem Elastomers Ltd.
Krynac	Miles
Krynac	Polysar
Nipol DN	Nippon Zeon
Paracril	Uniroyal Chemical

Nitrile rubber, Carboxylated N-6

Synonyms: *Carboxylated NBR. Carboxylated nitrile rubber. Carboxylated poly(acrylonitrile-co-butadiene). Carboxylated acrylonitrile-butadiene copolymer. Poly(1,3-butadiene-co-acrylonitrile), carboxylated*
Related Polymers: Nitrile rubber, Carbon black filled, Nitrile rubber, Nitrile rubber, Isoprene copolymer, Nitrile rubber, Ethylene copolymer, Nitrile rubber, Hydrogenated
Monomers: Methacrylic acid, Acrylic acid, Acrylonitrile, 1,3-Butadiene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: acrylonitrile and copolymers, polybutadiene
CAS Number:

CAS Reg. No.	Note
123773-26-2	graft, methacrylic acid
9010-81-5	methacrylic acid copolymer
25265-19-4	acrylic acid copolymer
158496-90-3	graft, acrylic acid

Molecular Formula: $[(C_4H_6)_x(C_3H_3N)_y(C_3H_4O_2)_2]_n$ $[(C_4H_6).(C_3H_3N).[C_4H_6O_2)]$
Fragments: C_4H_6 C_3H_3N $C_3H_4O_2$ C_4H_6 C_3H_3N
Molecular Weight: MW 20000-25000
Additives: Zinc oxide, silica, antioxidants
General Information: All data refer to methacrylic acid copolymer unless otherwise stated
Morphology: C-13 nmr spectroscopy and pyrolysis-gc studies used to examine sequence distribution of terpolymer, which varies with mode of addition of methacrylic acid comonomer; mechanism of

polymerisation involves initiation reaction where methacrylic acid is preferentially involved [34]; microstruct. consistent with mech. props. [34]
Miscellaneous: Blend systems with ethylene acrylic rubber and fluoroelastomers have been reviewed [31]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{25} 0.9382 g/cm^3	[35]

Latent Heat Crystallization: Heat of combustion 41.4–42.3 kJ g^{-1} (9.9–10.1 kcal g^{-1}) (acrylic acid copolymer) [7]
Glass-Transition Temperature:

No.	Value	Note
1	-7–-5°C	approx., commercial rubber [8]
2	19–224°C	17.3–48.1 wt% butadiene, 16.5–32.4 wt% acrylonitrile, 66.2–19.5 wt% methacrylic acid [33]

Transition Temperature General: T_g highly dependent on butadiene content of terpolymer [33]. T_g of the acrylic acid copolymer has been reported [6]
Transition Temperature:

No.	Value	Note	Type
1	1°C	[35]	Order-disorder transition
2	24°C	[35]	Order-disorder transition

Surface Properties & Solubility:

Solubility Properties General: Blend systems of carboxylated nitrile rubber (acrylic acid terpolymer) with ethylene acrylic rubber (VAMAC) and fluoroelastomer (Viton E60C) have been reviewed. Mech. props. (modulus, hardness, tensile strength, elongation at break), cure state, and solvent-swelling behaviour (e.g. in 2-butanone and THF), are dependent on blend preparation technique, i.e. preblending (with and without preheating) or master batch process; some phase separation observed in latter technique; fluoroelastomer blends show ageing effects; solvent-swelling studies used to determine phase adhesion between nitrile and additional rubber component; ir spectra of 50/50 blends reported [31]
Cohesive Energy Density Solubility Parameters: Interaction parameter 3.82 (acrylic acid copolymer) [10]
Solvents/Non-solvents: Sl. sol. toluene (acrylic acid copolymer) [11]. Sol. $CDCl_3$ [26]. Swollen by $CHCl_3$; 47–76% wt loss after 72h (various carbon-black mixtures) [9]
Wettability/Surface Energy and Interfacial Tension: Surface tension has been reported [24]. Adhesion to tin has been reported [20]

Transport Properties:

Polymer Melts: Mooney viscosity 57 (100°, commercial rubber, Krynach 7.50) [8]; 50 (100°, butadiene/acrylonitrile/methacrylic acid (66/27/7)) [9]; 60 (butadiene/acrylonitrile/methacrylic acid (67/27/6)) [18]
Permeability of Gases: Gas permeability data have been reported [20]
Water Content: Other water absorption data have been reported [22]
Water Absorption:

No.	Value	Note
1	0.86 %	acrylic acid copolymer [10]

Mechanical Properties:

Mechanical Properties General: Mechanical props. of the acrylic acid copolymer have been reported [1,2]. Other mechanical props. have been reported [13,24,27,28,29]. Other values of tensile strength have been reported [13,14,20,22]. Dynamic mechanical props. of terpolymer moulded in presence of ZnO, and effects of Si filler, have been reported at 28° and 3.5 Hz; variation of storage modulus and loss tangent with temp. reveals occurrence of biphasic struct. (particularly at high ZnO level, e.g. 12 phr); low temp. transition at approx. -5° is due to T_g of terpolymer, while high-temp. transition at 50° appears to result from formation of clusters; latter more prominent in presence of Si filler [8]; comparative studies of terpolymer cross-linked by a sulfur-accelerator system also reported [8]. Other dynamic mechanical investigations on unvulcanised terpolymer (butadiene/acrylonitrile/methacrylic acid (66/28/6)) have examined variation of complex shear compliance with temp. and frequency; frequency variation of compliance reveals existence of broad retardation (or relaxation) dispersion (over temp. range) similar to that found for amorph. polymeric materials; additional sharp resonance features found at temps. above 20° and below 0°; latter believed to be order/disorder transitions. These results, together with microstructural and stress requirements, indicate some type of one-dimensional order (characteristic length) extending over approx. 6μm in terpolymer [35]. Dynamic mechanical studies (-100°-200°, 3.5 Hz) and measurements of failure props. have been used to examine chemical interactions between nitrile rubber and surface-oxidised carbon black; functional groups of oxidised carbon black chemically react with carboxylated rubber when heated at high temps. for prolonged periods; reinforcing ability of surface-oxidised carbon black greater than non-oxidised material [9]; solvent-swelling studies in $CHCl_3$ also reported [9] in complementary studies. Stress-strain behaviour (ASTM D412-87) of various carboxylated rubber carbon-black mixes, moulded at 160° for 60 min., has been reported [9]. Modulus, tensile strength, elongation at break and hardness of blend systems with ethylene acrylic rubbers and fluoroelastomers have been reported [31]. Storage modulus of acrylic acid copolymer has been reported [6]
Tensile Strength Break:

No.	Value	Note	Elongation
1	4.48 MPa	carbon black filled, acrlic acid copolymer [9]	489%
2	0.94–8.11 MPa	various carbon black mixtures [9]	1970–988%

Miscellaneous Moduli:

No.	Value	Note	Type
1	1.26–3.33 MPa	various carbon black mixtures [9]	100% modulus
2	1.6–5.03 MPa	various carbon black mixtures [9]	300% modulus

Viscoelastic Behaviour: Stress-strain curves of carbon black filled, acrylic acid copolymer have been reported [9]
Hardness: Hardness of the acrylic acid copolymer has been reported [2]. Shore A70 (carbon black filled acrylic acid copolymer) [9]. Shore A51–A70 (various carbon black mixtures) [9]
Failure Properties General: Tear strength 39.1 N mm^{-1} (carbon black filled, acrylic acid copolymer) [9]. Other values of tear strength have been reported [14]
Fracture Mechanical Properties: Cut-growth crack props. have been reported [13]
Friction Abrasion and Resistance: Abrasion resistance of the acrylic acid copolymer has been reported [2,3]. Abrasion loss 0.12 cm^3 h^{-1} (BS903 part A9: 1957- method C, carbon black filled acrylic acid copolymer). Other values of tear strength have been reported [14]. Abrasion loss 0.12-0.38 cm^3 h^{-1} (various carbon black mixtures) [9]

Electrical Properties:

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.1–0.35	3.5 Hz	28°, 0–60 phr ZnO [8]
2	0.1–0.2	3.5 Hz	28°, 0–60 phr sulfur [8]

Optical Properties:

Transmission and Spectra: C-13 nmr [4,26,32,34], ir [17,31], mass [25] and H-1 nmr [32,33] spectral data have been reported

Polymer Stability:

Thermal Stability General: Resistance to heat ageing [13] and to high temp. has been reported [19]. Overall thermal stability of terpolymer dependent on thermal stability of each comonomer component, particularly methacrylic acid content; thermal behaviour of terpolymers similar to thermal degradation behaviour of individual homopolymers; evidence that methacrylic acid is thermally the weakest link in terpolymer [33]

Decomposition Details: Thermo-oxidative degradation of the acrylic acid copolymer has been reported [5]. Activation energy for thermal decomposition 52 kJ mol^{-1} (approx., acrylic acid). Rate of decomposition differs with composition. Major products of pyrolysis at 550° and 600° are ethylene, propylene, butadiene, C_6H_6, toluene and vinylcyclohexene (from butadiene part), and acrylonitrile and acetonitrile (from acrylonitrile part); cyclised products also involved, e.g. cyclised PBD, which undergo further thermal decomposition to give various products. The greater the alternating nature of the copolymer the greater the extent of cyclisation reactions [34]. Additional spectroscopic studies of decomposition processes have been reported [12]

Flammability: Scorch control experiments have been reported for terpolymer (butadiene/acrylonitrile/methacrylic acid (67/27/6)); standard compounding recipes contain sulfur and ZnO; however, affinity of latter for carboxyl groups in acid component leads to excessive scorch and short shelf-life; such excessive scorch can be prevented by isolating ZnO from carboxylic acid groups until desired cure temp. is reached; zinc sulfide-coated ZnO, zinc phosphate-coated ZnO, or metallic alkoxide (combined with ZnO) have been used for these purposes; good scorch control achieved without affecting final physical props. [18]

Environmental Stress: Resistance to uv [15] and to humidity has been reported [19]

Chemical Stability: Chemical resistance of kaolin, TiO_2 and lithopane filled material has been reported [20]

Hydrolytic Stability: Water resistance has been reported [14]

Stability Miscellaneous: Resistance to γ-irradiation has been reported [16]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by emulsion polymerisation at 50° using AIBN or potassium persulfate [33] as a catalyst [29,32,34]. Detailed study of polymerisation process, including kinetics and identification of the azeotropic composition, has been reported [33]

Applications: Acrylic acid copolymer is used as a binder fuel in solid boosters of the space shuttle. Other uses in ball mill linings, mud pump pistons, pump impellors, roll coverings, conveyor belting covers, conveyor rollers, blow-out preventers, seals, O-rings

Nitrile rubber, Hydrogenated N-9

Synonyms: *Poly(1,3-butadiene-co-acrylonitrile), hydrogenated. HNBR. Hydrogenated acrylonitrile-butadiene copolymer. Hydrogenated nitrile rubber. Hydrogenated poly(acrylonitrile-co-butadiene). HSN. Highly saturated nitrile elastomer*
Related Polymers: Nitrile rubber, carboxylated, Nitrile rubber, isoprene copolymer, Nitrile rubber, ethylene copolymer, Nitrile rubber, mineral filled, Nitrile rubber, Nitrile rubber, carbon black filled, Nitrile rubber, PVC blends
Monomers: 1,3-Butadiene, Acrylonitrile
Material class: Synthetic Elastomers, Copolymers
Polymer Type: acrylonitrile and copolymers, polybutadiene
CAS Number:

CAS Reg. No.	Note
88254-10-8	
9003-18-3	Nitrile rubber

Molecular Formula: $[(C_4H_6)_x(C_4H_8)_y(C_3H_3N)_z]_n$
Fragments: C_4H_6 C_4H_8 C_3H_3N
Molecular Weight: MW 150000 (100% hydrogenated)
Additives: Curing agents include sulfur, and peroxides with triallyl cyanurate or isocyanurate. Fillers (carbon black); antioxidants; plasticisers; stearic acid; blend components (e.g. PMMA, nylon-6)
General Information: Fully hydrogenated nitrile rubber is a speciality elastomer with excellent physical and mech. props., good resistance to heat, ageing and aggressive environments; has outstanding wear resistance under adverse conditions. Reviews, including physical and mech. props., and applications (in particular those in the oil field industries) have been reported [2,6]. Details of heat- and swell-resistant elastomer containing 34% nitrile component have been reported [1]. Physical props., stability and potential applications of partially hydrogenated nitrile rubber have been reviewed; generally displays similar props. to nitrile rubber, but in addition has improved chemical, environmental and thermal stability [5]
Morphology: Struct. has been reported [20]. Microstructure of hydrogenated nitrile rubbers has been analysed by spectroscopy. Ir spectra indicate preferential hydrogenation reaction of 1,2-butadiene units over 1,4-units; good complementary information about longer sequences and distributions along the chains and mechanisms of hydrogenation reaction are provided by pyrolysis studies and C-13 nmr spectroscopy; C-13 nmr spectra suggest more likelihood of hydrogenation of butadiene units next to acrylonitrile units in polymer chain than of those next to same (butadiene) units [33]
Identification: Degree of unsaturation (iodine value, g $(100g)^{-1}$) 14 (37% acrylonitrile), 28 (37% acrylonitrile), 25 (45% acrylonitrile) (commercial raw elastomers) [2]
Miscellaneous: Blend system with zinc-PMMA has been reported [18]. Studies of blends of hydrogenated rubber with nylon-6 have been reported [37]. General chemical and physical props. of (selectively) hydrogenated nitrile rubber explained by ethylene sequences, which result from 1,4-butadiene sequences, and acrylonitrile content; increased degree of hydrogenation leads to increased crystallinity on account of increased ethylene sequences [38]; in principle, hydrogenated nitrile rubber could be obtained by terpolymerisation of ethene, 1-butene and acrylonitrile [38].

Blends of hydrogenated nitrile rubber and PVC, when processed at high mould temps., undergo cross-linking without aid of any cross-linking agents; known as 'self-cross-linkable polymer blends' [25]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15 g/cm^3	44% acrylonitrile, Zetpol 1020 [34]
2	d 0.95 g/cm^3	fully saturated, double bond content <1%; 34% acrylonitrile [31]
3	d 0.99–1.18 g/cm^3	vulcanisate; dependent on composition
4	d 1.18 g/cm^3	30 phr resin [34,35]
5	d 0.98–1 g/cm^3	commercial raw elastomer; 37–45% acrylonitrile [2]
6	d 1.24 g/cm^3	vulcanisate compound formulation [6]

Glass-Transition Temperature:

No.	Value	Note
1	-40–-15°C	[15]
2	-3°C	Zetpol 1020 [36]
3	-25°C	butadiene:acrylonitrile 2:1 [9]
4	-25°C	vulcanisate compound formulation [6]
5	-26°C	45% acrylonitrile [2]
6	-32°C	37% acrylonitrile [2]
7	-33°C	37% acrylonitrile [2]

Transition Temperature General: Brittleness temp. has been reported [4]. Thermal props., e.g. T_g, affected by degree of crystallinity/hydrogenation [38]. Copolymer shows no melting endotherm at or below 180° indicative of non-crystalline material [9]. Brittleness temp. is approx. 6° lower than that of corresponding non-hydrogenated rubber [2]

Vicat Softening Point:

No.	Value	Note
1	85°C	uncured; disappears after vulcanisation by γ-irradiation [31]

Surface Properties & Solubility:

Solubility Properties General: Effects of compatibilisers or fillers on miscibility and processing of hydrogenated nitrile rubber and nylon-6 have been reported [37]. Forms binary blends with PVC at high moulding temp. without any additional cross-linking agents; known as self-crosslinkable polymer blends [25]

Cohesive Energy Density Solubility Parameters: Solvent interaction parameters with alkanes, cyclohexane, C_6H_6 and CCl_4 have been reported [10]. Interaction parameter 0.61 (Me_2CO) [10]. Cohesive energy has been reported [10]. Relative cohesive energy 7.91 kJ mol^{-1} (calc.) [11]. Solubility parameter δ 6.4–6.43 J$^{1/2}$ cm$^{-3/2}$, (9.81–9.88 cal$^{1/2}$ cm$^{-3/2}$,viscosity method); 6.35–6.37 J$^{1/2}$ cm$^{-3/2}$ (9.64–9.69 cal$^{1/2}$ cm$^{-3/2}$, graphical method; 6.37 J$^{1/2}$ cm$^{-3/2}$ (9.7 cal cal$^{1/2}$ cm$^{-3/2}$ (50–100% hydrogenation) [21]. Huggins constant 0.478 (100% hydrogenation) [21]. Little change observed in value of solubility parameter of nitrile rubber upon hydrogenation, and upon level of hydrogenation [21]

Plasticisers: Di(butoxyethoxyethyl) adipate, trioctyl trimellitate, triisononyl trimellitate, trioctylphosphate [15]

Solvents/Non-solvents: Sol. chlorinated hydrocarbons [21], THF [31]. Insol. MeOH [9]

Wettability/Surface Energy and Interfacial Tension: Interfacial tension 0.24 mN m^{-1} (nylon) [24]. Studies of the adhesion of PVC to hydrogenated nitrile rubber (self-crosslinkable polymer blend system) have been reported; adhesive strength determined by T-peel tests (Instron); peel-fracture energy dependent on presence of stabiliser and plasticiser in PVC phase, in addition to moulding and test conditions; plasticisation improves adhesion; peel strength affected by stabiliser only at high contact temp. and long contact times; high joint strength caused by formation of chemical bonds (cf. self-crosslinkable blend system) [25]. Contact angle measurements have been used to investigate changes in wettability of the hydrogenated rubber surface with ageing time and temp. (75–150°, 0–8h); wettability increases with time and is more rapid when temp. increases [13]

Transport Properties:

Polymer Melts: Mooney viscosity 68 (100°, fully saturated; double-bond content <1%; 34% acrylonitrile) [31], 80 (100°, commercial raw elastomers; 37–46% acrylonitrile) [2]

Permeability of Gases: Permeability coefficients for several gases have been reported; temp. dependence (related to activation energy) found [14]. High-pressure permeation studies of H_2 through hydrogenated nitrile rubber (38% acrylonitrile) containing moderate loadings of filler have been reported [16]

Permeability of Liquids: Permeation rate [MeOH] 0.008 mmol cm^{-2} h^{-1} (23°, 1.1 mm film) [30]

Mechanical Properties:

Mechanical Properties General: Mech. props. of partially hydrogenated nitrile rubbers have been reported, including brittle temp., compression set, tensile strength and abrasion resistance [4]. Temp. dependence of tensile strength of hydrogenated nitrile rubber (filled and unfilled) has been reported over range 20–180° [19]. Mech. props. (e.g. tensile strength) of raw rubber and carbon black filled vulcanisates affected by degree of crystallinity/hydrogenation [38]. Tensile strength of vulcanised (γ-irradiated) rubber increases with dosage rate, while value of elongation at break is reduced; optimum dose to achieve best balance of props. reportedly 14–20 Mrad [31]. Mech. and viscoelastic (dynamic mech.) props. as a function of vulcanisate composition, e.g. carbon black and resin content, cure system and cross-link density have been reported [34,35]; incorporation of resin increases strength props.; 30 phr resin found to be optimum [35]. Comprehensive studies of the mech. props. (tensile strength/elongation, 50% modulus, hardness, elongation at crack) of hydrogenated nitrile rubber vulcanisate compound formulations with varying acrylonitrile contents (e.g. 37% and 45%) after exposure to a severe environment (oil-field type) have been reported [2,5].

Tensile Strength Break:

No.	Value	Note	Elongation
1	30 MPa	approx., carbon black filled	
2	35.7 MPa	44% acrylonitrile, Zetpol 1020 [34,35]	320%
3	17 MPa	100° [35]	
4	11–39 MPa	25° [34,35]	
5	6–30 MPa	75° [34,35]	
6	8–35 MPa	50° [34,35]	
7	4–20 MPa	100° [34,35]	320–600%
8	27–38 MPa	after ageing, 120°, 70h, (vulcanisate; dependent on composition [34,35]	
9	15–35 MPa	various vulcanisate compound formulations [6]	60–500%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	32 MPa		37% acrylonitrile; commercial raw elastomer [2]
2	29.4 MPa	110% extension	37% acrylonitrile; vulcanisate compound formulation [2]
3	28.3 MPa	310% extension	45% acrylonitrile; vulcanisate compound formulation [2]
4	13 MPa		150°; 37% acrylonitrile; vulcanisate compound formulation [2]
5	9 MPa		150°; 45% acrylonitrile; vulcanisate compound formulation [2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2.5–36.2 MPa	vulcanisate; dependent on composition [34,35]	300% modulus
2	13.9 MPa	37% acrylonitrile; vulcanisate compound formulation [2]	50% modulus
3	3.7 MPa	45% acrylonitrile; vulcanisate compound formulation [2]	
4	26.3 MPa	37% acrylonitrile; vulcanisate compound formulation [2]	100% modulus
5	7.7 MPa	45% acrylonitrile; vulcanisate compound formulation [2]	100% modulus
6	19.5 MPa	45% acrylonitrile; vulcanisate compound formulation [2]	200% modulus
7	3–20 MPa	various vulcanisate compound formulations [6]	100% modulus
8	4.5–26 MPa	various vulcanisate compound formulations [6]	200% modulus
9	6–30 MPa	various vulcanisate compound formulations [6]	300% modulus

Viscoelastic Behaviour: Dynamic mech. props. and relaxation behaviour are affected by degree of crystallinity/hydrogenation [38]. Relaxation behaviour of vulcanised (by γ-irradiation) rubber has been reported. Cross-linking (three-dimensional network) restrains chain motion and therefore material cannot flow (even at higher temps.); behaves like cross-linked elastomer [31]. Dynamic mech. props. and influence of cross-link density, curing system, filler and resin, of hydrogenated nitrile rubber vulcanisates has been reported [34]. Log G′ 6.25–8.1 Pa; unaffected by cross-link density in glassy region, but increases with density in rubber (plateau) zone; G′ for different cure systems (peroxide or sulfur), with same cross-link density, has same values in glassy state; increases with temp. from 90–180°, and reduces above 180°; increases with both resin and carbon-black filler content; also increases with carbon-black surface area; loss tangent (-50–250°) 0.01–1.26; unaffected by cross-link density in glassy region, but decreases with density in rubber (plateau) zone; loss tangent for different cure systems (peroxide or sulfur), with same cross-link density, has same value in glassy state; decreases with temp. from 90–180°, and increases again above 180°; decreases with both resin- and carbon-black filler content; also affected by surface area of filler [34]

Mechanical Properties Miscellaneous: Flexural stiffness measurement at low degrees of deformation has been reported as a method for monitoring ageing behaviour and heat resistance [12] Rebound resilience 30–40% (various vulcanisate compound formulations) [6] Compression set 15% (70h, room temp.), 20% (70h, 150°) (various vulcanisate compound formulations) [6]
Hardness: Shore A79 (44% acrylonitrile, Zetpol 1020) [34]. Shore A51-A85 (vulcanisate; dependent on composition) [34,35]; Shore A70 (commercial raw elastomer; 37% acrylonitrile); A92 (37% acrylonitrile, vulcanisate compound formulation); A84 (45% acrylonitrile, vulcanisate compound formulation) [2]. Shore A50-A90 (various vulcanisate compound formulations) [6]
Failure Properties General: Tear strength 920 N cm^{-1}, (44% acrylonitrile, Zetpol 1020) [34]. Breaking energy (Zetpol 1020) 28.7 kJ m^{-2} (25°), 23.5 kJ m^{-2}, (150°), 1.6 kJ m^{-2} (75°), 11.8 kJ m^{-2} (100°) [35] Tear strength 350–1090 N cm^{-1} (vulcanisate; dependent on composition) [34,35]. Breaking energy 9.2–29.8 kJ m^{-2} (25°), 3.5–26.6 kJ m^{-2} (50°), 1.5–18.8 kJ m^{-2} (75°), 0.6–14.9 kJ m^{-2} (100° vulcanisate; dependent on composition).
Friction Abrasion and Resistance: Displays outstanding abrasion resistance [18]. Comprehensive studies of the influence of compositional variables and testing temp. on the wear of hydrogenated nitrile rubber vulcanisates [35] and investigations of the mechanisms of wear, using optical and scanning electron microscopy [36], have been reported. Abrasion loss v 0.75–5.5×10^{-10} m^3 rev^{-1} (Dupont abrader); values increase with decrease in cross-link density (similar values obtained for sulfur and peroxide-cured systems). Incorporation of resin and carbon-black filler decreases abrasion loss, in former case at all temps. (25–100°). [35] μ_{dyn} 1.24–1.96 (Dupont abrader); values increase with carbon-black filler loading, and decrease with cross-link density, temp. and incorporation of resin [35]. Frictional force 44–69.4 N (Dupont abrader); values increase with carbon-black filler loading, and decrease with cross-link density and incorporation of resin (both with temp.) [35]. Abradability $2.2–11.4 \times 10^{-15}$ m^3 J^{-1} m^2 (25–100°); increases linearly with reciprocal of breaking energy [35]. Abraded surfaces at 25° do not show any ridges except ploughing marks along direction of abrasion; ridges observed above 50°, with spacing between adjacent ridges increasing with temp., and decreasing with carbon-black filler loading and incorporation of resin; worn surfaces of swollen vulcanisates show ridges at all normal loads (6–44 kPa); change from abrasive wear mechanism (at 25°) to frictional wear mechanism above 50° [35,36]. Abrasion loss 30–50 mm^3 (various vulcanisate compound formulations) [6]

Electrical Properties:

Dissipation (Power) Factor:

No.	Value	Note
1	0.157	50°, Zetpol 1020 [35]
2	0.118–0.167	50° [34,35]
3	0.11–0.163	75° [34,35]
4	0.108–0.158	100° [34,35]

Optical Properties:

Transmission and Spectra: Ir [9,31,32,33], H-1 nmr [32,33], C-13 nmr [32,33] and mass spectral data have been reported [33]

Polymer Stability:

Polymer Stability General: Degree of crystallinity (cf. hydrogenation) does not have significant effect on ageing behaviour [38]
Thermal Stability General: Has good thermal ageing characteristics (partially hydrogenated nitrile rubber) [4,5,18]; heat resistance has been measured by the use of a flexural stiffness method [12]. Hydrogenated nitrile rubber is thermally more stable than unhydrogenated rubber [13]. Incorporation of resin into vulcanisate compound formulation improves the heat resistance [35]

Upper Use Temperature:

No.	Value	Note
1	140–150°C	[6]

Decomposition Details: Activation energy of degradation 175–220 kJ mol^{-1} [13], 330 kJ mol^{-1} [18], 220kJ mol^{-1} (37% acrylonitrile; partially hydrogenated), 350 kJ mol^{-1} (40% acrylonitrile; highly saturated rubber). Characteristic degradation products at 550°: butadiene, 4-vinylcyclohexane (butadiene dimer), acrylonitrile, hydrocarbons, mononitrile species and dinitrile species; nitriles can be either α-olefinic or saturated species; hydrocarbons represent the methylene chains produced by hydrogenation [33]. Oxidative decomposition behaviour and kinetics of hydrogenated rubber have been studied. Decomposition in air is a two-stage process; in first stage, majority of nitrile rubber (86%) decomposes; onset at 340°, with maximum rate at 495° (for both filled and unfilled material); combustion of carbon-black filled samples and decomposition of remainder of nitrile rubber take place in second stage (onset at approx. 540°, with maximum rate at 580°). Degradation characteristics and kinetics are not influenced by cross-link density, curing system or carbon-black loading [18]. Oxidative degradation initiated by γ-irradiation at 40° has been examined by FT-ir spectroscopy [9]. Studies of degradation at low and high temps. in air and N_2 have been reported [13]
Environmental Stress: Has excellent resistance to ozone [17]. Partially hydrogenated nitrile rubber displays good ozone and weather resistance [5,18]
Chemical Stability: Resistant to aliphatic hydrocarbons and to inorganic chemicals other than oxidising acids [28]. Partially hydrogenated nitrile rubber displays good resistance to lubricating oils and their additives [2,4,5,28], and fuels (in particular, oxidised fuels) [2,4]; ageing behaviour in various corrosive media has been monitored by the use of flexural stiffness measurements; ageing in oil, in presence of air, takes place more rapidly than in oil or air alone [12]; good resistance to 'sour-gas' and petroleum (also in presence of H_2S and amines) [12]. Degradation rates of hydroxylated nitrile rubber are several times slower than those of nitrile rubber and epichlorohydrin- ethylene oxide copolymer (factor of 10) in oxidised fuel [2]; dimensional (elongational) changes of hydroxylated nitrile rubbers in lubricating oil much less than those of polyacrylates [2]. Detailed information on the chemical resistance of hydrogenated rubber to a wide range of reagents has been reported [2]; elastomer resistant to alkali, most acids, water, ASTM standard oils and alcohols [2]; attacked by concentrated sulfuric and nitric acids, toluene, EtOAc and Me_2CO (reduction in tensile strength) [2]
Hydrolytic Stability: Resistance to steam has been reported [22]
Stability Miscellaneous: Service temps. of hydrogenated rubbers (at given service life) are approx. 20° higher than those of corresponding unhydrogenated rubbers [2]. Partially hydrogenated nitrile rubber displays good performance profiles and requires little maintenance [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by a soln. process that gives selective hydrogenation of the 1,3-butadiene double bond [29]. Also synth. by hydrogenation using Rh or Pd catalysts [32]. Compounding similar to that of standard nitrile rubbers; however, more careful selection of vulcanisation system is required [4]. Hydrogenation carried out under high pressure in presence of rhodium triphenylphosphine catalyst [21]
Applications: Has applications in the oil industry (blow-out preventers, drill pipe protectors, down hole packers, mud pump pistons, valve seals, cable jackets, pressure accumulator bags, fuel diaphragms); in the automotive industry (rotating shaft seals, lip seals, bearing/wheel seals, O-rings, valve cover gaskets, fuel pump diaphragms, fuel pump isolators, fuel hose tubes, timing belts, valve stem seals, water pump seals). General industrial applications in hydraulic hose and packings; as power station cable jacket; in laminating rolls, printing rolls, textile rolls, paper mill rolls; in military components and chemical plant diaphragms. Partially hydrogenated nitrile rubber finds applications on account of good heat and oil resistance, excellent ageing props. and outstanding abrasion resistance (even under adverse conditions) in tank track pads, oil well packers, automotive shaft seals etc. Blend compositions (e.g. with PMMA) also used for similar applications, i.e. under adverse conditions (oil at high temps.) Highly saturated nitrile elastomers have applications on account of excellent resistance to heat, ageing, wear and aggressive environments, and good mech. props., at both low and high temps., in automotive, aircraft, construction and oil field industries

Nitrilemethyl silicone rubber, Room temp. vulcanised N-12

Synonyms: *Methylnitrile silicone rubber, Room temp. vulcanised*
Monomers: Dichlorodimethylsilane, Dichlorocyanopropylmethylsilane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones, dimethylsilicones
CAS Number:

CAS Reg. No.
158465-71-5

Molecular Formula: $[(C_2H_6OSi).(C_5H_9NOSi)_n$
Fragments: C_2H_6OSi C_5H_9NOSi
Additives: Finely divided silica is usually incorporated as a reinforcer to improve mech. props.
General Information: Silanol groups are present in the pre-cure gum. During the cure they form cross links through condensation. Fully cured elastomer has few free silanol groups

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.1 g/cm^3	[3]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0006 K^{-1}	high nitrile content; increases with decrease in nitrile substitution [3]	V

Glass-Transition Temperature:

No.	Value	Note
1	-110°C	5% cyanopropyl, 95% methyl
2	-87°C	20% cyanopropyl, 80% methyl [6]

Transition Temperature:

No.	Value	Note	Type
1	-118°C	-180°F, 10% cyanopropylmethylsilicone [1,2]	S

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18–19 J$^{1/2}$ cm$^{-3/2}$ (8.8–9.3 cal$^{1/2}$ cm$^{-3/2}$ (increases with nitrile substitution) [1]

Solvents/Non-solvents: Sol. ethers, esters, ketones. Insol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, alcohols, H_2O [1]. Vulcanised rubber swollen by solvents rather than dissolved
Surface and Interfacial Properties General: Generally low surface adhesion [5]

Transport Properties:
Permeability of Gases: Gas permeability depends on composition; it decreases as nitrile substitution increases [4]
Gas Permeability:

No.	Gas	Value	Note
1	CO_2	43772–218862 cm^3 mm/(m^2 day atm)	0.05–0.25 cm^2 (s GPa)$^{-1}$, 25° [4]
2	O_2	5515–39395 cm^3 mm/(m^2 day atm)	0.0063–0.045 cm^2 (s GPa)$^{-1}$, 25° [4]
3	N_2	2188–43772 cm^3 mm/(m^2 day atm)	0.0025–0.05 cm^2 (s GPa)$^{-1}$, 25° [4]

Mechanical Properties:
Mechanical Properties General: Requires reinforcing filler to possess acceptable mech. props.
Tensile Strength Break:

No.	Value	Note	Elongation
1	5.6 MPa	825 psi, 40% cyanopropylsilicone, with reinforcing filler [1]	120%

Hardness: Durometer A80–A85 (40% cyanopropyl silicone, with reinforcing filler) [1]

Electrical Properties:
Electrical Properties General: Has low electrical resistance compared to other silicones
Dielectric Permittivity (Constant):

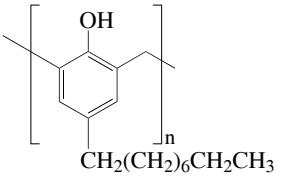
No.	Value	Note
1	4–20	increases with increase in nitrile substitution [3,5]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.45	increases with increase in nitrile substitution [3]

Polymer Stability:
Polymer Stability General: Solvent resistant material with good low temp. props.
Thermal Stability General: Usable from -120–200° [1,7]
Upper Use Temperature:

No.	Value	Note
1	200°C	
2	200°C	[7]



Environmental Stress: Resistant to oxidative degradation, H_2O, weathering, and ozone. Unaffected by uv radiation [5]
Chemical Stability: Swollen by esters, ethers and ketones. Relatively unaffected by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. sulfuric acid. Relatively unaffected by weak alkali, weak acids and alcohols [1,2,3,5]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam [5]
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack [5]

Applications/Commercial Products:
Processing & Manufacturing Routes: Dimethyl and methyl cyanopropyl cyclic polysiloxanes are polymerised together at 150–200° with alkaline catalysis in the presence of small quantities of water. The gum cures at room temp. with alkoxysilane cross-linking agent and metal salt catalyst. Cross-linking requires moisture
Applications: Nitrilemethylsilicone rubbers are solvent resistant and stable over a wide temp. range. They have not found important commercial applications

para-Nonyl Phenolic resins N-13

Synonyms: *4-Nonylphenol based resins*
Related Polymers: Phenol-aldehyde resins
Monomers: 4-Nonylphenol, Formaldehyde
Material class: Thermoplastic
Polymer Type: phenolic
CAS Number:

CAS Reg. No.
31605-35-3
134443-11-1

Molecular Formula: $(C_{16}H_{24}O.CH_2O)_n$
Fragments: $C_{16}H_{24}O$ CH_2O
Molecular Weight: M_n 730 MW 470–745
Additives: Additives include kaolin, calcium carbonate, colloidal silica, hydroxymethyl starch, styrene-butadiene rubber latex
General Information: The resins do not crosslink, as the phenol is difunctional (since the *para*-position is blocked)

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	34°C	[3]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. oils [8]

Transport Properties:
Polymer Solutions Dilute: Apparent shear viscosity 12715–20637 P (uncured novolac, formaldehyde: *p*-nonylphenol ratio 0.25–0.67)

[4]. Resins with M_n 490–1400 show non-Newtonian rheological behaviour of the pseudoplastic type [4,7]

Optical Properties:

Transmission and Spectra: H-1 nmr and ir spectral data have been reported [7]

Polymer Stability:

Decomposition Details: Resins of low MW show greater weight loss than those of higher MW. Activation energy of decomposition 70.3–154 kJ mol^{-1} (16.8–36.8 kcal mol^{-1}) which increases with increasing MW. Below 300°, phenol and formaldehyde are the major decomposition products. At higher temps. aromatic hydrocarbons, substituted phenols and C_1–C_4 gaseous products are formed [4,5]. Char yield 79.83% (200°, uncured novolac) [5], 83.10% (400°, uncured novolac) [5]. Pyrolysis at 770° produces a mixture of branched chain nonenes, *p*-nonylphenol and methyl-substituted *p*-nonylphenol [6]
Chemical Stability: Ethoxylation of the phenol hydroxyl groups increases compatibility with oil

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by reaction of *p*-nonylphenoxymagnesium bromide with paraformaldehyde in dry C_6H_6 for 12h at 80°, followed by acidic quenching [1]. This procedure gives "high-*ortho*" novolaks [10]. Novolak-type resin synth. by reaction of paraformaldehyde and *p*-nonylphenol with H_2SO_4 catalyst [2,4,7]. Resole-type resin synth., for example, by reaction of paraformaldehyde with *p*-nonylphenol in the presence of triethylamine catalyst (pH 7–9) at 90° [9]
Applications: Potential application as an antimicrobial agent. Novolak-type used as tackifiers in manufacture of pressure-sensitive adhesives, and in the coated front sheet formulation which receives the image in carbonless paper transfer systems. Resole-type has potential applications in coatings and in adhesives "High-*ortho*" novolaks have potential application as an antioxidant in lard. May be used as a sulfur free alternative curing agent for rubber compounding. The solid resole (5–12%) is compounded with rubbers using activators and acts as a non-sulfur containing vulcanisation agent. For nitrile-butadiene rubber activators are pyromellitic anhydride, phthalic anhydride or fumaric acid. For styrene-butadiene rubber, *p*-toluenesulfonic acid or chloroacetic acid are used. For neoprene, the activator can be zinc oxide and tin(*II*) chloride. The novolak is compounded with kaolin clay, calcium carbonate, colloidal silica and SBR latex to form a coated front (CF) sheet for carbonless copy paper systems. Ethoxylation of the phenol hydroxyl groups gives a resin compatible with oil, for oil recovery

Nucleic acid N-14

Monomers: Cytosine, Guanine, Thymine, Adenine, Uracil
Material class: Polynucleotides
General Information: General term describing natural macromolecules found in living cells formed by the polymerisation of mixed nucleotides. There are two main types: Deoxyribonucleic acid which usually has a very high molecular weight, particularly that present in bacterial and animal cells, and Ribonucleic acid which has lower molecular weights.
Morphology: RNA is a polymer of ribonucleotides derived mainly from Adenine, Cytosine, Guanine and Uracil, linked by 3′,5′-phosphodiester bonds, whereas DNA consists of similar polymers, but of deoxyribonucleotides, derived mainly from Adenine, Guanine and Cytosine, as in RNA, but with Thymine in place of Uracil

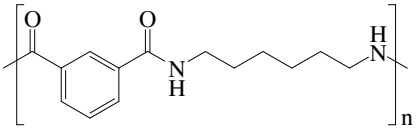
Nylon N-15

Applications/Commercial Products:



Processing & Manufacturing Routes: *Commercial Polymerisation of Polyamides.* There are usually at least three stages in a commercial nylon plant and the process is either continuous or semi-continuous. In a typical Nylon 6,6 polym., a purified soln. of salt is charged to thin film evaporator where the water is removed under a constant pressure of 250 psi at 235°. The molten polymer is pumped to a second thin film evaporator where it is further condensed under 15 psi of pressure before passing into a third stage filmtruder[13]. *In the* **DuPont Canada process**, 40% nylon salt soln. is conc. to 50% in an evaporator at 100° after which it is stored in the surge tank prior to condensation. It is next passed to a reactor into which appropriate quantities of additives, (hexamethylene diamine and acetic acid) are fed. The polymer and steam passes through a partial condenser at 265 psi and 210° to minimise diamine losses, before reaching a flasher reactor (230°) to flash off steam. It passes on through two further stages in which temp. is raised up to 280° and the pressure reduced. *In the* **tank continuous process**, purified nylon salt soln. is charged to a stirred autoclave under 18 bar pressure at 275°. It passes onto a second stage pressure reactor equipped with a diamine recirculation system where it is further condensed to a "prepolymer molecular weight" and is still sufficiently mobile to pump to a finishing extruder to be converted to high MW (Plant scale is typically about 13000 tonnes per annum). *In the* **tubular continous process**, purified salt soln. is increased in concentration from 65% to 85% by a stage 1 evaporator operating at 230° and 250 psi. It passes on through a tubular reactor at 280° at low pressure (0.5 psi). In the final step, it is vented under vacuum at 0.05 psi before finishing in a vented extruder. The main problem with this system is the potential for gelling the polymer (Annual throughputs are about 13000 tonnes per annum). In another variant, *a* **column continuous reactor** is fed with 65% soln. of purified Nylon 6,6 salt at 160°. The bottom of the tube reactor is heated to 290° while an upper bank of tubes is kept at 180° by steam heating. The whole reactor is pressured to 8 bar and the vertical upper section is a fractionating column. The salt soln. concentrates to 85% in this three component vertical column tank reactor before passing on through the bottom section as molten polymer to a finishing extruder. The commercial process for the production of *Trogamid T amorphous polyamide* (Huls) relies upon the hydrol. of the initial charge of dimethyl terephthalate by aq. trimethyl hexamethylene diamine at 90° in the first reactor. MeOH is removed under vacuum. Nylon 6(3),T aq.

salt soln. is transferred to a second vessel where the soln. is conc. to 70% at 100°. The conc. soln. is now pumped to an autoclave at 225° and 25 bar for 1.5h in order to ensure sufficient polycondensation and reaction of volatile diamine. The oligomeric Nylon 6(3),T is pumped to a subsequent stirred vessel where it is heated at 270° under 10 bar to form prepolymer with intrinsic viscosity of 0.7–0.8 dl/g. It is discharged to a twin screw extruder and converted to high MW polymer with an intrinsic viscosity in the range 1–1.5 dl/g. Residence time in the extruder is usually less than three mins. The product is removed as strands which are quenched and chopped to pellets. *Nylon 6* is prepared commercially from the polym. of ϵ-caprolactam, in the presence of some water and ϵ-aminocaproic acid catalyst. Caprolactam is hydrolysed under steam pressure. Polym. then proceeds by polycondensation. Pressure reactors release moisture in a similar fashion to Nylon 6,6 reactors. The final polymer contains 10% equilib. concentration of caprolactam which must be removed in an additional leaching stage. Molten polymer is first extruded, quenched and pelletised before passing to a leaching tower to be washed with hot water. The product still contains about 2% caprolactam. After drying this level is reduced to about 0.2%. There is extensive literature on nylon melt polym. processes. Possible variants include a first step solid condensation of salt to prepolymer followed by a second stage through a filmtruder to convert to high MW. A first batch stage to produce prepolymer in a reactor is also feasible. The majority of commercial processes seem to be based on a continuous or semi-continuous process. The commercial preparation of *Aromatic polyamide fibres* from acid chlorides in soln. is also discussed under "Aramids". These materials cannot be prepared by melt condendation processes. *N*-methyl pyrrolidone containing $CaCl_2$ is the preferred solvent for producing high MW aramids

Nylon 6,I N-16

Synonyms: *Poly(hexamethylene diamine-co-isophthalic acid. Poly(hexamethylene isophthalamide). Poly(iminocarbonyl-1,3-phenylenecarbonylimino-1,6-hexanediyl)*
Related Polymers: Terephthalic/isophthalic acid copolymides
Monomers: 1,3-Benzenedicarboxylic acid, 1,6-Hexanediamine
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
25668-34-2

Molecular Formula: ($C_{14}H_{18}N_2O_2$)
Fragments: $C_{14}H_{18}N_2O_2$

Molecular Weight: 13000, 30000–35000
Additives: Polymerisation control additives include ammonium hypophosphite or phosphoric acid (thermal stabilisers and catalysts); benzoic acid as MW control agent
General Information: Nylon 6,I is a very transparent essentially amorph. resin with good impact and tensile props. Molecular models show that the chain is too kinked to permit ease of crystallisation [3]. However, crystallisation can be effected by prolonged boiling in water with consequent loss of tensile strength. Crystallisation only occurs with hydrogen bond-forming solvents. This was investigated by FT-IR spectroscopy [7]

Volumetric & Calorimetric Properties:

Nylon 3 N-17

Synonyms: *Polypropiolactam. Poly[imino(1-oxo-1,3-propanediyl)]. Poly(3,3′-dimethylpropiolactam). Poly(4,4′-dimethylpropiolactam). N3*
Monomers: Propiolactam, 4,4′-Dimethylpropiolactam, 3,3′-Dimethylpropiolactam, 3-Amino-3-methylbutanoic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24937-14-2

Molecular Formula: $[(C_3H_5NO)_n$(unsubst.).$(C_5H_9NO)_n$(subst.)]
Fragments: C_3H_5NO C_5H_9NO
General Information: Unsubstituted polymers decompose on melting. 3,3′-Dimethyl substituted polymer is highly cryst., and gives strong fibres at MW 20000 due to the strong hydrogen bonding. 4,4′-Disubstituted polymer has CO and NH at angles to the fibre axis; MW of 200000 is required for strong fibres

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.1 g/cm^3	4,4-dimethyl subst.
2	d 1.17 g/cm^3	unsubst., cryst. [3]

Melting Temperature:

No.	Value	Note
1	330°C	cryst., unsubst. [3]
2	296°C	4,4′-dimethyl subst. [2]
3	250°C	4,4′-dimethyl subst. [1]

Glass-Transition Temperature:

No.	Value	Note
1	111°C	cryst., unsubst. [4]

Transport Properties:
Polymer Solutions Dilute: η_{inh} 4.5 dl g^{-1} (1% in H_2SO_4, 4,4′-dimethyl subst.)

Mechanical Properties:
Mechanical Properties General: 4,4′-Dimethyl subst. polymer has tensile strength 50% that of Nylon 6

Polymer Stability:
Environmental Stress: 4,4′-Dimethyl subst. polymer fibres are stable to oxidation; 3,3′-dimethyl subst. polymer discolours readily

Applications/Commercial Products:
Processing & Manufacturing Routes: Prepared by low temp. anionic polymerisation of monomer in DMSO at 0–20° with potassium *tert*-butoxide. Initiated by Nylon 6,6 salts, gives MW up to 500000
Applications: Not commercial, though 4,4′-dimethyl polymer can be spun into silk-like fibres. Other fibres and films have been prepared from propiolactams

Nylon 4 N-18

Synonyms: *Poly(4-aminobutyric acid). Poly[imino(1-oxo-1,4-butanediyl)]. Polypyrrolidone. Poly(γ-butyrolactam)*
Monomers: 2-Pyrrolidinone
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24938-56-5

Molecular Formula: $(C_4H_7NO)_n$
Fragments: C_4H_7NO
Additives: Carbon dioxide and potassium pyrrolidinone to increase thermal stability for melt spinning. Higher MW fibres formed with quaternary ammonium salts
General Information: Has a much higher equilibrium water content than its higher Nylon homologues. While it is not dissimilar to cotton in this respect, it has a lower modulus than cotton. It is inferior to Nylon 6 and Nylon 6,6 in physical property stability (due to high moisture take up). It is difficult to polymerise and less thermally stable than the commercial Nylons
Morphology: Unit cell, a 9.44, b 12.1, c 8.22, β 64°, 8 monomer units per unit cell

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.25 g/cm^3	amorph. [4]
2	d 1.34–1.37 g/cm^3	cryst . [4]

Thermodynamic Properties General: Heat of evaporation proportional to binding force of functional groups being greatest for >1 combined water molecule [5]

Melting Temperature:

No.	Value	Note
1	250–265°C	[4]

Glass-Transition Temperature:

No.	Value	Note
1	81°C	[5]

Transition Temperature General: There is a sharp depression in the T_g with increasing water content up to a critical value at which additional water molecules form clusters around the amide sorption centres [5]

Transition Temperature:

No.	Value	Note	Type
1	-111°C	[6]	T_γ

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. MeOH, cresol, *o*-chlorophenol, formic acid, sulfuric acid, hot AcOH, hot benzyl alcohol, hot pyrrolidone [13]. Insol. DMF, H_2O [13]

Transport Properties:

Water Content: 9.1% (65% relative humidity), 28% (99% relative humidity) [8,9], 7.3% moisture regain [11,12]

Mechanical Properties:

Mechanical Properties General: The high moisture uptake of Nylon 4 can cause excessive loss of useful props. This seriously limits its use especially as a textile fibre. Tenacity (of fibre) 0.22–0.4 N tex^{-1} [11,12]

Optical Properties:

Transmission and Spectra: C-13 nmr spectral data have been reported [7]

Applications/Commercial Products:

Processing & Manufacturing Routes: Produced by the anionic polymerisation of 2-pyrrolidinone with acid chloride, anhydride or esters. Polymerisation in hydrocarbon dispersion at <60° has prod. high MW polymer in 85% yield. Unreacted monomer and catalyst residues are removed by extraction. Melt spinning from soln. using potassium pyrrolidinone salt and carbon dioxide stabilisation allows spinning at up to 270°

Applications: Not commercially available

Nylon 4,6 N-19

Synonyms: *Poly(imino-1,4-butanediylimino(1,6-dioxo-1,6-hexanediyl)). Poly(tetramethylenediamine-co-adipic acid). Poly(tetramethylene adipamide)*

Related Polymers: Glass fibre reinforced

Monomers: Tetramethylenediamine, Adipic acid

Material class: Thermoplastic

Polymer Type: polyamide

CAS Number:

CAS Reg. No.
50327-22-5

Molecular Formula: $(C_{12}H_{22}N_2O_2)_n$

Fragments: $C_{12}H_{22}N_2O_2$

Molecular Weight: MW 32900, MW 1000000

Additives: Cu and Mn halide salts and halo-organic compounds act as thermal stabilisers. Sb_2O_3 and halopolystyrene used for fire resistant formulations. Glass and carbon fibres give high rigidity, especially at elevated temps. Polyphenylene oxide and EPDM rubber blends used to improve impact resistance

General Information: Nylon 4,6 is the most recently commercialised nylon (1990). It has much higher yield stress and flexural modulus. It melts 30° higher than Nylon 6 at 290° and has outstanding heat and wear, chemical (oil) and fatigue resistance. It withstands 220° under heavy loads and has a continuous use temp. of 150° and is especially suited to applications in the electrical, electronic and automobile industries. High melting fibres of Nylon 4,6 have good friction and abrasion resistance and should compete well with Nylon 6 and 6,6. Recently, it has surprisingly been discovered that Nylon 4,6 is more thermally stable than Nylon 6,6 due to its lower oxygen permeability, resulting from its high crystallinity (70%) [3]. Its market has expanded dramatically from 100 tonnes per annum in 1990 to approx. 20000 tonnes per annum in 1996. Potential property disadvantages which may restrict further usage are high water absorption, which leads to significant dimensional changes after moulding, and rapid crystallisation from the melt, which affects processing and moulding tolerances

Morphology: Nylon 4,6 shows excellent props. compared to other aliphatic nylons in stiffness, dimensional stability, chemical resistance, creep modulus, etc. at higher temps. Because of its high degree of crystallinity (approx. 70%), it is distinctly superior to others in its mech. props., especially in its thermal dimensional stability [10]. These props. are evidently related to a higher degree of crystallinity and a higher melting temp. The determination of the crystallinity of Nylon 4,6 however, presents a problem because of the large discrepancies between the results of different crystallinity determination techniques. These differences and the remarkable thermal behaviour of Nylon 4,6 may largely be explained by imperfections in the cryst. struct. [11]. The struct. and morphology of soln. grown crysts. have been determined and compared with those of other polyamides [12]. They have similar lath-shaped crystallisation products, possessing the characteristics of chain-folded lamellar crysts. with a thickness of approx. 6 nm, and often aggregate to form sheaves. Electron diffraction patterns show that the chains lie perpendicular to the lamellar surfaces and that cryst. twinning occurs. The fold plane corresponds to the plane of the hydrogen bonds, these lying along the long axis of the cryst. in agreement with the electron diffraction results. Sedimented mats of the crysts. have been examined using both wide- and low-angle X-ray diffraction in directions perpendicular to the lamellar normals. The lamellar thickness remains constant up to 125° and then increases with crystallisation temp. Analyses of

the X-ray diffraction patterns confirms that the chain stems in Nylon 4,6 chain-folded crysts. are parallel to the lamellar normal in contrast to previous results from other polyamides, where the chain stems are inclined at substantial angles to the lamellar normal. The consequences of these findings demand an entirely new mechanism for folding in nylons, where an amide group is incorporated in the fold, rather than alkane segments as in previous chain-folded nylons. The fold exhibits similarity with the β-bend in proteins. The lamellar thickness is sufficient to accommodate four structural repeats of the chain. The crystallographic subcell is monoclinic, a 0.96, b 0.826, c 1.47 nm, γ 115°, and contains four chain segments (two sheet segments), which bears similarity with the unit cell of Nylon 6 [12]
Identification: A study of dimensional stability has been reported [34], in which thermal shrinkage, viscoelastic props., wide and small x-ray diffractions, and molecular orientation by fluorescence are all measured on Nylon 4,6 fibre samples. The molecular chains are well oriented along the fibre axis and the onset of thermal movement is shifted to a higher temp. than Nylon 6,6

2	10–40 kJ/m^2	Notched		23°
3	9–12 kJ/m^2	Notched		-40°

Charpy:

No.	Value	Notch	Break	Note
1	9–12	Y		-40°
2		N	Y	23°
3	12–45	Y		23°

Electrical Properties:

Electrical Properties General: Has less useful insulating props. compared to nylons 6 or 6,6 and is more anisotropic in props. Arc resistance rating 1 (CTI method)

Surface/Volume Resistance:

No.	Value	Note	Type
1	10×10^{15} Ω.cm	parallel [8]	S
2	0.01×10^{15} Ω.cm	perpendicular [8]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.9	50 Hz	[8]
2	3.6	1 MHz	[8]

Dielectric Strength:

No.	Value	Note
1	>25 kV.mm^{-1}	min., parallel [8]
2	>15 kV.mm^{-1}	min., perpendicular [8]

Complex Permittivity and Electroactive Polymers: Dielectric props. have been studied as a function of frequency, temp. and moisture content. Above T_g ionic conductivity is observed which gives rise to strong polarisation (due to high crystallinity of nylon). At high temps. conductivity increases to such an extent that it causes electrode polarisation and obscures further dielectric effects. α and β relaxations are significantly enhanced by water uptake, while the corresponding activation energies of the relaxations are reduced [38]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.007	50 Hz	parallel
2	0.877		perpendicular
3	0.026	1 MHz	parallel
4	0.12	1 MHz	perpendicular

Optical Properties:

Transmission and Spectra: H-1 nmr and C-13 nmr spectral data have been reported [32]

Polymer Stability:

Polymer Stability General: Overall thermal stability and effect of ageing upon physical props. as good as or better than Nylon 6 or Nylon 6,6. However, long residence times in extrusion/moulding have to be avoided because of narrow temp. window between melting and onset of thermal degradation

Thermal Stability General: Better than Nylon 6,6; retains half its tensile strength at 140° for longer than Nylon 6,6. Degradation is a surface phenomenon and is oxygen diffusion limited [6]. Thermal and oxidative stability can be improved by incorporating a copper salt insol. in water with a halogen substituted organic compound [9]

Upper Use Temperature:

No.	Value	Note
1	<163°C	max. 2500h [8]
2	<152°C	max. 5000h [8]
3	141°C	max. 10000h [8]
4	130°C	max. 20000h [8]
5	150°C	[6]

Flammability: Flammability rating V2 (0.9 mm thick). Insulation classification F. Limiting oxygen index 27%. Glow wire time 5 s extinguishing time, (850°, 2 mm) [8]

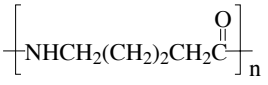
Chemical Stability: Especially suited for hot oil applications, e.g. engine or transmission oil which runs between 130–165°. Physical props. are not impaired over long testing periods. Otherwise, chemical resistance generally similar to Nylon 6,6

Applications/Commercial Products:

Processing & Manufacturing Routes: Nylon 4,6 is technically more difficult to polymerise than Nylon 6,6 due to its much higher melting point (295°), which makes it more sensitive to degradation and branching. Melt polymerisation and processing also pose problems due to the high volatility of the adipic acid component. Low temp. polymerisation in a solvent [13] or melt polymerisation followed by a solid phase polymerisation has been reported [14]. Continuous process polymerisation [15] may be carried out where aq. salt soln. is first evaporated to form a molten prepolymer, the prepolymer and vapour phase are passed through mass transfer zone to remove the vapour phase prior to discharge of the molten polymer. A method for the synth. of Ultra High MW polymer has been reported [16]. MW exceeding 1000000 has been achieved using tetramethylammonium chloride as the catalyst, in conjunction with a crown ether (18-crown-6) and carbonated potassium pyrrolidonate. Rapid rate of crystallisation makes melt spinning difficult. This problem has been solved by a melt spinning process with controlled temp. and pressure conditions. [33] It possesses high stiffness and low creep at elevated temps., with reduced cycle times and excellent mouldability

Mould Shrinkage (%):

No.	Value	Note
1	1.5–2%	anisotropic shrinkage



Applications: The main property advantages of Nylon 4,6 are heat and wear resistance, chemical (especially oil) and fatigue resistance. It is particularly suited for use in the electric, electronic and automobile industries where a continuous use temp. of at least 150° is required under the bonnet, e.g. vacuum tubing, fuel line retainer, and special grades have been developed for this purpose. Other automotive uses include halogen lamps, Volkswagen's automatic transmission, manual gear change for Range Rover due to excellent high temp. oil and grease resistance. In the electrical and electronic industries, examples of its use include brush carriers for electric motors, circuit breakers for domestic use (where temps. can reach 150°), electromagnetic coils for electric motors, and electronic sensors and connectors

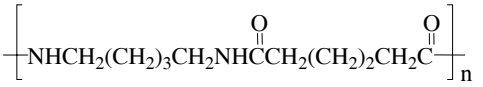
Nylon 5 N-20

Synonyms: *Poly(5-aminovaleric acid). Poly(imino-1-oxopentamethylene). Poly(5-aminopentanoic acid). Poly(δ-valerolactam)*
Monomers: 5-Aminopentanoic acid, 2-Piperidinone
Material class: Thermoplastic
Polymer Type: polyamide
Molecular Formula: $(C_5H_9NO)_n$
Fragments: C_5H_9NO
Morphology: Triclinic a 9.5, b 5.6, c 7.5. Unit cell a 0.965, b 0.978, c 0.726; α 60.4°, β 90.0°, γ 66.7° [3]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.3 g/cm^3	[2]



Melting Temperature:

No.	Value	Note
1	258°C	[1]

Nylon 5,6 N-21

Synonyms: *Poly(iminopentamethyleneadipoyl). Poly(pentamethylene diamine-co-adipic acid. Poly[imino-1,5-pentanediylimino(1,6-dioxo-1,6-hexanediyl)]*
Monomers: Hexanedioic acid, 1,5-Pentanediamine
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
41724-56-5

Molecular Formula: $(C_{11}H_{20}N_2O_2)_n$
Fragments: $C_{11}H_{20}N_2O_2$

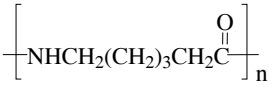
Volumetric & Calorimetric Properties:

Latent Heat Crystallization: Activation energy for transport 61.1 kJ mol^{-1} [1]
Melting Temperature:

No.	Value	Note
1	254°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	45°C	heating rate 2° per min. [2,3]



Transport Properties:

Polymer Solutions Dilute: η_{inh} 0.941

Nylon 6 N-22

Synonyms: *Poly(ε-caprolactam). Poly[imino(1-oxo-1,6-hexanediyl)]. Poly[6-aminohexanoic acid]. Polycaproamide. Polypentamethylenecarbonamide*
Related Polymers: Nylon
Monomers: Caprolactam, Caproamide
Material class: Thermoplastic
Polymer Type: polyamide

CAS Number:

CAS Reg. No.
25038-54-4

Molecular Formula: $[C_6H_{11}NO]_n$
Fragments: $C_6H_{11}NO$
Additives: Caprolactam monomer remaining from polymerisation acts as plasticiser to increase flexibility and strength. 30–33% Glass fibres blended to improve strength and modulus and reduce mould shrinkage. Mineral filled grades have lower creep. 30–33% Chopped fibreglass (approx. 3 mm) blended and co-extruded. Glass reinforcement increases tensile and flexural props., reduces creep, shrinkage and moisture absorption; toughness is reduced. Mica to improve solvent resistance and strength
General Information: Nylon 6 resembles Nylon 6,6 in chemical and physical props. Nylon 6 is used mainly for fibres and engineering resin moulding applications
Morphology: Nylon 6 develops γ-crystallinity during routine moulding or extrusion but will change to the α-crystalline form by nucleation [43]. Degree of crystallinity 0.4 [1]. α-monoclinic a 9.56, b 8.01, c 17.24, γ 67.5, 8 units in cell [27]; α-monoclinic a 4.81, b 7.61, c 17.1, γ 79.5, 4 units in cell; α-monoclinic a 9.65, b 8.11, c 17.2, γ 66.3; β-monoclinic a 4.9, b 8.0, c 3.6-4.1; γ-monoclinic a 9.14, b 4.84, c 16.68, γ 121, 4 units in cell [18]. Dark spots are seen which react with OsO_4. These are regions of microstructure damage whose number diminish with rising water content/reducing crystallinity. They are low-density areas of cavities formed to relieve stress due to material misfit between domains of lamellae and spherulites during plastic deformation [44]. A collection of all crystallographic data on the α and γ unit cells of Nylon 6 has been reported [45,46]. Crystallisation from dilute soln. has been reported [47]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.084 g/cm^3	amorph. [1]
2	d 1.09 g/cm^3	moulded [15]
3	d 1.23 g/cm^3	crystalline [1]
4	d 1.12–1.14 g/cm^3	moulded [1]
5	d 1.13 g/cm^3	[15]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8.9×10^{-5} K^{-1}	125°, α-cryst. [31]	L
2	0.0001 K^{-1}	125°, α-cryst. [31]	L
3	9×10^{-5} K^{-1}	-30–30°, ASTM D696 [97]	L

Volumetric Properties General: Molar Volume 100 cm^3 (crystalline rods) [13]; 103 cm^3 (amorph.) [15]. Specific volume 0.917 cm^3 g^{-1} (amorph., 20°); 0.813 cm^3 g^{-1} (α-monoclinic); 1.032 cm^3 g^{-1} (270°, melt) [15]. Other heat capacity data have been reported [1,13]
Thermal Conductivity:

No.	Value	Note
1	0.23 W/mK	23°, mouldings [25]
2	0.43 W/mK	23°, crystalline, moist [25]
3	0.35 W/mK	23°, amorph., moist [25]
4	0.21 W/mK	250°, melt [26]
5	0.23 W/mK	dry, IEC 1006 [30]

Thermal Diffusivity: 1.8×10^{-3} (ambient), 1.4×10^{-3} (100°); 0.65×10^{-3} cm^2 s^{-1} (melt) [26]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.47–1.6 kJ/kg.C	solid state, 23°, 50% relative humidity [1,29]	P
2	2.13–2.47 kJ/kg.C	liquid, 25° [1]	P
3	1.7 kJ/kg.C	dry, IEC 1006 [30]	P

Melting Temperature:

No.	Value	Note
1	260°C	α crystalline form [1,12]
2	231°C	equilibrium [21]
3	218°C	[97]

Glass-Transition Temperature:

No.	Value	Note
1	40°C	[1]
2	60°C	dilatomer, dry [12]
3	53–54°C	27% crystalline sample [12]
4	50–80°C	lower transition [1]
5	125–132°C	[1]

Transition Temperature General: Molar thermal decomposition function $\gamma_{d½}$ 79 kcal mol^{-1} [10]
Deflection Temperature:

No.	Value	Note
1	190°C	0.45 MPa, ISO 75 [28]
2	95°C	1.8 MPa [28]
3	160°C	0.45 MPa, dry, moulded, ISO R75 [12,28]
4	55–90°C	1.8 MPa [12,28]
5	>160°C	min., 0.45 MPa [30]
6	55–75°C	1.8 MPa [30]
7	180°C	0.45 MPa
8	67°C	1.8 MPa, ASTM D696 [97]

Transition Temperature:

No.	Value	Note	Type
1	40–45°C	[1]	2nd order T_g
2	350°C	[1]	decomposition temp. T_d
3	430°C	[1]	half life temp.of decomposition
4	400°C	[12]	flash ignition temp.
5	440°C	[12]	self ignition temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 22.5 J^{½} cm$^{-3/2}$ [1]; d 27.8 J^{½} cm$^{-3/2}$ (amorph., 25°) [17]
Plasticisers: Very polar non-volatile liquids e.g. *p*-toluenesulfonamide

Solvents/Non-solvents: Sol. typical polyamide solvents such as dimethyl acetamide or DMF (dissolution of chloride salts 1–2% assists) and strong acids such as sulfuric (cold), formic or AcOH (hot). Polar solvents will often swell the nylon or dissolve it to a limited extent, e.g. Me_2O, $CHCl_3$, CCl_4, aniline (>40°); cresol, phenol, resorcinol

Surface Tension:

No.	Value	Note
1	40 mN/m	from contact angle [1,24]
2	43 mN/m	[1,24]
3	36 mN/m	[1,24]

Transport Properties:

Transport Properties General: Permeability and diffusion increase significantly with water content, which may vary between 0–10%, and with increasing temp.

Polymer Solutions Dilute: Unperturbed viscosity coefficient Kθ 0.19–0.23 $cm^3\ mol^{1/2}\ g^{-3/2}$ [1]

Polymer Melts: Melt density 0.96 g cm^3 [12]. Spencer and Gilmore equation constants have been reported [1,4,5]. Coefficient of zero-shear-rate-melt viscosity, K 9.5 × 10^{-14} (250°) [22]. Melt viscosity 140 Pa s (250°) [30]. Melt viscosity 1000 Pa s (250°, M_n 26000)

Permeability of Gases: Permachor prediction of gas permeability has been reported [8]. Nylon 6 has very low permeability to organic vapours and permanent gases, and is often used for its barrier props. Impermeability to gases may be further enhanced by blending with the commercial amorph. copolyamide of isophthalic acid, terephthalic acid and hexamethylene diamine, Selar AP

Permeability of Liquids: Nylon 6 has the highest permeability of all common thermoplastics to water vapour. [H_2O] 0.13 × 10^{-13} (30°) (0.16 × 10^{-13} cm^2 (s Pa)$^{-1}$ (0–85% humidity, 23°)

Water Content: Mouldings from Nylon 6 are hygroscopic and gradually take up moisture until equilibrium is reached, but will increase further as humidity rises. The effect upon physical props. is quite profound; toughness and impact strength increase; tensile strength is reduced while elongation is increased; moulding dimensions increase linearly with absorbed water; 0.3% per 1% water uptake. The electrical props. are adversely affected, although generally still OK for domestic purposes. Water absorption is low and it may take several months for a thick section of moulding to equilibrate. Usually mouldings are preconditioned at 60° and 20° prior to despatch to customers, so as to reach equilibrium. As Nylon 6 takes up 10% water, the peeling strength of metal coatings on Nylon 6 is significantly affected by the water absorbed on its surface. Nylon 6 is plated by a wet process to optimise peeling strength, peeling force 1.8 kg cm^{-1} is similar to that of ABS [48]. Structural changes accompanying hydration of Nylon 6 have been reported [49]

Water Absorption:

No.	Value	Note
1	9.5 %	[12]
2	10 %	23°, saturated [28,30]
3	3.2 %	20°, 48h [97]
4	2.6–3.4 %	23°, saturated, 50% relative humidity [30]
5	3.5 %	20° equilibrium., 65% relative humidity
6	3.3–4.5 %	21°, 65% relative humidity
7	7.1–7.8 %	21°, 95% relative humidity

Gas Permeability:

No.	Gas	Value	Note
1	[N_2]	26.26 cm^3 mm/ (m^2 day atm)	0.03 × 10^{-13}
2	[N_2]	6.26 cm^3 mm/ (m^2 day atm)	0.00715 × 10^{-13} (30°) [1,2,3,4,5,12]
3	[O_2]	24.95 cm^3 mm/ (m^2 day atm)	0.0285 × 10^{-13} (30°)
4	[O_2]	52.53 cm^3 mm/ (m^2 day atm)	0.06 × 10^{-13} (40% humidity) [30]
5	[CO_2]	57.78 cm^3 mm/ (m^2 day atm)	0.066 × 10^{-13} (20°)
6	[CO_2]	350.18 cm^3 mm/ (m^2 day atm)	0.40 × 10^{-13} (0% humidity)
7	[H_2S]	223.24 cm^3 mm/ (m^2 day atm)	0.255 × 10^{-13} (30°)
8	[NH_3]	768.64 cm^3 mm/ (m^2 day atm)	0.878 × 10^{-13} cm^2 (s Pa)$^{-1}$ (20°)

Mechanical Properties:

Mechanical Properties General: Mechanical loss factor tan δ (0.1–10 Hz, ISO 537), 0.016 (dry, 20°); 0.048 (dry, 40°); 0.175 (dry, 60°); 0.127 (dry, 80°); 0.064 (dry, 100°) [12]. At moisture content <0.15% mechanical props. are stable, but complex shapes crack [50]. To avoid complications, manufacturers pre-condition granules to 3.5% moisture content. Tensile modulus 2.2–3.1 N tex^{-1} (normal tenacity), 2.9–4.1 N tex^{-1} (65% relative humidity). Tensile stress break 0.4–0.6 N tex^{-1} (normal tenacity), 0.75–0.84 N tex^{-1} (high tenacity)

Tensile (Young's) Modulus:

No.	Value	Note
1	168000 MPa	along chain, oriented fibre [1]
2	3000 MPa	dry, 23° [12,30]
3	1500 MPa	moist, ISO 1110, 23° [12,30]
4	500 MPa	dry, 100° [12]

Flexural Modulus:

No.	Value	Note
1	2200 MPa	dry, 23° [28,29]
2	800–970 MPa	50% relative humidity, 23°, ISO 178 [28,29]

4	1500 MPa	dry, nucleated, 23° [12]	Shear modulus
5	200 MPa	dry, 100° [12]	Shear modulus
6	800 MPa	dry, 200°, ISO 537 [12]	Shear modulus
7	230 MPa	23°, 50% relative humidity	Apparent creep modulus
8	440 MPa	nucleated	
9	600 MPa	20°, ASTM D1043 [97]	Modulus of rigidity in torsion
10	2100 MPa	20° ASTM D790, [97]	Modulus of elasticity in flexure

Impact Strength: Dispersion of core-shell polymer in caprolactam soln. of telechelic polymerised to form rubber modified Nylon 6 block copolymer with improved impact resistance [96]
Viscoelastic Behaviour: Speed of sound 2700 m s^{-1} (longitudinal), 1120 m s^{-1} (shear) [7]; 1400–2300 m s^{-1} (fibres, 20°) [23]
Hardness: Ball indentation hardness 6.25 [1]; Ball indentation hardness H358/30 (ISO 2039, 150 MPa, dry, 23°). Shore D72 [1]. Rockwell 85 [1], M100 (23°), M70 (moist, ISO 1110, 23°) [1,14]. Rockwell R 118, M 80 [97]
Fracture Mechanical Properties: Fracture energy W_{50} 100 J (dry, 23°); 140 J (moist, 23°); 40 J (dry, -20°, DIN 53443Ti) [30]. Hoop stress 15–12 N m^{-2} (20°, H_2O, 100h); 6 N m^{-2} (19000h) [30]. Average toughness 0.07–0.14 N tex^{-1} [1,14,30]
Friction Abrasion and Resistance: Taber abrasion resistance 8 mg $(1000\ cm^3)^{-1}$, (ASTM D1044); Taber loss factor 15 mg (DIN 53516) [1]. Coefficient of friction 0.39 [1]; 0.35 (roughness depth 0.1 μm); 0.32 (roughness depth 1 μm, 2μm); 0.43 (roughness depth 6 μm) [14]. Friction and wear coefficients of Nylon 6 pins slid against stainless steel at 20°, -196° and -268.8° have been reported. Although harder at cryogenic temps., non-dimensional wear coefficients are in the range $5 \times 10^{7.5}$ to 10^6. Good correlation between friction and wear coefficients indicates a third to fourth power relationship between them for both unfilled and reinforced nylon. Adhesive wear is the dominant wear mechanism [54]. Mechanism of friction and fatigue limit of Nylon 6 have been reported [94,95]
Izod Notch:

No.	Value	Notch	Note
1	50–100 J/m	N	23°, dry [12]
2	30–50 J/m	N	-40°, dry [12]
3	120 J/m	N	23°, moist, ISO 1110 [12]

Dielectric Strength:

No.	Value	Note
1	100 $kV.mm^{-1}$	dry [1]
2	40 $kV.mm^{-1}$	dry [12]
3	60 $kV.mm^{-1}$	moist, ISO 1110 [17]
4	14 $kV.mm^{-1}$	dry, 23°
5	10 $kV.mm^{-1}$	50% relative humidity, IEC 243, 3 mm specimens [28]
6	100 $kV.mm^{-1}$	dry [31]
7	60 $kV.mm^{-1}$	moist [31]

Complex Permittivity and Electroactive Polymers: Resistance to tracking CTI 600 (method CTI); CTI-M 600 (method CTI-M) [30]. Comparative tracking index >600 (IEC 112) [28]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.2	1 kHz	[29]
2	0.023–0.03	1 MHz	moist, DIN 50014, IEC 250 [30]
3	0.06	1 kHz	[97]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.53	mouldings [12]

Total Internal Reflection: Birefringence 1.53 (perpendicular) [13]; 1.58 (parallel) [1]

Polymer Stability:

Thermal Stability General: Excellent thermal stability to 300°, in absence of air and dry

Upper Use Temperature:

No.	Value	Note
1	120°C	[1]
2	70–85°C	20000h [30]
3	180°C	5–10h

Decomposition Details: Decomposition occurs slowly above 300°, combustible gases given off between 450–500°, plus water, H_2O, CO, N_2 and other nitrogenous compounds. Above 400° decomposition products are as toxic as burning wood. Surface degradation begins at 10% O_2 in inert gas atmosphere [41] above 100° [97]. Graphite, kaolin and other filled grades undergo loss of mass and transformation at 360–500° [39]. Other thermal degradation studies have been reported [40, 42]. Nylon structural residues remain in char after pyrolysis [37]

Flammability: Flammability rating HB (reinforced grades, UL94) [28]; V2 (<1.6 mm, cast sheet, UL94) [30]; V0 (flame retardant, UL94); BH (2–20 mm, IEC 707/VDE 0304T); FH (3–15 mm, IEC 707/ VDE 0304T). Limiting oxygen index 23% [1], 25–27% (dry, ASTM D2863) [12,28]. A range of fire retardants with Nylon 6 have been studied, including brominated polystyrene [59]. Phosphorus compounds [11, 60, 64, 68], phosphine oxide [61], melamine and glass fibre [62]; antimony and zinc compounds [63, 67] and brominated epoxy resins [64]. Polypentabromobenzyl acrylate/reactive butadiene rubber/Nylon 6 flame retardant compounds have been investigated, with improved impact strength, suggesting compatabilisation [36, 65]

Environmental Stress: Unstabilised Nylon 6 mouldings degrade under load in warm wet climate, with creep, loss of fracture energy and stress. Extended exposure causes crystallinity and orientation changes [43]. Embrittlement occurs above 80° on exposure to O_2 or Uv radiation. Mechanical props. are also affected by Uv radiation. Stabilisers such as copper halides, amines and esterified phenols, and light stabilisers [56] are used to minimise weathering effects [28]. Nylon 6 undergoes salt induced crazing [32,33]. Above 50°, water and ion sorption increases [55], absorbed salt can be removed by immersion in water. At high temp. T_g and crystallisation changes occur suggesting plasticisation mechanism [34]. Environmental effects on mechanical props. have been reported[52]

Chemical Stability: Nylon 6 is resistant to attack by Me_2CO, AcOH, hydrated alumina salts, NH_3, amyl acetate, antifreeze, C_6H_6, borates, butane, butyl alcohol (<40°), citric acid, copper sulfate, decalin, diesel fuel, edible fat, Et_2O; fats and fatty esters, fluorine, formaldehyde, formic acid, fuel oils, glucose, glycerol

(<60°), glycol, heptane, hexane, hydraulic fluid, hydrochloric acid, H_2S, H_2O_2, hydroquinone, ink, isooctane, kerosene, lactic acid, 50% $MgCl_2$, Hg, milk, mineral oil, motor oil, naphthalene, nitric acid, nitrobenzene, oleic acid, ozone, perchloroethylene (<40°), petrol, petroleum jelly, phenol, 10% KOH, propane, salicylic acid, sea water, silicone oil, sodium carbonate, 10% NaOH, Na_2SO_4 aq. (<40°), starch, stearates, styrene, sulfur, 10% sulfuric acid, tartaric acid, tetraethyl lead, toluene (<40°), transformer oil, turpentine, urea, uric acid, urine, water, wax, white spirit, wine, xylene (<40°) [28]. Swollen by $CHCl_3$, EtOH. It is attacked by strong acids especially at elevated temps. Flexural and impact strength of glass reinforced Nylon 6 are maintained to at least 80% of their initial values after immersion in engine oil or radiator fluid at 120° for up to 2000h [30]

Hydrolytic Stability: Amorph. regions are attacked first but crystalline areas are not immune to hydrolysis

Applications/Commercial Products:

Processing & Manufacturing Routes: Caprolactam is polymerised to Nylon 6 by heating at 250–270° in an autoclave with water and initiator (aminocaproic acid). AcOH used to control MW. Conversion reaches 90%. Polymer is is extruded into water and cut into chips. Polymer is treated with hot water to remove 9% monomer, then dried before processing. Non-woven forms are usually produced by melt spinning and distributing nylon fibres directly onto a mat e.g. on a conveyor belt. Treatments are applied to bond the fibres through mechanical entanglement of the filaments by needle punching. Continuous polymerisation. Caprolactam is continuously metered into steam pressured hydrolyser. Resulting mixture of lactam and polymer are passed through one or more polymerisation reactors designed for moisture release to give satisfactory MW. Molten polymer is metered from final reactor through a strand die and pelletised. Pellets are washed in leaching tower to remove excess lactam. A new invention relates to the polymerisation of caprolactam in which a reactant stream containing caprolactam and a lactam polymerisation initiator are brought into a contact with a second stream containing caprolactam and a lactam magnesium halide. 2-Pyrrolidinone and a pyrrolidinyl capped initiator enhance the rate of polymerisation [101]. During conventional polymerisation of Nylon 6, excess water is evaporated at the degassing stage from the reaction product, which is close to polymerisation equilibrium. Degassing is not always smooth for high viscosity melts. The optimium prepolymer condition at the degassing stage has been determined to be 170–175° [104]. Unique starburst Nylon 6 macromolecules have been synth. which have extraordinary symmetry, extensive branching and a high number of terminal functionality [105]. Nylon 6 two-armed and three-armed systems, prepared from anionic bulk polymerisation, have different characteristics from linear nylon and exhibited lower melting points and higher melt flow than conventional Nylon 6 [106]. Activated anionic polymerisation of caprolactam occurs rapidly reaching equilibrium in a few minutes, compared to conventional polymerisation which takes several hours. This method is used in important industrial applications of Casting and Reaction Injection Moulding (RIM). Polymerisation is conducted below Nylon 6 melting point to permit direct fabrication of parts from monomer [93,107]. Rotational moulding can be used for manufacturing relatively cheap but complex shapes with little built-in mould stress [92]. Nylon rotational moulding was developed for Nylon 11 and 12 powders. Since the 1980s Nylon 6 has entered this market which is growing, and is supplied in pellet form. Powders are employed with particle sizes approx. 500 μm and mould temps. are around 230–280°. Flushing with inert gas during moulding prevents oxidative attack and discolouration of the interior surface. Nylon 6 pellets are processed at oven temps. of 300–360°. Materials of mould construction include cast and sheet aluminium, stainless steel and electroformed nickel [86]. Rotational moulding is a single unique process capable of producing hollow items with very uniform wall thickness [87]. High melt flow powder is placed in a closed, heated mould which is rotated about two perpendicular axes to ensure uniform distribution. The high melt flow index requirement leads to a decrease in toughness and environrental stress cracking resistance which is partly offset by the fact that mouldings are stress free. Where high strength is necessary, then the process can be adopted to coat the inside of a metal tank with a corrosion resistant coating. The technique has been applied successfully to Nylon 6 and HDPE [88]. The props. of Nylon 6 and ethylene-chloro-trifluoroethylene (ECTFE) make them the natural choice for applications requiring better heat resistance, greater strength, modulus and superior environmental stress crack resistance. The chemical resistance of HDPE, Nylon 6 and ECTFE give typical rotomoulded props., tensile creep at 93°, environmental ageing and ambient gasoline permeation compared graphically [89]. Nylon castings are cost effective for making large or heavy-wall parts [70,76,77,78]. Spin casting is a further variation of the process in which molten caprolactam monomer is anionically polymerised in a mould employing a catalyst system comprising typically a metal lactam and a polyacyl lactam. Fillers or fibres may be incorporated into the casting. Spin casting has proved more economical than injection moulding for low volume Nylon 6 materials [73,74]. In order to achieve optimum mechanical strength, stiffness and cold flow, the interfacial bond between the inorganic reinforcing material and the nylon polymer should be made through a chemical reaction. *n*-((3-Triethoxysilylpropyl)-carbamyl) caprolactam is particularly suitable in anionic cast polymerisation [75]

Applications: Fibres. Nylon 6 and 6,6 dominate the use of fibres in carpets due to excellent wear resistance with retention of appearance and low cost. A full range of colours and lustre are available. Nylon fibres predominated in the carcass of truck tyres, racing car tyres and airplane tyres. Used less in radial tyres and replacement tyres due to temporary flat spots. Nylon continues to be principal fibre in hosiery, women's underwear and stretch fabrics. Nylon lost market share to Polyesters in the apparel market from the mid 80s, but continues to dominate womens underwear. Nylon blends with other fibres, e.g. Lycra, are used by wrapping Lycra filaments with nylon to give a nylon appearance together with high stretch and recovery props. There is a large market in soft-sided luggage due to its strength. Some nylon is also used in upholstery fabrics. Non-woven fabrics are used for artificial leather, component of carpet underlay and for disposable garments in the health care field. Products made from automated moulding operations include many car parts e.g. fluid reservoirs, wheel covers. Electrical applications incude plug sockets, switches. Large amounts of Nylon 6 used in film and wire and cable. Most film is coextruded with polyethylene to utilise oxygen barrier props. of nylon. Nylon 6 also finds use in power tool industry due to excellent pigmentation props. Unreinforced Nylon 6 a) Low viscosity grades used to extrude: monofilaments, bristles, fishing lines, oriented tapes and coatings, machinery parts, housings for hand held tools, thin walled parts, housing/chassis for gasoline pumps, cable sheathing. b) medium viscosity: fittings, car trims, thick walled parts. c) high viscosity: blown film, sheet, thick monofilaments, automotive tubes, blow mouldings. d) anionic mouldings: semi-reinforced prods. and containers. e) impact modified: anchors, rollers. Glass-fibre reinforced applications include automotive mirror housings (high impact), wheels of mountain bikes; also very stiff, dimensionally stable high temp. resistant mouldings e.g. electrically insulating parts. Impact modified glass-fibre reinforced for high notched impact strength applications e.g. BMX bike wheels, steering wheels and power tools. Mineral reinforced grades used for high impact, food dimensional stability and low warpage (e.g. wheel coverings and engine covers, toothbelt guards on engines). Combined glass fibre and mineral reinforced grades used for intermediate stiffness and good dimensional stability and surface finish and low warpage

Nylon 6,6 N-23

Synonyms: *Poly(hexamethylenediamine-co-adipic acid). Poly(hexamethylene adipamide). Poly(iminohexamethylene iminoadipoyl). Poly(imino(1,6-dioxo-1,6-hexanediyl)imino-1,6-hexanediyl)*
Related Polymers: Nylon polymerisation
Monomers: 1,6-Hexanediamine, Hexanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
32131-17-2

Molecular Formula: $(C_{12}H_{22}N_2O_2)_n$
Fragments: $C_{12}H_{22}N_2O_2$
Additives: Titanium dioxide is used to reduce lustre. Manganese phosphates and phosphates are thermal stabilisers. Copper salts are used for fibres.
General Information: An important engineering plastic due to its inherent toughness and solvent resistance, it is employed principally in fibre form commercially. Its most important property is its "tenacity" (tensile strength at break). Tensile props. depend upon spin speed, draw ratio and are controlled by the intimate morphology of the fibres, especially the crystalline and amorph. degree of orientation. [3]
Morphology: Max. crystal linear growth rate 20μm s^{-1} [26]. Correlation with density has been reported [37]. Crystalline forms: 40-60% spherulites; triclinic a 4.9, b 5.4, c 17.2. 1 monomer per unit cell [6]; α_{11} triclinic a 4.97, b 5.47, c 17.3 [18]. β triclinic a 4.9, b 8.0, c 17.2 [6]. Above 160° β-pseudo hexagonal form a 5, b 5.9, c 16.2. [19]. Single crystals annealed in glycerol show stepwise increase in lamellar thickness, corresponding to crystal thickness calculated from observing melting point. Two thickening mechanisms are involved, half a monomer unit and $1\frac{1}{2}$ monomer units. [80] Crystallisation studies from quenched melt show defective crystals form as fibrous entities oriented to strain axis; defect migration gives axial density modulation; local softening may relax strain and let crystal relax its orientation to the most stable form [81]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.21–1.24 g/cm^3	α, triclinic cryst., [6,7,26,38]
2	d 1.152–1.165 g/cm^3	αII, triclinic cryst. [18]
3	d 1.25 g/cm^3	β, triclinic cryst. [1,6]
4	d 1.1 g/cm^3	triclinic, 170° [19]
5	d 1.13–1.145 g/cm^3	cryst moulding [1]
6	d 1.069 g/cm^3	amorph. [14]
7	d 1.09 g/cm^3	amorph. [1,13]
8	d 0.989 g/cm^3	melt, 270°, 1 bar [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	7×10^{-5}–0.0001 K^{-1}	cryst., 20°	L
2	0.0001–0.00014 K^{-1}	cryst., 100°	L
3	2.1×10^{-5} K^{-1}	αa, triclinic, 20°	L
5	7×10^{-5} K^{-1}	ASTM D696 [54]	L
6	0.000117 K^{-1}	parallel	L
7	0.000114 K^{-1}	normal	L
8	0.00028 K^{-1}	cryst., 20° [32]	V
9	0.00022 K^{-1}	β, triclinic, 20°	L

Latent Heat Crystallization: Energy of activation 54 kJ mol^{-1}. [4] Energy of activation of cryst. 64.5 kJ mol^{-1} [26]. Energy of activation of diffusion of water 58 kJ mol^{-1} [1]. Heat of fusion 36.8–68 kJ mol^{-1} (triclinic cryst., α1) [15,16,18,26]. Heat of fusion 196 kJ kg^{-1} [40]. Mandelkern's equation parameters, applicable to the transport process involved in the growth of spherulites in polymer melts, have been reported [24]. Flow activation energy (melt) 60 kJ mol^{-1} [45]. Heat of combustion 31.4 kJ g^{-1} [26]. Enthalpy 85 kJ kg^{-1} (60 Mpa, 20°); 170 kJ kg^{-1} (100 Mpa, 20°); 590 kg kJ (250 MPa 20°) [1]. Enthalpy 250 kJ kg^{-1} (0 Mpa, 150°); 340 kJ kg, (100 Mpa, 150°); 420 kJ kg^{-1} (200 Mpa, 150°) [34]. Stress relaxation activation energy 598 kJ mol^{-1} [71]

Thermal Conductivity:

No.	Value	Note
1	0.24–0.35 W/mK	amorph. [26]
2	0.23 W/mK	mouldings [1,57]
3	0.43 W/mK	cryst., moist, 30°
4	0.36 W/mK	amorph., moist, 30° [53]
5	0.25 W/mK	

Specific Heat Capacity:

No.	Value	Note	Type
1	1.47 kJ/kg.C	[26]	P
2	1.66 kJ/kg.C	cryst. [42]	P
3	1.674 kJ/kg.C	[54]	P
4	1.7 kJ/kg.C	[57]	P

Melting Temperature:

No.	Value	Note
1	263°C	ISO 3146C [56]
2	265–280°C	α1 triclinic [16,17]
3	269.5°C	αII triclinic [16]
4	267–280°C	effective melting point [26]

Glass-Transition Temperature:

No.	Value	Note
1	50°C	[21,22,23]
2	57–58°C	27% cryst. [24,26]
3	80°C	dry [58]
4	26°C	50% relative humidity
5	-17°C	saturated [58]

Deflection Temperature:

No.	Value	Note
1	235°C	0.45 Mpa, ASTM D648
2	235°C	0.5 Mpa, ASTM D648
3	90°C	1.8 Mpa, ASTM D648 [55]
4	200°C	0.45 MPa, dry as moulded
5	100–110°C	1.8 MPa, dry as moulded, ISO-R 75 [1]

Vicat Softening Point:

No.	Value	Note
1	200°C	[58]

Brittleness Temperature:

No.	Value	Note
1	-80°C	ASTM D746 [55]
2	-65°C	[62]

Transition Temperature:

No.	Value	Note
1	390°C	[1] flash ignition temp.

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: 27.8 J $^{1/2}$cm$^{-3/2}$ [26]

Plasticisers: Plasticisation by water and alcohols has been reported. T_g is reduced proportionally to amount of plasticiser per chain unit [68,107]

Solvents/Non-solvents: Sol. strongly polar solvents, formic acid, conc. H_2SO_4, THF. Absorbs alcohols to high levels without being dissolved; EtOH absorption: 9–12% (mouldings, saturated, 20°); butanol absorption: 4–8% (mouldings, saturated, 20°) glycol absorption: 2–10% (mouldings, saturated, 20°) MeOH absorption: 9–14% (mouldings, saturated, 20°); propanol absorption: 9–12% (mouldings, saturated, 20°) [1]

Surface and Interfacial Properties General: Surface tension 42–46 mN m^{-1}. [26] 40–44 mN m^{-1} (23°) [26,48]. 36 mN m^{-1} (melt) [51,49]

Surface Tension:

No.	Value	Note
1	42–46 mN/m	[26]
2	40–44 mN/m	23°, [26, 48]
3	36 mN/m	melt [51,49]

Transport Properties:

Transport Properties General: Nylon 6,6 melts from cryst. form to a comparatively low viscosity liq. and does not require a high level of power and shear to process. Solid resin has very good resistance to permeation by gases due to its high crystallinity when dry, but is less efficient moist. It absorbs moisture continuously and can take up to 9% by weight. Consequently, Nylon 6,6 film finds applications in packaging where flexibility, strength and barrier props are suited. Poor resistance to water vapour may be overcome by sandwich construction of composite films with a nylon layer between moisture resistant polyethylene layers. Composite film of this nature is ideal for vacuum packaging of perishable foods. Nylon 6,6 film is easily thermoformed to appropriate shapes, and finds many uses in the medical and chemical engineering sectors

Melt Flow Index:

No.	Value	Note
1	50 g/10 min	285°
2	120 g/10 min	melt volume ISO 1133 [57]

Polymer Solutions Dilute: Mark Houwink constants have been reported. [1] [η] 2.6 dl g^{-1} (1g dl^{-1}, H_2SO_4 M_n 18000); 3.4 dl g^{-1} (1g dl^{-1}, H_2SO_4 M_n 26000)

Polymer Melts: Melt viscosity 10–1000 Pa s, dependent on temp. and MW. Oxidation increases melt viscosity, leading to loss of mech. props. Melt viscosity 110 Pa s (270°M_n 1400); 70 Pa s (280°) 50 Pa s (200°) [4]. Apparent melt viscosity, shear stress relationship has been reported. [5] Ostwald power law equation parameters have been reported. [27] Other equation of state (melt) information has been reported [26,39,45]. Nylon 6 and Nylon 6,6 have similar rates of degradation and onset of severe degradation as a function of temp. workable melt temp. range for extruding stock shapes without risk of serious polymer breakdown. [77] A qualitative description of the viscoelastic behaviour of Nylon 6,6 was given taking into account temp., MW and MW distribution, branching etc. has been reported [118] Rheological behaviour is related to structural characteristics such as chain stiffness, length, branching and composition [121]

Permeability of Gases: [CO_2] 0.51×10^{-10} cm^2 (s cmHg)$^{-1}$ (amorph.); Pc = 0.47×10^{-10} cm^2 (s cmHg)$^{-1}$ (cryst.) [O_2]; Pa = 0.14×10^{-10} cm^2 (s cmHg)$^{-1}$ (amorph.); Pc = 0.3×10^{-11} cm^2 (s cmHg)$^{-1}$ (dry cryst.) Pc = 0.13×10^{-10} cm^2 (s cmHg)$^{-1}$ (amorph.); (saturated cryst); [N_2] Pa = 0.3×10^{-11} cm^2 (s cmHg)$^{-1}$ (amorph.); Pc = 0.27×10^{-11} cm^2 (s cmHg)$^{-1}$ (cryst.)

Permeability of Liquids: Coefficient of diffusion of [H2O] 0.2×10^{-8} cm^2 s^{-1} (20°); 3.5×10^{-8} cm^2 s^{-1} (60°); 35×10^{-8} cm^2 s^{-1} (100°); [52]

Permeability and Diffusion General: The Gruneisen thermodynamic coefficient for several polymers including Nylon 6,6 at room temp. has been reported [113]

Water Content: 8.5% ± 0.5 (saturation 92% water, 25–90°) [ISO 62 [26,55,50]] [26]; 2.9% (50% relative humidity, 100 days). 9.6% (100% water saturation, 20 days). Mouldings from Nylon 6,6 are hygroscopic and gradually take up moisture until equilibrium is reached, about 3% for environment of 50% relative humidity and 23°, but will increase further as the humidity rises. Toughness and impact strength increase; tensile strength is reduced while elongation is increased; moulding dimensions increase linearly with absorbed water: 0.3% per 1% water uptake; the electrical props. are adversely affected, although OK for domestic purposes. Water absorption is slow and it may take several months for a thick section of moulding to equilibrate. Usually mouldings are preconditioned at 60° and 20° prior to despatch to customers, so as to reach equilibrium at 20°, 65% relative humidity. The effect upon dimensional stability is a maximum increase of 0.9% volume associated with each 1% rise in weight of water absorbed, corresponding to a 0.2–0.3% change in the length of a specimen. This change is limited to <0.1% in the case of glass filled nylon. Max moisture content and diffusion coefficient fit a Fickian diffusion model [112]

Water Absorption:

No.	Value	Note
1	1.2 %	24h, dry moulding, ASTM D570 [54,55]
2	2.8 %	23°, 50% relative humidity [56]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	0.51 cm^3 mm/(m^2 day atm)	amorph.
2		0.47 cm^3 mm/(m^2 day atm)	cryst.
3		0.14 cm^3 mm/(m^2 day atm)	amorph.
4		0.3 cm^3 mm/(m^2 day atm)	dry cryst.
5		0.13 cm^3 mm/(m^2 day atm)	amorph., saturated cryst.
6		0.3 cm^3 mm/(m^2 day atm)	amorph.
7		0.27 cm^3 mm/(m^2 day atm)	cryst.

Mechanical Properties:

Mechanical Properties General: Nylon 6,6 has an excellent combination of medium strength, rigidity, creep strength, high toughness (when moisture absorbed) and excellent tribological props. Nylon 6,6 has the best overall props. of the aliphatic commercial nylon resins, combining greatest hardness, rigidity and resistance to abrasion and heat deformation. It is therefore better suited to fabricate parts which need to withstand high loads, wear and high temps. Nylon resins are extremely tough even when dry. Nylon 6,6 mouldings of housings, panels or specimen boxes survive the impact of a 10kg weight falling from 1.5m in 50% of impacts, even at subzero temps. Impact modified grades are produced for high toughness even in dry conditions. Nylon 6,6 possesses a low coefficient of friction and rate of wear. Moisture regain of Nylon 6,6 fibre is 4.5% at 65% and 7–8% at 90% relative humidity. Tenacity holds up well at 93° but falls dramatically after 300h exposure to 120°. Tensile (Young's) Modulus (includes specific Modulus): 2.2–3.1 N/tex (normal tenacity fibres, conditioned) 2.9–4.1 N/tex (high tenacity fibres, conditioned) [68]. Normal Tenacity (elongation at break %); 0.4–0.6 N/tex (23–43%, conditioned),(wet) ; 0.36–0.51 N/tex (wet); 0.4–0.49 N/tex (loop); 0.35–0.42 N/tex (knot). Average toughness: 0.06–0.14 N/tex (normal tenacity); 0.06–0.14 N/tex (high tenacity). High tenacity (elongation at break %); 0.75–0.84 N/tex (12–17%, conditioned). 0.64–0.7 N/tex (wet); 0.57–0.69 N/tex (loop); 0.52–0.72 N/tex (knot). Maximum tenacity; 1.8 N/tex. [68]

Tensile (Young's) Modulus:

No.	Value	Note
1	2000 MPa	[26]
2	3500 MPa	dry relative humidity
3	1600 MPa	50% relative humidity [58]
4	3000 MPa	dry
5	1500 MPa	50% relative humidity [56]

Flexural Modulus:

No.	Value	Note
1	2300 MPa	[26]
2	2830 MPa	dry ASTM D790
3	1200 MPa	50% relative humidity [55]

Tensile Strength Break:

No.	Value	Note	Elongation
1	80 MPa	[26]	200%
2	90 MPa	dry, 23° [1]	
3	60 MPa	moist, 2% water 23° [1]	
4	35 MPa	moist, saturated, 23° [1]	
5	40 MPa	100° [1]	
6	83 MPa	dry [58]	5%
7	77 MPa	equilibrium	25%
8	103 MPa	-45° ASTM D638	20%
9	83 MPa	21° [57]	80%
10	62 MPa	90° [54]	>300%
11	83 MPa	[55]	60%

Flexural Strength at Break:

No.	Value	Note
1	117 MPa	dry [58]
2	42 MPa	50% relative humidity ASTM D790
3	90 MPa	0.2% H_2O
4	42 MPa	2.5% H_2O [54]

Elastic Modulus:

No.	Value	Note
1	3.3 MPa	23° dry [1]
2	1.7 MPa	moist ISO 1110, 23° [1]
3	0.6 MPa	dry 100° ISO 537 [1]

Poisson's Ratio:

No.	Value	Note
1	0.46	[26]
2	0.3–0.4	mouldings 20°
3	0.1–0.25	extruded rod 0.1*
4	0.3–0.6	extruded rod 0.2*
5	0.4–0.44	extruded rod 0.4*
6	0.43–0.46	extruded rod 0.6* [45]
7	0.44	100° [26]
8	0.5	melt [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	57 MPa	25%	[26]
2	83 MPa	4.5% dry	[60]
3	59 MPa	26%	50% relative humidity [56]

Compressive Strength:

No.	Value	Note
1	100 MPa	20° [26]
2	14 MPa	20° 1% strain [1]
3	28 MPa	20° moulded, 2% strain [1]
4	56 MPa	20° moulded, 4% strain [1]
5	70 MPa	20° moulded, 6% strain [1]

Miscellaneous Moduli:

No.	Value	Note	Type
1	8.1 MPa	[26]	
2	3.3 MPa	crystalline rods, dry [55]	Bulk modulus
3	1300 MPa	dry 23° [1]	Shear modulus
4	1700 MPa	dry, nucleated [1]	Shear modulus
5	0.3 MPa	dry, 100°	Shear modulus
6	0.15 MPa	dry, 200° [1]	Shear modulus
7	66.2 MPa	dry Zytel 101 [62]	Shear strength

Impact Strength: Izod 110 J m^{-1} (moist ISO 1110, 23°) [1,26]; no break (unnotched, ASTM D250); 53 J m^{-1} (notched, dry) [54,55]; 112 J m^{-1} (notched 50% relative humidity); 159 J m^{-1} (notched, 25% water) [54]; 5.4 kJ m^{-2} (notched, dry, 23°) [56]; 11.7 kJ m^{-2} (notched, 50% relative humidity, 23°) [56]; 213.7 kJ m^{-2} (notched, dry, 30°); 2.7 kJ m^{-2} (notched, 50% relative humidity). 850 J m (notched super tough Zytel ST801 Nylon 6,6, ex DuPont) [8]; 900–950 J m (notched, Thermotuf V-1000 toughened Nylon 6,6, ex LNP). [8] Charpy no break (unnotched, -30–23°)[51,56]; 6 kJ m^{-2} (notched, dry, 23°); 16 kJ m^{-2} (notched, 50% relative humidity, 23°)[56]; 4 kJ m^{-2} (notched, dry, -30°); 3 kJ m^{-2} (notched, 50% relative humidity, -30°)[50]

Viscoelastic Behaviour: Moisture promotes toughness even at subzero temps. Special impact modified grades may be used when dry. Increasing glass fibre reduces toughness. Fibrous fillings offer better creep resistance than particulates [83]

Mechanical Properties Miscellaneous: Tensile Impact test 504 kJ m^{-2} (long specimen); 167 kJ m^{-2} (short specimen) [55]. Falling Top impact test 140 Nm (min, 50% failure rate, 23°; DIN 53443). Impact modified grades have lower moisture absorption, lower density and better dimensional stability with lower tensile and flexural props. [75]

Hardness: Rockwell Hardness R114; M70 (ASTM D785)[26]; M 105 (dry 23°) ASTM D785; M 95 (moist ISO-1110, 23°) [1] R 121 (dry ASTM D785); R 108 (50% relative humidity) M 85, R 120 (0.2% H_2O); M 60, R 105 (2.5% H_2O) [54] M 79, R 121 [55,56]. Ball indentaion; 72.5 Mpa [26]; Ball Indention Hardness H 358/30: 160 MPa (dry 23°); 170 MPa (dry, nucleated, 23°) 100-110 MPa (moist ISO-1110, 23°); 85 MPa (50% relative humidity) [50]; 160 MPa (H 961/30) (dry) [56]. Shore D: 75 [26]

Failure Properties General: Abrasion loss factor 25 mg [26]. Wear Resistance: 0.28 μm km^{-1} (0.1*); 0.3 μm km^{-1} (0.5*); 0.35 μm km^{-1} (1.0*); 0.48 μm km^{-1} (2.0*); 0.52 μm km^{-1} (4.0*); 0.55 μm km^{-1} (6.0*); * average roughness height μm. Wear resistance; 0.1μm km^{-1} (0.02*); 0.24 μm km^{-1} (0.05*); 0.48 μm km^{-1} (0.10*); 1.2 μm km

(0.25*); 4.8 μm km^{-1} (1.00*); 24 μm km^{-1} (5.0*); 72 μm km^{-1} (15.0*): * average surface pressure (n mm^{-2}). Coefficient of friction, dynamic; 0.15 (dry metal; 0.24 self) 0.5 (0.1 μm); 0.43 (0.5 μm); 0.38 (1 μm); 0.35 (2.0); 0.38 (4.0); 0.46 (6 μm) [30] 0.36 [26]. Creep Modulus: 2500 MPa (dry); 12000 MPa (65% relative humidity) [28]. Apparent Creep modulus; 400 MPa (23°, 50% relative humidity); 450 MPa (nucleated) (ISO 899) [1]

Fracture Mechanical Properties: Fracture energy (housing) W50: 100 J (dry); >140 J (moist) (23°); 30 J (-20°) (IEC 6603/1) [57]. At a given temp., fatigue resistance is greatest for a given water content corresponding to an optimum combination of storage modulus, E', and loss compliance, D. Both quantities influence fatigue crack growth. [86] Upper limit temp. of friction has been reported [116]. Stable crack growth features dimples obtained first by the crack tip blunting, voids initiating, coalescing and extending and the polymer rupturing and contracting to the dimple morphology. [125]. Void coalescence is observed in fracture surface micromorphology of Nylon 6,6, when moisture and impact modifier (IM) levels are low. At higher levels of moisture/IM numerous secondary fissures orient normal to the crack direction to give a rumpled appearance. Trans-spherulitic fracture is observed below T_g [126]. Substantial advances in understanding of the toughening mechanisms have been reported [129]

Friction Abrasion and Resistance: Magnitude of max. friction varies with velocity for continuous sliding, whereas nearly the same value is always obtained for discontinuous sliding between 0.1 and 10 mm s^{-1}. Minimum wear is obtained at maximum friction. [133]. The wear of Nylon 6,6 has been reported under rolling contact conditions [135]. Oil impregnated plastics are used for mechanical parts to reduce friction. A table of props. of four types of oil impregnated plastics (including Nylon 6,6 and glass fibre reinforced Nylon 6,6) have been reported [137]. Wear rate and coeff. of friction were determined for AI, brass, polyethylene and Nylon 6,6 against stainless steel. Nylon had the minimum wear rate and coeff. of friction was 8–12 times less for Nylon compared to aluminium alloy used in bearing bushes. Nylon brushes are now used in energy meters as a direct consequence [138]

Electrical Properties:

Electrical Properties General: Has efficient dielectric props., good volume and surface resistivity and resistance to tracking. Combined with its excellent heat and ageing resistance these props. make it an important material for electrical engineering. Dielectric strength can fall from 30 to 5 kV mm^{-1} when saturated with 8% water at its upper continuous use temp. (80°). Comparative tracking index 600 [56] 550 M (IEC 112/A) [57]. Glass fibre or mineral filled Nylon 6,6 can be injection moulded under special conditions, then electroplated with new activators, followed by a special pre-treatment and plated with commercial nickel or copper baths. Electric attenuation (shielding) 80 dB up to 92 GHz; 60 dB (1 MHz). Excellent at short temp.-time shock tests. No delamination of metal coating when stored 50h at 50° [108].

Surface/Volume Resistance:

No.	Value	Note	Type
8	1×10^{15} Ω.cm	50% relative humidity [56]	S
9	0.01×10^{15} Ω.cm	dry [57]	S
10	$1 \times 10^{-5} \times 10^{15}$ Ω.cm	moist [60]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.8–4.3		[26]
2	3.1–3.4	100 Hz–1 GHz	-30° [38]
3	3–3.3	100 Hz–1 GHz	0° [38]
4	3–3.6	100 Hz–1 GHz	30° [38]
5	3.1–5	100 Hz–1 GHz	60° [38]
6	10–35	100 Hz–1MHz	90° [38]
7	2–3	1 GHz	90° [38]
8	3.7–7.5	100 Hz–1 GHz	23°, 50% relative humidity [38]
9	3.6	1 Mhz	dry, 8 saturated
10	3.7	100 Hz	0.2% water [54]
11	3.1	1 MHz	0.2% water [50]
12	6	100 Hz	2.5% water
13	3.5	2 Mhz	2.5% water [54]
14	4	100 Hz dry; 1 Mhz, 50% relative humidity	
15	10.9	100 Hz	50% relative humidity [56]

Dielectric Strength:

No.	Value	Note
1	120 kV.mm^{-1}	dry
2	80 kV.mm^{-1}	moist, ISO 1110
3	40 kV.mm^{-1}	dry, 120°
4	31.5 kV.mm^{-1}	IEC 112 [56]
5	24 kV.mm^{-1}	[54]

Dissipation Power Factor: 0.02–0.03 (0.2% H_2O, 100 Hzh–1 MHz, 21°); 0.04 (2.5% H_2O, 1 kHz, 21°); 0.08 (2.5% H_2O, 1 MHz 21°) [54]. 0.01 (dry, 100 Hz); 0.02 (dry 1k Hz–1 MHz) [55]; 0.008 (dry, 100 Hz); 0.026 (dry, 1MHz); 0.58 (100 Hz, 50% relative humidity); 0.07 (1 MHz, 50% relative humidity) [56]

Arc Resistance:

No.	Value	Note
1	116s	dry, ASTM D495 [58]

Magnetic Properties: Magnetic susceptibility χ 0.76 × 10^{-6} cm^3 g^{-1} [26]

Optical Properties:

Optical Properties General: Nylon films tend to lose both clarity and flexibility by cryst. Cast films are clearer and more supple than blown as they are quenched and chilled faster. Finished film can also crystallise in storage at elevated temps. and humidity causing cloud and shrink. A soln. is nucleation, in which fine grain talc is added to provide sites for cryst. Smaller crysts. are generated leading to greater overall transparency. In processing terms, the advantages include better gauge control; broader processing parameters; uniform spherulite size and distribution; improved coefficient of friction; reduction of post cryst.; improved dimensional stability; better roll conformity; easier thermoformity with better side and corner thickness control; improved transparency after thermoforming due to changes of the cryst. composition through heat and orientation. Nucleating agents control the ratios of the crystaline and amorph. phases rate number, type and size of spherulites. [122]. Finely dispersed silicas are added in altering concentrations form 0.1–1.0% by weight [128]. Cryst. Nylon 6,6 is a white translucent material. Dispersion of finely divided titanium dioxide particles (0.1–0.5 microns range) within the nylon fibre delusters to reduce transparency and increase whiteness. 0.3% TiO_2 is used for *semi-dull yarns* and 2% TiO_2 for *dull* yarns [2]

Refractive Index:

No.	Value	Note
1	1.53	[26]
2	1.475–1.58	[26]
3	1.475	single cryst., α triclinic
4	1.568	single cryst., β triclinic
5	1.58	single cryst., γ
6	1.53	mouldings [6]

Transmission and Spectra: X-ray diffraction [82], ir [43], nmr and other spectral data [131] have been reported
Molar Refraction: Velocity of sound: 2785m s^{-1} (longitudinal); 1120m s^{-1} (transverse) [26]; 2770m s^{-1} (mouldings) [46]
Total Internal Reflection: n: 1.58 (parallel); n: 1.53 (perpendicular) [26]

Polymer Stability:

Polymer Stability General: Mouldings retain shape due to highly crystalline nature. Survives 1000 days in air at 120° losing half tensile strength [58]. Stabilisers include copper halides, secondary amines and ester modified phenols [119]
Thermal Stability General: Exhibits excellent stability up to 300° when dry in absence of air. Heat and oxidation lead to a reduction in MW, discoloration and loss of props. Thermal ageing has been reported [105,106]
Upper Use Temperature:

No.	Value	Note
1	85°C	
2	125°C	mechanical with impact
3	75°C	mechanical
4	200°C	few hours

Decomposition Details: Decomposes slowly above 300° yielding CO_2, NH_3 and amines [103]. Cyclopentanone is also produced [64]. Decomposition onset temp. 350°, 50% decomposition temp. 420° [26]
Flammability: Flammability rating V2 (1 mm–3.2 mm UL94) [54,56,57,62]. Limiting Oxygen Index 23% [26] 28–29% (ASTM D2863) [1] 31% [62]. Flash ignition temp. 390° [1]. Flammability BH2 (10 mm IEC 707); FH2 (20 mm, IEC 707) [57] B1–B2 (1mm DIN 4102). Flame retardants have been reported [94,95,144,145]. These include tin, phosphorus, antimony and halogens [140,141,144]. Non halogenated flame retardants have been reported [151,152]. Flame retardant grades have flammability rating VO
Environmental Stress: Uv radiation causes yellowing and loss of mech. props. Heat and light stabilisers must be used to minimise weathering effects. Cross-linking and loss of crystallinity occurs. Sunlight causes decrease in MW [10,104]. Stress cracking occurs in salt solns. [65] at 50–100° [88,89,120]. Tensile props. decrease significantly. Crazing shows linear growth. Sunlight causes reduction of MW. Cross-linking occurs at elevated temps. in amorph. regions. C-N bond scission may occur. Irradiation causes reduced impact strength and increasing elastic modulus. Ionising radiation produces free radicals leading to discoloration and oxygen permeability
Chemical Stability: Stable to CH_2Cl_2, and 2-butanone. Plasticised and saturated by MeOH. Attacked by oxidising agents at elevated temp., by chlorinated solvs. and metal salt solns. [58,59]. Unfilled grades more susceptible to attack than filled grades [43,60]
Hydrolytic Stability: Slowly affected by boiling water. Stable between pH 5–13. Stable to 10% NaOH at 85° for 16h. Degrades rapidly in 1% H_2SO_4 at 85°. Hydrolyses more slowly then Nylon 6 [61]. Hydrolysis resistant grades are available [111]
Biological Stability: May undergo slight degradation in the body [110]
Recyclability: May be recycled [111]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured from Nylon 6,6 salt of hexamethylene diamine and adipic acid aq. soln. Acid is added to the diamine soln. to obtain a 50% salt concentration, then condensation of the salt soln. in an autoclave at 250–300° under pressures up to 2 MPa or in a continuous reactor [66]. Water of soln. and polymerisation must be removed while minimising loss of diamine to ensure adequate MW in resulting Nylon 6,6. Typically, the salt soln. is concentrated to 60% above 100°, then fed to the autoclave and polymerised at 212° under 1.7 MPa; the temp. is gradually raised to 275°. At this stage MW is 4500. The pressure is slowly reduced over 1.5h and polymerisation is complete in a further hour then extruded to a water bath, cut and dried. Typical MW for the finished polymer is between 12000-20000 [62]
Mould Shrinkage (%):

No.	Value	Note
1	1.6%	60°, ASTM D966 [11]
2	1.5–2%	[54]
3	1.4%	parallel to flow ISO 2577 [56]

Applications: Principal commercial uses are in carpets, apparel, tyre reinforcement and industrial applications. Predominant fibre used in the carcasses of truck, racing and airplane tyres due to excellent strength but not favoured for radial tyres due to flatspotting tendency. Nylon 6,6 and 6 are the principal fibres in hosiery, womens underwear and stretch fabrics. They also find applications in non-woven applications e.g. as a substrate for artificial leather (PVC). Injection moulding applications especially of glass filled grades are the major use of Nylon 6,6 in moulding. Main markets include car industry, electrical and electronics and film and wire coating. Its excellent pigmentation qualities make it especially useful for power tools. Non reinforced grades used in bearings, gear wheels, cable connectors, thin-walled housing, coils formers etc. Extrusion grades are used for semi-finished products, tubes, profiles, sheet and roasting film. Glass fibre reinforced grades are injection moulded less than 30% glass; machinery components, electrical insulating parts, housings such as coil formers and bearing cages, lamp sockets housings, cooling fans, insulating profiles for aluminium window frames, water containers for automotive cooling systems. More than 35% gear wheels, solenoid valves, housings, electric flow heaters, trailing cable attachments. Impact modified glass reinforced: for high stiffness, notch impact and heat resistant, low warpage mouldings, e.g. wheel covers in automobiles and housing components. There has been a dramatic increase in the use of Nylon in the automotive industry in the 1990s, e. g. air intake manifolds in vehicles. Heat stabilised Nylon 6,6 are used for cylinder head cam covers to protect valves, seal the oil and shield against noise. Heat aged grades used for automotive connectors. Flame resistant grades used in electronics and electrical parts such as cable ties, conductors and terminal blocks

Nylon 6,8 N-24

Synonyms: *Poly(hexamethylene suberamide). Poly(hexamethylene diamine-co-suberic acid). Poly(iminohexamethyleneiminosuberoyl)*
Monomers: 1,6-Hexanediamine, Suberic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24936-73-0

Molecular Formula: $(C_{14}H_{26}N_2O_2)_n$
Fragments: $C_{14}H_{26}N_2O_2$
Morphology: Semi-crystalline, triclinic crystals

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	232°C	[4]
2	235°C	[8]
3	241°C	[1, 5]

Glass-Transition Temperature:

No.	Value	Note
1	57°C	heating rate 0.5° min^{-1} [1]

Transport Properties:

Polymer Melts: Spencer and Gilmore equation of state parameters have been reported [2,3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2800 MPa	2.8×10^{10} dyn cm^{-2}, 25°C
2	700 MPa	7×10^{9} dyn cm^{-2}, 100°C

Nylon 6,9 N-25

Synonyms: *Poly(hexamethylene azelamide). Poly(hexamethylene-diamine-co-azelaic acid). Poly[iminohexamethyleneiminoazelaoyl]. Poly[imino-1,6-hexanediylimino(1,9-dioxo-1,9-nonanediyl)]*
Monomers: 1,6-Hexanediamine, Nonanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
28757-63-3

Molecular Formula: $(C_{15}H_{28}N_2O_2)_n$
Fragments: $C_{15}H_{28}N_2O_2$
General Information: Nylon 6,9 has lower moisture absorption than Nylon 6,6 and consequently offers better dimensional stability

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.08 g/cm^3

Thermal Expansion Coefficient:

No.	Value	Type
1	0.000149 K^{-1}	L

Thermal Conductivity:

No.	Value
1	0.216 W/mK

Specific Heat Capacity:

No.	Value	Type
1	1.67 kJ/kg.C	P

Melting Temperature:

No.	Value	Note
1	210°C	DSC

Glass-Transition Temperature:

No.	Value	Note
1	68°C	cryst.

Deflection Temperature:

No.	Value	Note
1	183°C	0.455 MPa, ASTM D648
2	61°C	1.8 MPa, ASTM D648

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. mineral acids, e.g. sulfuric acid, nitric acid; phenols. Insol. aliphatic hydrocarbons, aromatic hydrocarbons

Transport Properties:
Permeability of Liquids: Solubility in and diffusion coefficients of water at different humidities have been reported [1]. Exhibits much lower moisture absorption than Nylon 6,6 and thus has better dimensional stability
Water Absorption:

No.	Value	Note
1	0.48 %	max., 24h, 0.2% moisture content

Mechanical Properties:
Mechanical Properties General: Better dimensional stability due to low moisture absorption gives more stable physical props. than the conventional Nylons 6,6 and Nylon 6
Flexural Modulus:

No.	Value	Note
1	1999.5 MPa	-40°

Flexural Strength at Break:

No.	Value	Note
1	75.8 MPa	21°

Tensile Strength Yield:

No.	Value	Elongation	Note
1	58.6 MPa	10%	21°, ASTM D638

Hardness: Rockwell R111 (21°, ASTM D785)
Izod Notch:

No.	Value	Notch	Note
1	64.16 J/m	Y	½" × ⅛" bar

Electrical Properties:
Electrical Properties General: Well suited to electrical applications e.g. wire jacketing
Dielectric Permittivity (Constant):

No.	Value	Frequency
1	3.7	100 Hz
2	3.6	10 kHz
3	3.2	10 MHz

Dielectric Strength:

No.	Value	Note
1	22.4 $kV.mm^{-1}$	570 V mil^{-1}, short time
2	19.9 $kV.mm^{-1}$	507 V mil^{-1}

Dissipation (Power) Factor:

No.	Value	Frequency
1	0.02	100 Hz–1 MHz

Polymer Stability:
Chemical Stability: Attacked by chlorine, bromine and conc. hydrogen peroxide. Temporarily loses stiffness in alcohols
Hydrolytic Stability: Crazed only by very conc. alkali soln.

Applications/Commercial Products:
Processing & Manufacturing Routes: Manufactured by condensation of hexamethylene diamine and azelaic acid. The Nylon 6,9 salt is prepared and then polymerised in an autoclave as for Nylon 6,6. Higher MW grades are made by solid state polymerisation of pellets below melt temp.
Applications: Common uses are electrical wire jacketing, battery cases and cams

Nylon 6,10 N-26
Synonyms: *Poly(hexamethylene sebacamide). Poly(hexamethylenediamine-co-sebacic acid). Poly[imino-1,6-hexanediylimino(1,10-dioxo-1,10-decanediyl)]*
Monomers: 1,6-Hexanediamine, Decanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
9008-66-6

Molecular Formula: $(C_{16}H_{30}N_2O_2)_n$
Fragments: $C_{16}H_{30}N_2O_2$
General Information: Tensile strength and hardness increase with crystallinity, while water absorption and toughness decrease
Morphology: High crystallinity (40-60%) obtained due to regular struct., good chain alignment and high degree of H-bonding. Cryst. forms: α-triclinic, a 4.95, b 5.4, c 22.4, α 49°, β 76.5°, γ 63.5°, 1 monomer per unit cell; β-triclinic, a 4.9, b 8.0, c 22.4, α 90°, β 77°, γ 67.5°, 2 monomers per unit cell

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.04–1.05 g/cm^3	amorph. [8,9]
2	d 1.16–1.19 g/cm^3	crystalline [8,12]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	8×10^{-5}–0.0001 K^{-1}	cryst., 20° [4]	L
2	0.00038 K^{-1}	cryst., 20° [3]	V

Equation of State: Spencer and Gilmore equation of state information has been reported [8]

Latent Heat Crystallization: Enthalpy of melting ΔH_m 58.6 kJ mol^{-1} [8]. Entropy of melting ΔS_m 116.6 J mol^{-1} K^{-1} [8]. Heat of fusion 215 kJ kg^{-1} [4]. Enthalpy of activation for transport 61.1 kJ mol^{-1} [8]. Enthalpy of activation of crystallisation 53.6 kJ mol^{-1} [2,8]. Heat of sorption (melt) -58500 [6]. Molar volume 260 cm^3 mol^{-1} (20°, cryst.); 271 cm^3 mol^{-1} (amorph.) [9]. H_f 80 kJ kg^{-1} (60°); 160 kJ kg^{-1} (100°); 400 kJ kg^{-1} (200°); 580 kJ kg^{-1} (250°); 700 kJ kg^{-1} (300°) [4]
Thermal Conductivity:

No.	Value	Note
1	0.23 W/mK	mouldings [4]
2	0.35 W/mK	30°, amorph., moist [5]

Thermal Diffusivity: 1.4×10^{-3} cm^2 s^{-1} [13]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.59 kJ/kg.C	solid, 25° [8]	P
2	2.18 kJ/kg.C	liq. [8]	P
3	502 kJ/kg.C	20°, crystalline [3]	P

Melting Temperature:

No.	Value	Note
1	226–232°C	[8]

Glass-Transition Temperature:

2	65–85°C	method A, 1.8 MPa, ISO R75, moulded, dry [4]

Transition Temperature:

No.	Value	Note	Type
1	415°C	ASTM D1929-1977 [4]	Flash ignition temp.

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: δ 26 $J^{1/2}$ $cm^{-3/2}$ [8]
Solvents/Non-solvents: Polymer mouldings absorb alcohols; MeOH 16%; EtOH 8–13%; propanol 10%; butanol 8–12%; glycol 2–4% [4]
Surface Tension:

No.	Value	Note
1	37 mN/m	265°, melt

Transport Properties:
Melt Flow Index:

No.	Value	Note
1	60 g/10 min	MVR 275/5 [7]

Polymer Melts: Melt viscosity flow activation energy 60 kJ mol^{-1}
Volatile Loss and Diffusion of Polymers: Coefficient of diffusion of H_2O 0.1×10^{-8} cm^2 s^{-1} (20°); 1.5×10^{-8} cm^2 s^{-1} (60°); 30×10^{-8} cm^2 s^{-1} (100°)
Water Absorption:

No.	Value	Note
1	3.3 %	saturated, in range 20–90°, mouldings [4]
2	1.2–1.6 %	23°, 50% relative humidity [7]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	2400 MPa	23°, dry, ISO-R527
2	400 MPa	100°, dry, ISO-R527
3	1500 MPa	23°, moist, ISO-1110

Tensile Strength Break:

No.	Value	Note	Elongation
1	70 MPa	23°, dry	50%
2	50 MPa	1% water, 23°	50%
3	20 MPa	dry, 100°	

Poisson's Ratio:

No.	Value	Note
1	0.3–0.4	mouldings, 20° [4]

Tensile Strength Yield:

No.	Value	Note
1	70 MPa	dry, 23°

Miscellaneous Moduli:

No.	Value	Note	Type
1	800 MPa	23°, dry, ISO 537	Shear modulus
2	120 MPa	100°, dry, ISO 537 [4]	Shear modulus
3	400 MPa	23°, 50% relative humidity, 1000h, ISO 899 [4]	Apparent creep modulus

Impact Strength: Falling weight impact strength W_{50} 140 N m (min., 23°, 50% failure level, 1.5 mm, DIN 53443); W_{50} 110 N m (-20°, 50% failure, 1.5 mm, DIN 53443) [7]
Hardness: Rockwell R75 (dry, 23°, ASTM D785); M60 (moist, 23°, ISO 1110) [3,8]
Izod Notch:

No.	Value	Notch	Note
1	50 J/m	N	23°, dry, ISO 180/1a [4]
2	35 J/m	N	-40°, dry, ISO 180/1a [4]
3	75 J/m	N	23°, moist, ISO 1110 [4]

Electrical Properties:
Electrical Properties General: Tracking resistance CTI 600

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	5.4	1 kHz	23°, 65% relative humidity [10]
2	3.5	1 MHz	23°, 65% relative humidity [10]
3	3	1 GHz	23°, 65% relative humidity [10]

Dielectric Strength:

No.	Value	Note
1	100 $kV.mm^{-1}$	dry, VDE 0303 part 2, IEC-243, electrode K20/P50
2	60 $kV.mm^{-1}$	moist, ISO-1110, VDE 0303

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.2	1 kHz	20°, 65% relative humidity [10]
2	0.1	1 MHz	20°, 65% relative humidity [10]
3	0.035	1 GHz	20°, 65% relative humidity [10]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.565	single cryst.
2	1.53	mouldings [4]

Polymer Stability:

Thermal Stability General: Stable up to 350° for short periods in inert atmosphere
Decomposition Details: Decomposition begins at 310°
Flammability: Flash ignition temp. 415° (ASTM D1929-1977) [4]. Flammability rating FH3 (13 mm min^{-1}); V2 (1.6 mm, UL 94) [7]. Limiting oxygen index 24% (dry, ASTM D2863) [4]
Environmental Stress: Outdoor weathering of up to 10 years can be achieved with uv stabilisers, glass reinforced resins are more vulnerable to erosion, but acceptable mech. props. retained up to 5 years [11]
Chemical Stability: Stable to aliphatic and aromatic hydrocarbons and to many aq. salts and alkalis. Resistant to common wetting agents, oils and alcohols; creep performance not affected [11]. Swollen by some alcohols. Attacked by some chlorinated and polar solvents and aromatic bases at elevated temp. Sensitive to $ZnCl_2$ soln. [11]
Hydrolytic Stability: Hydrolysed by inorganic acid solns. [11]
Biological Stability: Good biological stability
Recyclability: Regrind scrap consisting of solely Nylon 6,10 can be returned to moulding process [11]
Stability Miscellaneous: Electrical props. maintained up to 1000 Mrad of radiation exposure; resin may become discoloured

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured by condensation of the Nylon 6,10 salt from conc. aq. soln. in an autoclave at 250–300° and 1.8 MPa
Mould Shrinkage (%):

No.	Value	Note
1	1.2%	60°, ASTM D955 [4]
2	0.8%	longitudinal [7]

Applications: Extrusion grades are manufactured for applications such as semi-finished prods., blown and flat film, monofilaments and bristles. Stabilised injection moulding grades are used for precision parts and highly transparent weather resistant and low temp. impact resistant applications

Nylon 6,12 N-27

Synonyms: *Poly(hexamethylenediamine-co-dodecanedioic acid). Poly[imino-1,6-hexanediylimino(1,12-dioxo-1,12-dodecanediyl)]. Poly[iminohexamethyleneiminododecanedioyl]. Poly(hexamethylene dodecanamide)*
Monomers: 1,6-Hexanediamine, Dodecanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24936-74-1

Molecular Formula: $(C_{18}H_{34}N_2O_2)_n$
Fragments: $C_{18}H_{34}N_2O_2$
Additives: Mineral fillers
General Information: A partially crystalline polyamide, with equilibrium water content (1.4%) intermediate between Nylon 6 and Nylon 12. Its props. otherwise closely resemble Nylon 6 but with better dimensional stability and more constant mech. and electrical props. in humid conditions. It is favoured for the production of bristles due to wet strength and rebound resilience

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.06 g/cm^3

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9×10^{-5} K^{-1}	[1]	L
2	0.00013 K^{-1}	parallel/normal moulding direction, ASTM E831 [2]	L

Thermal Conductivity:

No.	Value	Note
1	0.22 W/mK	[1]

No.	Value	Elongation	Note
1	51 MPa	25%	23°, 50% relative humidity [1]
2	51–61 MPa	7–25%	[2]

Hardness: Rockwell R114 [2]
Fracture Mechanical Properties: Shear strength 55.8 MPa (dry, 23°)
Izod Notch:

No.	Value	Notch	Note
1	75 J/m	N	[1]

Izod Area:

No.	Value	Notch	Note
1	3.5–5 kJ/m^2	Notched	0–50% relative humidity, ISO 180/1A [2]

Charpy:

No.	Value	Notch	Note
1	5–6	Y	0–50% relative humidity [2]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	5.3	1 kHz	[1]
2	6	100 Hz	[2]
3	4	1 MHz	[2]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.15	1 kHz	[1]
2	0.02	1 MHz	dry [2]
3	0.1	1 MHz	50% relative humidity, ISO IEC250 [2]

Polymer Stability:

Flammability: Limiting oxygen index 28% [1]. Flammability rating V2 (UL 94) [2]

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by polymerisation of Nylon 6,12 salt from aq. soln., in autoclave at 250–300° and 1.8 MPa, then extruded and pelletised. Higher MW prods. are made by solid state polymerisation of pellets below the soft point

Mould Shrinkage (%):

No.	Value	Note
0	1.1%	DAM test parallel

Applications: Engineering resin, used unfilled or filled. Significant quantities are used in military wire applications due to low moisture resistance. Low to medium viscosity compds. are used to injection mould for monofilaments, sieve fabrics and high quality bristles (toothbrushes). 50% Glass reinforced grades are used for industrial mouldings; 30% carbon fibre reinforced grades are used for injection moulding of medical and sports equipment

Nylon 7 N-28

Synonyms: *Poly(enantholactam). Poly[imino(1-oxo-1,7-heptanediyl)]. Poly(7-aminoheptanoic acid). Poly(ω-enanthamide)*

Monomers: ω-Enantholactam, 7-Aminoheptanoic acid

Material class: Thermoplastic

Polymer Type: polyamide

CAS Number:

CAS Reg. No.
25035-01-2

Molecular Formula: $(C_7H_3NO)_n$

Fragments: C_7H_3NO

General Information: Has similar props. to Nylon 6 but has higher melting point (230-235°) and lower equilibrium monomer content. It has been commercialised in the former Soviet Union

Morphology: Triclinic a 9.8, b 10, c 9.8, α 56°, β 77°, γ 69°, 4 monomers per unit cell (space group C1-1, ρ 1.8 g cm^{-3}) [6]. Struct. and crystallinity of commercial samples have been reported [2]. Melt crystallised samples do not contain γ-form, whereas chemically treated and soln. cryst. samples do have γ-form crystals

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d <1.095 g/cm^3	max., amorph.
2	d 1.21 g/cm^3	cryst.

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00035 K^{-1}	$T < T_g$	L

Specific Heat Capacity:

No.	Value	Note	Type
1	1.67–1.84 kJ/kg.C	solid, 25°	P

Melting Temperature:

No.	Value
1	230–235°C

Glass-Transition Temperature:

No.	Value
1	52–62°C

Transition Temperature General: Annealing increases polymer melt temp. [2]

Surface Properties & Solubility:
Solvents/Non-solvents: Dissolved by strong mineral acids

Optical Properties:
Transmission and Spectra: N-15 nmr spectral data have been reported [2]

Polymer Stability:
Chemical Stability: Possesses similar stability to Nylon 6. Resistant to most aliphatic, aromatic and chlorinated hydrocarbon solvents, dilute acids and alkalis. Strongly attacked by polar solvents

Applications/Commercial Products:
Processing & Manufacturing Routes: Nylon 7 is polymerised from enantholactam in the presence of 4% H_2O in an autoclave for 13h at 200° or 5h at 280°. The polymerisation reaches a specific viscosity of *ca*. 1.2. It can also be polymerised directly from 7-aminoheptanoic acid at 260° with evolution of H_2O [3]
Applications: Suitable for applications similar to those of Nylon 6; not thought to be available in USA or Europe

Nylon 8 N-30

Synonyms: *Poly[imino(1-oxo-1,8-octanediyl)]. Poly(capryllactam). Poly(8-aminooctanoic acid). Poly(8-aminocaprylic acid)*
Monomers: Capryllactam, 8-Aminooctanoic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
25035-02-3

Molecular Formula: $(C_8H_{15}NO)_n$
Fragments: $C_8H_{15}NO$
General Information: Nylon 8 is thermally stable [1]. As its monomer and oligomer content is low, there is no need for the additional monomer extraction step used in the manufacture of Nylon 6. Although fibre and engineering props. are similar to other crystalline aliphatic nylons, its comparatively low melting point (200° compared to 270° for Nylon 6,6) and expensive monomer discourages commercialisation. Much lower water absorption than Nylon 6
Morphology: Monoclinic, a 9.8, b 22.4, c 8.3, β 65°, 8 monomers per unit cell (space group C2-2, ρ 1.14 g cm^{-3})

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.04 g/cm^3	amorph.
2	d 1.14 g/cm^3	cryst.

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00031 K^{-1}	solid, 25°	L

Melting Temperature:

No.	Value	Note
1	185–209°C	[1]
2	200°C	[2]

Glass-Transition Temperature:

No.	Value	Note
1	50°C	[1,2]
2	51°C	[1,2]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Solubility parameter 26 $J^{1/2}$ $cm^{-3/2}$. Cohesive energy density 91900 J mol^{-1} [2]
Plasticisers: *p*-Toluenesulfonamides
Solvents/Non-solvents: Dissolved by inorganic acids and organic bases such as aniline and pyridine

Polymer Stability:
Chemical Stability: Resistant to most aliphatic and aromatic hydrocarbons and alcohols
Hydrolytic Stability: Resistant to conc. inorganic salt solns. and bases

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerisation is readily carried out in the melt using a small amount of amino acid initiator, or by anionic initiation. No monomer extraction step is required
Applications: Applications are limited due to low melting point (200°)

Nylon 11 N-38

Synonyms: *Poly(11-aminoundecanamide). Poly(ω-aminoundecanoic acid). Poly[imino(1-oxo-1,11-undecanediyl)]*
Related Polymers: Nylon Powder Coatings
Monomers: 11-Aminoundecanoic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
25035-04-5

Molecular Formula: $(C_{11}H_{21}NO)_n$
Fragments: $C_{11}H_{21}NO$
Additives: Glass or carbon fibre to give rigid products for moulding. Fillers are used to control rigidity and shrinkage. Carbon black is employed for uv resistance and antistatic props. Flame retardants such as ammonium polyphosphate are added to improve self-extinguishing props.
General Information: Hydrophobic nylon, easier to prepare than Nylon 6 or Nylon 6,6. The physical props. of Nylon 11 are very similar to Nylon 12, but differ significantly from Nylon 6, and Nylon 66. The long chain confers better water resistance (only 25% of the absorption of Nylon 6 at saturation) resulting in electrical and mech. props. less sensitive to atmospheric variation. Impact props. are high and tensile strength and moduli are reduced compared to Nylon 6/66. The polymer is more flexible and the balance of toughness and flexibility is readily controlled by plasticiser addition. Mouldings are dimensionally stable over a wide range of humidity conditions. It exhibits excellent toughness at low temps. combined with good stress cracking resistance. It is

less susceptible to strong polar solvents such as formic acid suited to underground cable usage resisting formic acid generated by termites

Morphology: Exists in the stable α triclinic cryst. form at room temp. [10,11,12]. A study of the morphology of melt spun Nylon 11 fibres by wide angle x-ray, DSC and birefringence studies has been reported [13]. Melt spun Nylon 11 possesses the α triclinic struct. Orientation in thin Nylon 11 films has been studied by Trichroic ir spectroscopy to characterise the three dimensional orientation which develops from drawing, annealing or external electric field application [14,15]. Partial dissolution of crystallites and extraction of low MW chains occurs during swelling with formic acid [15]. Reversal of the process leads to amorph. chains recrystallising and the restoration of the original order and morphology. Crystallisation of Polyamide 11 on glass fibre has been studied by chemical etching [16]. Orientation of spherulites in the matrix is related to the mech. process conditions. Nylon 11 polymorphism has been investigated during solid state forging studies [17]. Studies on cross laminates of unidirectionally reinforced Nylon 11 composites show novel aspects of the nature and origin of polymorphism in melt crystallised Nylon 11 prior to and after forging. Two distinct crystalline species are observed; semi-disordered smectic δ and three dimensional α-form. Respective contents depend upon thermal history. The δ-form is kinetically favoured but transforms into the thermodynamically favoured α-form. Thermal analysis shows a characteristic broad transition associated with a cryst.-condis transition. Differences in the mode of hydrogen bonding are given as an explanation of polymorphism. Low temp. forging favours the δ-form, but optimal forging conditions at higher temps. prod. a mixture of crystals. [34] Melt spun Nylon 11 fibres are found to possess an α-triclinic form. The influence of annealing and solid state drawing has been reported [31]. The morphology of EPR/Nylon 11 blends is constructed from a nodular part and a fibrillar part. The stability of the fibrillar part determines whether the blend morphology will evolve into nodules by the Rayleigh mechanism or into phase inversion by coalescence of stable fibres [68]. α-Triclinic cryst. (space group C1-1), a 9.5, b 10, c 15, 60°, 90°, 67°, 4 monomer units per cell [10]; α-triclinic cryst., a 4.78, b 4.13, c 13.1, 90°, 75°, 66°, 1 monomer unit per cell [10]; α-triclinic cryst. Solvents/Non-solvents: Sol. *m*-cresol, sulfuric acid, formic acid, alcohol/phenol mixtures. Insol. hydrocarbons, organic acids, Me_2CO, gas-oil, glycerine, greases, lactic acid, paraffin, petrol, stearine, turpentine, EtOH [1]

Wettability/Surface Energy and Interfacial Tension: An adhesive composition comprising a blend of polyester and aliphatic polyamides was formed to an adhesive sheet and pressed in a sandwich between Nylon 4,T and Nylon 11 at 250° and found to give a composite with good layer bonding strength. Adhesive strength of Nylon 11 coatings (<300 mm thick) 11 kN m^{-1} (ISSN 0285-3787) [60]

Surface Tension:

No.	Value	Note
1	33–43 mN/m	[2]

Transport Properties:

Polymer Melts: Miscibility, crystallisation and rheological props. of poly-*p*-phenylene terephthalamide/Nylon 11 composites have been studied. The viscosity of Nylon 11 is reduced, unlike Nylon 6

where cross hydrogen-bond interactions lead to a magnitude rise in melt viscosity [21]
Permeability and Diffusion General: The diffusion of gases from the wellstream to the annular space in unbonded flexible pipelines has been reported. A thermoplastic Nylon 11 fluid barrier and steel carcass or armour wire is employed for the pipeline. Diffused gas increases the pressure in the annular space and must be vented to prevent the pipeline from bursting [40]
Water Content: 1.9% (saturated, 23°) [1], 2.5% (saturated, 100°) [1], 1.1% (long term) [6]

5	H_2	0.088 cm^3 mm/(m^2 day atm)	1.34 × 10^{-13} cm^2 (s Pa)$^{-1}$, 20–60° [3]

Mechanical Properties:

Mechanical Properties General: Nylon 11 possesses excellent impact strength and abrasion resistance, has a high resistance to attack by most chemicals, and satisfactory ageing props. It has lower melting point, water absorption and specific gravity compared to Nylons 6, 6,6 or 6,10. Continuous duty at 100° can be achieved by incorporating anti-oxidants. High flexibility and impact even down to low temps. are possible by plasticising the nylon. Good moulding tolerances (±1.6%) and dimensional stability can be achieved by employing a wide range of additives, particularly fillers. Physical props. of nylon injection moulding compounds, including Nylon 11, have been reported. Nylon 11 or 12 may be treated with an alkyl or alkoxyalkyl silane to give a moisture cross-linkable product with improved thermal and mech. props. [69]. Fibre tenacity 0.26–0.44 N tex^{-1} [7]

Tensile (Young's) Modulus:

No.	Value	Note
1	1730 MPa	[6]

2	54 MPa	[6]	330%

Flexural Strength at Break:

No.	Value	Note
1	45 MPa	19 mm max. flexure, ISO 178 [1]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	40 MPa	10%	[1]
2	34 MPa	22%	[6]

Mechanical Properties Miscellaneous: Low acrylonitrile rubbers enhance toughness from 20% levels, but reduce strength and modulus. The two polymers are partially miscible, according to DSC/DMA studies [67]
Hardness: Rockwell R103 (ISO 2039/2) [1]. Shore D70-D72 (ISO 86B) [1]. Surface hardness 820 kg cm^{-2} (10 s under load, DIN 53–456, 20°) [1]
Failure Properties General: Mandrels used for manufacture of hoses comprise 1–20% Rilsan nylon 11 and 7% glass fibre. They show hose pullout time of 2.25 min., compared to 10.25 min. without any glass fibre. [57] Shear strength 35.3–42.2 MPa (3.6–4.3 kg mm^{-2}, ASTM D732) [1]
Fracture Mechanical Properties: The long term resistance of 32 mm Nylon 11 gas pipe to rupture over a range of pressures has been investigated. At any given temp. the relationship between internal pressure and time to rupture is linear on a double log plot. Applying an Arrhenius time-temp. dependence law to pipe stress rupture data gives a high level of confidence for a fifty year lifetime [25]. Mixtures of poly(phenylene terephthalamide) (PPTA) and Nylon 11 were extruded through a capillary die and coagulated in water; 70/30 PPTA/Nylon 11 extrudates were uniaxially oriented. The fracture surfaces of soln. processed extrudates reveal uniformly dispersed microfibrils of PPTA. 5% PPTA compositions have improved tensile modulus and strength [33]
Friction Abrasion and Resistance: Abrasion resistance 20 mg (Elf-Aquitaine test) [1]. The influence of fillers (ZnS, PbS, ZnF_2) on transfer film formation was studied by optical and scanning electron microscopy. PbS dissociates during wear and forms a strong adherent film which improves wear resistance. The other fillers increase wear relative to unfilled Nylon 11 [47]. 35 vol% PbS gives the best wear resistance. Wear rate increases considerably upon doubling applied force and speed, and when increasing the surface roughness; coefficient of friction is not affected [44]. With copper fillers (CuS, CuF_2, CuO, CuAc), only copper acetate has an adverse effect upon wear rate; the other composites transfer well to the steel counterface to give strongly adherent thin films [48]. Transfer films of CuS and CuF_2 decompose under rubbing conditions and produce copper, FeF_6 and $FeSO_4$. Highest concentrations are closer to the transfer film-counterface interface. No chemical change is observed with copper acetate [49]. The wear rate of Nylon 11 composites containing CuS filler and short fibres, (CuS has an unusual ability to reduce wear in a number of polymers) is lowest for 20% volume carbon fibre and further reduces in the presence of CuS filler. Synergistic behaviour between the carbon fibre and CuS filler occurs as the filler decomposes which increases adhesion of the composite surface to the steel substrate. A theoretical model for the optimal filler proportion in polymer composites has been reported. [46] Scratch resistance 6 kg (0.4 mm coating on steel) [1]
Charpy:

No.	Value	Notch	Break	Note
1		N	no break	-23 - 40°C [1]
2	12	Y		23° [1]
3	6	Y		-40° [1]

Electrical Properties:

Electrical Properties General: Nylon 11 has very good dielectric props. which are much less affected by humidity than Nylons 6 or 6,6 due to its much lower water absorption props. Tracking resistance 600 V (min., NFC 26220)

Surface/Volume Resistance:

No.	Value	Note	Type
1	0.1×10^{15} Ω.cm	ASTM D257 [1]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.7		[2]
2	4	1 MHz	[6]

Dielectric Strength:

No.	Value	Note
1	30 $kV.mm^{-1}$	dry, ASTM D149

Complex Permittivity and Electroactive Polymers: It has been found that the degree of double crystallite orientation resulting from uniaxial stretching below T_g for odd-numbered nylons decreases with increasing amide group content. Unit cells are reoriented without cryst. struct. modification by electric field poling. 90° Reorientation of unit cells occurs for all odd nylons studied (at same moisture level), but Nylon 11 gives only 72° when poled using a dry air purge. The difference may be due to an increase in electric field applied to the cryst. phase when moisture is present in the amorph. regions during poling [66]. Measurements of high frequency dielectric and thickness mode electromechanical props. of ferroelectric Nylon 11 film samples have been reported. Permanent polarisation of the unoriented film 27 mC m^{-2} [69]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.03	1 MHz	[6]

Optical Properties:

Optical Properties General: Substrate coated with Nylon 11 and gold successively by vacuum deposition gives a recording disc with good lightfastness and storage stability [54]. Matting agents used in plastic coatings are mainly in the form of needles or pellets with average length 1–2000 mm and aspect ratio 10–40:1. Nylon 11 powder coating containing 0.5% terephthalic acid dianilide gives films with 60° gloss 7.2, compared to 44.5 for pure Nylon 11 [64]

Transmission and Spectra: Ir and N-15 nmr spectral data have been reported [14,28,29,41,42]

Volume Properties/Surface Properties: Experimental specific volume data as a function of temp. have been reported [11]

Polymer Stability:

Thermal Stability General: Heat and oxidation lead to a reduction in MW, discoloration and loss of mech. props. Principal stabilisers used are copper halides, secondary amines and esterically modified phenols. Nylon 11 is more readily stabilised against light degradation than Nylons 6 or 6,6

Upper Use Temperature:

No.	Value
1	100°C

Decomposition Details: A photo-oxidation study of *N*-substituted Nylon 11 in the solid state has been reported [32]. Hydroperoxide and imide groups are characterised as main intermediate products in long wave and at 60°. The *N*-substituted imide groups are more stable than the unsubstituted and accumulate much faster in substituted Nylon 11. *N*-Substitution does not promote radical attack on H atoms located in the α position with respect to substituted N atoms

Flammability: Average time of burning 20 s (3.2 mm specimen). Average extent of burning 40 mm (ASTM D635, UL 94) [1]. Flammability rating V2 (3.2 mm); HB (1.6 mm, UL 94) [1]. The pyrolysis of pure Nylon 11 and Nylon 11 containing flame retarding decabromodiphenyl/Sb_2O_3 mixture has been reported [20]. Ammonium polyphosphate (APP) strongly modifies the thermal degradation process of Nylon 11. α and β unsaturated nitriles are the major volatile products of degradation, whereas only α nitriles are given off for the pure Nylon 11. Minor amounts of hydrocarbons, CO, and CO_2 evolved from the pure nylons are suppressed. A charring process occurs which is little affected by APP, but the char intumesces in the presence of APP leading to improved fire retardancy. Formation of intermediate phosphate ester bonds is postulated whose decomposition accounts for the differences observed [34]

Environmental Stress: The susceptibility of nylons to environmental stress cracking in aq. salt soln. has been investigated. Razor cut precracked samples immersed in NaCl, $CaCl_2$ at various initial stress intensities, levels and temps. crack and craze above T_g for Nylon 6 and Nylon 6,6 but Nylon 11 is not susceptible to salt induced cracking [18]

Chemical Stability: Exhibits good resistance to ammonia, $CaCl_2$, $CuSO_4$, gas-oil, glucose, greases, hydrogen, lactic acid, mercury, milk, oils, paraffin, petrol, sea water, NaCl, stearine, turpentine (20–60°), agricultural sprays, fruit juices, sulfur, citric acid, glycerine, oxygen, sodium carbonate (conc.) (20–40°) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Manufactured in a continuous process, in an inert gas at atmosphere pressure. Monomer suspended in water, transferred to a converter, melted, water is eliminated and monomer polymerised. Ricin, a protein present in Castor beans from India, Central America and Africa is now being used to make monomer that is polymerised to Nylon 11 [23]. Prepared from Castor oil feedstock, which is treated with MeOH to yield methyl ricinoleate, which upon pyrolysis, hydrol. and HBr addition is converted to 11-aminoundecanoic acid. The acid is polymerised at 200° in the presence of hypophosphoric acid/phosphoric acid to Nylon 11 with continuous removal of water. The polymer is extruded under inert gas and chopped into pellets

Mould Shrinkage (%):

No.	Value
1	1.5%

Applications: Has excellent electrical props. Mainly used in mechanical engineering for moving components e.g. gears, bearings. Injection moulding and extrusion grades are sold with glass or carbon fibre fillers to improve rigidity. Extruded pressure tubing and hoses have important applications in the automobile industry. Precision grades are readily achieved from filled grades. 70% of Nylon 11 finds uses as powder especially for anti-corrosion coatings for metal tubing applications. Plasticised grades are prod. for flexible coatings and ability to withstand subsequent shaping e.g. coated tubes. Applications for Nylon 11 include fuel lines, hydraulic or pneumatic hoses and pumps, bearings, gaskets, housings, gears, flexible teeth on harvesting machinery and the soles of soccer shoes. A new thermoplastic hose for vehicle hydraulics is made by extrusion from improved grade Nylon 11, reinforced with braided synthetic fibre and covered by outer sheaf. It is designed to withstand 70 bar and water/MeOH fluids. Other applications include underfloor heating pipes, shrunk-on hoses and wire insulation. A new development of a Freon gas-escape proof hose, needed for car air conditioners to meet global regulations, has been developed from a laminated construction of Nylon 6/Nylon11/polyolefin for the thin inner wall to satisfy all the requirements of impermeability to Freon gas (reduced to

one-tenth of conventional hose) and water with acceptable flexibility and heat resistance. A layered tubing for use in motor vehicles has been patented which incorporates a thick outer layer of Nylon 11 or Nylon 12 (0.2–0.7 mm) with four other internal layers. Nyclad-jacketed ammunition incorporates Nylon 11, the jacketing material introduced with the intention of reducing airborne lead concentrations

Nylon 12 N-39

Synonyms: *Poly(ω-dodecanolactam). Poly(12-aminododecanoic acid). Poly[imino(1-oxo-1,12-dodecanediyl)]. PA12*
Related Polymers: Nylon
Monomers: ω-Dodecanolactam, 12-Aminododecanoic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24937-16-4

Molecular Formula: $C_{12}H_{23}NO$
Fragments: $C_{12}H_{23}NO$
Additives: Fillers increase rigidity under load and reduce mould shrinkage. Glass/carbon fibres give rigidity and temp. resistance; conductive fillers (carbon black) added for anti-electrostatic props.; flame retardants and impact modifiers (ABS resins) also used
General Information: Amide groups may be detected by ir or nmr spectroscopy. Nylon 12 may be hydrolysed by acid to the monomer 12-aminododecanoic acid. Complete identification of monomers and ratios present may be carried out by nmr. Nylon 12 differs from Nylon 6 and Nylon 6,6 in that it possesses high dimensional stability over a wide range of humidity conditions. Low water absorption gives rise to substantially constant mech. and electrical props. It exhibits excellent toughness at low temps. combined with good stress crack resistance. These props. make it particularly suitable for tube and hose applications in the automobile industry, and for precision injection mouldings
Morphology: Crystallinity 26% [25]. Hexagonal, a 4.8, b 4.8, c 232.1 [27]. Pseudohexagonal, a 4.79, b 31.9, c 9.58, β 120° [28]. Monoclinic, a 4.90, b 4.67, c 32.1, γ 121.7°. [29] Oriented lamallae form large anisotropic domains on highly oriented substrates of syndiotactic polypropylene [56]

Miscellaneous: Influence of chain struct. and amount of epoxide silane on morphology and crystallite size of cross-linked Nylon 12 has been reported. Cryst., amorph. and transition regions are observed. Lamellar thickness (5–7 nm) is independent of chain struct. or cross-linking agent. Lamellar length is >100 nm for linear Nylon 12 but reduces to block-like struct. when highly cross-linked. Transition region *ca.* 2 nm [10]. Worldwide market of 40000 ton per annum (1992) [19]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.01 g/cm^3	[1,38]
2	d 1.04 g/cm^3	cryst. [36]
3	d 1.034 g/cm^3	monoclinic cryst. [28]
4	d 0.84 g/cm^3	melt density [34]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00011 K^{-1}	20°, cryst.	L
2	0.0002–0.00023 K^{-1}	100°, cryst. [34]	L
3	0.00029 K^{-1}	20°, cryst.	V
4	9.9×10^{-5} K^{-1}	23°, 50% relative humidity [50,51,52]	L
5	0.00015–0.00016 K^{-1}	20–80°, longitudinal	V
6	0.00011–0.00012 K^{-1}	23–80°, transverse [38]	V

Equation of State: Spencer-Gilmore equation of state parameters have been reported [32]
Latent Heat Crystallization: Flow activation energy E_o 60 kJ mol^{-1} [30]. Enthalpy ΔH 80 kJ kg^{-1} (60°); 165 kJ kg^{-1} (100°); 800 kJ kg^{-1} (300°) [31]. ΔH_{fusion} 75 kJ kg^{-1} (amorph., annealed 8h, 50°) [39]. Gruneisen parameters have been reported [33]
Thermal Conductivity:

No.	Value	Note
1	0.25 W/mK	mouldings [34]
2	0.19 W/mK	[50,52]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.26 kJ/kg.C	[50,51,52]	P

Melting Temperature:

No.	Value	Note
1	178–180°C	[1]
2	184°C	γ cryst. [2]
3	177°C	γ-form [2]
4	169°C	α-form [2]
5	175°C	ISO 314, method C [36]
6	187°C	equilibrium [36]

Glass-Transition Temperature:

No.	Value	Note
1	50°C	γ-form
2	45°C	γ-form
3	40°C	α-form [2]
4	43–54°C	MW 4000-12000 [8]
5	40–43°C	[25,26]

Deflection Temperature:

No.	Value	Note
1	80–110°C	0.45 MPa, ISO 75 [38]
2	40–50°C	1.8 MPa, ISO 75 [38]
3	150°C	dry, 0.45 MPa [34]
4	55°C	1.8 MPa, ISO R75 [34]

Vicat Softening Point:

No.	Value	Note
1	130–140°C	50N, ISO 306
2	170°C	10N, ISO 306

Surface Properties & Solubility:

Plasticisers: *p*-Toluenesulfonamide. Plasticised grades of Nylon 12 are available commercially for injection moulding and extrusion applications [18]
Solvents/Non-solvents: Insol. MeOH, EtOH, petrol. Absorbs these solvents, MeOH 8.5% (1000h, 20°) [1], petrol 1.4% (1000h, 20°) [1]
Surface Tension:

No.	Value	Note
1	31 mN/m	[42]
2	25 mN/m	melt [40]

Transport Properties:

Transport Properties General: Nylon 12 is the best moisture barrier and poorest gas barrier of the commercial nylons
Melt Flow Index:

No.	Value	Note
1	4 g/10 min	230°, 0.02% water content [55]
2	11 g/10 min	230°, 0.1% water content [55]
3	20 g/10 min	230°, 0.26% water content [55]

Polymer Melts: Melt viscosity 570 Pa s (270°) [34], 330 Pa s (270°, 0.1% moist) [34]
Permeability of Liquids: [H_2O] 9 (0.05 µm, 65% relative humidity); 18 (flat film, 100 µm); 14 cm^3 (m^2 day atm)$^{-1}$ (blown film, 100µm, 38°, 90% relative humidity, BS 1133) [55]
Permeability and Diffusion General: Good aroma and grease impermeability. Nylon 12 has poor fuel diffusion and dimensional stability in fuel lines, which are overcome using suitable barrier materials
Water Content: 0.26%; 0.06% (after 32h drying at 80°) [55]

Water Absorption:

No.	Value	Note
1	0.85 %	65% relative humidity, 20° [1]
2	1.5 %	1000h, 20° [1]
3	1.6–1.8 %	23°, saturated [38]
4	1.3 %	65% relative humidity [50]
5	2.7 %	99% relative humidity

Gas Permeability:

No.	Gas	Value	Note
1	O_2	0.03 cm^3 mm/(m^2 day atm)	300 cm^3 (m^2 day atm)$^{-1}$, 100 µm flat film [1]
2	O_2	0.02 cm^3 mm/(m^2 day atm)	200 cm^3 (m^2 day atm)$^{-1}$, 100 µm blown film, ASTM D1434 [1]
3	O_2	15 cm^3 mm/(m^2 day atm)	300 cm^3 (m^2 day atm)$^{-1}$, 0.05 mm, 65% relative humidity [1]
4	N_2	0.007 cm^3 mm/(m^2 day atm)	70 cm^3 (m^2 day atm)$^{-1}$, 100 µm flat film [55]
5	N_2	0.005 cm^3 mm/(m^2 day atm)	50 cm^3 (m^2 day atm)$^{-1}$, 100 µm blown film [55]
6	CO_2	0.13 cm^3 mm/(m^2 day atm)	1300 cm^3 (m^2 day atm)$^{-1}$, 100 µm flat film [55]
7	CO_2	0.06 cm^3 mm/(m^2 day atm)	600 cm^3 (m^2 day atm)$^{-1}$, 100 µm blown film, ASTM D1434 [55]

Mechanical Properties:

Mechanical Properties General: A general expression to determine the strength props. of polyamides has been derived [14]. Compressive modulus values have been reported [34]. Tenacity (of fibre) 0.22-0.4 N tex^{-1}. [53] Elongation at yield 8% [34]

Tensile (Young's) Modulus:

No.	Value	Note
1	1400 MPa	23°, dry [34]
2	1200 MPa	23°, moist, ISO 1110 [34]
3	200 MPa	100°, dry [34]
4	1350–1450 MPa	ISO 527, 1 mm min^{-1} [38]

Flexural Modulus:

No.	Value	Note
1	1209 MPa	
2	393 MPa	plasticised [18]
3	1100 MPa	[53]

Tensile Strength Break:

No.	Value	Note	Elongation
1	63.7 MPa	[1]	>50%
2	50 MPa	23°, dry [34]	
3	30 MPa	23°, 0.9% water [34]	
4	17 MPa	100°, dry [34]	

Flexural Strength at Break:

No.	Value	Note
1	47 MPa	ISO 178 [53]

Elastic Modulus:

No.	Value	Note
1	1172 MPa	[34]

Poisson's Ratio:

No.	Value	Note
1	0.3–0.4	20°, moulding [34]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	45 MPa	5%	[38]

Flexural Strength Yield:

No.	Value	Note
1	48–64 MPa	20°, 65% relative humidity [55]

Miscellaneous Moduli:

No.	Value	Note	Type
1	4000 MPa	cryst. rods, dry [34]	Bulk modulus
2	500 MPa	dry, 23°	Shear modulus
3	100 MPa	dry, 23°	Shear modulus
4	300 MPa	ISO 899, 23°, 50% relative humidity [34]	Creep modulus
5	450 MPa	DIN 52448-E [38]	Tensile creep modulus

Impact Strength: Impact strength 122.5–205 Nm (notched) [1]
Mechanical Properties Miscellaneous: Mech. loss modulus tan δ 0.01 (20°); 0.048 (40°); 0.16 (60°); 0.08 (80°); 0.048 (100°); (0.1–10 Hz) [34]
Hardness: Ball indentation hardness 63.7 MPa [1], 98 MPa (dry, 23°, ISO 2039) [34]. Rockwell R110 [34]
Friction Abrasion and Resistance: Roughness height 0.1 µm, wear resistance 0.2 µm km^{-1}, coefficient of friction 0.55 (dry). Roughness height 1 µm, wear resistance 0.6 µm km^{-1}, coefficient of friction 0.38 (dry). Roughness height 2 µm, wear resistance 1 µm km^{-1}, coefficient of friction 0.35 (dry). Roughness height 4 µm, wear resistance 2.5 µm km^{-1}, coefficient of friction 0.34 (dry). Roughness height 6 µm, wear resistance 3.9 µm km^{-1}, coefficient of friction 0.4 (dry) [35]
Izod Notch:

No.	Value	Notch	Break	Note
1	200–501 J/m	N		dry, ISO 180/1A [34]
2		N	Y	23°, ISO 180/1C [38]

Izod Area:

No.	Value	Notch	Note
1	7–30 kJ/m^2	Notched	23°, ISO 180/1C [38]
2	6–7 kJ/m^2	unnotched	-30°, ISO 180/1C [38]

Electrical Properties:

Electrical Properties General: Nylon 12 is a good insulator, much better than other commercial semi-crystalline nylons such as Nylon 6 or Nylon 6,6, but a long way short of polyethylene. Dielectric loss factor is half that of Nylon 6 and specific resistivity is two orders of magnitude better - a similar magnitude short of polyethylene. In general all electrical props. lie between Nylon 6 and polyethylene [1]. Nylon 12 conductive filler composites have been studied for effective electromagnetic shielding. Surface treatment of aluminium fibres can be very effective [15]. Electrical props. are unaffected by moisture

Surface/Volume Resistance:

No.	Value	Note	Type
1	0.1×10^{15} Ω.cm	[1]	S
3	0.1×10^{15} Ω.cm	VDE 0303 T30 [38]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	30	100 Hz	-30°
2	3.1	100 Hz	0°
3	4	100 Hz	30°
4	11.5	100 Hz	60°
5	20	100 Hz	90°
6	2.9	100 kHz	-30°
7	3	100 kHz	0°
8	3.1	100 kHz	30°
9	4.5	100 kHz	60°
10	10	100 kHz	90° [37]
11	3.6–3.9	50 Hz	23°
12	2.2–3	1 MHz	23° [38]

Dielectric Strength:

No.	Value	Note
1	90 kV.mm^{-1}	VDE 0303, pt. 2; IEC 243 electrode K20/50, dry [34]
2	25 kV.mm^{-1}	moist [34]
3	27–29 kV.mm^{-1}	VDE 0303, T21; electrode K20/P50 [38]

Complex Permittivity and Electroactive Polymers: Comparative tracking index (ISO 112) has been reported [38]. Tracking resistance CT1 600 [34]

Magnetic Properties: Nylon 12 filled with ferrite magnetic powder produces effective anisotropic magnets, in which orientation is determined by the matrix interacting with the magnetic powder. Magnetic props. are thermally stable [16]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.05	100 kHz	[1]
2	0.04–0.044	50 Hz	[38]
3	0.025–0.028	1 MHz	[38]

Polymer Stability:

Polymer Stability General: Mouldings have good dimensional stability due to low moisture uptake and, consequently, mech. props. are much more stable. Notched impact is not adversely affected by dryness at low temps., unlike Nylon 6. Like polyethylene, Nylon 12 is a good barrier to moisture but a poor barrier to gas. It has good overall chemical stability, but is still sensitive to hydrol. in the melt. It is a good insulator and its electrical props. are not affected by moisture

Thermal Stability General: Composites with Al or Cu fillers are especially good with a Nylon 12 matrix, exhibiting high thermal stability of the shielding function [4]. Thermal stability is improved by reaction of bisoxasolones with amine terminated Nylon 12 [5]. Embrittlement occurs after 24h at 140° (standard grade), 750h (protected grade)

Upper Use Temperature:

No.	Value	Note
1	45–59°C	DIN 53462 [55]
2	140–160°C	heat and weather resist [55]

Decomposition Details: The main products of thermal degradation are α unsaturated nitriles, plus dodecanolactam, hydrocarbons, CO and CO_2. When ammonium polyphosphate (APP) is employed as a fire retardant then major degradation products are α and β unsaturated nitriles [3]

Flammability: Limiting oxygen index 26% (ASTM D2863, dry). Ammonium polyphosphate is used as a fire retardant, suppression through intumescent char formation

Environmental Stress: Uv exposure causes significant loss of strength in 200h, cracking is observed after ≥1000h [6]. Cast Nylon 12 has superior resistance to chemical, thermal and mech. stresses due to its higher crystallinity and MW [13]

Chemical Stability: Stable to oils, greases, petrol, most hydrocarbons, organic acids including formic acid. Stable to oxidation up to 60° [53]

Hydrolytic Stability: Unaffected by 3% NaCl over 30 d, but some loss of strength occurs after 60 d. Despite low water uptake, it is sensitive to hydrol.. 0.1% Water content is sufficient to reduce melt viscosity from 570–330 Pa s in 20 min. at 270°. Stable to many aq. salt solns., e.g. $CaCl_2$, $CuSO_4$, Na_2CO_3; sea water and dilute mineral acid

Biological Stability: Resistant to formic acid prod. by termites

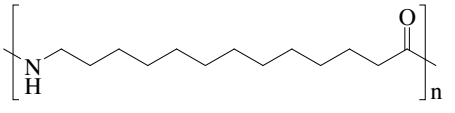
Stability Miscellaneous: Amorph. Nylon 12 used for sight glasses shows long term resistance to yellowing and uv radiation. Cracks and signs of embrittlement do not occur until after 25 months of continuous outdoor exposure; this compares with only 7 months for other nylons [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Carothers' original patent [22] first indicated the means of preparation of Nylon 12 and industrial production was first considered after the development of a method for preparing cyclododecatriene [23]. Polymerisation of Nylon 12 is similar to Nylon 6 and is based on high pressure hydrolytic ring opening of laurolactam using acid catalyst and temps. of 300–350° in an autoclave reactor, polymer being extruded into cold water. Unlike Nylon 6, only small levels (<0.5%) of unreacted monomer remain. Alternatively, anionic polymerisation may be carried out in the absence of water using alkali/alkaline earth metals and co-catalysts [1]. The polymerisation of nylons, including 12-aminododecanoic acid [43,44,45,46], can be effected at 270–280° in the presence of a suitable catalyst, such as ammonium or manganese hypophosphite, in a suitable reactor or autoclave to prod. material with relative viscosity 0.7. This low MW prepolymer may be pelletted and fed to a twin screw reactor to be converted to higher MW grades up to relative viscosity 1.4, suitable for injection moulding and extrusion. Lower MW grades may be powdered and used for powder coating applications [48]. The microwave polymerisation of 12-aminododecanoic acid to Nylon 12 has been reported [49]. A new form of Nylon 12 is manufactured by a non-pressurised casting process and can be cast around metal components to provide gears, pinions, propellors etc. It is claimed to have superior creep props. compared to other available nylons, and retains excellent mech. props. up to 120° [12]. Lauramid PA12G is made by this process displaying higher crystallinity and MW than conventional Nylon 12, with advantages in chemical, thermal and mech. props. [13]

Mould Shrinkage (%):

No.	Value	Note
1	1–1.5%	longitudinal
2	0.6–1.4%	transverse



Applications: Injection moulded samples of impact modified conductive Nylon 12 have superior aesthetic qualities, lower warpage and water absorption than Nylon 6,6, and is therefore chosen for electrostatic discharge applications. Plasticised grades are injection moulded or extruded. Applications (extruded) include tubing for the agricultural industry, cable sheathing and pipe for the gas transmission and telephone industries; injection moulded applications include gas filter housings, bearings and gears. Nylon 12 is available in moulding and extrusion grades (granules) and fine powders for powder coating and rotomoulding applications. Major applications are in the automotive, offshore oil, aerospace and most high technology industries. Injection moulded applications include (unfilled): fuel filters, gear wheels, guide rail; (reinforced) gear housings, breathing equipment, centrifugal separators, sports equipment. There are also a wide variety of extruded applications: wire insulation, cable sheathing, fabrics, filters, packaging films, vacuum hoses, window frames, semi-rigid tubing for vacuum, fuel, pneumatics. Nylon 12 is resistant to formic acid, choice material for underground cable coatings, as they resist the action of termites. Fine powder grades are employed in rotomoulding in the temp. range 230–280° and for the formation of anti-corrosion coating of metallic substrates. Coatings are applied by a metal substrate heating process, the most common methods being fluidised bed, electrostatic and flame spraying. Continuous coating methods have been developed to coat welded tubes up to 30 mm diameter with circular, oval or square profiles. Thicknesses of 100 microns can be applied at speeds of 100 m min^{-1}. This type of tubing is employed for central heating installations, garden tools and fencing, etc. Nylon 12 coatings have excellent resistance to corrosion, good impact resistance and electrical insulation, low surface friction, long life and good hygienic props., and no volatile toxic emissions during application. Nylon 12 may be used as part of a multipolymer tubing system, e.g. fuel line hose constructed of five layers with an outer layer of Nylon 12, intermed. and inner layers of Nylon 6 with polyolefin bonding layers in between. Radiation cross-linking technology, long established for the manufacture of PE underfloor heating pipes, is now being applied to moulded reinforced Nylon 12. Also used as an adhesive

Nylon Acrylic Blends N-41

Related Polymers: Nylon 6, ABS, SAN, Poly(ethylene-*co*-acrylic acid), Poly acrylic acid
Material class: Blends
General Information: Nylon-ABS blends. The preparation of true alloys of acrylic amorph. plastics with semi-crystalline nylons produces materials with much improved impact and toughness down to quite low temps. Alloys represent a unique combination of amorph. and cryst. thermoplastic materials with an excellent balance of props., especially toughness, chemical resistance, dimensional stability and mouldability. The alloy has high-impact strength and resistance to chemical cleaning solns. [2], adopted for snowmobile throttles and brake handles and for automotive roof racks [3]. Toughness of nylon/ABS blends measured by J-integral method have been reported. [4] ABS/Nylon 6/SMA (styrene-maleic anhydride copolymer) ternary blends (grafted SMA-Nylon 6 is formed during blending and acts as an effected compatibiliser) are formed when ABS is blended with a 90/10 preblend of SMA/Nylon 6. The graft copolymer formed during the preblending seems to be mainly within the Nylon 6 domain and enhances its modulus and thermal resistance [5]. ABS/Nylon 6 blends can be produced without compatibilisers but props. are inferior to those of the components. The addition of a maleinised polymer acts as compatibiliser by reacting chemically with the Nylon 6 during extrusion to form a graft copolymer which promotes interphase adhesion. The effect of compatibiliser and nylon concentrations on morphology and improved toughness has been reported [6]. The most recent ABS/Nylon 6 alloy to be marketed is Stapron N from DSM, which is a true alloy of ABS and Nylon 6. Within a broad range of blend ratios, very high levels of impact strength are claimed. By using a suitable compatibiliser, a very fine dispersion has been created, which is claimed to impart the high toughness, excellent surface finish and reproduction of mould texture obtained with these alloys. Applications which have been commercialised are those in which the ability to produce a deep matt finish is important. Standard blends are employed for applications such as instrument surrounds, arm rests, air vents, demister grilles, chair seats, lawnmower hoods. Improved grades are used for more demanding applications like car bumpers [7]. Nylon-Acrylic Blends (general). The dispersion of brittle polymer into a ductile polymer matrix followed by chemical grafting is a method frequently employed to obtain toughened plastics. The dispersion of styrene-acrylonitrile (SAN) copolymer into Nylon 6 in the presence of a small amount of styrene-maleic anhydride (SMA) copolymer produces a much finer dispersion of SAN particles, due to the formation of nylon-SMA graft copolymer which acts as a compatibiliser for the two phases. Significant improvements in tensile and impact props. are attributed to the compatibiliser ability to induce a brittle-ductile transition in SAN particles [8]. Nylon 6 blends with poly(ethylene-*co*-acrylic acid) (PEA) containing low levels of acid groups have been prepared by melt processing. Changes in the crystallisation behaviour of the blends indicate that the two polymers are intimately mixed. Fractionation results suggested that the two polymers react at elevated temps. to produce small amounts of copolymer which is believed to act as a compatibilising agent [9]. Blends with polyacrylic acid (PAA) have also been investigated. These are prepared as films cast from formic acid soln. Miscibility and composition of phases have been reported. Crystallinity is observed below 50 wt.% PAA. In the non-crystalline state, the polymers are fully miscible. A max. blend T_g was observed at 25 wt.% PAA [10]. Acrylic core/shell modifiers for reinforced polyamides improve impact resistance. Particular uses envisaged are automotive and tool housings as well as sporting gear [11]. High MW Nylon 6 modified grades using blends with rubber impact modifiers and acrylic-imide viscosity enhancers are suitable for blow moulding.

Mechanical Properties:

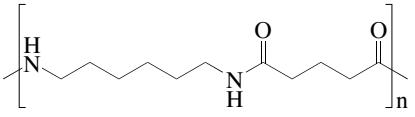
Nylon Barrier blends N-43



Related Polymers: Nylon 6, Nylon 12, Nylon 6,12
General Information: The three main barrier polymers are polyvinylidene chloride, ethylene vinyl alcohol copolymers and polyacrylonitrile copolymers. Although Nylon 6, MXD-6 and many amorph. polyamides have been reported to have excellent barrier props. they have found limited opportunites in the barrier and packaging markets due to expense. There have been a number of attempts to blend Nylons with other materials to find a more economic means of utilising their intrinsically useful barrier props. The dispersion of small amounts of a polymer with good permeability resistance to gases, in a matrix of a polymer which is generally quite permeable, can significantly enhance the impermeability of the latter. This can be achieved if the dispersed phase is distributed in effectively parallel and large thin lamellae, rather than the normal homogeneous particle dispersion. The technology for achieving these types of blends has been applied to blow moulding of large containers to enhance their barrier props. Effective barrier enhancement of polyethylene can be achieved with 10–20% Nylon 66/6 or with Selar amorph. polyamide as the dispersed phase [1]
Morphology: V. recent studies of the microstructure and permeability of extruded ribbons of blends of polypropylene (PP/EVOH) and PE/Nylon 6 have shown that the formation of discrete overlapping platelets of the dispersed phases of the barrier

materials can be reproduced in a controllable fashion. Under special processing conditions, laminar morphology was obt. in HDPE/Nylon 6 blends. The toluene permeabilities of extruded ribbons were in the range obt. with conventional multilayer barrier packaging materials [2]. The morphological, thermal, rheological and mechanical props. of blends of Nylons 6, Nylon 12 and Nylon 6/12 with EVOH have been investigated. Vinyl alcohol contents of 62% and 71% were employed and homogeneous phase morphologies were observed in Nylon 6 rich blends with fine phase separations in the EVOH rich regions. The polymers showed compatibility due to enhanced hydrogen bonding. In contrast, 71% EVOH blends with Nylon 12 and Nylon 6/12 gave clean separation with large domains and a decrease in physical props. was noted [3]. The longer Nylon 12 chains appear to inhibit interhydrogen bond links sufficiently to prevent compatibility. In consequence, these blends may be more useful in obtaining platelet morphology of a nylon dispersed phase and could help to improve the moisture barrier resistance of EVOH

Nylon 12 cycloaliphatic/aromatic copolymers N-45

Synonyms: *Nylon 12 copolymers with cycloaliphatic and aromatic comonomers. Poly(azacyclotridecan-2-one-co-4,4′-methylenebis(2-methylcyclohexanamine-co-1,3-benzenedicarboxylic acid))*
Related Polymers: Nylon 12
Monomers: 12-Aminododecanoic acid, Azacyclotridecan-2-one, 4,4′-Methylenebis(2-methylcyclohexanamine), 1,3-Benzenedicarboxylic acid
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
79331-75-2

General Information: Commercialised in 1976. Good hydrolytic stability and retains transparency in boiling water. Good performance as medium range engineering polymers [1,2,3,5]
Morphology: Grilamid is amorph. and transparent

Volumetric & Calorimetric Properties:

Density:

1	100–120 J/m	N	ASTM 256, Crystamid

Charpy:

No.	Value	Notch	Break	Note
1	23–40	N	N	ASTM D179, Crystamid
2	8–10	N	N	23°, Crystamid
3	6–8	N	N	-40°, Crystamid

Electrical Properties:

Electrical Properties General: Tracking resistance 600 (min DIN 53480)

Surface/Volume Resistance:

No.	Value	Note	Type
1	0.006×10^{15} Ω.cm	DIN 53482,TR55	S
2	0.001×10^{15} Ω.cm	ASTM D257, Crystamid	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.9	50 Hz	DIN 53483 TR55
2	2.9	1000 Hz	DIN 53483 TR55
3	3–3.4		ASTM D150, Crystamid

Dielectric Strength:

No.	Value	Note
1	40 $kV.mm^{-1}$	DIN 53481, TR55
2	50 $kV.mm^{-1}$	ASTM D1491, Crystamid

Dissipation Power Factor: tan δ 0.005 (50 Hz); 0.007 (1000 Hz, DIN 53483)

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.535	DIN 53491

Transmission and Spectra: Light transmission 85% (3 mm ASTM D1003). 7% Haze (ASTM D1003)

Polymer Stability:

Polymer Stability General: Low moisture absorption provides good dimensional stability at elevated temp. and high electrical resistance even in moist environment

Upper Use Temperature:

No.	Value	Note
1	80°C	[1,2,3]
2	90°C	oil
3	130°C	short term, TR55
4	110–135°C	short term, Crystamid

Decomposition Details: Significant decomposition occurs above 350°

Flammability: Self extinguishing (ASTM D635). Flammability rating V2 (1.6 mm UL94); HB (0.8 mm UL94). Limiting oxygen index 26% (ASTM 1863)
Environmental Stress: Stress cracking may occur with mechanically stressed parts with polar solvents and detergents (JR55). Crack resistant to alcohols, ketones, esters and aromatic solvents Crystamid)
Chemical Stability: Resistant to hydrocarbons, solvents, dilute salts and alkali. Attacked by polar alcohols, AcOH, pyridine
Hydrolytic Stability: Hydrolysed by strong acids. Resistant to hot water and steam

Applications/Commercial Products:
Processing & Manufacturing Routes: Polymerisation route is similar to other amorph. polyamides, e.g. Nylon 6(3), T (see polymerisation of nylons). The amorphous polyamides may be injection moulded or extruded at 100–120° above their softening point (range 240–280°)
Mould Shrinkage (%):

No.	Value	Note
1	0.65%	long
2	0.75%	trans

Applications: In high stress environments, e.g. covers/caps, filter bowls (air, oil and water), pump casings, flow meters, covers for control temps., buttons, fashion jewellery, coffee filters, sanitary fittings, fuse boxes, sight glasses, milking machine covers etc.

No.	Value	Frequency	Note
1	4.3	50 Hz	parallel [1]
2	16	50 Hz	perpendicular [1]
3	4	1 MHz	parallel [1]
4	4.7	1 MHz	perpendicular [1]

Dielectric Strength:

No.	Value	Note
1	>30 kV.mm^{-1}	min., parallel [1]
2	>20 kV.mm^{-1}	min., perpendicular [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.007	50 Hz	parallel [1]
2	0.6	50 Hz	perpendicular [1]
3	0.02	1 MHz	parallel [1]
4	0.1	1 MHz	perpendicular [1]

Polymer Stability:

Thermal Stability General: Polymer may be used in air up to 185° for prolonged periods without serious loss of props. Very high stiffness maintained up to 290°

Upper Use Temperature:

No.	Value	Note
1	>175°C	max. 2500h [1]
2	163°C	max. 5000h [1]
3	151°C	max. 10000h [1]
4	139°C	max. 20000h [1]
5	290°C	short periods
6	185°C	

Flammability: Flammability rating HB (22 mm thick). Limiting Oxygen Index 22%. Glow Wire test extinguishing time 15 s; (temp. 960°; 3 mm thick)

Chemical Stability: Possesses similar chemical stability to Nylon 6,6. Very resistant to greases, oils, aliphatic and aromatic hydrocarbons up to 150° for prolonged periods

Nylon 6, glass reinforced N-49

Synonyms: *Glass reinforced Nylon 6*
Related Polymers: Nylon 6, Nylon 6,6, Nylon 6,6 glass reinforced
Monomers: Caprolactam, Caproamide
Material class: Thermoplastic
Polymer Type: polyamide
Molecular Formula: $(C_6H_{11}NO)_n$
Fragments: $C_6H_{11}NO$
General Information: Long (10mm) fibres improve flexural and creep props with respect to conventional length (5mm) fibre filled materials. Increasing glass fibre content increases stiffness.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.22–1.25 g/cm^3	15% glass fibre [2,3,12]
2	d 1.33–1.37 g/cm^3	30% glass fibre [2,3]
3	d 1.55 g/cm^3	50% glass fibre [3]
4	d 1.5 g/cm^3	50% glass spheres [2]

Thermal Expansion Coefficient:

Surface/Volume Resistance:

No.	Value	Note	Type
1	1×10^{15} Ω.cm	dry, 15–50% glass fibre, IEC 190 [2]	s
2	0.001×10^{15} Ω.cm	50% relative humidity, IEC 190 [2]	s
3	0.01×10^{15} Ω.cm	dry, 15–50% glass fibre, IEC 93 [3]	s
4	0.001×10^{15} Ω.cm	dry, 30% glass fibre, IEC 93 [3]	s
5	$1 \times 10^{-5} \times 10^{15}$ Ω.cm	moist, 30% glass fibre, IEC 93 [3]	s
6	$1 \times 10^{-5} \times 10^{15}$ Ω.cm	moist, 15–50% glass fibre, IEC 93 [3]	s

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.5	1 MHz	dry, 15% glass fibre, IEC 250 [2]
2	4	1 MHz	50% relative humidity, 15% glass fibre, IEC 250 [2]
3	3.8	1 MHz	dry, 30% glass fibre, IEC 250 [2,3]

Dielectric Strength:

No.	Value	Note
1	70 $kV.mm^{-1}$	moist, 15–30% glass fibre, IEC 243 [3]
2	90 $kV.mm^{-1}$	dry, 50% glass fibre, IEC 243 [3]
3	80 $kV.mm^{-1}$	moist, 50% glass fibre, IEC 243 [3]
4	11 $kV.mm^{-1}$	dry, 15–30% glass fibre, IEC 243 [2]
5	8 $kV.mm^{-1}$	50% relative humidity, 15–30% glass fibre, IEC 243 [8]
6	80 $kV.mm^{-1}$	dry, 15–30% glass fibre, IEC 243 [3]

Complex Permittivity and Electroactive Polymers: Comparative tracking index 520 (15–50% glass fibre, IEC 112) [2]; 5550 (15–50% glass fibre) [3]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.025	1 MHz	dry, 15% glass fibre [3]
2	0.2	1 MHz	moist, 15% glass fibre [3]
3	0.02	1 MHz	dry, 30% glass fibre [3]
4	0.2	1 MHz	moist, 30% glass fibre [3]
5	0.014	1 MHz	dry, 50% glass fibre [3]
6	0.4	1 MHz	moist, 50% glass fibre [3]

Polymer Stability:

Thermal Stability General: Small decreases in tensile and impact strength occur after periods at 70°, resulting from relaxation processes caused by mobility of glass filler. Once ordering has occurred, props remain constant [14]

Upper Use Temperature:

No.	Value	Note
1	180°C	15-30% glass fibre [3]
2	200°C	50% glass fibre [3]

Flammability: Flammability rating UNCL (UL94)[2]; HB (vertical, 1.6–3.2 mm, 15–50% glass fibre, UL94) [3]. BH3 (13 mm, 30% glass fibre); BH2 (70 mm, 50% glass fibre); FH3 (21 mm, 30% glass fibre); FH3 (70 mm). Limiting oxygen index 23% (15% glass fibre); 22% (30% glass fibre, ASTM D863) [2]

Chemical Stability: High resistance to lubricants, engine oils and fuels, hydraulic and radiator fluids, refrigerants, paints, solvents and cleaners, aliphatic and aromatic hydrocarbons. Susceptibility is reduced at high glass content relative to base resin, reducing uptake of polar solvents. [4]

Hydrolytic Stability: Increasing glass fibre content increases susceptibility to alkali, attacked by dil. inorganic acids. [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Processed by injection moulding or extruding. High viscosity grades used to produce rods and tubes

Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.85%	dry, long, 15% glass fibre [3]
2	0.35–0.8%	dry, long, 30% glass fibre [3]
3	0.2–0.7%	dry, long, 50% glass fibre [3]
4	0.4–0.5%	[6,12]

Applications: Used for materials requiring high stiffness and impact strength such as cycle wheels, tool casings, electrical insulating parts, machine components and housings, and sports and exercise equipment, tool handles, steering wheels, cable sheathing

Nylon 6,6, Glass reinforced N-50

Synonyms: *Poly(hexamethylene adipamide). Poly(hexamethylene-diamine-co-adipic acid). Poly[imino(1,6-dioxo-1,6-hexanediyl)imino-1,6-hexanediyl]*
Related Polymers: Nylon 6,6, Carbon fibre filled Nylon 6,6, Nylon 6, Glass reinforced
Monomers: 1,6-Hexanediamine, Hexanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
32131-17-2

Molecular Formula: $(C_{12}H_{22}N_2O_2)_n$
Fragments: $C_{12}H_{22}N_2O_2$
General Information: Long fibres (20 mm) significantly improve creep resistance and flexural props.

Volumetric & Calorimetric Properties:

Density:

3	1.5–1.9 %	saturation, 23°, 50% relative humidity, 30% glass fibre [1]
4	1.4–1.8 %	saturation, 23°, 50% relative humidity, 35% glass fibre [1]
5	1–1.4 %	saturation, 23°, 50% relative humidity, 50% glass fibre [1]
6	0.7 %	24h, Vydyne 909 [2]
7	1 %	33% glass fibre
8	1.5 %	30% glass fibre, DIN 53495 [13]

Mechanical Properties:

Mechanical Properties General: Effects of fill time (range 0.8-20 s) on mech. and surface appearance and dimensions of injection moulded specimens have been reported. Peak tensile stress increases by 15% and flexural strength decreases by 10% as fill time increases. Scatter in flexural modulus diminishes with fill time. These variations can be attributed to differences in skin/core orientation of glass fibres. Little effect upon shrinkage is noted for tensile specimens. Dramatic changes in surface appearance observed; at short fill times a dark uniform colour and smooth appearance contrasts with lighter colour and more porous surface at longer fill times, attributed to crystallisation prior to complete pressurisation of mould [11]

Tensile (Young's) Modulus:

No.	Value	Note
1	6000 MPa	dry, 15% glass fibre
2	4500 MPa	moist, 15% glass fibre
3	8500 MPa	dry, 25% glass fibre
4	6000 MPa	moist, 25% glass fibre
5	9500 MPa	dry, 30% glass fibre
6	7500 MPa	moist, 30% glass fibre
7	11000 MPa	dry, 35% glass fibre
8	8500 MPa	moist, 35% glass fibre
9	1600 MPa	dry, 50% glass fibre [1]
10	1300 MPa	moist, 50% glass fibre [1]
11	9700 MPa	dry, 33% glass fibre [2]
12	7500 MPa	moist, 33% glass fibre, ASTM D638
13	10000 MPa	dry, 30% glass fibre, ASTM D638 [13]

Flexural Modulus:

No.	Value	Note
1	6200 MPa	33% glass fibre, ASTM D790
2	7300 MPa	0.2% moisture
3	4840 MPa	1.5% moisture, 33% glass fibre [2]
4	3100 MPa	[3]
5	5200 MPa	30% glass fibre, equilib. 50% relative humidity [4]
6	14000 MPa	50% long glass fibre [5]
7	12000 MPa	50% glass fibre [6]
8	9400 MPa	30% glass fibre [12]

Tensile Strength Break:

No.	Value	Note	Elongation
1	130 MPa	dry, 15% glass fibre [1]	3%
2	80 MPa	moist, 15% glass fibre [1]	6%
3	170 MPa	dry, 25% glass fibre	3%
4	130 MPa	moist, 25% glass fibre [1]	5%
5	210 MPa	dry, 35% glass fibre [1]	3%
6	160 MPa	moist, 35% glass fibre [1]	5%
7	230 MPa	dry, 50% glass fibre	2%
8	180 MPa	moist, 50% glass fibre, DIN 53455 [1]	3%
9	193 MPa	dry, 33% glass fibre	4%
10	152 MPa	moist, 33% glass fibre, ASTM D638	5%
11	114 MPa	0.2% moisture	7%
12	86.5 MPa	1.5% moisture	7%
13	76 MPa	Maranyl AMX9 fibres [3]	
14	200 MPa	Maranyl A-690, 50% glass fibre [6]	
15	127.5 MPa	15% long glass fibre [7]	

16	168 MPa	30% long glass fibre [7]	
17	178 MPa	30% glass fibre, ASTM D638 [13]	3%

Flexural Strength at Break:

No.	Value	Note
1	180 MPa	dry, 15% glass fibre [1]
2	125 MPa	moist, 15% glass fibre [1]
3	220 MPa	dry, 25% glass fibre [1]
4	200 MPa	moist, 25% glass fibre [1]
5	270 MPa	dry, 30% glass fibre [1]
6	220 MPa	moist, 30% glass fibre [1]
7	280 MPa	dry, 35% glass fibre [1]
8	230 MPa	moist, 35% glass fibre [1]
9	320 MPa	dry, 50% glass fibre [1]
10	260 MPa	moist, 50% glass fibre, DIN 53452 [1]
11	200 MPa	33% glass fibre, ASTM D790
12	194 MPa	0.2% moisture [2]
13	138 MPa	1.5% moisture [2]
14	104 MPa	[3]
15	333 MPa	50% long glass fibre [6]
16	321 MPa	50% glass fibre [6]
17	250 MPa	30% glass fibre, ASTM D790 [13]
18	193 MPa	30% glass fibre [18]

Poisson's Ratio:

No.	Value	Note
1	0.375	30% glass fibre [13]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	175 MPa	2.89%	30% glass fibre, ASTM D638 [13]

Miscellaneous Moduli:

No.	Value	Note
1	3190 MPa	30% glass fibre [13]

Impact Strength: Other values of Izod impact strength have been reported. [2,5,7,18] Increasing fibre length confers higher falling weight impact resistance [15,20]. Various impact props. such as notched Izod and Gardner at -40, 0 and 23° of unreinforced and 30% glass reinforced Nylon 6,6, either unmodified, impact modified or ionomer modified have been reported [15]
Mechanical Properties Miscellaneous: Stiffness and strength are both reduced for glass fraction >0.20; the rubber reinforced grades are tougher under impact due to modification in the mode of cracking [16]
Hardness: Rockwell R120 (33% glass fibre, ASTM D785); M89, R120 (0.2% moisture); M70, R110 (1.5% moisture) [2]. Ball indentation hardness H 961/30 200 (dry); 150 (moist, 15% glass fibre), H 961/30 240 (dry); 190 (moist, 25% glass fibre), H 961/30 270 (dry); 200 (moist, 30% glass fibre), H 961/30 280 (dry); 210 (moist, 35% glass fibre), H 961/30 300 (dry); 260 (moist, 50% glass fibre, ISO 2039/1) [1]

Failure Properties General: Fatigue strength for glass reinforced thermoplastics declines linearly with logarithm of load cycles up to 10^6 cycles [8]. Glass fibre improves fatigue strength, unlike glass bead. Fractographic analysis shows that pull out of fibres requires considerable energy and arrests crack growth. Fibre reinforced Nylon 6,6 can withstand higher temps. than fibre reinforced Nylon 6 (based on temp./stress measurements) [9]. Strength of glass composites tested between 10–3000 cycles $(min.)^{-1}$ decreased significantly with increasing loading frequency, particularly in the range 10-600 cycles $(min.)^{-1}$, largely due to softening effect caused by increase of temp. [10]
Fracture Mechanical Properties: Fracture energy (housing) W_{50} 3–4 J (23°, dry); 15 J (23°, moist, 15% glass fibre, ISO 6603/1); 15 J (23°, moist, 25% glass fibre); 15 J (23°, moist, 30% glass fibre); 15 J (23°, moist, 35% glass fibre); 2 J (dry); 10 J (23°, moist, 50% glass fibre). The fracture mechanism of short E-glass fibres/Nylon 6,6 composites has been studied by scanning electron microscopy. The fracture processes, including crack initiation and propagation, were observed *in situ*. There are five stages of fracture: (1) voids located at fibre ends; (2) propagation of interfacial cracks on the fibre sides; (3) occurrence of bands of microcracks and shear bands in the matrix; (4) slow crack propagation in the shear bands with yielding and necking; (5) catastrophic crack propagation [21]
Friction Abrasion and Resistance: Coefficient of friction 0.15 (dry); 0.17 (moist, against metal, 33% glass fibre, ASTM D1894); 0.23 (dry); 0.23 (moist, against self, 33% glass fibre). Wear behaviour of short glass fibre reinforced Nylon 6,6 sliding against smooth steel has been reported [19]
Izod Notch:

No.	Value	Notch	Note
1	170 J/m	N	dry, 30% glass fibre, impact modified [4]
2	370–470 J/m	N	40% long glass fibre [7]

Izod Area:

No.	Value	Notch	Note
1	5.5 kJ/m^2	Unnotched	dry [1]
2	6.5 kJ/m^2	Unnotched	moist, 15% glass fibre

3	0.15	1 MHz	moist, 35% glass fibre, IEC 250 [1]
4	0.015	1 MHz	dry, 50% glass fibre, IEC 250 [1]
5	0.13	100 Hz	[2]
6	0.15	1 kHz	[2]
7	0.02	1 MHz	23°, 0.2% moisture, 33% glass fibre [2]
8	0.03	100 Hz	
9	0.3	1 kHz	
10	0.05	1 MHz	23°, 1.5% moisture, 33% glass fibre [2]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	240°C	15–50% glass fibre [1]
2	218°C	Maranyl AMX9 [3]

Flammability: Flammability rating HB (1.6–3.2 mm thick, 15–50% glass fibre, UL 94) [1], 2–50 mm (Method BH, class 707, 25–50% glass fibre), 3–20 mm $min.^{-1}$ (method FH, class 707, 25–50% glass fibre), + rating (FMVSS 302, flammability rating for car interiors, 15–50% glass fibre). Improved fire resistant props. of Nylon 6 or 6,6 containing 3–25 wt.% of melamine, melamine cyanurate or a mixture thereof and 5–45 wt.% unsized glass fibres have been reported [20]

Environmental Stress: Max. dimensional change from 20% relative humidity to 80% relative humidity 0.4% (length), 1–2% (thickness) (30% glass fibre) [24]

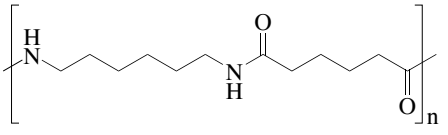
Chemical Stability: After 100 days' exposure to aggressive solvents such as EtOH, petrol, detergents, formalin, cyclohexanone etc., the mech. props. of glass filled Nylon 6,6 are affected much less than the unreinforced Nylon [17]. 30% Tensile strength is lost after 88.5h immersion in 50% soln. of ethylene glycol (30% glass fibre). Unreinforced Nylon 6,6 loses 70–80% strength [28]

Applications/Commercial Products:

Processing & Manufacturing Routes: Batch and continuous processes are used. In both, the first step is to form a salt of the diamine and diacid. The salt is heated in a reactor to give polymerisation. Nylon 6,6 must be dried at 80° by passing hot inert gases over it. 70% of reinforced grades are injection moulded compared to 30% extruded. For extrusion L/D ratios of 20:1 to 24:1 are common with screw compression ratios in the range 3.5–4:1. Heating zones must be capable of holding temps. up to 290°. Good pressure and temp. controls are mandatory for safety and quality of product. Extrusion is used typically for pipe and complex shape profiles. Injection moulding is normally carried out with efficient reciprocating screw machines. For reinforced nylons, equipment life can be prolonged by using screws and barrels made of bimetallic alloys or nitrided steel. Nylon moulding grades are very fluid and drool must be controlled by using reverse-taper or positive shut-off nozzles. The mould life may be extended by chromium plating, especially where high gloss finish is required, as nylons precisely reflect the quality of the mould. The mould must be cored for cooling (usually 70–90°) as crystallisation must be critically controlled to ensure dimensional control. For optimum pressure transmission, material should flow from thick sections to thin sections. Nylons are suited to automated moulding operations [25]. Use of surface treated glass fibres as a reinforcement of anisotropic composites results in many improvements in props. such as stiffness. It can also lead to increased fatigue time limit in flow, improved hot shape retention, decreased thermal expansion, slower processing etc. The critical length of the fibre is of importance in processing and in the final props. of the composite [26]

Mould Shrinkage (%):

No.	Value	Note
1	2–6%	0.2% moisture, 33% glass fibre [2]



Applications: Fibres (main use) - for carpets, tyres, textiles. Engineering plastics & resins - combines toughness with impacts & abrasion resistance. Fibres, cable sheathing, gears, tubing, connectors, fasteners, powder coating, solvent resistant containers. Reinforced grades of Nylon 6,6 (<30% glass fibre) are used mainly for the injection moulding of machinery parts, electrical insulating parts, housings such as coil formers and bearing cages. Reinforced grades (30–35%) find uses in lamp socket housings, cooling fans, insulating profiles for aluminium window frames; reinforced grades (35–55%) find uses in moulding gear wheels, solenoid valve housings, electric flow heaters, trailing cable attachments. Impact modified glass fibre reinforced grades are employed for applications requiring tough stiffness, notched impact and heat resistance, low warpage, e.g. housing components and wheel covers in automobiles. Other applications include use in high thrust electric trolling motors. Long glass fibre composite (50% glass fibre) for injection moulding of car parts offers improved impact and temp. related stiffness. Externally lubricated 30% glass fibre reinforced Nylon 6,6 modified with PTFE is used in moulded gears, cams, bearings and other moving parts requiring combination of high physical props., wear resistance and dimensional stability. Nylon 6,6 with 30–35% glass fibre is recommended for chains up to 30 m long. Longer chains require 50% glass fibre. Glass reinforced Nylon 6,6 is finding increasing uses in car engine compartments, air intake manifolds, cam covers, rocker covers and other heavy metal parts. Other applications include fan wheels for freezers, dishwasher pump housings, typewriter daisy wheels and rear view mirror housings. Flame retardant grades are used in many electrical applications, e.g. compact electrical contactor systems, multifunctional coffee grinder motor brackets. Nylon 6,6 remains the most widely used material in the electrical/electronics component industry. The thermoplastic air intake manifold for the 1995 GM Cadillac Northstar V-8 engine is made from BASF glass fibre reinforced Ultramid Nylon 6,6. Radiator tanks for European automotive air conditioning and engine cooling systems are now being made from heat and hydrol. resistant Nylon 6,6 containing 30% glass fibre

1	4	1 MHz	DIN 0303T4 [1]

Dielectric Strength:

No.	Value	Note
1	100 $kV.mm^{-1}$	DIN 0303-T21 [1]

Complex Permittivity and Electroactive Polymers: Comparative tracking index CTI 600 (test soln. A, DIN 0303-T1).
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.03	1 MHz	dry, DIN 0303-T4 [1]
2	0.04	1 MHz	saturated, DIN 0303-T4 [1]

Polymer Stability:

Thermal Stability General: Stable in nitrogen to about 310°. 50% loss of tensile strength 20000h (110°, ISO 216-1); 5000h (130°, ISO 216-1)
Upper Use Temperature:

No.	Value
1	250°C

Flammability: Flammability rating HB (1.6 mm, UL94). Limiting oxygen index 24%

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by copolymerisation of caprolactam, and Nylon 6,T salt in an autoclave. Processing is similar to that for Nylon 6,6 hence conventional Nylon injection moulding and extruders can be employed

Mould Shrinkage (%):

No.	Value	Note
1	1%	longitudinal
3	1.2%	transverse
4	0.4–0.7%	glass fibre filled [1]

Applications: Automotive engine parts, bearing retainers, mechanical and electrical parts requiring additional heat resistance. It is available unreinforced, in impact modified glass reinforced grades, mineral and carbon-filled grades

Trade name	Details	Supplier
Ultramid T	KR grades include miner.	BASF

Nylon-Polycarbonate blends N-53

Synonyms: *Nylon-PC blends*
Related Polymers: Nylon 12, Nylon 6, Nylon 6,6, Polycarbonate
Material class: Thermoplastic, Blends
Polymer Type: polyamide, polycarbonates (miscellaneous)
Additives: Poly(allyl-*co*-maleic anhydride) and poly(ω-caprolactone) added as reactive compatibilisers

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	65°C	75% nylon/25% PC [3]

Transition Temperature General: Miscibility of polymers influences thermal transitions, possibly due to copolymer formation [2]

Surface Properties & Solubility:

Solubility Properties General: Miscibility has been studied as a function of mixing time and composition. The two components show well segregated phases; at high nylon content they become homogeneous after long mixing time, possibly due to block copolymerisation [3]. Phase contrast and glass-transition studies suggest immiscibility; order of homogeneity amorph. Nylon >Nylon 12 >Nylon 6 >Nylon 6,6

Transport Properties:

Polymer Melts: Compatibilisation reduces MW and reduces melt viscosity [3]

Mechanical Properties:

Mechanical Properties General: Useful improvement in phys. props. can be achieved [1]
Impact Strength: No improvement in notched impact strength is observed on blending both polymers [1]

Optical Properties:

Transmission and Spectra: Ir spectral data suggest reactivity between nylon and compatibiliser

Applications/Commercial Products:

Processing & Manufacturing Routes: Difficult to mould from melt blends. Poly(ω-caprolactone) compatibilised ternary blends may be prepared by screw extrusion [5]
Applications: As yet no commercial applications

1	16	Y	23°, dry, ISO R179 [2]
2	12	Y	-12°, dry, ISO R179 [2]

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
1	4.8×10^{15} Ω.cm	ASTM D257	S

Dielectric Strength:

No.	Value	Note
1	19 $kV.mm^{-1}$	2 mm thick, ASTM D149

Complex Permittivity and Electroactive Polymers: Tracking resistance 600 V (min., NF C26-220)
Dissipation (Power) Factor:

No.	Value	Frequency
1	0.062	100 Hz
2	0.065	1 kHz
3	0.025	1 MHz

Polymer Stability:

Flammability: Flammability rating HB (UL94). Burning rate does not exceed 40 mm min^{-1} greater than 3 mm thick
Environmental Stress: Very good all round chemical resistance
Chemical Stability: Excellent resistance to all hydrocarbons, alcohols
Hydrolytic Stability: Water absorption $<20\%$ of Nylon 6 at equilibrium results in marked improvement to resistance to aq. acids and alkalis due to polypropylene content. Resistant to hydrol. by 10% NaOH at 85° but degraded slowly by dilute sulfuric acid at 85°. Resistant to 3% aq. sulfuric acid at 23°

Applications/Commercial Products:

Processing & Manufacturing Routes: Melt blending with grafting reactions in extruder
Mould Shrinkage (%):

No.	Value	Note
1	0.7%	longitudinal
2	1.2%	transverse

Applications: Car under bonnet applications, power tool housings; packaging of hollow vessels, films, moulded compounds, blow moulded engineering components, cable manufacture, tube and profile extrusion, motorcycle cowlings

Nylon 12-*block*-poly(tetramethylene glycol) N-56

Synonyms: *PA12-block-PTMG. Polyether Block Amide*
Related Polymers: Nylon 12
Monomers: 12-Aminododecanoic acid, Tetramethylene glycol
Material class: Thermoplastic, Copolymers
Polymer Type: polyamide, polyester
Molecular Formula: $[(C_{12}H_{23}NO)_n.(C_4H_8O_2)_m]$
Fragments: $C_{12}H_{23}NO$ $C_4H_8O_2$
Molecular Weight: M_n 2135 or 4200 for the Nylon 12 block. M_n 2032 for the polyether block [1]
General Information: Behaves as a thermoplastic rubber. It is rigid due to crystalline segments at room temp., but rubbery at elevated temps. when hard segments have melted. Pebax is a thermoplastic block copolymer of Nylon 12 and polytetramethylene glycol, with hard nylon and soft ether segments. The polymer has been studied by a thermally stimulated current method [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value
1	d 1.01–1.04 g/cm^3

Thermal Expansion Coefficient:

2	60°C	5% cryst., ASTM D1525

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	10 g/10 min	10 min., 5% cryst. [3]
2	6 g/10 min	25% cryst. [3]

Polymer Melts: Melt viscosity 2000 Pa s (10 s^{-1}, 170°, 5% cryst.); 100 Pa s (10000 s^{-1}, 170°, 5% cryst.)

Mechanical Properties:

Mechanical Properties General: Very good impact resistance at low temp., good flexibility and dynamic props.

Tensile (Young's) Modulus:

No.	Value	Note
1	10.4 MPa	5% cryst., ASTM D638

Flexural Modulus:

No.	Value	Note
1	15 MPa	5% cryst., ASTM D790
2	390 MPa	25% cryst., ASTM D790

Tensile Strength Break:

No.	Value	Note	Elongation
1	29–33 MPa	ASTM D638	
2	52 MPa	ASTM D638 [3]	420%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	24 MPa	18%	25% cryst., ASTM D638 [3]

Impact Strength: No break (notched, DIN 53453); 50 J m^{-1} (notched, 40°, 25% cryst., ASTM D256) [3]
Hardness: Shore D69 (25% cryst.); D25 (5% cryst.); A75 (5% cryst., ASTM D2240) [3]
Failure Properties General: Tear resistance 58 kN m^{-1} (unnotched, 5% cryst.); 38 kN m^{-1} (notched, 5% cryst., ASTM D1242)
Friction Abrasion and Resistance: Abrasion resistance 94 mg (1000 cycles)$^{-1}$, 5% cryst., ASTM D1242

Electrical Properties:

Surface/Volume Resistance:

No.	Value	Note	Type
3	0.003×10^{15} Ω.cm	5% cryst., ASTM D257 [3]	S
4	0.004×10^{15} Ω.cm	25% cryst., ASTM D257 [3]	S

Polymer Stability:

Polymer Stability General: Has few property variations between -40 and 80°

Chemical Stability: Resistant to most chemical attack

Applications/Commercial Products:

Processing & Manufacturing Routes: May be moulded into a variety of shapes. Moisture levels should be below 0.2% before processing

Mould Shrinkage (%):

No.	Value	Note
1	0.5%	5% cryst.
2	1.1%	25% cryst.

Applications: Suitable for a wide range of applications where good mech. props. are important, casings, fittings, keyboard, sports equipment. May also be extruded into films, sheaths, filaments, tubes and sheets

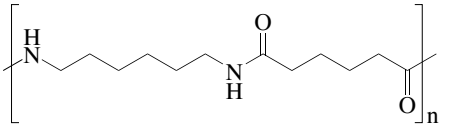
Nylon powder coatings N-57



Related Polymers: Nylon 6, Nylon 6,6, Nylon 11, Nylon 12

General Information: Polyamides find extensive use as anti-corrosion coatings for metallic substrates, but only Nylon 11 and Nylon 12 can readily be prod. in a suitable powder form for powder coating. The most common methods of application are fluidised bed dipping and electrostatic spraying; flame spraying is also used for large articles but can be very wasteful of material. The metal part which is to be covered must be carefully cleaned of oils, greases and oxides, and primered prior to coating. Nylon coatings give low coefficient of friction, high abrasion resistance and other useful props., and act as a barrier to corrosion. Typical film thicknesses are between 0.1 and 0.38 mm. Fluidised bed coating [1] is simple to use and produces thick durable coatings from 0.0008 to 0.25 in. thick on a variety of substrates. It is especially suitable for protective and decorative coatings on metal. The fluidised bed consists of a suitable sized tank to be able to immerse the article to be coated, two thirds filled with nylon powder. Air is blown through a porous base to expand and produce a fluid-like state in the powder into which an article preheated to 250-350° can easily be immersed. The powder melts on contact with the hot metal surface. The coating thickness applied is dependent upon the mass of the part and the time of dipping. Dip coating is readily adapted to production line operations with minimum of labour and very little loss of powder. It is particularly well suited to wire coatings, where the area to be coated is small [2]. Spray methods include electrostatic, airstatic and flock sprays for powders [3]. Electrostatic spraying needs very fine powder with a particle size 60 μm and produces much thinner coatings than those prod. by dip coating, the optimum range being 120-150 μm. The powder is fed at high electrical potentials through a nozzle where it becomes electrically charged, then sprayed onto a metal surface at zero potential and held there by the charge until fused by heating into a continuous coating [4,5]. Flame spraying, a slow operation with high powder losses, is suited to coating very large objects. It can be employed to coat non-metallic flammable substrates such as wood, rubber, masonry and other items, because the flame is used only to melt the plastic powder near the applicator and is not directly involved with the substrate [6]. The advantages of powder coatings over traditional paint systems have been reviewed for Nylon 11 [7]. Flame spraying is singled out as having future potential due to its ease of use on site. Industrially, continuous coating methods have been developed to coat welded tubes up to 30 mm diameter with circular, square or oval profiles, with up to 100 μm thickness applied at rates of 100 m $(min)^{-1}$. The tubing may subsequently be shaped for use in central heating installations, garden tools or fencing. A minicoat system has also been developed for coating small items from a few mm to 10 cm. Elf-Aquitaine, manufacturers of Rylsan Nylon 11 and 12 powders, have been instrumental in the development of these techniques [8]. Powder technology is continuously being developed [9]. Nylon coated aluminium tube components for cars have been prod. [10]; these are 50% lighter than similar stainless-steel tubes. Nylon coated steel has made inroads into the stainless-steel market in certain applications, primarily in the automotive industry, where superior wear resistance or lubricity is needed and where the bright look of stainless steel is not needed, e.g. window trims and wheel opening moulds [11]. Coatings can also be applied to complex geometric shapes to provide increased service life for the chemical processing, petrochemical, pulp and paper, semi-conductor, nuclear electronics and military industries [12]. Techniques have also been developed for prod. Nylon 6 suitable for powder coating.

Nylon 6,T N-59
Synonyms: *Poly(hexamethylene diamine-co-terephthalic acid). Poly(hexamethylene terephthalate). Poly(iminocarbonyl-1,4-phenylenecarbonylimino-1,6-hexanediyl)*
Related Polymers: Terephthalic/Isophthalic acid copolyamides
Monomers: 1,6-Diaminohexane, 1,4-Benzenedicarboxylic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
24938-70-3

Molecular Formula: $(C_{14}H_{18}N_2O_2)_n$
Fragments: $C_{14}H_{18}N_2O_2$
Additives: 0–0.5% Ammonium hypophosphite (usually 0.1%) as polymerisation catalyst and thermal stabiliser
General Information: Highly crystalline, melts at 370° (above its decomposition temp.). Monomers are inexpensive but need solid phase polymerisation to give sufficient MW for spinning. Fibres spun from sulfuric acid have props. on par with Nylon 6,6 fibres and retain strength to much higher temps. [1]. Unit cell parameter c 15.6 [2]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.21 g/cm^3	[4]

Melting Temperature:

No.	Value	Note
1	370°C	[4,5]
2	350–371°C	[4,5]

Glass-Transition Temperature:

No.	Value	Note
1	140°C	[3]

Surface Properties & Solubility:
Solvents/Non-solvents: Being very crystalline, it is inert to the majority of solvents. Dissolved by strong acids (sulfuric, formic) and by strong polar solvents such as DMF or *N*-methylpyrrolidone. Solvent action is increased by addition of 1–2% $CaCl_2$ or boric acid. Resistant to alkalis

Transport Properties:

Polymer Solutions Dilute: η_{inh} 1 dl g^{-1} (96% H_2SO_4, M_n 15000)
Water Content: 4.5% (70% relative humidity)

Mechanical Properties:

Mechanical Properties General: Tenacity (of fibre) 0.22–0.44 N tex^{-1} (30–45% elongation) [4]

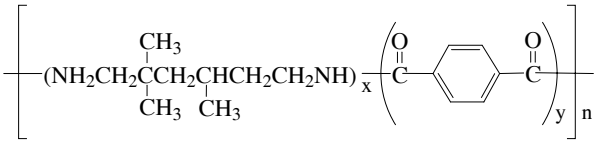
Tensile (Young's) Modulus:

No.	Value
1	4250 MPa

Tensile Strength Break:

No.	Value	Note	Elongation
1	425 MPa	21° [4]	35%
2	100 MPa	185°, 5h [4]	

Failure Properties General: Tensile strength retained after ageing in air, to a certain extent at high temp. [4]



Applications/Commercial Products:

Processing & Manufacturing Routes: May be polymerised in the solid state by heating a suspension of low water sol. salt [11] and 0.2–0.5% ammonium hypophosphite in liq. paraffin or other inert liq. at 200–220° for several hours. Soln. polymerisation may be effected by treating terephthaloyl chloride with hexamethylene diamine in *N*-methylpyrrolidone containing $CaCl_2$ or boric acid. Soln. polymerisation occurs also from terephthalic acid salt dissolved in *N*-methylpyrrolidone/dimethylacetamide solvents containing dissolved 1–2% boric acid and refluxing with triphenyl phosphite as dehydrating agent [6,7]. Copolymers containing 20–35% Nylon 6,I which are still crystalline can be prod. by melt polymerisation below 324°. Optimum compositions for fibre fabrication correspond to those containing 35% Nylon 6,I [8]
Applications: Has potential application as a fibre, but due to expensive polymerisation process and need to wet spin from sulfuric acid soln., it has not found commercial acceptance compared with Nylon 6,6 which is much cheaper and easier to produce. Bicomponent fibres comprising a sheath of Nylon 6 (40%) and a core of Nylon 6,T (60%) were manufactured commercially in the 1960s. Bicomponent fabrics have unique props. of shape and helical crimp and were used in hose and tricot fabric. Over 2000 tons were manufactured in 1976, but eventually the bicomponents lost their markets as stretching and texturing of monofibres were improved

Brittleness Temperature:

No.	Value	Note
1	-12°C	ASTM D746 [1]

Surface Properties & Solubility:

Plasticisers: *p*-Toluenesulfonamide
Solvents/Non-solvents: Sol. MeOH [7], CH_2Cl_2, 2-butanone, phenols, formic acid, conc. H_2SO_4, DMF, *N*-methylpyrrolidinone. Attacked by acids [4,6]

Transport Properties:

Transport Properties General: Has very low gas permeability which makes it of particular interest in packaging applications
Polymer Solutions Dilute: Apparent viscosity 6500 N Sm^{-2} (shear rate 1 s^{-1}, 270°), 4000 N Sm^{-2} (shear rate 100 s^{-1}, 270°). Viscosity 1.36 dl g^{-1} (M_n 26700, 96% sulfuric acid) [1], 1.23 dl g^{-1} (MW 44180, M_n 20000)
Polymer Melts: Melt viscosity 10000 Poise (100% strain, 35% glass fibre). Viscosity number 110 (cresol, 35% glass fibre)
Water Absorption:

No.	Value	Note
1	7.5 %	saturated, 23°, DIN 53495-1L [4]
2	3 %	50 days [1]
3	2 %	4 mm thick, 23°, 300 days, 50% relative humidity [4]
4	5 %	23°, saturated, 35% glass fibre

Gas Permeability:

No.	Gas	Value	Note
1	O_2	3.54 cm^3 mm/(m^2 day atm)	54 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 0% relative humidity [9]
2	O_2	1.31 cm^3 mm/(m^2 day atm)	20 × 10^{-13} cm^2 (s cmHg)$^{-1}$, 100% relative humidity [9]
3	O_2	2.62 cm^3 mm/(m^2 day atm)	40 × 10^{-13} cm^2 (s cmHg)$^{-1}$ [1]
4	CO_2	4.59 cm^3 mm/(m^2 day atm)	70 × 10^{-13} cm^2 (s cmHg)$^{-1}$ [1]

Mechanical Properties:

Mechanical Properties General: Good range of props. for engineering plastic. Less notch sensitive than polycarbonate. Mech. props. decrease on exposure to boiling water. Does not crack in flexural test, good stress cracking resistance

Tensile (Young's) Modulus:

No.	Value	Note
1	3800 MPa	-40°, ASTM D638 [1,4]
2	2800 MPa	23°, ASTM D638 [1,4]
3	2046 MPa	93°, ASTM D638 [1,4]
4	10000 MPa	1 mm min^{-1}, 35% glass fibre, DIN 53457-1

Flexural Modulus:

No.	Value	Note
1	2659 MPa	23°, ASTM D7960-66 [1]
2	2177 MPa	93°, ASTM D7960-66 [1]
3	2570 MPa	20°, ASTM D790 [2]

Tensile Strength Break:

No.	Value	Note	Elongation
1	67 MPa	23°, ASTM D638 [1]	132%
2	140 MPa	5 mm min^{-1}, 35% glass fibre, DIN 53455	2.1%

Compressive Modulus:

No.	Value	Note
1	2336 MPa	ASTM D695 [1]

Elastic Modulus:

No.	Value	Note
1	3000 MPa	DIN 53457 [5]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	67 MPa	8.8%	ASTM D638 [1]
2	85–90 MPa	9.5%	DIN 53455 [4,5]
3	81 MPa		20°, BS2782 method 301C [2]

Flexural Strength Yield:

No.	Value	Note
1	143.7 MPa	5% elongation, -40°, ASTM D7960-66 [1]
2	91.4 MPa	5% elongation, 23°, ASTM D7960-66

3	64.5 MPa	5% elongation, 93°, ASTM D7960-66 [1]
4	190 MPa	35% glass fibre

Compressive Strength:

No.	Value	Note
1	120 MPa	11.5% yield pt, DIN 53454 [5]

Miscellaneous Moduli:

No.	Value	Note	Type
1	6900 MPa	1000h, DIN 53444	tensile creep modulus

Impact Strength: Falling weight impact strength 38 J (2.2 mm thick unnotched disc) [2,7]. Very tough material, impact strength increases with moisture absorption. Charpy impact strength 20 kPa (notched, 23°, ASTM D256) [3]
Hardness: Rockwell M93 (23°, ASTM D785), R120 [1,5]
Failure Properties General: Tear strength 60 kJ m^{-2} (elongation 70–180%, DIN 53455) [5]. Creep strength 50 N mm^{-2} (after 1000h) [3]
Fracture Mechanical Properties: Tensile impact B 1.18 MPa (type 3 mm bar, ASTM D1822) [1]
Friction Abrasion and Resistance: Abrasion resistance 21 mg $(1000 \text{ cycles})^{-1}$ (ASTM D1044, Taber CS 17 test)
Izod Notch:

No.	Value	Notch	Break	Note
1		N	N	23° [3,4]
2	177000 J/m	Y	Y	room temp.

Izod Area:

No.	Value	Notch	Note
1	9–15 kJ/m^2	Notched	20°, DIN 53453 [3,4]
2	3–5 kJ/m^2	Notched	-50°, DIN 53453 [3,4]
3	24–25 kJ/m^2	Unnotched	-30–23°, 35% glass fibre
4	6–6.5 kJ/m^2	Notched	23–-30°, 35% glass fibre

Charpy:

No.	Value	Notch	Note
1	67	Y	23°, 3.8 mm notch hp radius [2,7]
2	68	Y	20° [2]

Electrical Properties:

Electrical Properties General: Insulating props. similar to general purpose cryst. nylons. Good tracking resistance. Dielectric props. have slight dependency on temp. and frequency and are not affected by high humidity
Surface/Volume Resistance:

No.	Value	Note	Type
1	$>0.01 \times 10^{15}$ Ω.cm	min., dry, DIN 53482 [3]	S
2	1×10^{15} Ω.cm	dry, VDE 0303T30 [4]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.44	0.3 MHz	-5°, ASTM D15068 [1]
2	4.32	0.3 MHz	38° [1]
3	3.3		-35° [1]
4	3.4	1 MHz	VDE 0303 T4 [4]
5	4.5	50 Hz	
6	3.8	1 MHz	VDE 0303 T4

Dielectric Strength:

No.	Value	Note
1	67 $kV.mm^{-1}$	ASTM D149 [1]
2	35 $kV.mm^{-1}$	35% glass fibre, ISO 243 [2]

Arc Resistance:

No.	Value	Note
1	120s	ASTM D495 [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.022	1 kHz	-35° [1]
2	0.036	1 kHz	-5° [1]
3	0.029	1 kHz	38° [1]
4	0.025	1 kHz	52°, ASTM D15068 [1]
5	0.016	50 Hz	
6	0.024	1 MHz	

Optical Properties:

Optical Properties General: A clear transparent material even in relatively thick samples. Light transparency in visible range *ca.* 85%
Refractive Index:

No.	Value	Note
1	1.566	20° [1,9]

Transmission and Spectra: Ir, uv and visible spectral data have been reported [1]

Polymer Stability:

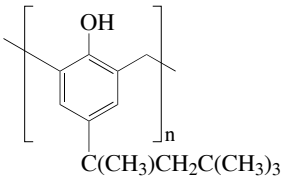
Polymer Stability General: Exhibits good dimensional stability. Low thermal expansion and high heat deflection temp. confer good thermal stability. Changes in temp. and frequency do not affect electrical props. adversely
Thermal Stability General: Amorph. nature has low thermal coefficient of expansion and low mould shrinkage. Good physical props. to within 50° of T_g
Decomposition Details: Stable in N_2 up to 310°. Above this temp. weight loss is observed (gravimetric analysis)
Flammability: Limiting Oxygen Index 26.8%. Flammability rating V2 (1.6 mm specimen, UL 94-1985). Polyamide is self extinguishing
Chemical Stability: Stable to most aliphatic, aromatic and halogenated hydrocarbons. Unaffected by oils, esters and salt solns. Less resistant to polar molecules especially alcohols and nitrogenous bases, leading to stress cracking

Hydrolytic Stability: Susceptible to hot water; prolonged exposure to boiling water leads to loss of transparency [5]. Unaffected by dilute mineral acids and alkalis, but hydrolysed by stronger solns.
Biological Stability: Not biodegradable

Applications/Commercial Products:

Processing & Manufacturing Routes: Commercially prod. from the dimethyl ester (DMT) and a 1:1 mixture of 2,2,4- and 2,4,4-trimethyl-1,6-hexanediamine. Diamine and diacid salt are charged in an autoclave at 270° and 1.8 MPa. Water is slowly removed and benzoic acid or AcOH added to limit MW. Processed at 250-300° using oven dried granules of $<0.1\%$ water content. May be compression or injection moulded or extruded
Mould Shrinkage (%):

No.	Value	Note
1	0.5–0.7%	
2	0.05%	longitudinal
3	0.65%	transverse



Applications: Transparent additive-free grades are used for electronic and electrical engineering components, telecommunications, water engineering, machine and apparatus construction, optics and in medical technology applications. Uv stabilised material is used for components with high mechanical strength such as machine elements, electrical switch parts and water engineering applications. 35% Glass fibre reinforced grades are used for rigid, low warpage injection mouldings. Transparent blends with semi-crystalline Nylons are used especially for spectacle frames and orthopaedic products. Advantages of blends are superior toughness and stress cracking resistance. Applications include profiles, lamp covers, inspection windows and light strips

para-Octyl Phenolic resins O-1

Synonyms: *4-Octylphenol based resins. p-tert-Octylphenol resins. 4-(1,1,3,3-Tetramethylbutyl)phenol resins*
Related Polymers: Phenol-aldehyde resins, Phenolic resins Rubber adhesives
Monomers: 4-*tert*-Octylphenol, Formaldehyde
Material class: Thermoplastic
Polymer Type: phenolic
CAS Number:

CAS Reg. No.	Note
26678-93-3	*p-tert*-octylphenol-formaldehyde copolymer
124765-80-6	4-*tert*-octylphenol-formaldehyde copolymer

Molecular Formula: $[(C_{14}H_{22}O).(CH_2O)]_n$
Fragments: $C_{14}H_{22}O$ CH_2O
Molecular Weight: M_n 755
Additives: Additives include kaolin, calcium carbonate, colloidal silica, hydroxymethylstarch, styrene-butadiene rubber
General Information: The resins do not cross-link as the phenol is difunctional (the *para*-position is blocked). The *p*-octyl side chain can exist in several isomeric forms. The only isomer of commercial importance is the *p-tert*-octyl form

Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	72–76°C	[1]

Glass-Transition Temperature:

No.	Value	Note
1	45°C	[3]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. oils [4]

Optical Properties:

Transmission and Spectra: Mass spectral data have been reported [2]

Polymer Stability:

Thermal Stability General: Details of thermal props. have been reported [6]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by reaction of p-*tert*-octylphenoxymagnesium bromide with paraformaldehyde in C_6H_6 soln. for 12h at 80° followed by acidic quenching [1]. The effect of catalyst on struct. and props. has been reported [5]
Applications: The solid resole (5–12%) may be compounded with rubbers using activators and acts as a non-sulfur-containing vulcanisation agent. Activators for nitrile-butadiene rubber are pyromellitic anhydride, phthalic anhydride or fumaric acid. For styrene-butadiene rubber (SBR), *p*-toluenesulfonic acid or chloroacetic acid are used. For neoprene, the activator can be zinc oxide and tin (*II*) chloride. The novolak is compounded with kaolin clay, calcium carbonate, colloidal silica and SBR latex to form a coated front (CF) sheet for carbonless copy paper systems. Potential application as an antimicrobial agent. In varnishes and protective coatings. Novolak-type resin used in the production of speciality printing inks. Resoles may be mixed with rubber and alkaline earth hydroxides to make adhesives. May be used as a sulfur free alternative curing agent for rubber compounding. May be used with epoxy resins as coatings for equipment for the chemical industry

Trade name	Details	Supplier
Rütaphen KA	adhesive resins	Bakelite
Standard sample	novolak type	
Sumilite resin R	PR-19900; novolak-type	Sumitoma Chemical, Japan

29436-19-9	2-methyl-1-propene/SO_2 copolymer
51749-80-5	2-heptene/SO_2 copolymer
33991-01-4	1-hexadecene/SO_2 copolymer
25104-10-3	1-butene/SO_2 copolymer

Molecular Formula: $(RSO_2)_n$
Fragments: RSO_2
Molecular Weight: MW of polysulfones is controlled by chain-transfer agents such as $BrCCl_3$, CBr_4 or thiols. [3,4,5]
General Information: Olefin-sulfur dioxide copolymers degrade readily at high temp. preventing commercial application. Their density increases with increasing sulfone to hydrocarbon ratio. Crystallinity has been detected by x-ray diffraction in the poly(ethylene sulfone)s of variable composition, in poly(butadiene sulfone), and in polysulfones with three, four, five, or six main - chain carbon atoms in the repeat unit. No crystallinity was detected in some poly(1-olefin sulfone)s. Alkenes, conjugated and non-conjugated dienes and some alkynes and vinyls combine with SO_2 to form alternating copolymers with a 1:1 SO_2/alkene ratio. Most polysulfones have SO_2 groups separated by two saturated carbon atoms. Separation by more than two carbon atoms can result from the copolymerisation of some dienes and also via polymerisation using a dimercaptan/diolefin or dimercaptan/dihalide reaction with a subsequent oxidation step. Copolymers with lower contents of SO_2 units can be made by polymerisation in the gas phase using γ-irradiation [21]
Tacticity: Are generally atactic [1]. Isotactic and syndiotactic forms of Poly(cyclohexene sulfone) are possible. [6,39]
Morphology: Monoclinic unit cell a 9.88Å, b 9.62Å, c 18.24Å, β 121.7° (hexamethylene); a 9.88Å, b 9.62Å, c 34.00Å, β 121.7° (hexamethylene and pentamethylene); a 9.88Å, b 9.62Å, c 15.68Å, β 121.7° (hexamethylene and tetramethylene); a 9.88Å, b 9.62Å, c 7.76Å, β 121.7° (pentamethylene); a 9.88Å, b 9.62Å, c 28.33Å, β 121.7° (tetramethylene and pentamethylene) [9]. For α-olefin polysulfones the side chain crystallises independently of the backbone when the chain length reaches C_{18} [23]. 1-Hexene and 1-tetradecene polysulfones adopt a helical struct., whereas cyclohexene and other 1,2-disubstituted polysulfones do not [32,33, 34,35]. Alkyne/SO_2 copolymers have a *trans* configuration [38]
Identification: Ir [38], H-1 nmr and C-13 nmr spectral data have been reported [6,7,8,14,20,26,34,36,40]

Volumetric & Calorimetric Properties:

Equation of State: Mark-Houwink constants have been reported
Latent Heat Crystallization: The ceiling temp. (T_c) for polysulfone formulation, i.e. where free energy change for the reaction is zero, varies with the parent alkene. For straight chain 1-alkenes (T_c) decreases from above 137° for ethylene to 90° for propylene, and 64° for 1-butene after this it remains reasonably constant. For alkenes T_c decreases from 2-butene (34°) to 2-pentene (8°), and 2-heptene (-38°). Branching in the side chain lowers T_c particularly at the double bond, e.g. T_c 2-for methyl-1-pentene is -34°. Polysulfones of cyclic alkenes have much higher values of T_c than the corresponding acyclic polymer, e.g. T_c of cyclopentene polysulfone is 102°, compared with 63° for 1-pentene [25,29]
Transition Temperature General: T_m of alkyne/SO_2 copolymers varies with MW and with crystallinity [38]. Some 1-alkene sulfones (e.g. 1-eicosene, 1-hexadecene) have liq. cryst. phases at temps. between room temp. and 100°. Softening point and clearing temp. for 1-eicosene polysulfone are 54° and 71° respectively; those for 1-hexadecene polysulfone are 65° and 70° respectively [14]

Transport Properties:

Polymer Solutions Dilute: Huggins constants for cyclopentene polysulfone and cyclohexene polysulfone have been reported [22]
Permeability of Gases: Permeabilty of α-olefin polysulfones to O_2 and CO_2 is quite high and reaches a maximum at C_{16} [23]

Mechanical Properties:

Hardness: Brinell hardness 40 propylene polysulfone, 25–30 2-butene polysulfone, 20–23 1-butene polysulfone, 18–19 1-pentene polysulfone [19]
Fracture Mechanical Properties: Films from cycloaliphatic polysulfones tend to crack in solvents although the incorporation of α-olefins in a terpolymer improves the film props. in this respect [28]

Optical Properties:

Molar Refraction: Complex refractive index over the ir range for poly(2-methyl-1-pentene sulfone) has been reported [41]. Some sulfones of, for example, 1-eicosene and 1-hexadecene have liq. cryst. phases between room temp., and 100°. Softening point and clearing temp. for 1-eicosene sulfone are 54° and 71° respectively; those for 1-hexadecene sulfone are 65° and 70° respectively [14]

Polymer Stability:

Thermal Stability General: The polysulfones of norbornene and some of its derivatives are thermally more stable than those of 1-butene and cyclohexene. Stabililty can be enhanced by the use of stabilisers such as thioacetamide or tin(II) oxide [31]
Decomposition Details: Thermal decomposition of 1-alkene polysulfones yields the respective monomers. Cyclic alkene sulfones and 2-alkene sulfones undergo a more complex decomposition yielding a variety of products including aromatics [11]. An ethylene polysulfone is stable up to approx. 225°. Above 275° decomposition proceeds rapidly with 100% weight loss by 350°. A copolymer with only 9 mol% SO_2 decomposes more slowly than the 1:1 copolymer [21]. Weight loss (3h, 190°): cyclohexene polysulfone 16.1%; 1-butene polysulfone 30.5%; 5-norbornene-2-carbonitrile polysulfone 5.4%; methyl 5-norbornene 2-carboxylate polysulfone 9.5%; 5-norbornen-2-yl acetate polysulfone 8.9% [31]
Chemical Stability: Chemical stability of cyclohexene polysulfones may be improved by introduction of aromatic rings into the polymer chain [37]
Stability Miscellaneous: Poly(alkene sulfones) are very sensitive even to relatively low doses of ionising radiation and undergo rapid chain scission alkene. Cleavage occurs predominantly at the C-S bond [29,30]

Applications/Commercial Products:

Processing & Manufacturing Routes: Poly(olefin sulfone)s are obtained by the free-radical reaction of olefins with sulfur-dioxide. They can also be formed from other dienes and alkynes, though not from acetylene. Another method of preparation is by polysulfide oxidation. Poly(olefin sulfone) is formed from an olefin and sulfur dioxide in the gas phase. Following UV or high energy irradiation, copolymerisation has also been carried out in the solid state with isobutene, butadiene and vinyl acetate at low temp. When the polymerisation is homogenous, the feeds are mixtures of SO_2 with the other monomers and perhaps a solvent. Stainless-steel bombs or sealed tubes are used as reaction vessels at elevated temps. where the pressure may rise to >20 Mpa. For free radical initiation oxygen, ozonides, peroxides, hydroperoxides and hydrogen peroxide-paraldehyde have been used. Initiation is also effected by various forms of ionizing radiation or UV light on monomer feeds. Poly(propylene sulfone) can be moulded between 180 and 200°, and poly(1-butene sulfone) between 125 and 180°. Hot-pressed films have been prepared at 120° from the polysulfones of 1-butene, cyclopentene, and bicyclo-[2.2.1]-2-heptene at high pressures of 140 MN/m^2 which prevented decomposition. Synth. has been reported [6,7,8,10,13] some of the polysulfones may be spun into fibres
Applications: Thermal instability near the moulding temp. has prevented olefin-sulfur dioxide copolymers from being used as bulk thermoplastics, but certain speciality uses have been developed. Gypsum and other minerals have been coated with various polysulfones to impart compatibility with polymeric hydrocarbons, such as polyethylene, to achieve a reinforcing effect. Some polysulfone - based formulations e.g. Stadis 450, are used as antistatic additives for hydrocarbon fuels. Poly(olefin

sulfone)s are considered for use in the membranes of heart-lung machines and other medical purposes due to their biocompatibility and high permeability to oxygen and to CO_2. The most significant use at present exploits sensitivity to high energy radiation. Poly(1-butene sulfone) (PBS) is used as a resist in the electron-beam fabrication of chromium photomasks using electron-beam exposure. It is available as a filtered solution ready for spin coating. Most important application is electron beam resists, photolitho compositions, and in x-ray resists. They also find application in anti-fouling and anti-static formulations and in membranes

Trade name	Details	Supplier
PBS	Poly(1-butene sulfone)	Mead Chemical Co.
PBS		Rolla Mo.
PBS		Chisso Corporation

Molecular Formula: $(C_8H_8)_n$
Fragments: C_8H_8
Additives: No plasticisers are usually used. For food packaging applications any additives used must be approved for food contact
General Information: OPS is a large volume, thermoplastic material [1]. It has high optical clarity and high surface gloss, high permeability to water and gases, e.g. oxygen, high flexural modulus, excellent dimensional stability and machinability, low taste and odour transfer and low cost [1,2]. The thickness of OPS film is typically <0.08 mm and for OPS sheet >0.08 mm. Commercial products are available in the range 0.025–0.75 mm
Tacticity: Most commercially produced PS film is atactic. Syndiotactic PS film has been produced commercially for specialist applications [28,29,30,33,34,35,36,37,38,39,40,41]. Isotactic film has been used for research purposes [27] and speciality products [42,43,44]. Syndiotactic film may be white [38] or transparent [36]
Morphology: Most OPS is biaxially oriented. The orientation increases the elongation values and overcomes the problems with brittleness observed for unoriented, cast PS sheet. Uniaxial orientation can also be used to produce fibres and films but this process is not as significant commercially

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.05–1.06 g/cm^3	[4]

Thermodynamic Properties General: For an oriented sample, the linear coefficients of thermal expansion parallel and perpendicular to the direction of draw are different. The effect of orientation on the linear thermal expansion coefficient for atactic and isotactic films at different draw ratios has been reported [1,45]. α_L perpendicular to the draw is slightly greater than that for unoriented PS. α_L parallel to the draw is much lower than that for unoriented PS
Thermal Conductivity:

No.	Value	Note
1	900–1500 W/mK	0.9–1.5kW m^{-1}, K^{-1} ASTM C177 [4]

Glass-Transition Temperature:

No.	Value	Note
1	105°C	378K [46]

Transition Temperature General: T_g is not affected by orientation or the draw ratio [46]

Surface Properties & Solubility:

Solubility Properties General: Orientation does not affect the solubility or surface props.

Transport Properties:

Transport Properties General: Rheological props. in the melt and the melt flow index are important for the manufacture of PS film and sheet
Permeability of Liquids: The rate of sorption of *n*-pentane increases almost fourfold when the PS is uniaxially oriented [1,53]
Permeability and Diffusion General: Permeability and diffusion are very sensitive to the test conditions and to small changes in the degree of orientation [1,49] and the morphology [47] and vary with film thickness [4,5]. When biaxially oriented PS film is strained uniaxially the gas permeability is affected [1,54,55]. The strain dependence of the permeability and diffusion coefficients for Ar, Kr, Xe, N_2 and CO_2 have been reported [54,55]. Permeability and diffusion coefficients decrease with time at constant rate of strain [54,55]. Other gas permeability values have been reported [1,4,5,49]
Water Absorption:

No.	Value	Note
1	0.04–0.1 %	ASTM D570 [4,5]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	100.6 cm^3 mm/(m^2 day atm)	102000 cm^3 μm m^{-2} day^{-1} bar^{-1}, ASTM D1434/ASTM D3985 [47]
2	O_2	142.5–143.2 cm^3 mm/(m^2 day atm)	2.17–2.18 × 10^{-10} cm^3 cm cm^{-2} (s cm Hg)$^{-1}$ [48]
3	O_2	0.099 cm^3 mm/(m^2 day atm)	2 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, 25° [50,51]
4	N_2	23.6–26.9 cm^3 mm/(m^2 day atm)	0.36–0.41 × 10^{-10} cm^3 cm cm^{-2} (s cm Hg)$^{-1}$ [48]

5	N_2	0.03 cm^3 mm/(m^2 day atm)	0.59 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, 25° [50,51]
6	H_2	0.83 cm^3 mm/(m^2 day atm)	17 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, [50,51]
7	He	0.69 cm^3 mm/(m^2 day atm)	14 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, 25° [50,51]
8	CO_2	0.39 cm^3 mm/(m^2 day atm)	7.9 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, 25° [50,51]
9	CO_2	394.76 cm^3 mm/(m^2 day atm)	400000 cm^3, µm m^{-2} day^{-1} bar^{-1}, ASTM D1434/ASTM D3985 [47]
10	H_2O	0.35–0.41 cm^3 mm/(m^2 day atm)	717–840 × 10^{-13} cm^3 cm cm^{-2} (s Pa)$^{-1}$, 25° [50]

Mechanical Properties:

Mechanical Properties General: Biaxially oriented PS has higher values of elongation and greater resistance to brittle fracture compared to unoriented PS [1]. Biaxially oriented PS has a large flexural modulus [1]. Mechanical props. for melt oriented material (uniaxially oriented), at high draw rates and temps. just above T_g, show a fairly good relationship with the birefringence [1]. For example, tensile strength at yield [1,67] and impact strength [1,70] increase with increasing birefringence. Biaxially oriented polymers have increased elongation to break in all directions in the plane of the film [72,73]. The tensile modulus of uniaxially oriented PS increases with birefringence [1,67]

Tensile (Young's) Modulus:

No.	Value	Note
1	2760 MPa	ASTM D638 [4,5]
2	3100 MPa	[1]

Tensile Strength Break:

No.	Value	Note	Elongation %
1	56.2–84.4 MPa	ASTM D882 [4,5]	3–40%
2	62–83 MPa	[1]	5–60%
3	23–33 MPa	ASTM D882, grip speed 12.7 cm min^{-1}, distance 5.1 cm, film thickness 45.5 µm [71]	11–15%

Impact Strength: Pendulum impact strength 1–5 kg cm^{-1} (3.2 mm thick) [4,5]
Mechanical Properties Miscellaneous: Elmendorf tear strength 2 g mm^{-1} (ASTM D1922) [4,5]. Bursting strength 16–35 Mullen points (0.0254 mm thick, ASTM D774) [4,5]. Yield 31.6 m^2 (kg mm)$^{-1}$ (ASTM D2103) [4,5]. Material yield 3.8 m^2 N^{-1} (0.025 mm) [1]
Hardness: Rockwell M85 (ASTM D785) [4,5]
Failure Properties General: Uniaxially oriented PS under normal tensile testing rate, shows brittle to ductile behaviour in the draw direction at a birefringence of -0.002 [1,67]. At this point crazing is suppressed and shear yielding is the predominant mode of deformation. In the cross direction the tensile strength decreases sharply with birefringence [1,68]. Under high speed notched impact conditions the onset of brittle to ductile behaviour occurs at a birefringence of -0.005 [1]. For biaxially oriented PS, brittle to ductile behaviour occurs when the ratio of the birefringence to the intrinsic birefringence is 0.04 at room temp. [1,69]. Biaxial orientation of PS reduces crazing and increases the environmental stress crack resistance [1,70,74,75]. Susceptible to pinhole formation under conditions of repeated flexing [76]

Electrical Properties:

Electrical Properties General: Oriented PS has excellent electrical props.

Dielectric Permittivity (Constant):

No.	Value	Note
1	2.5	22°, ASTM D150 [4,5]

Dielectric Strength:

No.	Value	Note
1	197 $kV.mm^{-1}$	22°, ASTM D149 [4,5]
2	20 $kV.mm^{-1}$	60 Hz [2]

Dissipation (Power) Factor:

No.	Value	Note
1	0.0005	22°, ASTM D150 [4,5]

Optical Properties:

Optical Properties General: Optical props. are affected by orientation
Refractive Index:

No.	Value	Note
1	1.6	ASTM D542 [4,5]

Transmission and Spectra: Ir [1,11,12,60,61,62,63,64], uv, Raman, nmr and fluorescence spectral data have been reported [65,66]
Total Internal Reflection: Birefringence may be used to determine the amount of orientation in films [1,56]. Birefringence is proportional to the stress at low stress levels only [1]. Intrinsic birefringence -0.1 [1,57,58]. Stress optical coefficient 4700 × 10^{-12} Pa^{-1} [1,59]. Birefringence may be related to the recoverable strain and heat released just above the T_g [1]
Volume Properties/Surface Properties: Transparency 39% (ASTM D1746) [4,5]. Haze 0.1–3.0% (ASTM D1003) [4,5]

Polymer Stability:

Thermal Stability General: Dimensional shrinkage and polymer disorientation may occur [4]. For uniaxially drawn PS, shrinkage occurs just above T_g [46]
Upper Use Temperature:

No.	Value	Note
1	88 °C	[4,5]
2	-63 °C	min., continuous service [4]
3	88 °C	max., continuous service [4]

Decomposition Details: A method for predicting the temp. for the onset of thermal degradation of films in air has been reported [77]. The activation energy of thermal degradation and the temp. for the onset of thermal degradation are affected significantly by the heat pretreatment of films, *e.g.* annealing and quenching [77]
Flammability: Flammability 3.8 cm s^{-1} (ASTM D635) [4,5]
Environmental Stress: PS film has fair resistance to uv radiation with tensile strength and heat resistance being affected by irradiation time [4,5]. The stability of PS films to uv radiation has been studied in fresh water, salt-water and air. The tensile strength and elongation at break of the PS films initially increases for all environments with the greatest increase for the uv-air environment and the least for the uv-fresh water environment. This increase may be attributed to the formation of free radicals by photo-induction resulting in cross-linking [71]. Uniaxial orientation enhances craze and environmental stress cracking propagation in the direction parallel to the orientation [1]. Biaxial orientation of PS reduces crazing and increases the resistance to environmental stress cracking [1,70,74]

Chemical Stability: Has good resistance to strong acids and strong alkalis [4,5] with good to poor resistance to greases and organic solvents [4,5]
Hydrolytic Stability: Stable in aq. solns.
Biological Stability: Stable to bacteria and microorganisms. However, bacterial adhesion to the polymer film surface may occur

Applications/Commercial Products:

Processing & Manufacturing Routes: OPS is usually made of a high heat distortion, unplasticised, high MW, general purpose resin. For food packaging applications, resins that are low in residual ethylbenzene and styrene monomer are used. Scrap resin can be added back to the process as either ground sheet or repelletised material. OPS film and sheet may be prepared commercially using a tentering process or a bubble process. The tentering process is most common for OPS sheet and the bubble process for film, both consisting of an extrusion stage where orientation of the film takes place followed by thermoforming. The 'orientation' stretching must be performed at the optimum temp. 95–120°. Biaxially oriented sheet is thermoformed by heating it above T_g (typically 149°) and then shaping in a mould. Vacuum forming is usually used. Biaxial orientation must be maintained during thermoforming. OPS film may be prepared using a blown film (bubble) extrusion process [1,2], where film can be stretched simultaneously in machine and transverse directions [1]. This is followed by rapid cooling to retain biaxial orientation. Although the blown film process is similar to the common bubble process used for making polyethylene, polypropylene and Saran films superficially, there are a number of substantive differences, and the polystyrene process is considerably more difficult to achieve, as the blown film must be stabilised by cooling below T_g. This involves extremely careful control of temp. in the blowing process. Speciality and research applications of polystyrene films may use a solvent casting method [22] or heating latex particles or powder above T_g so that they coalesce followed by cooling to form a film [23,24,25]. Syndiotactic OPS film can be injection moulded [33], laminated and thermoformed [34]
Applications: OPS film is used in window envelopes because of its clarity, stability, its ability to pace through packaging machinery at high speeds, and to be cut and sealed. These same props. have led to the application of OPS film for window cartons. An anti-fog film has been used for the windows of cartons of bacon. This typically has a film thickness of 0.025–0.032 mm. OPS film of thickness 0.06–0.13 mm may be used as inserts in wallets or as sheet protectors. OPS film and sheet is used in food packaging because of low cost and high optical clarity. Transmission characteristics for water and oxygen approximately coincide with the metabolic requirements of the produce being packaged. Hence OPS film and composites containing OPS have been used to wrap fresh fruit, vegetables and flowers and may also be used for packaging bakery goods. For OPS sheet the main use is in meat trays because of its transparency, resistance to moisture and dimensional stability. Rubber modified OPS film may be used for food packaging and for synthetic paper. OPS film is also used as a photographic film base because of its dimensional stability at all humidities and low gel count. OPS film can be used to calibrate ir and FT-IR spectrometers. Film with an adhesive layer may be used as a substrate for pressure sensitive adhesive tape. Transferable xerox indicia may be prepared which contains polystyrene film and a complex may be used to make film based carbon paper. Polystyrene film can be laminated and used for decorative purposes and OPS has been laminated to polystyrene foamed sheet and used for heat-resistant, recyclable foam containers. A composite containing polystyrene film laminated onto paper has been used as antistatic packaging for wrapping electronic devices and liq. cryst. display devices. Laminated PS film has been used as plastic advertising inserts for food packages. PS can be laminated with a gas barrier polymer e.g. EVOH for packaging applications. Coated PS film can be coextruded with EVA and the laminate formed used as push-through lids for paper and plastic containers. Optical compensations for liq. cryst. display devices are made from a composite of polycarbonate film and monoaxial PS film. Luminescent PS film has been used in a fibre optic oxygen sensor. Other applications of OPS film include transfers for china printing and an artists' substrate. Syndiotactic PS film (biaxially stretched) has been used to form laminated film capacitors. Syndiotactic PS film may also be useful as condenser dielectric, wrap up foil, substrate for adhesive tape and flexible printed circuits; as a base for magnetic tape or recording tape, packaging and photographic plates. Syndiotactic PS film may be injection moulded to form heat-treated mouldings or may be laminated onto foam sheets to give thermoformed food trays. Isotactic PS film has been used in electrical insulation and in heat and chemical resistant mouldings

Trade name	Details	Supplier
Celatron	PS film and sheet	British Celanese Ltd
Cellofoam	PS film and sheet	United States Mineral Products Co.
Dri-Lite	PS film and sheet	Poly Foam Inc
Dylene	PS film and sheet	Sinclair Koppers Co
Kandel	PS film and sheet	Union Carbide Corporation
Polyflex	PS film and sheet	Monsanto Chemical
Santoclear	PS film and sheet	Mitsubishi Monsanto Chem. Co
Styrofilm	PS film	Sekisui Chem. Co Ltd
Styrofilm	PS film	Daicel Chem.
Sumibrite	PS (cast) film	Sumitomo Chem Co
Sumibrite	OPS film (rubber modified)	Idemitsu Petrochemical Ltd
Sumibrite	PS film laminates	Asahi Chem. Co Ltd
Sumibrite	OPS film and sheet	Dainippon Ink and Chemicals
Sumibrite	PS film	Tokyo Cellophane Paper Co Ltd
Sumibrite	syndiotactic PS film	Toyo Boseki
Sumibrite	isotactic PS film	Toray Industries
Sumibrite	syndiotactic PS film	Idemitsu Kosan Co Ltd
Sumibrite	PS sheet laminates	Lustour Corp.
Sumibrite	PS film laminates with EVOH	Kuraray Co
Trycite	PS film and sheet	Dow
Trycite	PS film on PS foam	Oji Kako KK

Oxetane polymers O-4

(In the general series, any H may be substituted by another group)

Synonyms: *Polyethers (oxetane polymers). Poly(oxetane). Poly (oxy-1,3-propanediyl). Poly(trimethylene oxide). PTO. Poly(3,3-dimethyloxetane). PBCMO. PDEO. Poly(BEMO). Poly[3,3-bis(exothymethyl)oxetane]. Poly(bis(chloromethyl)oxetane). PDMO*
Related Polymers: 1,2-Epoxypropane polymers (polypropylene oxides), Poly[2,2-bis(chloromethyl)trimethylene-3-oxide]
Monomers: Oxetane
Material class: Thermoplastic
Polymer Type: polyetherketones
CAS Number:

CAS Reg. No.	Note
25722-06-9	Poly(oxetane)
25323-58-4	PBCMO
26917-50-0	PBCMO

Molecular Weight: M_n 250000–350000 (for PBCMO)
Morphology: Props. vary greatly with symmetry, bulk and substituents. Oxetane polymers range from completely amorph. liq. to highly cryst., high melting solids [1]. Conformational characteristics have been reported [5]
Miscellaneous: Although oxetane polymers have considerable potential with regard to props., prohibitive costs have meant that only poly(bis(chloromethyl))oxetane (PBCMO) has been commercially prod. and that is now withdrawn

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.05 g/cm^3	PTO, amorph., 25°
2	d 0.92 g/cm^3	PDMO, amorph., 25°
3	d 0.95 g/cm^3	PDEO, amorph, 25° [3]

Latent Heat Crystallization: ΔH_{fusion} 150.9 J g^{-1} (polyoxetane); 107 J g^{-1} (monoclinic poly(dimethyloxetane)); 86.5 J g^{-1} (orthorhombic poly(dimethyl oxetane)). ΔS_{fusion} 0.468 J g^{-1} K^{-1} (polyoxetane); 0.309 J g^{-1} K^{-1} (monoclinic poly(dimethyl oxetane)); 0.263 J g^{-1} K^{-1} (orthorhombic poly(dimethyl oxetane)) [2]. $\Delta H_{polymerisation}$ 80.9 kJ mol^{-1} (oxetane); 84.6 kJ mol^{-1} (3,3-bis(chloromethyl)oxetane (BMO)); 67.9 kJ mol^{-1} (dimethyloxetane) [1]
Melting Temperature:

No.	Value	Note
1	35°C	unsubstituted polyoxetane
2	47°C	3,3-dimethyl derivative
3	135°C	fluoro-derivative
4	180°C	chloro-derivative
5	220°C	bromo-derivative
6	290°C	iodo-derivative
7	50°C	unsubstituted orthorhombic form [1,2]

Glass-Transition Temperature:

No.	Value	Note
1	-54°C	[10]

Transition Temperature General: Heat capacity and T_g data for various polyoxides including polyoxetane have been reported [12]. T_g variations with alkyl substituents have been reported [8,9]

Surface Properties & Solubility:

Solubility Properties General: Most cryst. oxetane polymers are insol. in common organic solvents. Like most polyethers, oxetane polymers are attacked by strong acids. Amorph./low melting oxetane polymers are sol. in a wide variety of organic solvents [1]
Cohesive Energy Density Solubility Parameters: δ 19.3 $J^{1/2}$ $cm^{-3/2}$ (unsubstituted polyoxetane); 16.2 $^{1/2}$ $cm^{-3/2}$ (3,3-dimethyl derivative); 16.2 $^{1/2}$ $cm^{-3/2}$ (3,3-diethyl derivative) [1,3]. Experimental values and 3-D solubility parameters have been reported [3]

Transport Properties:

Polymer Solutions Dilute: Theta temp θ 27° (cyclohexane, PTO) [4]. Tabulated intrinsic viscosity data for PTO, PDMO, PDEO as a function of M_n have been reported [3]

Optical Properties:

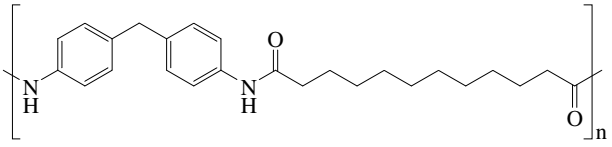
Refractive Index:

No.	Value	Note
1	1.46	PTO [3]
2	1.44	PDMO [3]
3	1.48	PDEO [3]

Polymer Stability:

Polymer Stability General: Energetic oxetane polymers (and their monomers) require special care in handling because of their explosive nature [1]
Flammability: PBCMO is self-extinguishing due to the chlorine in the side chain [1]
Chemical Stability: PBCMO is resistant to most solvents including ketones, aldehydes, esters, aromatic hydrocarbons
Hydrolytic Stability: PBCMO is resistant to water, ammonia, weak acids, weak and strong alkalis [1]

Applications/Commercial Products:



Processing & Manufacturing Routes: Not currently prod. commercially, but improved methods of polymerisation have been reported [6,7]
Applications: Cost has severely restricted application of oxetane polymers though the potential is great. Newer high tech. applications which may overcome this include solid rocket propellants, explosives, liq. crysts.

PACM-12 P-1

Synonyms: *Poly(bis(4-aminocyclohexyl)methane-co-dodecanoic acid). Poly(bis(4-aminocyclohexyl)methane 1,10-decanedicarboxamide). Poly[imino-1,4-cyclohexanediylmethylene-1,4-cyclohexanediylimino(1,12-dioxo-1,12-dodecanediyl)]. Poly-4,4′-methylenedicyclohexylene dodecanediamide*
Monomers: Bis(4-aminocyclohexyl)methane, Dodecanedioic acid
Material class: Thermoplastic
Polymer Type: polyamide
CAS Number:

CAS Reg. No.
25035-12-5

Molecular Formula: $(C_{27}H_{48}N_2O_2)_n$
Fragments: $C_{27}H_{48}N_2O_2$
General Information: DuPont introduced Qiana in 1968, but it was withdrawn in the 1980s. Fibres were silk-like and contained 70% *trans-trans* PACM. Fibres have good tenacity and dimensional stability and low moisture absorption [3]
Morphology: The *trans-trans* polymer gives rise to orthogonal crystals, a 9.3, b 6.06, c 45.0, 4 monomers per unit cell [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.034 g/cm^3	amorph. [1, 2]
2	d 1.04 g/cm^3	cryst. [2]

Latent Heat Crystallization: Latent heat of fusion ΔH_m 12 kJ mol^{-1} [2]
Specific Heat Capacity:

No.	Value	Note	Type
1	2.8 kJ/kg.C	[2]	P

Melting Temperature:

No.	Value	Note
1	275–308°C	[2]
2	280°C	fibre [5]

Glass-Transition Temperature:

No.	Value	Note
1	135–147°C	[2]
2	190°C	dry, fibre
3	85°C	wet, fibre [5]

Transport Properties:

Water Content: 2.5% (65% relative humidity) [5]

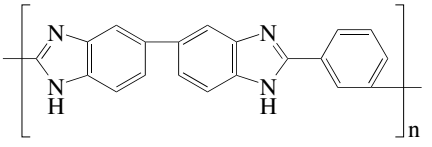
Mechanical Properties:

Mechanical Properties General: Tenacity 0.78 N tex^{-1} (13% elongation) (fibre) [4]; 0.26–0.29 N tex^{-1} (Qiana fibre) [5]

Applications/Commercial Products:

Processing & Manufacturing Routes: The nylon salt is prepared under pressure above 100° due to its low solubility. The temp. of the conc. soln. is raised in an autoclave with gradual release of H_2O until molten polymer is formed (typically up to 300° and 1.8 MPa). The polymer is extruded to obtain high MW and melt spun above 280° to form fibres
Mould Shrinkage (%):

No.	Value	Note
1	4–10%	Shrinkage in boiling water [5]



Applications: Commercial use of polymer in fibre form (1970–1980) under tradename Qiana. The fibre resembles polyester fibre in props., e.g. for fabric stability and wrinkle resistance. It has a silk-like appearance

Trade name	Details	Supplier
Qiana	Withdrawn in 1980s	DuPont

PBI P-2

Synonyms: *Poly([5,5′-bi-1H-benzimidazole]-2,2′-diyl-1,3-phenylene). 1,3-Benzenedicarboxylic acid polymer with [1,1′-biphenyl]-3,3′,4,4′-tetramine*
Monomers: 1,3-Benzenedicarboxylic acid, 1,3-Benzenedicarboxylic acid, 3,3′,4,4′-Biphenyltetramin
Material class: Thermoplastic
Polymer Type: polybenzimidazole
CAS Number:

CAS Reg. No.	Note
25734-65-0	Poly([5,5′-bi-1*H*-benzimidazole]-2,2′-diyl-1,3-phenylene)
26101-19-9	1,3-Benzenedicarboxylic acid polymer with [1,1′-biphenyl]-3,3′,4,4′-tetramine

Molecular Formula: $(C_{20}H_{12}N_4)_n$
Fragments: $C_{20}H_{12}N_4$
Additives: Polymer can be doped with acids such as phosphoric or sulfuric acid to increase proton conductivity [1].
General Information: High-strength engineering plastic with good thermal stability and flame resistance. Prod. as golden-brown powder.
Morphology: Amorphous polymer with very high glass-transition temperature. No regular crystalline structure according to x-ray diffraction data [2,3]. Acid-doping leads to increase in crystallinity through formation of hydrogen bonds [3].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d1.3 g/cm^3	moulded resin [4]

Glass-Transition Temperature:

No.	Value	Note
1	420–427°C	[4,5]

Transition Temperature General: A secondary β-transition reported at 300°C [5]

Deflection Temperature:

No.	Value	Note
1	435°C	[5]

Surface Properties & Solubility:

Solubility Properties General: Dimethylacetamide is the usual solvent for preparation of PBI solns. and fibres.

Solvents/Non-solvents: Sol. dimethylacetamide, dimethylformamide, DMSO [6], formic acid [2], polyphosphoric acid [7], conc. H_2SO_4, strong bases [1]. Insol. most organic solvents.

Transport Properties:

Water Absorption:

No.	Value	Note
1	12–19%	high moisture affinity [1,8]

Mechanical Properties:

Mechanical Properties General: Exhibits a very high shear yield stress, resulting in high compressive and tensile yield stresses [5]. It can be brittle as a result of surface irregularities [5].

Tensile (Young's) Modulus:

No.	Value	Note
1	5900 MPa	[4]

Flexural Modulus:

No.	Value	Note
1	6500 MPa	[4]

Compressive Modulus:

No.	Value	Note
1	5900–6200 MPa	[4]

Poisson's Ratio:

No.	Value	Note
1	0.34	[4]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	160 MPa	3	[4]

Flexural Strength Yield:

No.	Value	Note
1	220 MPa	[4]

Compressive Strength:

No.	Value	Note
1	390–400 MPa	[4,5]

Electrical Properties:

Electrical Properties General: Insulator for electron conduction but exhibits proton conductivity [9]. When doped with acids, the nitrogen atoms are protonated and anions are linked by hydrogen-bonding, while a hopping mechanism for proton transfer occurs [10]. For membrane applications, acid-doped PBI has been tested at high temperatures (150–200°C), with proton conductivities up to 6×10^{-2} S cm^{-1} at different degrees of humidity [11,12]. The conductivity increases markedly on absorption of water by polymer [8]. The electroluminescence of PBI films with light emission at λ_{max} *ca.* 540nm has been examined in LED devices [13].

Optical Properties:

Optical Properties General: Film exhibits uv absorption centred at *ca.* 360nm and photoluminescence at *ca.* 525nm [13].

Transmission and Spectra: pmr [14], ir [2,8,10,14], uv and photoluminescence [13] and x-ray diffraction [2,3] data have been reported.

Polymer Stability:

Thermal Stability General: Water only is evolved from fibre up to *ca.* 300°C [16]. Polymer starts to decompose at *ca.* 500°C in inert gases, with rapid decomposition between 550–900°C [2,15].

Flammability: Powder and fibre are nonflammable in air with only non-toxic gases (water and CO_2) evolved up to 560°C [15].

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. mainly in a two-stage polymerisation of 3,3′,4,4′-tetraaminobiphenyl with diphenyl isophthalate in polyphosphoric acid [2,17]. Isophthalic acid [7,18], hexapropyl orthoisophthalate [19], and isophthalaldehyde bis(bisulfite) [20] have been used in place of diphenyl isophthalate. A one-stage process using sulfolane as solvent has also been reported [21]. Polymer can be processed into moulded products, spun into fibres, or used as solutions in dimethylacetamide.

Applications: Moulded polymer products are used in high heat-resistant applications such as in semiconductors and in the chemical and petrochemical industries. Fibres can be used in the fire service, protective industrial clothing, and also in blended fabrics with aramid fibres. The solutions are used for film castings and coatings. A potential application for acid-doped or modified PBI is as a membrane for fuel cells.

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.015	50 Hz	VDE 0303-4, Crastin XB 3035 [2]
2	0.165	1 MHz	VDE 0303-4, Crastin XB 3035 [2]
3	0.03		Celanex X-203101 [3]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [6]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	120°C	[11]

Flammability: UL 94 rating V0 (Crastin XB 3035) [2]. Flammability of Celanex X-203101 has been reported [3]. Oxygen index 31% (Crastin XB 3035, ASTM D2863) [2], 26.7–31.2% [10]

Environmental Stress: Resistance to uv radiation has been reported [7]. Valox grade rapidly loses its mechanical props. on ageing at high temps. and humidity [1]. Has good resistance to weathering [9]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	2%	ASTM D955 [11]

PBT, injection moulding glass fibre filled P-6

Synonyms: *Polybutylene terephthalate, injection moulding glass fibre filled*
Related Polymers: Polybutylene terephthalate, PBT flame retardant, PBT high impact, PBT fibres, PBT films/sheets, PBT mineral filled, PBT carbon fibre filled, PBT Polycarbonate blends, PBT Polyethylene terephthalate blends, PBT phenoxy blends
Monomers: 1,4-Benzenedicarboxylic acid, 1,4-Butanediol
Material class: Composites, Thermoplastic
Polymer Type: PBT and copolymers, polyester
CAS Number:

CAS Reg. No.	Note
24968-12-5	repeating unit
26062-94-2	
30965-26-5	from dimethyl terephthalate
59822-52-5	from terephthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$
General Information: Glass fibre reinforced PBT provides improved mech. and thermal props., and increased fatigue endurance, creep resistance and high temp. resistance

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.5 g/cm^3	30% glass fibre [3,17]
2	d 1.54 g/cm^3	30% glass fibre, Celanex [16]
3	d^{23} 1.69 g/cm^3	30% glass fibre, Arnite T [17]
4	d 1.53 g/cm^3	30% glass fibre, ASTM D792 [18]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	4×10^{-5} K^{-1}	30% glass fibre [3]	V
2	1.4×10^{-5} K^{-1}	30% glass fibre, ASTM D696 [17]	V
3	2.5×10^{-5} K^{-1}	30% glass fibre, ASTM D696 [17,21]	L
4	4×10^{-5}–5×10^{-5} K^{-1}	flow direction, 30% glass fibre, Arnite T [17]	L
5	7×10^{-5}–8×10^{-5} K^{-1}	cross direction, 30% glass fibre, Arnite T [17]	L

Thermodynamic Properties General: Heat transfer coefficient 13.4 kJ m^{-3} s^{-1} K^{-1}, (30% glass fibre, Novadur 5010) [7]
Thermal Conductivity:

No.	Value	Note
1	12.1 W/mK	30% glass fibre, ASTM C177 [17]
2	0.24 W/mK	30% glass fibre, Arnite T [17]
3	0.21 W/mK	30% glass fibre, ASTM C177 [21]

Specific Heat Capacity:

No.	Value	Note	Type
1	0.46 kJ/kg.C	30% glass fibre [17]	P
2	1.15 kJ/kg.C	40°, 30% glass fibre, Arnite T [17]	P

Melting Temperature:

No.	Value	Note
1	220–225°C	30% glass fibre [3]
2	223°C	30% glass fibre, Arnite T [17]

Deflection Temperature:

No.	Value	Note
1	206°C	1.82 MPa, 30% glass fibre, Celanex [16]
2	213°C	1.82 MPa, 30% glass fibre, ASTM D648 [17]
3	205°C	30% glass fibre, Arnite T [17]
4	210°C	1.82 MPa, 30% glass fibre, ASTM D648 [18]

Vicat Softening Point:

No.	Value	Note
1	205°C	30% glass fibre, DIN 53460 Method B [3]
2	215°C	30% glass fibre, Arnite T, IDN [17]

Transport Properties:

Polymer Melts: Rheological props. have been reported [5]
Permeability of Liquids: Water diffusion coefficient of Duranex 2002 has been reported [8]
Water Content: Water content of Duranex 2002 has been reported [8]. Water absorption of Celanex 917 has been reported [11]
Water Absorption:

No.	Value	Note
1	0.3 %	23°, 30% glass fibre [3]
2	0.06 %	24h, 30% glass fibre, ASTM D570 [17,21]
3	0.26 %	equilibrium, 30% glass fibre, ASTM D570 [18]

Mechanical Properties:

Mechanical Properties General: Mechanical props. of 30% glass fibre filled material have been reported [10,12]. Tensile modulus (Valex 735, mineral filled) has been reported [6]. Dynamic storage modulus (Novadur 5010, 30% glass fibre) has been reported [7]. Other values of tensile strength (Celanex 917) have been reported [11]. Shear modulus of Valox 735 (mineral filled) has been reported [6]

Tensile (Young's) Modulus:

No.	Value	Note
1	8300 MPa	30% glass fibre, ASTM D638 [17]
2	4090 MPa	Duranex 2002 [8]
3	9700 MPa	30% glass fibre, Celanex [16]
4	10200 MPa	30% glass fibre, Arnite T [17]

Flexural Modulus:

No.	Value	Note
1	8300 MPa	30% glass fibre, Celanex [16]
2	8100 MPa	30% glass fibre, ASTM D790 [17]
3	7580 MPa	30% glass fibre, ASTM D790 [18]
4	9900 MPa	30% glass fibre, Arnite T [17]

Tensile Strength Break:

No.	Value	Note	Elongation
1	74.58 MPa	Duranex 2006 [8]	2.26%
2	135 MPa	30% glass fibre, Celanex [16]	2%
3	131 MPa	30% glass fibre, ASTM D638 [17]	4%
4	135 MPa	30% glass fibre, Arnite T [17]	2%
5	117 MPa	30% glass fibre, ASTM D638 [18]	4%

Flexural Strength at Break:

No.	Value	Note
1	193 MPa	30% glass fibre, Celanex [16]
2	193 MPa	30% glass fibre, ASTM D790 [18]

Poisson's Ratio:

No.	Value	Note
1	0.34	Valox 735, mineral filled [6]

Compressive Strength:

No.	Value	Note
1	124 MPa	30% glass fibre, ASTM D695 [17]

Impact Strength: Impact strength 75 J m^{-2} (20°, ASTM D1822) [2].
Viscoelastic Behaviour: Stress-strain curves for Duranex 2002 have been reported [18]. Creep resistance (Celanex 917) has been reported [11]
Hardness: Rockwell R118 (30% glass fibre, ASTM D785) [17,18], M87 (30% glass fibre, Arnite T) [17], M90 (30% glass fibre, ASTM D785) [18]
Failure Properties General: Continuous stress deformation 1.60% (13.8 MPa, 50°, 24h, 30% glass fibre, ASTM D620) [18]
Fracture Mechanical Properties: Creep rupture and fatigue have been reported [1]. Fatigue behaviour (Novadur 5010, 30% glass fibre) has been reported [7]. Shear strength 61 MPa (30% glass fibre, ASTM D732) [28]
Friction Abrasion and Resistance: Abrasion resistance 40 mg (1000 cycles)$^{-1}$ (ASTM D1044) [17]. Taber abrasion 19 mg (1000 cycles)$^{-1}$ (30% glass fibre, ASTM D1044, CS-17) [18]. Coefficient of friction μ 0.15 (against self, ASTM D1894), 0.19 (against metals, 30% glass fibre) [18]
Izod Notch:

No.	Value	Notch	Note
1	136.1 J/m	Y	20°, 30% glass fibre, ASTM D256 [2]
2	979.8 J/m	N	20°, ASTM D256 [2]
3	90.7 J/m	Y	30% glass fibre, Celanex

4	240 J/m	N	[16]
5	96 J/m	Y	30% glass fibre, ASTM D256 [17]
6	96 J/m	Y	23°, 30% glass fibre, ASTM D256
7	800 J/m	N	23°, 30% glass fibre, ASTM D256
8	747 J/m	N	-40°, 30% glass fibre, ASTM D256 [18]
9	147 J/m	Y	-40°, 30% glass fibre, ASTM D256
10	870.9 J/m	N	-40°, ASTM D256 [2]
11	85 J/m	Y	-40°, 30% glass fibre, ASTM D256 [8]

Charpy:

No.	Value	Notch	Note
1	8	Y	30% glass fibre, Arnite T[17]

Electrical Properties:

Electrical Properties General: Electrical props. of 30% glass fibre filled material [10,12] and Celanex 917 have been reported. [11] Volume resistivity (Valox 310) has been reported. [9] Dissipation factor [9] and its variation with temp. [3,7] has been reported

Surface/Volume Resistance:

No.	Value	Note	Type
4	0.03×10^{15} Ω.cm	30% glass fibre, Arnite T [17]	S

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.9		30% glass fibre [3]
2	3.7		30% glass fibre, Celanex [16]
3	3.8	60 Hz	30% glass fibre, ASTM D150 [17]
4	3.7	1 kHz	30% glass fibre, Arnite T [17]
5	3.6	1 MHz	30% glass fibre, Arnite T [17]
6	3.8	1 kHz	30% glass fibre, ASTM D150 [18]
7	3.7	1 MHz	30% glass fibre, ASTM D150 [18]

Dielectric Strength:

No.	Value	Note
1	>0.4 kV.mm^{-1}	min., Valox 310 [9]
2	22 kV.mm^{-1}	560 V mil^{-1}, 30% glass fibre, Celanex [16]
3	14 kV.mm^{-1}	357 V mil^{-1}, 30% glass fibre, ASTM D149 [17]
4	47 kV.mm^{-1}	30% glass fibre, Arnite T [19]
5	24.8 kV.mm^{-1}	30% glass fibre, ASTM D149 [21]

Arc Resistance:

No.	Value	Note
1	135s	30% glass fibre, ASTM D495 [17]
2	110–175s	30% glass fibre, ASTM D495 [17]
3	146s	30% glass fibre, ASTM D495 [18]

Strong Field Phenomena General: Breakdown voltage 76 kV (30% glass fibre, Arnite T) [17]

Static Electrification: High voltage track rate 4.65 cm min^{-1} (UL Bulletin 494, flame retardant, mica) [13], 29.46 cm min^{-1} (UL Bulletin 494, flame retardant) [13]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.01		30% glass fibre [3]
2	0.002	1 kHz	30% glass fibre, Arnite T [17]
3	0.002	1 kHz	30% glass fibre, ASTM D150 [18]
4	0.02	1 MHz	30% glass fibre, ASTM D150 [18]
5	0.011	1 MHz	[17]

Optical Properties:

Transmission and Spectra: Ir spectral data (Novadur 5010, 30% glass fibre) have been reported [7]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	120°C	air, 30% glass fibre
2	65°C	H_2O, 30% glass fibre [18]

Flammability: Heat resistance and flame retardancy details have been reported. [12] Flammability rating HB (0.8 mm, Celanex, UL94) [16,17]; HR2 (140°, 30% glass fibre, UL08) [2]; V0 (1.5 mm, Arnite T, UL94). [17] Limiting oxygen index 18.2% (30% glass fibre, ASTM D2863) [18]

Environmental Stress: Weathering of Duranex 2002 has been reported [8]

Chemical Stability: Chemical resistance [12] of Celanex 917 has been reported [11]

Hydrolytic Stability: Hydrolytic stability of 30% glass fibre filled material has been reported [4]

Recyclability: Recycling details have been reported [15]

Stability Miscellaneous: Effect of γ-irradiation has been reported [14]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	0.003%	30% glass fibre, ASTM D955 [17]
2	0.2–0.3%	flow direction, 30% glass fibre, Arnite T
3	1.5–1.6%	cross direction, 30% glass fibre, Arnite T [17]

PDMS fluid P-7

Synonyms: *Dimethicones fluid. Dimethylsilicone fluid. Polydimethylsilicone fluid. Poly[oxy(dimethylsilylene)]*
Related Polymers: Polydimethylsiloxane, Polymethyloctylsiloxane fluid, Polydimethyldiphenylsiloxane fluid, Polymethylphenylsiloxane fluid, Polyphenylsiloxane fluid, Fluorosilicone oil, Polymethylhydrogen siloxane, Silly putty, Poly(methylhydrogensiloxane-*co*-dimethylsiloxane) fluid
Monomers: Dichlorodimethylsilane, Hexamethylcyclotrisiloxane
Material class: Fluids
Polymer Type: dimethylsilicones
CAS Number:

CAS Reg. No.
9006-65-9
9016-00-6
63148-62-9

Molecular Formula: $[C_2H_6OSi]_n$
Fragments: C_2H_6OSi
Molecular Weight: MW 250–25000

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.96 g/cm^3	n >50 [1]
2	d 0.8–0.9 g/cm^3	very small n

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.001 K^{-1}	n >10 [1,3]	v
2	0.0015 K^{-1}	very small n	v

Thermal Conductivity:

No.	Value	Note
1	0.16 W/mK	0.00038 cal (cm s °C)$^{-1}$, n >50 [3,11]
2	0.1 W/mK	very small n

Specific Heat Capacity:

No.	Value	Note	Type
1	1.5 kJ/kg.C	0.36 cal (g °C)$^{-1}$ [3,7,14]	P
2	1.1–1.3 kJ/kg.C	increases with increase in n	V

Melting Temperature:

No.	Value	Note
1	-80–-50°C	increases with increase in n [11]

Transition Temperature:

No.	Value	Note	Type
1	-50°C	n >200, [9,11]	Pour point
2	-80°C	low n	Pour point

Surface Properties & Solubility:

Solubility Properties General: Solubility of gases has been reported [5,12]
Cohesive Energy Density Solubility Parameters: δ 15.5 $J^{1/2}$ $cm^{-3/2}$ (7.5–7.6 $cal^{1/2}$ $cm^{-3/2}$); δ_d 15.9; δ_p 0.0; δ_h 4.1 $J^{1/2}$ $cm^{-3/2}$ [4,5,13,15]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons. Mod. sol. ethers, esters, ketones. Insol. alcohols, H_2O [5,7,8,10,12]
Wettability/Surface Energy and Interfacial Tension: γ_c 20 mJ m^{-2} (20 dyne cm^{-1}, n >10) γ_c 16 mJ m^{-2} (small n). Interfacial tension against water 42 mJ m^{-2} [1,5,9,16,17]

Transport Properties:

Polymer Melts: η 0.0065 St (25°) [1]. Variation of viscosity with MW at 25° has been reported [3]. Other viscosity values have been reported [2,7,10,11]. Viscosity is only moderately affected by pressure. A rise in pressure from 1–2000 atm raises viscosity by a factor of 16
Water Content: Water absorption has been reported [4]

Mechanical Properties:

Mechanical Properties General: Highly compressible
Elastic Modulus:

No.	Value	Note
1	1100 MPa	11000 kg cm^{-2} [8]

Electrical Properties:

Electrical Properties General: Has excellent insulating props.
Dielectric Permittivity (Constant):

No.	Value	Note
1	2.8	25°, n >200 [7,11,18]

Dielectric Strength:

No.	Value	Note
1	10–20 $kV.mm^{-1}$	[6,18]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00015	800 Hz	[7]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.4	n >10 [1]

Transmission and Spectra: Transparent above 280 nm [5]

Polymer Stability:

Polymer Stability General: Stable over wide temp. range
Thermal Stability General: Usable between -65° and 170°, in presence of air. In absence of air usable up to 300°
Upper Use Temperature:

No.	Value	Note
1	200°C	[9]
2	170°C	

Decomposition Details: Oxidised at temps. >200° [9]
Flammability: Fl. p. 315° (n >100) [7,10]. Flame point 380° (n >100) [11,19]
Environmental Stress: Stable to water and air. Damaged by radiation [7]
Chemical Stability: Chemically inert but decomposed by conc. mineral acids. Very thin films are liable to degradation [4,5,7]
Hydrolytic Stability: Stable to H_2O and in aq. solns. Very thin films spread on water; liable to hydrolytic degradation [4,5,7]
Biological Stability: Non-biodegradable [4,5]
Recyclability: Can be reused. No large scale recycling

Applications/Commercial Products:

Processing & Manufacturing Routes: For low viscosity fluids dimethyldichlorosilane is hydrolysed and the hydrolysate equilibrated under acid catalysis at 180° with small amounts of hexamethyldisiloxane to serve as chain terminator. For high viscosity fluids cyclic dimethylpolysiloxanes are equilibrated together under alkaline catalysis with traces of chain terminator at 150°
Applications: Used as an hydraulic fluid for vibration damping, as antifoamer, in dielectric media, as surfactant, as grease, in heat transfer media, as polish, lubricant, plastic additive and emollient. Particularly important as mould release agent in plastics and rubber industries and in applications where high and low temps. and large temp. ranges are liable to be encountered. PDMS fluid can be copolymerised with polyethers to produce polymers with valuable surfactant props.

PDMS-polyether copolymer P-8

Synonyms: *Silicone glycol copolymer. Poly[dimethylsiloxane (oxyethylene cooxypropylene)]*
Related Polymers: PDMS fluid
Monomers: Dichlorodimethylsilane, Ethanediol, Propanediol
Material class: Fluids
Polymer Type: silicones
CAS Number:

CAS Reg. No.
64365-23-7
67762-96-3
68937-54-2
68938-54-5

Molecular Formula: $[(C_2H_6OSi).(C_3H_6O).(C_2H_4O)]_n$
Fragments: C_2H_6OSi C_3H_6O C_2H_4O
Molecular Weight: M_n 600-20000

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1 g/cm^3	[1,2]

Transition Temperature General: Cloud point and pour point increase with increase in fraction of polyoxyethylene in copolymer [3]
Transition Temperature:

No.	Value	Note	Type
1	-48–32°C	-55–90°F [1,2]	Pour point
2	10–64°C		Cloud point

Surface Properties & Solubility:

Solubility Properties General: Solubility in H_2O decreases with increase in temp.; effectively insol. above cloud point [3]
Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, ketones, ethers, alcohols, esters. Mod. sol. H_2O. Insol. aliphatic hydrocarbons, polydimethyl siloxanes [1,2,3]
Surface and Interfacial Properties General: Has better lubricating props. than PDMS fluid [6]
Wettability/Surface Energy and Interfacial Tension: γ_c 20.5–30.5 mJ m^{-2} [1,2,3]. Copolymer in aq. soln. reduces γ_c to 21–27 mJ m^{-2} [3,5]

Transport Properties:

Polymer Melts: Viscosity 0.2-20 St. Viscosity is more temp. dependent than for PDMS fluid

Polymer Stability:

Flammability: Fl. p. 80–140° (175–280°F) [1,2]
Hydrolytic Stability: SiC copolymers are resistant to hydrolysis. SiOC copolymers hydrolyse in the presence of catalysts; this limits their use in the chemical industry. Slow hydrolysis occurs, in absence of catalysts, with separation of silicone oil
Recyclability: Non-recyclable

Applications/Commercial Products:

Processing & Manufacturing Routes: Polydimethylsiloxane containing a small number of SiH groups (often only in the terminal positions) is treated with hydroxyl terminal or vinyl terminal polyethers to prod. SiOC or SiC silicone glycol copolymers [3,4,5]
Applications: Surfactant, dispersant and wetting agent. Used as a spreading agent for various applications, a lubricant, slip additive, wetting and gloss agent, defoamer and emollient. Widely used in pharmaceutical and personal care products, mining, agricultural, automotive, textile and plastics applications

172501-09-6	norbornene, 1-decene comonomer

Molecular Formula: $(C_2H_4)_n$
Fragments: C_2H_4
Additives: Antiblock; slip; antioxidants (includes vitamin E for food use); antifogging agents, tackifiers (eg HMW polybutene).
General Information: Film is made from all density types of PE and many copolymers. Film use accounts for around 40% of PE use overall, but about half of LDPE use and about 60% of LLDPE use.
Morphology: Film produced by the 'blown film' method is bi-oriented and data may be segregated into machine direction (MD) and transverse direction (TD). Processing variables and MWD affect morphology. Both stacked lamellae and fibril nuclei have been observed [30]

Surface Properties & Solubility:

Surface and Interfacial Properties General: Due to the inherent inertness of polyethylenes, surface treatment to promote wettability is normally needed prior to printing on PE film.

Transport Properties:

Melt Flow Index:

No.	Value	Note
1	0.15–4.6 g/10 min	LDPE [4]
2	0.5–4.1 g/10 min	LLDPE [2,4,5]
3	0.06–0.08 g/10 min	HDPE [2]

Permeability of Gases: mVLDPE is claimed to have very high oxygen transmission rates [31]
Water Absorption:

No.	Value	Note
1	0.01 %	max, 24 h. ASTM D570 [3]

Gas Permeability:

No.	Gas	Value	Note
1	O_2	96.3–236 cm^3 mm/(m^2 day atm)	1.1–2.7 × 10^{-13} cm^2 (s Pa)$^{-1}$, 20–25° LDPE [1,3,4]
2	O_2	49–210 cm^3 mm/(m^2 day atm)	0.56–2.4 × 10^{-13} cm^2 (s Pa)$^{-1}$, 20–25°, MDPE [1,3,4]
3	O_2	39.4–78.8 cm^3 mm/(m^2 day atm)	0.45–0.9 × 10^{-13} cm^2s Pa^{-1}, 20–25°, HDPE [1,3,4]
4	CO_2	393–1050 cm^3 mm/(m^2 day atm)	4.5–12 × 10^{-13} cm^2(s Pa)$^{-1}$ 20–25°, LDPE [2,3,4]
5	CO_2	197–980 cm^3 mm/(m^2 day atm)	2.25–11.2 × 10^{-13} cm^2(s Pa)$^{-1}$, 20–25°, MDPE [1,3,4]
6	CO_2	227–275 cm^3 mm/(m^2 day atm)	2.6–3.15 × 10^{-13} cm^2(s Pa)$^{-1}$, 20–25 HDPE [1,3,4]
7	N_2	39.4–78.8 cm^3 mm/(m^2 day atm)	0.45–0.9 × 10^{-13} cm^2(s Pa)$^{-1}$, 20–25°, LDPE [1,3,4]
8	N_2	26.2–1221 cm^3 mm/(m^2 day atm)	0.3–1.4 × 10^{-13} cm^2(s Pa)$^{-1}$, 20–25°, MDPE [1,3,4]
9	N_2	15.8–23.63 cm^3 mm/(m^2 day atm)	0.18–0.27 × 10^{-13} cm^2(s Pa)$^{-1}$, HDPE [1,3,4]
10	H_2	770 cm^3 mm/(m^2 day atm)	8.8 × 10^{-13} cm^2(s Pa)$^{-1}$, 25°, LDPE, MDPE [3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	190–430 MPa	LDPE [4]

Tensile Strength Break:

No.	Value	Note	Elongation
1	17–55 MPa	transverse direction, LLDPE [1,2,3,4]	630–840%
2	14–28 MPa	MDPE [2,3]	50–650%
3	16–42 MPa	HDPE [2,3]	10–650%
4	21–38 MPa	UHMWPE [2,3]	300%
5	10–34 MPa	machine direction, LDPE [1,2,3,4]	200–600%
6	14–21 MPa	transverse direction, LDPE [1,2,3,4]	480–800%
7	30–72 MPa	machine direction, LLDPE [1,2,3,4]	390–700%

Tensile Strength Yield:

No.	Value	Note
1	9–13 MPa	LDPE [4]
2	7–14 MPa	LLDPE [4]

Impact Strength: 27–42 kJ m^{-1} (LDPE); 31–50 kJ m^{-1} (LLDPE); 15–23 kJ m^{-1} (MDPE); 4–12 kJ m^{-1} (HDPE) (ASTA D1822). Dart impact strength 120–520 kg m^{-1} (30–130 g mil^{-1}, LDPE); 320–4200 kg m^{-1} (80–105 g mil^{-1}, LLDPE); 1000–5600 kg m^{-1} (250–1400 g mil^{-1}, metallocene LLDPE)
Failure Properties General: Tear strength 20–115 kN m^{-1} (machine direction, LDPE); 30–125 kN m^{-1} (transverse direction, LDPE) [1,3,4]; 20–50 kN m^{-1} (machine direction); 50–100 kN m^{-1} (transverse direction, conventional LLDPE) [4]; 75–125 kN m^{-1} (machine direction); 145–220 kN m^{-1} (transverse direction, metallocene LLDPE) [4]; 20–118 kN m^{-1} (MDPE, HDPE) [1,3]. Burst strength 10–12 Mullen points (LDPE) [1,3]

Electrical Properties:

Electrical Properties General: Dielectric permittivity increases with increasing polyethylene density
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.2–2.3	1 kHz–1 GHz	[1,3]

Dielectric Strength:

No.	Value	Note
1	19 $kV.mm^{-1}$	475 V mil^{-1}, LDPE [1]
2	20 $kV.mm^{-1}$	500 V mil^{-1}, MDPE, HDPE [1]
3	51 $kV.mm^{-1}$	1275 V mil^{-1}, UHMWPE [1]

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.0003	1 kHz–1 GHz	LDPE, MDPE [1,3]
2	0.0005	1 kHz–1 GHz	HDPE [1,3]
3	0.00023	1 kHz–1 GHz	UHMWPE [1,3]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.51	LDPE [1]
2	1.52	MDPE [1]
3	1.54	HDPE, UHMWPE [1]

Transmission and Spectra: Raman spectral data have been reported for determination of orientation parameters [3]
Volume Properties/Surface Properties: Transparency 0–47% (LDPE); 30–75% (LLDPE); 10–80% (MDPE); 0.40% (HDPE) [1,4]; Haze 4–50% (LDPE); 4.5–9% (LLDPE); 4–50% (MDPE); 10–50% (HDPE); 2% (mLLDPE) [1,3,4]; Gloss 45–75 (45°), 10–100 (20°, LDPE); 35–97 (45°, LLDPE) [4]. Clarity is improved for MPE [31]

Polymer Stability:

Polymer Stability General: Lower use temp. 57° (LDPE, MDPE); 45° (HDPE, UHMWPE) [1]
Thermal Stability General: Dimensional change at 100° for 30 min. -2% (LLDPE); 0 to -0.7% (MDPE); -0.7–3.0%(HDPE) [1,3]
Upper Use Temperature:

No.	Value	Note
1	88°C	LDPE [1]
2	104°C	MDPE [1]
3	121°C	HDPE, UHMWPE [1]

Biological Stability: Biodegradation of agricultural films, especially with additions of corn starch, pigments and stabilisers [6,7,8,13] have been reported
Recyclability: Unblended film is recyclable and is used in co-extruded film. Industry trends and comments on recycling [36,37,38,39,40] have been reported
Stability Miscellaneous: Vitamin E used as an antioxidant has also been found to eliminate taste and odour from aldehydes, reduce gel formation and improve colour stability [28]

Applications/Commercial Products:

Processing & Manufacturing Routes: Blown film processing: melt temp. 160–210°, BUR 1.5:1 to 3.5:1(LDPE); melt temp. 190–215° (conventional LLDPE), 210–320° (metallocene LLDPE), BUR 1.5:1 to 4:1 ; melt temp. *ca*. 150°, BUR 3:1 to 4:1 (HDPE) [2,4] LLDPE requires a deeper screw with more gradual transitions than LDPE to overcome the lower degree of viscosity reduction at high shear [9]. There are reports of mLLDPE requiring equipment modification and of mLLDPE needing no equipment modification [10,11,12,14,15,17]. Air ring size and bubble cooling affect throughput [16]. Cast film especially for LLDPE where higher tensile strength and puncture resistance and better low temp. props make it technically competitive to HDPE and LDPE. Flat film extrusion improves transparency, freedom from haze, gloss of LDPE. Typical conditions 150°, 40–50 MPa (HDPE).
Applications: Used in bags, stretch/cling film, industrial sheeting, agricultural mulch, heavy duty films, damp proof membranes, semiconductor polishing, surgical, babywear, food use. Different density grades are more appropriate to different aspects: LLDPE for strength; LDPE for stretch/wrap; HDPE for barrier props, strength, and higher temps; VLDPE for heavy duty film; mPE for food use, clarity, medical applications. PE for film use, especially LLDPE is an area of considerable current development. Blending and/or co-extrusion are commonly used to combine best features.

PFA, Carbon filled P-10

Synonyms: *Tetrafluoroethylene-perfluoromethylvinyl ether copolymer, Carbon filled*
Related Polymers: PFA, Mineral and mica filled, PFA, PTFE filled, PFA, PTFE and carbon filled, Filled PFA, PFA, Glass filled
Monomers: Tetrafluoroethylene, Perfluoro(methyl vinyl ether)
Material class: Composites, Copolymers
Polymer Type: PFA, fluorocarbon (polymers)

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 2.1 g/cm^3	10% PAN carbon fibre, 15% pitch carbon [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	2.2×10^{-5} K^{-1}	10% PAN carbon fibre [1]	L
2	9×10^{-5} K^{-1}	15% pitch carbon [1]	L
3	8.6×10^{-5} K^{-1}	20% carbon fibre, flow direction, D696 [2]	L

Thermal Conductivity:

No.	Value	Note
1	0.35 W/mK	10% PAN carbon fibre [1]
2	0.55 W/mK	20% carbon fibre, through-plane, C177 [2]

Melting Temperature:

No.	Value	Note
1	307°C	10% carbon fibre [1]

Deflection Temperature:

No.	Value	Note
1	240.56°C	1.8 MPa, 10% PAN carbon fibre [1]
2	85°C	1.8 MPa, 15% pitch carbon [1]
3	149°C	1.82 MPa, 20% carbon fibre, D648 [2]
4	204°C	0.45MPa, 20% carbon fibre, D648 [2]
5	238°C	1.82 MPa, 30% carbon fibre, D648 [3]

Transport Properties:

Water Absorption:

No.	Value	Note
1	0.041 %	24h, 10% PAN carbon fibre [1]
2	0.01 %	24h, 15% pitch carbon [1]

3	0.04 %	24h, 23°, 20% carbon fibre, D570 [2]
4	0.01 %	24h, 23°, 30% carbon fibre, D570 [3]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	20670 MPa	30% carbon fibre, D638 [3]

Flexural Modulus:

No.	Value	Note
1	365.2 MPa	10% PAN carbon fibre [1]
2	344.5 MPa	15% pitch carbon [1]
3	7580 MPa	20% carbon fibre, D790 [2]
4	12400 MPa	30% carbon fibre, D790 [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	34 MPa	20% carbon fibre, D638 [2]	1.5%
2	31 MPa	30% carbon fibre, D638 [3]	0.5%

Tensile Strength Yield:

No.	Value	Elongation	Note
1	34.47 MPa	2.5%	10% PAN carbon fibre [1]
2	33.1 MPa		15% pitch carbon [1]

Flexural Strength Yield:

No.	Value	Note
1	53.08 MPa	10% PAN carbon fibre [1]
2	55 MPa	20% carbon fibre, D790 [2]
3	48 MPa	30% carbon fibre, D790 [3]

Izod Notch:

No.	Value	Notch	Note
1	213.6 J/m	Y	10% PAN carbon fibre [1]
2	160.2 J/m	Y	15% pitch carbon [1]
3	107 J/m	Y	20% carbon fibre, 3.18mm section, D256 [2]
4	91 J/m	Y	30% carbon fibre, 3.18mm section, D256 [3]
5	534 J/m	N	20% carbon fibre, 3.18mm section, D256 [2]
6	267 J/m	N	30% carbon fibre, 3.18mm section, D256 [3]

Electrical Properties:

Electrical Properties General: Volume resistivity 10^4 Ω cm [1]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	260°C	10% PAN carbon fibre [1]

Flammability: Flammability rating V1 (10% PAN carbon fibre, UL 94) [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Injection Pressure 55–83 MPa [2]
Injection Cylinder Temperature 316–366°C [2]
Mold Temperature 149–232°C [2]

Applications/Commercial Products:

Mould Shrinkage (%):

No.	Value	Note
1	0.9%	10% PAN carbon fibre [1]
2	1%	20% carbon fibre, 3.18mm section, D955 [2]
3	2%	20% carbon fibre, 6.35mm section, D955 [2]
4	0.1%	30% carbon fibre, 3.18mm section, D955 [3]
5	0.2%	30% carbon fibre, 6.35mm section, D955 [3]

Applications: Potential applications due to increased resistance to friction and wear in gears, cams, bearings and other moving parts

Trade name	Details	Supplier

Phenol Aralkyl resins P-15

(n = 0 - 6)

Synonyms: *Xylok resins. Phenol-1,4-bis(methoxymethyl)benzene resins. Phenol-α,α′-dimethoxy-p-xylene resins*

Related Polymers: Phenol Aralkyl Resins, Mica filled, Phenol Aralkyl Resins, Glass filled

Monomers: Phenol, 1,4-Bis(methoxymethyl)benzene

Material class: Thermosetting resin

Polymer Type: phenolic

CAS Number:

CAS Reg. No.	Note
26834-02-6	
51937-31-6	copolymer with hexamethylenetetramine

Molecular Weight: MW 600–800 (uncured)

Additives: Fillers include mica, silica, glass fibre, carbon fibre, graphite, asbestos

General Information: Improved temp. resistance, compared with unmodified phenolic resins, owing to reduced oxidative susceptibility of the methylene linkages [8]. Details of molecular struct. and mouldability have been reported [2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.34 g/cm^3	Xylok 225, carbon-fibre filled [6]
2	d 1.68 g/cm^3	Xylok 225, asbestos-filled [6]
3	d 1.87 g/cm^3	Xylok 225, silica-filled [6]

Vicat Softening Point:

No.	Value	Note
1	94°C	uncured [4]

Transport Properties:

Water Absorption:

No.	Value	Note
1	5.5–9.6 %	Xylok 225, filled [6]

Mechanical Properties:

Mechanical Properties General: Xylok 210 graphite-filled composites retain their flexural, tensile and compressive props. at elevated temps. [1]

Tensile Strength Break:

No.	Value	Note
1	42–52 MPa	Xylok 225, silica and asbestos-filled

Flexural Strength at Break:

No.	Value	Note
1	43–58 MPa	250°, Xylok 225, asbestos, silica and carbon fibre filled [6]
2	65–85 MPa	Xylok 225, asbestos, silica and carbon fibre filled [6]

Izod Notch:

No.	Value	Notch	Note
1	15 J/m	Y	Xylok 225, asbestos filled [6]
2	16 J/m	Y	Xylok 225, silica filled [6]
3	20 J/m	Y	Xylok 225, carbon-fibre filled [6]

Electrical Properties:

Electrical Properties General: Lower dielectric props. than phenolic resins and are therefore superior insulating materials

Dielectric Strength:

No.	Value	Note
1	11.8 kV.mm^{-1}	Xylok 225, carbon fibre-filled

Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.053–0.076	1 MHz	Xylok 225, asbestos filled [6]

Optical Properties:

Transmission and Spectra: Optical transmission 1.5% (Xylok 210, graphite filled) [1]

Polymer Stability:

Thermal Stability General: The heat stability of Xylok 225 filled resins is superior to that of the corresponding phenolic material. Details of heat resistance have been reported [2]

Upper Use Temperature:

No.	Value	Note
1	150–250°C	Xylok 225 [6]

Decomposition Details: Char yield of Xylok 210 46% whereas that of its graphite composite is 83% (900°, N_2) [1]. Xylok 210 decomposes at 430° with max. rate of weight loss occurring at 525° [1]

Flammability: Limiting oxygen index 46% (Xylok 210, graphite filled, ASTM D2863) [1]. Smoke density reaches a max. after approx. 6 min. (Xylok 210, graphite filled, flaming, NBS-Aminco chamber) [1]

Chemical Stability: The asbestos, silica and carbon-fibre filled mouldings are resistant to most environments, except 98% sulfuric acid and DMF at 90°. Asbestos filled Xylok 210 is resistant to oil, ammonia and fluorocarbons [5]

Phenol-Butyraldehyde resins P-18

Synonyms: *Phenol-butanal resins*
Monomers: Butyraldehyde, Phenol
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.
27814-12-6

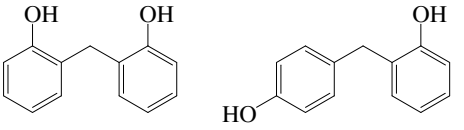
Volumetric & Calorimetric Properties:

Melting Temperature:

No.	Value	Note
1	58–66°C	high-*ortho*, uncured [2]
2	60°C	uncured [3]

Transport Properties:

Polymer Solutions Dilute: Viscosity 280 mPa s (methoxypropanol, 20°, uncured) [3]



Applications/Commercial Products:

Processing & Manufacturing Routes: High-*ortho* resin, with > *ortho-ortho* linkages [1], may be synth. by reaction of anhydrous phenol with butyraldehyde in the presence of a calcium hydroxide catalyst [2]. Novolak resin may be synth. by reaction of phenol and butyraldehyde in the presence of conc. H_2SO_4, in toluene soln. [3]. Butyraldehyde treated with phenol using HCl catalyst produces an oil-soluble resin. When base-catalysed with NaOH, phenol and butyraldehyde produces a moulding powder
Applications: The acid-catalysed phenol-butyraldehyde product can be used as an oil-soluble resin

Phenol-Formaldehyde Novolaks P-19

Uncured novolak

Cured novolak

Synonyms: *PF Novolaks. Novolaks*
Related Polymers: Phenol Formaldehyde Resins, Phenol formaldehyde resoles, Phenolic resins high-ortho, Phenolic Dispersions, Phenolic Resin, Moulding Powders, Mineral filled, Phenolic Resin, Moulding Powders, Graphite filled, Phenolic Resin, Moulding Powders, Mica filled, Phenolic Resin, Moulding Powders, Glass fibre filled, Phenolic Resin, Moulding Powders, Woodflour filled, Phenolic Resin, Moulding Powders, Cellulose filled, Phenolic Resin, Moulding Powders, Cotton filled
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.
9003-35-4

Molecular Formula: $[(C_6H_6O).(CH_2O)]_n$
Fragments: C_6H_6O CH_2O
Molecular Weight: MW 250–900; MW 500–5000. Generally MW < 2000
Additives: Hexamethylene tetramine (curing agent), carbon fibre, asbestos, basalt fibre, graphite fibre, wood flour. Wood flour, cellulose and nutshell flour are added as fillers to novolak moulding compounds to reduce shrinkage during cure, to improve impact strength and provide flow control. Poly(vinyl alcohol) and polyethylene to impove tensile strength
General Information: Novolaks are linear or slightly branched condensation products with methylene bridges of relatively low MW. Uncured resins are thermoplastic and sol. in a variety of solvents. Curing with an amine usual hexamethylene tetramine produces a cross-linked struct. which is hard, insol. and rigid.The cross-link procedure passes through several stages, the resins becoming rubbery (B-stage) and finally hard (C-stage).Props. of cured resin depend on type and amount of curing agent and time and temp. of cure. Props. given in this entry are representative examples of a specific cured resin

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: Calculation of the heat capacity of H41N has been reported [4]
Melting Temperature:

No.	Value	Note
1	80°C	uncured [22]

Glass-Transition Temperature:

No.	Value	Note
1	45–70°C	[9]
2	110–160°C	5–15 phr hexa, moulded resin [15]

Transition Temperature General: Deflection temp. of hexa cured moulded resin increases with increasing amount of curing agent and after heat treatment (210°, 8h) [15]
Deflection Temperature:

No.	Value	Note
1	98–178°C	5–20 phr hexa, moulded resin [15]
2	158–250°C	5–20 phr hexa, moulded resin, heat treated, 210°, 8 h [15]
3	130°C	asbestos filled [16]

Vicat Softening Point:

No.	Value	Note
1	50–60°C	hexa cured [7]
2	100°C	uncured [22]

Surface Properties & Solubility:

Solubility Properties General: Uncured novolak forms miscible blends with polyethylene-*co*-vinyl acetate [1]
Solvents/Non-solvents: Uncured sol. Me_2CO, 2-butanone, EtOAc, EtOH; insol. petroleum, C_6H_6, turpentine, toluene, CCl_4, $CHCl_3$ [22]

Transport Properties:

Polymer Melts: Melt viscosity of hexa cured novolac decreases with increasing temp. with the decrease most marked at temps. up to 150° [7]

Mechanical Properties:

Mechanical Properties General: The mech. props. of hexa cured, carbon fibre laminates are enhanced by increasing the volume of carbon fibre present, and by increasing the curing of the novolac [7]

Tensile (Young's) Modulus:

No.	Value	Note
1	95157 MPa	hexa cured, 15% carbon fibre, DIN 53455 [7]
2	99100 MPa	hexa cured, 30% carbon fibre, DIN 53455 [7]
3	120663 MPa	hexa cured, 45% carbon fibre, DIN 53455 [7]

Flexural Modulus:

No.	Value	Note
1	4964 MPa	720 kpsi, Borden RC-1000 [23]
2	4757 MPa	690 kpsi, BRPA-8152 [23]

Tensile Strength Break:

No.	Value	Note
1	323.7 MPa	hexa cured, 15% carbon fibre, DIN 53455 [7]
2	591.5 MPa	hexa cured, 30% carbon fibre, DIN 53455 [7]
3	20 MPa	asbestos filled [16]
4	663.1 MPa	hexa cured, 45% carbon fibre, DIN 53455 [7]

Flexural Strength at Break:

No.	Value	Note
1	301.2 MPa	hexa cured, 15% carbon fibre, DIN 53452 [7]
2	752.4 MPa	hexa cured, 30% carbon fibre, DIN 53452 [7]
3	1143.8 MPa	hexa cured, 45% carbon fibre, DIN 53452 [7]
4	21.6–110.9 MPa	2–20 phr hexa, moulded resin [15]
5	54.8 MPa	7.95 kpsi, Borden RC-1000 [23]
6	78.1 MPa	11.33 kpsi, BRPA-8152 [23]

Compressive Strength:

No.	Value	Note
1	70–80 MPa	asbestos filled [16]

Impact Strength: Impact strength 35–40 kJ cm^{-2} (asbestos filled) [16]
Failure Properties General: Interlaminar shear strength 14.1 N mm^{-2} (hexa cured, 15% carbon fibre, ASTM Norm D2344-65T), 27.9 N mm^{-2} (hexa cured, 30% carbon fibre, ASTM Norm D2344-65T), 38.9 N $^{-2}$ (hexa cured, 45% carbon fibre, ASTM Norm D2344-65T) [7]
Fracture Mechanical Properties: Fracture strain 1.18% (Borden RC-1000) [23]; 1.81% (BRPA-8152) [23]
Charpy:

No.	Value	Notch	Note
1	34.9	N	hexa cured, 15% carbon fibre, ISO R179-1961 [7]
2	71.4	N	hexa cured, 30% carbon fibre, ISO R179-1961 [7]
3	89.8	N	hexa cured, 45% carbon fibre, ISO R179-1961 [7]

Electrical Properties:

Electrical Properties General: The variation of permittivity and dielectric loss with frequency and temp. has been reported [8]

Optical Properties:

Transmission and Spectra: Ir [7], H-1 nmr [10,11] and C-13 nmr [12,13,14] spectral data have been reported
Volume Properties/Surface Properties: Colour Gardner scale 7 (uncured) [22]

Polymer Stability:

Polymer Stability General: Resistance to heat may be improved by increasing the amount of curing agent used [15]
Thermal Stability General: Cured resins decompose above 250°, with max. rate of decomposition occuring above 300° [9]
Decomposition Details: Char yield at 750° in N_2 59.1% (medium flow novolak, hexa cured) [3]. Char yields increase with increasing hexa content [3]. H41N shows approx. 22% weight loss over the temp. range 300–1100° when heated in an argon atmosphere [4]
Environmental Stress: Weathering in a hot climate for 60 months gives an increase in volume resistivity but decreases dielectric constant and dielectric loss tangent [6]
Chemical Stability: Asbestos filled material is resistant to sulfuric acid, hydrochloric acid and phosphoric acid [16]. Uncured resin is incompatible with linseed oil, tang oil and castor oil at 250°, but is compatible with double boiled linseed oil at the same temp. [22]

Applications/Commercial Products:

Processing & Manufacturing Routes: Novolaks synth. by reaction of phenol and formaldehyde in the presence of a strong acid

catalyst. Oxalic acid is the catalyst of choice (ideally less than 0.035%) [18] with sulfuric acid or *p*-toluenesulfonic acid also common. Phosphoric acid and hydrochoric acid are less frequently employed; the use of hydrochloric acid is not recommended owing to the formation of hazardous intermediates. The synth. is either a batch or a continuous process. In the batch process, hot phenol is stirred with formaldehyde and catalyst at 95° until the formaldehyde is consumed. Water is removed by a azeotropic distillation and phenol removed by heating *in vacuo* at 160°. In the continuous process, phenol, formaldehyde and catalyst are mixed and heated before being transferred to a second stage pressurized reactor at 120–180°. In both processes, the product is recovered by flaking onto a cooling belt. The resin may then be cured, typically using hexamethylene tetramine (9–10%). Epoxide resins may also be used to avoid release of gaseous by products. High-*ortho* novolaks are synth. by reaction of a large excess of phenol with formaldehyde in the presence of weak acids (pH 4–6) and a divalent metal catalyst [19,20,21]. High MW (up to 75700) novolaks may be synth. by the reaction of phenol and paraformaldehyde in a variety of organic solvents under acid catalysis at 80° [2]. C-13 nmr and N-15 nmr have been used to elucidate the curing mechanism involving hexamethylenetetramine [5]. Novolaks consisting of an all-*ortho*-substituted struct., may be synth. by repeated reaction of the bromomagnesium salts of phenol and salicyl alcohol [17]

Applications: High-*ortho* novolaks are used in foundry applications and in moulding compounds. Novolaks cured with epoxide resins have uses in commutators and other electrical applications. Powdered novolaks are used as moulding compounds. High-porosity papers impregnated with novolak in solution are used as filters. High MW novolaks in powder form are made into grinding wheels by a cold moulding process. A wide spectrum of phenolic resins are used as binders for friction materials including novolaks, Resoles, novolak/Resole blends, and thermoplastic modified novolaks. A novolak/ (hexamethyltetramine) blend can be used as a tackifier for rubber adhesives. Phenolic novolaks with fine particle hexamethyltetramine can be easily incorporated into rubber blends. On cure the phenolic moiety forms an interpenetrating network providing rubber reinforcement for tyres and shoe soles. Phenolic novolaks in granular form may be used in the hot curing (shell moulding) process for foundry sand binders. novolaks are formulated into a socket putty to bond the glass body to the metal socket in fluorescent lighting

Trade name	Details	Supplier
BRPA-8152	moulding compound	Union Carbide

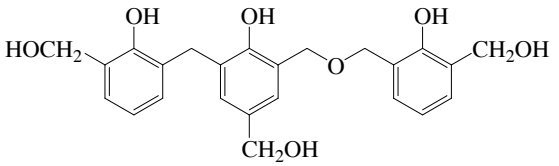
Phenol-formaldehyde resins P-20

Synonyms: *PF resins. Phenoplasts. Phenolic Resins. Resoles. Novolaks*
Related Polymers: Phenol-formaldehyde Resoles, Phenol-formaldehyde
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Formula: $[(C_6H_6O).(CH_2O)]_n$
Fragments: C_6H_6O CH_2O



Applications/Commercial Products:

Processing & Manufacturing Routes: Phenol-formaldehyde resins are made by the condensation reaction of molten phenol with formaldehyde, generally as a 37% aq. soln. With a basic catalyst and a molar excess of formaldehyde, a Resole is formed. With an acidic catalyst and excess phenol, a Novolak resin is formed. Resoles are used in soln. generally aq., but may also be used with alcoholic solvents added. They cure by application of heat or acid. Novolaks may be used as solid powdered resin, or in alcoholic solvents. They require a curing agent, generally hexamethylene tetramine. Phenolic resoles are made by treating Phenol with excess formaldehyde (F/p mole ratio above 1.5) with base catalyst, NaOH, $Ba(OH)_2$, $Ca(OH)_2$. A batch process in a resin kettle with good stirring and cooling to become exotherms. Reaction cycles of 60° upwards are chosen to achieve resin viscosities suitable for the application

Applications: See Phenol-aldehyde resins for a general discussion of the uses of phenolic resins

Trade name	Details	Supplier

Phenol-formaldehyde Resoles P-21

Synonyms: *PF Resoles. Phenoplasts. Phenolic Resoles. Resoles. A-Stage Resin*
Related Polymers: Phenol-formaldehyde Resins, Phenol-formaldehyde Novolaks, Phenolic Foam Resins
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Formula: $[(C_6H_6O).(CH_2O]_n$
Fragments: C_6H_6O CH_2O
General Information: Resoles are produced by treating phenol with formaldehyde in presence of base, producing low MW polyalcohol struct. Cured by heating, which causes cross-linking via the alcohol groups, or cure may occur by adjusting the pH of the initial reaction

Volumetric & Calorimetric Properties:

Specific Heat Capacity:

No.	Value	Note	Type
1	0.0692 kJ/kg.C	20° [12]	P
2	0.418 kJ/kg.C	100° [12]	P
3	2.01 kJ/kg.C	450° [12]	P

Glass-Transition Temperature:

No.	Value	Note
1	35°C	sodium hydroxide catalysed
2	47°C	hexa catalysed

Transport Properties:

Polymer Solutions Dilute: Viscosity 600–1500 mPa s (20°, wood applications)

Optical Properties:

Optical Properties General: Refractive index of uncured resin increases with increasing time of reaction [13]
Refractive Index:

No.	Value	Note
1	1.4844	uncured, reaction time 5 min [13]
2	1.5022	uncured, reaction time 1 h [13]

Transmission and Spectra: C-13 nmr [1, 2, 3, 4], ir [1, 2] and mass [5] spectral data have been reported

Polymer Stability:

Polymer Stability General: Resoles are most stable over prolonged periods of storage at pH approx. 5 [9]
Thermal Stability General: Thermal stability of cured resoles has been reported [8]
Decomposition Details: Complete volatilisation of cured resoles occurs upon heating in air above 300 ° whereas heating in an inert atmosphere causes only 25% weight loss up to 900° owing to formation of carbonaceous char [11]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by reaction of molten phenol with a molar excess of formaldehyde (F/P ratio > 1.5) with base catalyst, generally sodium, calcium or barium hydroxides in a batch process using a resin kettle with good mixing and cooling to overcome exotherms. Reaction cycles of temps. of 60° upwards are chosen to achieve resin viscosities suitable for the application. To increase the solids level, vacuum evaporation at 60° is necessary. Resoles may be cured by application of heat (the most important process) at 130°–200°; by acids [6] typically *p*-toluenesulfonic acid or phenolsulfonic acid; by microwave curing [7]. High-*ortho* liq. resoles may be synth. by reaction of phenol and formaldehyde (1:1.5–1.8 mole ratio) at pH 4–7 in the presence of a divalent metal salt catalyst at 80°–90° for 5–8 h. Synth. of low MW resole has been reported [10] Resoles with a high solids content and low viscosity are best synth. using a formaldehyde: phenol ratio of 1–1.1:1; a short reaction time is also preferable [13]
Applications: Used in wood and joinery applications for bonding woodchip for chipboard, bonding plywood, and decorative laminates. Moulded parts are used in automotive construction, door panels etc. Other uses include sand-based moulds for foundry casting of metals

Trade name	Details	Supplier
Aerodux	Resorcinol resins	Dyno
Aerophen	Phenolic resins	Dyno
Dynosol		Dyno
Exter 4010	PF resin for plywood	Neste

Phenolic dispersions P-22

Related Polymers: Phenol Aldehyde Resins, Phenolic Resoles, Phenolic Novolaks, Phenolic Resins, Oil-modified, Phenolic Resin Insulation Wool Binders, Phenolic Resins Coatings, Phenolic Resin Abrasives, Phenolic laminating Resins, Phenolic Resin Friction Materials
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin

Polymer Type: phenolic
Additives: Protective colloids are used to stabilise the resin in water systems

Applications/Commercial Products:

Processing & Manufacturing Routes: Phenolic dispersions are prepared by treating phenol and formaldehyde typically F/P mole ratio 1.5 with hexamethylene tetramine (6–12%) then adding poly(vinyl alcohol) and gum arabic as protective colloids
Applications: Particles of size >1000 microns are used in friction element composition

Phenolic laminating resins P-23

Related Polymers: Phenol-formaldehyde Resoles, Phenol-formaldehyde Novolaks, Urea-formaldehyde resins, Melamine-formaldehyde resins, Cresol-Formaldehyde Resins, Xylenol-formaldehyde Resins, Phenolic resins, Glass-reinforced plastic
Monomers: Phenol, Urea, Melamine, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Paper (kraft, alpha, or cotton linter), fabric, asbestos felt, glass fabric, nylon, cotton fabric
General Information: Usually based on resoles which contain sufficient methyl groups to allow for cross-linking without addition of formaldehyde donors. Resins are based on phenol or phenol-cresol mixtures when good mech. props are required; electrical grade laminates are based on *m*-cresol. Resins for mech. laminates are made using sodium hydroxide catalyst whereas ammonia catalyst is used for electrical laminates. Props. will depend upon nature of the resin, type of additive and method of synth. [3]. Phenolic resins may also be used for glass reinforced plastics

No.	Value	Note
1	140°C	paper [4]
2	130°C	coton fabric [4]
3	155°C	asbestos fabric [4]
4	180°C	glass fabric [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Paper and fabric are impregnated with resin, and dried at temps. of 100–190°. Aq. phenolic Resoles and MeOH/toluene solns. of modified cresol and xylenol Resoles are employed for specific laminates. Prepregs of glass filament cloth impregnated with phenolic resins are made into fibreglass reinforced components. The prepreg has a resin content of generally 40–50% and it may be stored at <20° before use. It is cured and compressed at 0.7 Pa and 125° for 1–2h to form FRP laminates having excellent fire-resistant and smoke props.
Applications: Paper- and fabric-based laminates are used as self-supporting insulating materials for electrical applications. Battery separators are made from phenolic resin impregnated cellulose and polyacrylonitrile fibres. The resin level is 25–30% and porosity is achieved by inclusion of surfactants. Industrial filter inserts are made from porous paper and fibrous materials impregnated with phenolic resoles. Fibreglass-reinforced flexible abrasive wheels are made from fibreglass yarn prepregs impregnated with phenolic resole. FRP laminates are used inside aircraft, rail vehicles (especially subway trains), buses and trucks for safety reasons. Cotton fabric laminates used to make gear wheels. Cotton and asbestos laminates used as bearings in steel rolling mills. Other uses in aircraft construction and in chemical plant (but not alkaline environments)

Phenolic resin foam P-24

Synonyms: *Phenolic foam. Phenol-formaldehyde foam*
Related Polymers: Phenol-formaldehyde resins, Phenol-formaldehyde Resole
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Formula: $[(C_6H_6O).(CH_2O)]_n$
Fragments: C_6H_6O CH_2O
Additives: Paper, glass fibre, asbestos, hollow microspheres to improve strength. Boron trioxide, aluminium hydroxide as flame retardants. Calcium carbonate as corrosion inhibitor . Inorganic filler (e.g. perlite) to improve mechanical strength and fire behaviour
General Information: Ratio of open to closed cells is dependent on the density, surfactant used in synth., and on the formulation. Low density forms may contain up to 90% open cells [4]

Morphology: A crosslinked three dimensional struct. with methylene ether and phenylmethane type 'bridges' within the network

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.035–0.08 g/cm^3	40% open cells [4]
2	d 0.08 g/cm^3	[3]
3	d 0.015–0.32 g/cm^3	dependent on synth. [1]
4	d 0.04 g/cm^3	Exeltherm [4]
5	d 0.035 g/cm^3	Cellobond [4]
6	d 0.038 g/cm^3	Celotex [4]

No.	Value	Note
1	0.43 MPa	[3]
2	0.19–0.46 MPa	DIN 53571 [4]

Flexural Strength at Break:

No.	Value	Note
1	0.38–0.78 MPa	DIN 53423 [4]

Compressive Strength:

No.	Value	Note
1	0.172 MPa	Exeltherm [4]
2	0.175 MPa	Cellobond [4]
3	0.207 MPa	Celotex [4]
4	0.2–0.55 MPa	DIN 53421 [4]

Viscoelastic Behaviour: Has better creep resistance under load than polystyrene foam [4]
Fracture Mechanical Properties: Shear strength 0.1–0.5 MPa (lengthwise) [3]
Izod Notch:

No.	Value	Notch	Note
1	2 J/m	N	[3]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.8	1 kHz	[3]

Dielectric Strength:

No.	Value	Note
1	7 kV.mm^{-1}	[3]

Polymer Stability:

Thermal Stability General: Heating at 130° causes 1% shrinkage and weight loss [4]
Upper Use Temperature:

No.	Value	Note
1	$<$120°C	max., [3]
2	-195–130°C	[4]
3	200°C	short time [4]
4	-196–150°C	Exeltherm, Cellobond, Celotex [4]

Flammability: Flammability rating V0 (UL 94) [3]. Has very low smoke emission [3]. Flame spread index 20–25 (ASTM E84) [4]. Self-extinguishing, but slowly char and erode in sustained flame [1,2].Smoke density 3–15 I M^{-1} (ASTM E84) [4]
Chemical Stability: Resistant to organic solvents [3]. Attacked by concentrated acids and bases

Applications/Commercial Products:

Processing & Manufacturing Routes: A high-solids (75%) resole is mixed with surfactants and a blowing agent, and the mixture stirred rapidly with an acidic curing agent (e.g. *p*-toluenesulfonic acid) then metered into a trough. Foams with a high (>90%) closed-cell content may be synth. by careful selection of the surfactant [1]
Applications: Applications due to chemical durability and 'difficult' flammability characterised by slow surface charring and very low smoke development. Closed-cell foams have good thermal insulation and are used in a variety of building applications; in roofboard, floor insulation, cork composites, cavity board etc. Open cell foams are used in floral displays (as Oasis) where ingress of water is desirable; as an absorbent in chemical industry. Applications may be limited by cost considerations. Other applications in energy-absorbent packaging; in dry cell batteries; in acoustic panels; in sandwich panels

Phenolic resin, Insulation wool binders P-25

Related Polymers: Phenol Formaldehyde Resins
Monomers: Phenol, Formaldehyde, Urea
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Weight: Generally a low MW resole
Additives: Additives include ammonia, aminosilane (for glass fibre binding), ammonium sulfate and antidusting agent
Miscellaneous: Urea and ammonia are included in the composition to scavenge free formaldehyde during the heat cure of the Resole soln. The amount of urea added also is influenced by economic factors as it is generally a cheap additive. Amino silane is added to improve the binding of the organic phenolic composition to the glass fibre surface. Ammonium sulfate is used as a latent catalyst producing acid during the heat curing step. An aq. emulsion of oil acts as an antidusting agent and is added to improve the handling feel of the cured insulation wool

Applications/Commercial Products:

Processing & Manufacturing Routes: Insulation wool binding Phenolic Resoles are made by treating phenol with a large molar excess of formaldehyde (F/P ratio >2) with base catalyst, is generally sodium, calcium or barium hydroxides. The Resole is mixed with urea and ammonium to scavenge formaldehyde, ammonia sulfate as a latent heat cure catalyst, aminosilane to promote bonding to the inorganic fibre surface and an oil emulsion as an antidusting agent. The composition is sprayed on at about 15% solids to bind insulation wool fibres as they are prod. in a centrifugal melt process. The mat of fibres is cured by conveying it through a curing oven at 200–300°. The resin soln. binds the fibres at crossover points to form a stable insulation product, which is compression packaged for transport
Applications: Insulation wool mats are made from fibreglass by a drum centrifugal blowing process and from rockwool and slagwool fibres by a centrifugal cascade drawing process. They are widely used for thermal and sound insulation in buildings. Insulation wool mats are widely used for domestic loft insulation. Slabs of insulation wool are used for a variety of insulation applications. The product is shaped for thermal insulation of pipework

Flammability: Limiting oxygen index 29–53% (short fibres), 57% (long fibres, ISO 4589) [1]. Flammability rating V0 (UL94) [2]
Stability Miscellaneous: Incandescence resistance no visible flame (ISO 181) [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Phenolic Novolak powders with hexamethylene tetramine curing agent containing glass fibres are suitable for compression, transfer or injection moulding. Compositions with short glass fibres as fillers may be either compression or injection moulded. Compositions with long glass fibre filler can be compression moulded and act as asbestos replacement materials. The compositions have good pourability and plasticity, and are suitable for moulding complicated parts, including hollow components. The compositions are suitable for many complicated precision parts with thin cross sections and narrow tolerances
Mould Shrinkage (%):

No.	Value	Note
1	0.15–0.45%	short fibres [2]
2	0.15–0.3%	long fibres

Applications: Glass-filled compositions are moulded to form components in electric motors, armature insulation, commutators, coil formers, insulators and solenoid covers. Long glass fibre filled compositions are used for high-voltage commutators. Automotive under-bonnet applications include water pump seals, impellers, thermostat housings, pulleys, cam shaft gear wheels, fuel rails, fuel inlet manifolds and starter motor brush holders. Further automotive applications include disc brake pistons, gaskets and automatic gearbox thrust washers, intake manifolds and rocker covers. Glass fibre filled compositions are replacements for asbestos in die-cast automotive metal parts e.g. reactors for automatic gear boxes. The composites are suitable as moulded complex precision parts for video recorders and compact disc players

Phenolic resins P-33

Synonyms: *Phenol-formaldehyde resins. PF resins*

Related Polymers: Cresol-Formaldehyde Resins, Xylenol-Formaldehyde Resins, Resorcinol-Formaldehyde Resins, Cardanol Resins, Phenol-formaldehyde resoles, Phenol-formaldehyde novolaks

Material class: Thermosetting resin

Polymer Type: phenolic

General Information: Phenol has a functionality of 3 by electrophilic substitution in the activated 2, 4 and 6 ring positions. The substituted phenols have a functionality of: 1 when both the 2- and 4- ring positions substituted, 2 when one of the 2- or 4- ring positions substituted otherwise 3. Formaldehyde has a functionality of 2. The resins are generally classified into two broad categories depending on the substrate mole ratios of phenol and formaldehyde, and the nature of the catalyst, whether basic or acidic. The categories are **Resoles** and **Novolaks.**

Resole Resins

When phenol is reacted with excess formaldehyde (F:P ratios 1 to 3) with basic catalyst under controlled conditions to avoid runaway exothermic reactions, the resulting mixture is a **Resole** or A-stage resin. Resoles are inherently thermosetting one-step resins fusible at 150° and soluble in alcohols and ketones.

Basic catalysts used to make resoles include **sodium hydroxide, calcium hydroxide, barium hydroxide and amines.** Condensation of two methylol phenols forms methylene ethers. These species react at 160° through a quinone-methide intermed. to form diphenol methane derivatives with methylene links between phenolic rings. Subsequent reactions form fully crosslinked species with methylene groups between activated ring positions, also known a C-stage resin. This is an infusible and insoluble product. MW of resoles are generally low with one to two phenol rings in the resin species. Resoles are manufactured in batch processes in resin kettles with efficient cooling to eliminate possible exotherms. When amine catalysed, the intermediate products contain nitrogen. On advancement and cure some ammonia is lost and most of the remaining nitrogen content is as dibenzylamine derivatives. Structural studies indicate a preponderance of *ortho* substitution in amine catalysed resoles. The resoles may be used as solns., liqs. and solids. Phenolic resin dispersions are made using a protective colloid in water using an amine catalyst. Colloids include proteinaceous compds., fatty acid amides, poly(vinyl alcohol), cellulosic derivatives or natural gums. In the dispersions much higher MW are achieved, up to as high as 5000. Solid one-step reactive resins are made by recovering and drying the spherical particles from the dispersion process.

Cure of Resoles

During cure of a low MW resole ring-bridging reactions take place building a 3 dimensional network. Resoles are generally heat cured at pH >9 at elevated temps. not exceeding 180°C. In foam and foundry applications acid conditions are used around room temp. to form -CH_2- bridges.

Novolak Resins

When phenol reacts with formaldehyde with acid catalyst and in excess the resultant resin product is a Novolak. To achieve increased rate of reaction, formaldehyde is used in 37–50% aq. soln. or as solid paraformaldehyde. The reaction proceeds with the formation of methylene bridges between phenolic rings to give MW <2500. Acid catalysts used in the manufacture of novolaks include sulfuric acid, 4-toluenesulfonic acid, hydrochloric acid,

phosphoric acid and oxalic acid. Oxalic acid has the advantage that it breaks down to volatile gases (CO, CO_2 and H_2O) when the resin is heated during processing. As with Resole resins methylene bridges are formed between the activated ortho- and para- ring positions. A range of highly reactive High-ortho Novolaks may be prepared which contain a high proportion of *ortho*-hydroxymethyl groups. These are made using divalent metallic acetates as catalyst, generally zinc, magnesium or calcium. The metal ion binds to the phenolic OH group directing addition of the formaldehyde to the nearby *ortho*-ring position. Precursors with from 3 to 12 phenolic rings can be made.

Cure of Novolaks

Because they are prepared with a molar deficiency of formaldehyde Novolaks require the addition of a curing agent capable of condensation reactions at the remaining activated phenolic ring positions. Novolaks are generally cured by addition of 8–15% hexamethylenetetramine (hexa). Structural studies indicate that 75% of the nitrogen is chemically bonded mostly as benzylamine derivatives. In some applications phenolic Resoles are used to cure Novolaks. This avoids the incorporation of nitrogen into the product. Other aldehydes may be used, but formaldehyde is by far the most common [12]. Phenolic resins may be prepared and used as dispersions, which can lead to higher MW in some cases.

Transport Properties:

Polymer Solutions Dilute: Viscosity 10 mPa s (room temp., fibre binders), 2000–3000 mPa s (20°, abrasive binders)

Applications/Commercial Products:

Processing & Manufacturing Routes: Resoles for fibre binding are typically made with a large molar excess of formaldehyde (2.5–3 times) which minimises the hazard of free phenol during application and scavenged with urea and ammonia. They may be catalysed with barium hydroxide so that alkali residues can be removed by precipitation to avoid damage to glass fibre during the application. Fleece filled materials are prod. from organic fibres and powdered phenolic resin and curing agent, cured at 160° Resole solns. for plywood bonding application have typically 40–50% solids. They react at F/P ratio 1.2–1.4 with sodium hydroxide catalyst for 3h at 100° then 3h at 65° Solid resoles for moulding materials are made using the stoichiometric F/P mole ratio of 1.5. They are typically cured at 60–70° followed by vaccum reflux at 80–100°. High-solids resoles are made by the reaction of phenol and formaldehyde generally sodium hydroxide catalysed followed by vacuum reflux to evaporate water with controlled/minimal advancement of the resin. Phenolic dispersions are prepared by treating phenol and formaldehyde typically F/P mole ratio 1.5 with hexamethylene tetramine (6–12%), then adding poly(vinyl alcohol) and gum arabic as protective colloids

Applications: Used in plywood, particle board, fibre board, wafer board, oriented strand board and medium-density fibreboard. Phenol-formaldehyde and Resorcinol-formaldehyde water-soluble resoles are the resins of choice when durability in high-humidity environments is required. Otherwise the related classes of Urea-formaldehyde, Melamine-formaldehyde and Melamine-urea-formaldehyde can be used. Used in Fibre Bonding. Glass fibre and rockwool insulation mats used for thermal insulation material are prod by spraying the fibre mat with the resin (Resoles in aq. soln.typically 10–15% solids) and then curing at 200°. fleece filled resins are used as acoustic noise reducing agents in household appliances and cars for bonnet insulation and support Foundry Resins are traditionally used as a binding agent for the consolidation of foundry sand moulds in the shell moulding process and hot-box process. Both phenolic one-step resoles or Novolak/hexamine systems are used. Also used are urea-formaldehyde, furfuraldehyde resins and urethane/phenolic blends. Laminating resins are used for paper, cotton and glass. Industrial uses include electronic circuit boards. Decorative uses for furniture and wall panelling. Abrasive grain material (corundum or silicon carbide), fillers (metal oxides, silicates, chalk) are bonded using low-viscosity resoles as wetting agents for the abrasive grain with the bonding agents powdered high MW novolaks with low free-phenol content and 9% hexamine as curing agent. These are used in grinding wheels, sand papers and pan scourers Brake linings, clutch facings and transmission belts for automotive use are prod from woven fabrics dip impregnated with the resin. Moulding materials are prod from highly-consolidated resin composites with particulate or fibrous fillers and are used as finished parts with a high crosslink density. Bakelite was an early plastic for electrical sockets, switchgears and circuit breakers. Novolaks cured with oxalic acid have also been used. Engineering Thermosets are phenolic resins with reinforcing fibres. Glass-fibre filled materials are used to manufacture many automotive and electrical parts. Other fillers are woodflour, mineral, cellulose, cotton and graphite. Phenolic resins find application as coatings in several systems, as a powder coating for high-temp. wire insulation; for battery separators; and as water dilutable coatings. Phenolics are used in combination with thermoplastic polymers in structural adhesives. The phenolic moiety provides metal/metal and metal/rubber adhesion. Polyvinyl acetate/phenolic resin blend finds uses in the aircraft industry, gas copper adhesives in printed circuit boards, to bind brake linings to brake shoes and in ski manufacture. The nitrile/phenolic and chloroprene/phenolic blends are used to generate bonds with high peel-strength and moisture resistance. Glass-reinforced Phenolics are made from high-solids resins to produce a product with very low smoke emission, suitable for underground railway locomotives. Novolak filaments are post-crosslinked to reduce brittleness. High-solids resoles are made into foams using surface-active agents, blowing agent and an acid catalyst. Phenolic foams have excellent flame-resistance and smoke emission props. in contrast to other foam systems (notably polyurethanes). However these props may be compromised by the phasing out of CFCs as blowing agents and their replacement by flammable alkanes. In the past, phenolic foams suffered by their friability and poor water resistance due to an open cell struct. Use of tailored surfactants has improved these props. Carbon fibre reinforced phenolics have temp. stability up to 230°. Phenolic resins have formed part of the cladding of spacecraft in aerospace application. The material chars on exposure to high temps. and acts as a sacrificial coating during re-entry into the earth's atmosphere. Pheno-formaldehyde resins act as vulcanising agents for rubbers. Particles of size >1000 microns are used in friction element composition. Aq. dispersions used in fibre bonding, paper coating; in laminates and wood bonding. Phenolic dispersions improve the strength of latex contact adhesive applications

Phenolic resins, Abrasive materials P-34

Related Polymers: Phenol Aldehyde Resins, Phenol Formaldehyde Resoles, Phenol Formaldehyde Novolaks, Furfuryl Resin
Monomers: Phenol, Furfuryl alcohol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Additives include corundum, silicon carbide, zirconium corundum, diamond and boron carbide. Fillers are most commonly cryolite, pyrite and antimony sulfide
General Information: These materials comprise bonded or coated abrasive grain wetted with liq. resin and compounded with powdered resin and fillers

Applications/Commercial Products:

Processing & Manufacturing Routes: Bonded or coated alumina or silicon carbide abrasive grain (60–95%) is wetted with liq. phenolic resole or furfuryl resin and compounded with powdered Novolak resin and fillers (0–20%) prior to pressing. Grinding Wheels are made by cold or hot pressing methods. Diamond and some Synthetic Corundum grinding wheels are made by hot pressing. The moistened grains are blended with powdered resin and special fillers and pressed at 15–35MPa at 150–170° for 30–45 min. The cold pressing at 15–25MPa produces "green wheels" which are stripped and cured in ovens with a temp. cycle up to 180° for up to 60h. The composition can also include phenolic resin impregnated glass filament mesh. Coated abrasives are made using binder resins, e.g. animal glues or phenolic resoles with fillers to provide thixotropy, enhance grinding rate and reduce costs. After cure, a second layer of binder (the finishing or sizer coat) is applied to embed the grains. For the binder resin a phenolic resole with viscosity 15000 MPa.s and 75% solids is preferred. For the sizer coat a resole with viscosity 1000 MPa.s and 50% solids is used. Abrasive grains may be blended with phenolic resin with latex as a binder for abrasive mats
Applications: Resin bonded grinding wheels; cold-pressed grinding wheels used for wet grinding; abrasive papers used for dry sanding; vulcan fibre discs and abrasive cloths, and abrasive mats such as those used for pan scourers

Phenolic resins, Carbon materials P-35

Synonyms: *Glassy carbon. Carbonaceous materials. Carbonaceous char*
Related Polymers: Phenolic Aldehyde Resins
Monomers: Phenol, Formaldehyde
Polymer Type: phenolic
General Information: Carbonaceous char formed by pyrrolysis of cured crosslinked phenolic network. On pyrrolysis at high temps. plastics decompose forming volatile components with varying amounts of solid carbon residue. Phenolic resins have the highest yield of carbon based residue up to 60% of the original weight. The carbon formed retains its bonding property with fillers and the material has a high-temp. resistance in excess of 1000°

Applications/Commercial Products:

Processing & Manufacturing Routes: Pyrolysis of cured phenolic resin in the absence of air can lead to a carbon material having excellent mechanical props. and bonding with fillers. Synthetic carbons are made from coke or graphite powder with phenolic resin as the binding agent, by gradually heating to over 1000° in an inert atmosphere. Carbon fibre reinforcement leads to marked improvement of mechanical strength. Glassy carbon is prod. from phenolic resin by special heat treatment at up to 2000° with air excluded. It is an impermeable, inert, high-strength material which conducts electricity
Applications: Synthetic carbons from graphite are used as special electrodes. Carbon materials form good inert impermeable lining materials for chemical apparatus and nuclear reactors. With carbon-fibre reinforcement they may be used as structural materials for large-scale apparatus in the chemical industry e.g. for heat exchangers. Glassy carbon has found application in several high-technology areas: as compressor wheels for turbo blowers, melting crucibles, vacuum vaporisation boats for metal deposition coatings, spinning nozzles, precision bearings and spot-welding electrodes. Glassy carbon is also used in medical implants: electrodes for heart pacemakers, artificial cardiac valves and bile ducts. Phenolic resins are included in the composition of heat shield laminates for spacecraft. They form a sacrificial ablative coating able to withstand the temp. shock of 14000° during re-entry in the earth's atmosphere

Phenolic resins, Cast resin P-36

Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Graphite to improve friction resistance
General Information: Largely superseded by cheaper, modern thermoplastics

Mechanical Properties:

Mechanical Properties General: Strength of cured resin is dependent upon the nature of the neutralising acid used in the synth. Mineral acids produce weak, brittle resins, whereas lactic acid, phthalic acid etc. produce resins with high strength characteristics. [5]
Compressive Strength:

No.	Value	Note
1	83 MPa	12 kpsi [5]
2	186 MPa	27 kpsi, case-hardened [5]

Polymer Stability:

Chemical Stability: Good chemical resistance; very good resistance to oils and petroleum products

Applications/Commercial Products:

Processing & Manufacturing Routes: Phenolic resole, synth. by reaction of phenol and formaldehyde plus alkali metal hydroxide catalyst [1,2] (1:2.25 mole ratio) for 3h at 70°, in soln. is neutralised then vacuum distilled to remove all H_2O. Product clarity may be improved by addition of a polyol (e.g. glycerol or glycol) [3].The colour and light transmissibility of the cured resin is dependent on nature of the acid used in neutralisation step [4]. At 55° the warm resin is poured into moulds and cured very slowly (3–10 days) at increasing temp. up to 138° and then slowly cooled taking at least 3h, trapping small droplets of H_2O. Clear

castings are produced if the droplets are smaller than the wavelength of visible light. [5]. Two-component resin systems can be used to make unreinforced products using mixing machinery. The system is acid cured. Cast resin is readily machinable by cutting, sawing, slicing etc. Optimum appearance is attained using finishing operations. Mould shrinkage may be reduced by case-hardening of the resin after removal from the mould [5]
Mould Shrinkage (%):

No.	Value	Note
1	0.4–0.6%	[5]

Applications: Applications due to attractive appearance in umbrella handles, knobs, propelling pencil bodies, billiard balls

Phenolic resins, Fibres **P-37**

Synonyms: *Novoloid fibres*
Related Polymers: Phenolic Novolaks
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin, Fibres and Films
Polymer Type: phenolic
Miscellaneous: Light gold in colour, darkening on exposure to heat or light [2]

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.27 g/cm^3	[4]
2	d 1.25 g/cm^3	[7]

Transport Properties:
Water Content: Moisture regain 6% (20°, 65% relative humidity) [4]

Mechanical Properties:
Mechanical Properties General: Tenacity 0.11–0.15 N tex^{-1} (30–60% elongation) [1]. Elastic recovery (3% elongation) 92–96% [4]. Tensile strength of Kynol decreases with increasing fibre diameter [7]

Tensile (Young's) Modulus:

No.	Value	Note
1	3300–4400 MPa	[4]
2	5900 MPa	[7]

Tensile Strength Break:

No.	Value	Note	Elongation
1	150–200 MPa	[4]	30–60%
2	200 MPa	[7]	30%

Viscoelastic Behaviour: Beyond an elongation of 9% stress required for elongation decreases markedly [7]

Optical Properties:
Volume Properties/Surface Properties: Dyeability is limited by inherent colour [4]

Polymer Stability:
Thermal Stability General: Has good thermal stability at 150° in air and at 200–250° in the absence of air [4]
Flammability: Does not melt when exposed to flame but gradually chars. Has low smoke emission. Limiting oxygen index 30–34% [1,4], 38% (Kynol) [2], 32.6% (Kynol fabric) [6], 33% (Kynol) [7].Vertical char length 0.1 cm [2], Smoke density 0.002 I m^{-1} (3 min. ignition), 0.2 I m^{-1} (15 min. ignition) [2]
Environmental Stress: Kynol has moderate stability to light and weathering [4]. Exposure to uv radiation causes degradation [5] resulting in loss of strength but only small reduction in limiting oxygen index [6]
Biological Stability: Has good resistance to microbial attack [6]

Applications/Commercial Products:
Processing & Manufacturing Routes: Phenolic Novolak of melt spun high MW (800–1000) is immersed in acidic aq. formaldehyde soln. to form an 85% wt. cross-linked amorph. network. Curing is completed by heat treatment. Fibres are typically 14–33 μm in diameter and 1–100mm long [1]. Other synth. has been reported [8]
Applications: Applications due to flame-resistant props. in textiles, upholstery and papers; as a replacement for asbestos in composites, gaskets and friction materials. Other applications as reinforcing agent for polypropylene and as a precursor to carbon fibre

Phenolic resins, Friction materials **P-38**

Related Polymers: Phenolic Resoles, Cresol Resoles, Phenolic Novolaks, Cresol Novolaks, Cardanol Resins, Phenolic Resins, Oil-modified, Phenolic Resin Dispersions

Monomers: Phenol, Cardanol, Formaldehyde, *o*-Cresol, *p*-Cresol, *m*-Cresol
Material class: Thermosetting resin
Polymer Type: phenolic
General Information: Phenolic and cardanol based resins have applications as friction lining compds.

Applications/Commercial Products:

Processing & Manufacturing Routes: Friction lining compds. contain fibres (up to 60%), fillers (5–30%), metals (5–70%), lubricants (0–5%) and binders (5–25%). Friction Dust (5–15%), derived from Cardanol resins, can be used as an organic filler. The binders comprise solid, liq. and dissolved phenolic resins and rubbers. Woven fabrics or yarns may be dip-impregnated with liq. resin or resin soln., which can also contain added soln. or dispersion of rubber. After drying to remove solvent, the fabric is shaped by calendering or extrusion, fibres, fillers and binders are masticated to give a doughy mass. After shaping, it is dried and cured in tension moulds or by hot pressing. Dry mixes for hot pressing or warm shaping followed by oven curing processes involve pressures of 3–10 MPa at - 110–120°. Phenolic dispersions are prepared by treating phenol and formaldehyde with hexamethylene triamine (6–12%), adding poly(vinyl alcohol) and gum arabic as protective colloids. Particles of size >1000 microns are used in friction element composition
Applications: Brake linings are made from impregnated woven fabrics and clutch linings from yarns. Machine and drum brake linings are best made by the wet processing method. Drum brake linings may be made by direct hot pressing to a considerable extent. Disc break linings are prod. by pressing friction lining compds. onto cleaned, adhesive-coated metal base plates

Phenolic resins, Glass-reinforced plastic P-39

Related Polymers: Phenolic Resoles
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin, Composites
Polymer Type: phenolic
Additives: Fillers are chopped strand mat/woven fabric with adhesion promotors such as vinylsilane or Volan (methacrylato chromic chloride). Acid-resistant fillers include wood flour, china clay, and alumina hydrates
Miscellaneous: The use of phenolic resins in hand-layup glass-reinforced plastic or low-pressure/low-temp. compression moulding laminating systems yields a product with inherent fire-retardant props. and low smoke emission. Prepregs may be made from high-solids phenolic resins using volatile solvents to aid prepreg flow props.

No.	Value	Frequency	Note
1	0.15	1 kHz	[2]

Polymer Stability:

Polymer Stability General: Uncured resin (containing 10% Me_2CO) has shelf life of 3 months at 20°

Decomposition Details: Burns slowly with very little flame producing CO_2, CO and SO_2 (35% filled)
Flammability: Fire Propagation class 0 (35% filled, BS476 part 6), fire propagation I = 2 i = 0.1 (BS476 part 6). [2] Surface spread of flame class 1 (35% filled, BS476 part 7), class 1 (BS 476 part 7) [2]. Smoke emission test D_s (max.) 11.76 min Time to D_s = 163.83 min; MoD smoke index 1 (NE 5711) [12]. Limiting oxygen index 46–54% (35% filled), 100% (BS5734 part 1 method 4; ISO 4589) [2]
Chemical Stability: 35% Filled material has good resistance to hydrocarbons, aromatic solvents and dilute acids but poor resistance to alkalis, conc. acids and Me_2CO

Applications/Commercial Products:

Processing & Manufacturing Routes: Prepregs are made of glass filament cloth impregnated with phenolic resins. The application viscosity is modified by solvent addition. The prepreg has a resin content of between 20% and 50% and it may be stored at $< 20^\circ$ before use. It is cured and compressed at 0.7 Pa and 90–160° over 1–2h to form laminates having excellent fire-resistant and smoke props. For hand lay-up glass-reinforced plastic or low-pressure/low temp. compression moulding, chopped strand mat is impregnated with a low viscosity acid-cured phenolic resole system in solvent. The inclusion of up to 30% of acid-resistant filler e.g. silica flour or china clay prevents crazing of the resin
Applications: Fibre glass-reinforced flexible abrasive wheels are made from fibre glass yarn prepregs impregnated with phenolic resole. Fibre reinforced laminates are used inside aircraft, rail vehicles (especially for subway trains), buses and trucks for fire safety reasons

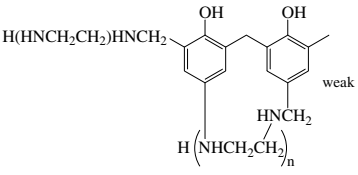
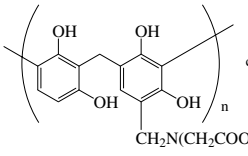
Phenolic resins high-ortho P-40

Related Polymers: Phenolic Novolaks, Phenolic Resoles, Phenolic Resin, Cast Resin
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Molecular Weight: MW 1800, M_n 550
Additives: A catalyst containing divalent metal ions, e.g. zinc acetate is required
General Information: Divalent metal ions are used to promote *ortho*-substitution
Morphology: Analysis by nmr of a zinc acetate catalysed resin (F/P mole ratio 0.6) shows isomeric distribution: 2,2′ - 45%; 2,4′ - 45% and 4,4′ - 10% indicating a 90% direction to the 2- position for the first condensation reaction



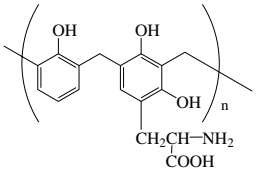
Applications/Commercial Products:

Processing & Manufacturing Routes: Anhydrous high-ortho liq. phenolic Resole is made using F/P mole ratio of between 1.5 and 1, at a pH 4–7 and a divalent salt at 80–90° for 5–8h
Applications: In the Liq. Injection Moulding process, monomers and oligomers are injected into the mould cavity and polymerised *in situ*. Highly-reactive anhydrous high-ortho resins with latent acid catalyst are used which give a peak exotherm at 130–140°



Phenolic Resins, Ion exchangers P-41

1. 



strong acid cation exchangers

2. 

weak base anion exchangers

3. 

chelation ion exchangers (based on iminodiacetic acid)

4. 

chelation ion exchangers (based on tyrosine)

Related Polymers: Phenol-formaldehyde resins
Monomers: Phenol, Formaldehyde, Resorcinol, Tyrosine, 4-Hydroxybenzenesulfonic acid, Iminodiacetic acid
Material class: Thermosetting resin
Polymer Type: phenolic
CAS Number:

CAS Reg. No.	Note
29659-43-6	phenol-formaldehyde-tyrosine copolymer
28303-16-4	phenolsulfonic acid-formaldehyde copolymer
98507-54-1	resorcinol-iminodiacetic acid-formaldehyde copolymer

Additives: Carbon fibre to improve thermal stability (strong acid cation exchangers)
General Information: May be categorised into three types [1,2]; strong acid cation exchangers (phenolsulfonic acid-formaldehyde copolymer); weak base anion exchangers (resol-oligomeric amine copolymer); chelation ion exchangers (either resorcinol-iminodiacetic acid-formaldehyde copolymer or phenol-formaldehyde-amino acid copolymer. The amino acid may be tyrosine, typically). The struct. and functionality of strong acid cation exchanger has been reported [7]

Polymer Stability:

Thermal Stability General: Thermal stability of strong acid cation exchangers is improved by addition of carbon fibre [8]
Decomposition Details: Weight loss and rate of thermal degradation of chelation ion exchangers may be reduced by complexation with Cu^{2+} [11]
Hydrolytic Stability: Strong acid cation exchanger (Duolite ARC-359) is stable at high pH [4]. Chelation ion exchanger (Chelex 100) is stable to alkaline soln. [4]

Stability Miscellaneous: Duolite ARC-359 is resistant to radioactivity whereas Chelex 100 is easily damaged [4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Strong acid cation exchangers are synth. by reaction of phenolsulfonic acid with formaldehyde, or by addition of sodium sulfite to phenol-formaldehyde mixture. Chelation ion exchangers may be synth. by reaction of resorcinol with iminodiacetic acid in the presence of 6*N* NaOH (pH 9) and a template such as $CaCO_3$. Neutralised resin is heat cured at 60° to yield a red-brown solid. The template may be removed by acid hydrolysis. The complexing affinity for ^{137}Cs increases with increase in temp. at which synth. is performed, whereas affinity for ^{85}Sr decreases with synth. temps. above 100°. Nature of the alkaline catalyst also affects affinity; use of NH_4OH produces resins with poor affinity; use of BaOH produces resins with high ^{85}Sr affinity but poor ^{137}Cs affinity [5]. Chelation ion exchangers containing tyrosine may be synth. by reaction of phenol, formaldehyde and tyrosine under basic conditions [9], under reflux at 100° for 15–30 min. followed by heat curing at 120–130° for 24h. [10]
Applications: Strong acid cation exchange resins and chelation ion exchange resins are used to remove ^{137}Cs, Pu and ^{90}Sr from alkaline solns. containing low level radioactive waste. Weak base anion exchangers have applications in the food industry (deacidification of fruit juices, removal of tannins and so on). Chelation ion-exchange resins with tyrosine groups are used to extract uranium ions from sea water. Aslo used to complex divalent metal cations. Aspartic acid as the amino acid component gives the best complexing affinity

Trade name	Details	Supplier

Phenolic resins, Oil recovery P-42

Related Polymers: *p*-Nonylphenol Formaldehyde Resins
Monomers: *p*-Nonylphenol, Formaldehyde, Ethanol
Material class: Thermoplastic
Polymer Type: phenolic
General Information: Ethoxylation of the phenolic resin makes the material more hydrophobic and hence compatible with oils

Applications/Commercial Products:

Processing & Manufacturing Routes: The Novolak is partially ethoxylated by reaction with EtOH
Applications: Ethoxylated nonylphenol resin Novolaks of varying MW and degree of ethoxylation are used for enhanced oil recovery operations

Phenolic resin Spheres P-43

Synonyms: *Phenolic microspheres. Phenolic microballoons*
Related Polymers: Phenolic Resoles
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Surfactants and blowing agent are required to make spheres

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.07–0.15 g/cm^3	bulk [2]

Optical Properties:

Volume Properties/Surface Properties: Colour red brown to purple brown

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. from aq. resole [1] mixed with surfactants and blowing agent (e.g. ammonium carbonate/ammonium nitrate, or dinitrosopentamethylenetetramine). Hollow spheres (5–50 μm diameter) obtained by spray drying
Applications: They act as hollow spherical fillers contributing lightness to composite materials. Phenolic spheres are useful as flotation aids; as a floating cap on petroleum naphtha or oil to retard evaporation. They also have applications in nitroglycerine-based explosives, to allow controlled detonation, and medical applications (artificial skin). May be incorporated into liq. resins (especially epoxy resins) to make syntactic foams which are used as structural core materials in automotive, marine and aerospace applications; in wall panels and ablative heat shields. Other uses as gap filler to deaden sound

Trade name	Supplier
Phenolic Microballoons	Union Carbide

Phenolic resins, Rubber adhesives P-44

Related Polymers: Phenol Aldehyde Resins, *p-tert*-Butyl Phenolic Resin, Phenolic Resoles, Phenolic Novolaks
Monomers: Phenol, 4-*tert*-Butylphenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic

Additives: Rubbers, metallic oxides and antioxidants
General Information: Resoles contain 2-Methylol phenols which crosslink by interaction with metallic oxides e.g. MgO

Applications/Commercial Products:

Processing & Manufacturing Routes: Solid *tert*-butyl phenolic Resole (20–40%) is compounded with Neoprene rubber and metallic oxides (e.g. magnesium oxide, zinc oxide) in solvent to make a contact adhesive. Heat-curing phenol Resoles are suitable for compounding with Nitrile rubber to make an adhesive soln.

Phenol Novolak (20–80%) is included in Polyurethane adhesive formulations. Adhesion primers for metallic surfaces to be bonded to rubber are based on elastomers and thermosetting resins. A combination of phenolic Resoles has proved successful as the thermosetting component. Modified phenolic Resoles are used as adhesive primers to copper films in printed circuit boards
Applications: Rubber adhesive soln. based on Neoprene are used in shoe manufacture. Rubber-phenolic adhesives are used widely in furniture, construction and automotive industry applications. Phenolic resoles as adhesion primers are used for electrical applications

Trade name	Details	Supplier
Rütaphen IZ	adhesion primer resin	Bakelite
Rütaphen KA	adhesive resins (Neoprene)	Bakelite
Rütaphen KP	adhesive resins	Bakelite

Phenolic resins, Textile fleece binders P-45

Synonyms: *Fibre fleece materials*
Related Polymers: Phenolic Novolaks
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Curing agent usually hexamethylene tetramine at level 4–10%. Anti-dusting agents are required

Applications/Commercial Products:

Processing & Manufacturing Routes: The range of organic fibres used includes wool, cotton, cellulose, flax, jute, polyester and acrylic. Fibres reclaimed from shredded cloth are homogenised and laid on a conveyor as a fluffy mat. The powdered phenolic novolak resin with added curing agent, generally hexamethylene tetramine is spread over the mat by a metering system. The binder is distributed evenly fluidising the mat in a stream of air. The fleece is cured by forcing through hot air at 160–200°. The fleece contains 20–40% of resin. The resin mainly creates point bonds at fibre intersections. The fleece may be shaped after preliminary drying at a lower temp. by increasing the conveyor speed. After shaping and cutting the parts are then finally cured at 160–200°
Applications: Textile fibre reinforced phenolic resin based materials are useful for acoustic noise reduction in automotive construction. Areas involved include bonnet hood insulation, doors, roofs, sides, footspace, pumps and ventilation areas. The fleece is also used as a self-supporting base for instrument panelling, door panelling, covers for the back rest and reserve panelling. In the roof lining, hat rack, floor damping, mat for the luggage boot and the wheel house insulation, the mat provides both insulation and support. Due to excellent thermal insulation, the fleeces are good climate and humidity regulators for automotive interiors. Fibre fleece materials are also used with laminating materials for direct damping of automobile body vibrations. Flat fleece mats provide excellent acoustic insulation in household appliances, such as washing machines, dishwashers and vacuum cleaners

Trade name	Details	Supplier
Rütaphen TP	textile fleece powder resins	Bakelite

Phenolic Resoles, Coatings P-46

Related Polymers: Phenol Aldehyde Resins, Phenol Formaldehyde Resins, Phenolic Resoles, Phenolic Novolaks, *p-tert*-Butyl Phenolic Resins
Monomers: Phenol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Many formulations require resin modifiers to meet specific coating application needs. Additives include adhesion promotors, chemical crosslinkers, and hardening agents

Applications/Commercial Products:

Processing & Manufacturing Routes: Coatings are formulated from substituted and unsubstituted phenols, and may be heat-reactive or non-heat-reactive. Phenolic resoles with high free-formaldehyde content and low MW are cured for 30 min at 150° for use as interior coatings. PF resins prepared using base catalyst is (e.g. benzyl dimethylamine) are used in stoichiometric amounts with epoxy resins and cured at 180° for 2h. Phenolic Resoles from substituted phenols are more compatible with oil and hydrocarbons. Resins from *p-tert*-butyl phenol find application as contact adhesives and as modifiers for baking alkyds, Rosin and estergum. Oleoresinous phenolic varnishes have drying times of 2–4h. The films remain flexible as they are not crosslinked
Applications: Phenol-formaldehyde resoles are applied as 25 micron interior coatings for cans, drum linings and pipes and are used as metal primers. Phenolic baked coatings are used on metals, ceramics and some plastics surfaces. Resoles from substituted phenols are used either alone or as modifiers for alkyds, polyester or epoxy resins for many heat-reactive coating applications. Novolaks are used as a hardener for epoxy resin coatings. Phenolic and epoxy resins in equal stoichiometric amounts give a coating having excellent resistance to heat, chemicals and moisture. Resins from *p-tert*-butyl phenol find application as contact adhesives for electrical insulation varnishes. Non-heat curing resins from substituted phenols are excellent modifiers for oleoresinous varnishes and alkyds

Phenolic Resoles, Foundry applications P-47

Related Polymers: Phenolic Resoles, Phenolic Novolaks, Furan Resins
Monomers: Phenol, Furfuryl alcohol, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
Additives: Additives depend on the foundry moulding process

Applications/Commercial Products:

Processing & Manufacturing Routes: In the shell-moulding (Croning) process quartz sand is hot-coated with a phenolic Novolak (2%), hexamethylene tetramine (0.02–0.04%) and calcium stearate (0.1–0.2%). The sand is then cured in hot pattern plates or core boxes to produce shells or cores. In the hot box process, quartz sand is batch mixed with phenolic Resole or urea-modified furan resin (1.4–2%) and a latent curing agent (e.g. ammonium nitrate 0.3–0.5%). The mix is shaped and precured at 200–260° for up to 2 min. in core boxes. Use of modified furan resins (0.9–1.2%) with curing agents usually sulfonic acids, (0.2–0.4%), enables a warm-box process for binding sand at 140–200°. Phenolic and furan resins with special curing agents may be employed in a vacuum warm box process where the core box is heated at 70–100°. In the thermoshock process, a highly-condensed phenolic or urea resin and acidic salt curing agent is hardened at very high temp. For a no-bake process, sand and phenolic Resole or furan resin (0.7–1.3%) and acidic curing agent (0.2–0.6%) are cured at ambient temp. for 20 min to several hours. In the ester no bake process, phenolic Resole binders are cured with liq. aliphatic esters. In the PUR cold box process, phenolic Resole with ether crosslinks (0.6–1%) is cured with a diisocyanate (0.6–1%) using a tertiary amine curing accelerator (0.02–0.1%). After compacting in the corebox, the material is gassed with an amine-air mixt. In the MF cold box process, aq. phenolic Resoles are gassed with methyl formate to form a solidified Resole
Applications: The processing and manufacturing routes are all used to prepare sand-based moulds for casting of metals in the foundry

Phenolic Resoles, Wood applications P-48

Related Polymers: Phenolic Resoles, Phenolic Novolaks, Urea Formaldehyde Resins, Resorcinol Formaldehyde Resins, Wood Applications
Monomers: Phenol, Urea, Melamine, Formaldehyde
Material class: Thermosetting resin
Polymer Type: phenolic
General Information: For superior moisture resistance for outdoor applications refer to melamine urea formaldehyde resins (MUF) and resorcinol formaldehyde resin (RF) or resorcinol-phenol formaldehyde resins (RPF)

Applications/Commercial Products:

Processing & Manufacturing Routes: Chipboard is made from wood chips (82 parts) with liq. phenolic Resole (15 parts), paraffin emulsion and/or wood preservatives. The mix is cured at pressure (2.5MPa 160–220°). Fibreboard is made from wood fibres and phenolic resin binder. The level of binder may vary from 1–2% for standard fibreboards or up to 5–10% for hard-wearing floor-baords with paraffin to limit moisture. The board is prod. by cure (200° and 4–6MPa). Moulded parts (Lignotock process) may be formed from a loose fleece of matted wood fibres with a thermoplastic binder and a dry phenolic resin (5–10%). The final shape is prod. by hot compression at 4MPa and 180°. Phenolic-resin bonded plywood is made from dry weights of wood (81–88%) and phenolic resin (4–10%) with moisture levels at 6–13%. Phenolic Resoles, aq. or in MeOH soln. are used as impregnating resins for compregs. Compregs may be used with decorative wood and paper veneers impregnated with melamine resin. Sodium Kraft paper is generally used for impregnation with phenolic Resole soln. and dried at 130–150° to give a resin level of 30–50%. Several layers are compressed at 7–15MPa and 150–200° for 60–90 min. to make resistant laminates
Applications: Phenolic resins are used to bond woodchips to form chipboard. Hard fibreboard is made from wood fibres from defibrilated wood and scrap. Moulded parts (Lignotock process) are used as light components in automotive construction e.g. dashboard shells (foam backed), hatracks, door and side panels and headliners. Plywood is at least three transverse layers of wood bonded with adhesive with final thickness from 4mm upwards. Reed beech veneer (thickness 0.2–2mm) is generally used to produce compreg - impregnated and compressed wood. Compreg blocks and boards are used for several engineering applications: in machinery, textiles and the electrical industries. Blockboard and chipboard can be covered by adhesive to a decorated laminated sheet or by compression bonding to layers of impregnated paper. Laminates having good resistance to most chemicals are made from layers of impregnated paper. They are used for kitchen surfaces. Structural wood bonding methods have been used to construct loadbearing structs. for both indoor and outdoor applications such as boat building

Phenylsilicone rubber, Heat vulcanised P-49

Synonyms: *Phenyl based silicone elastomer. Poly(methylphenyl)silicone rubber*
Related Polymers: Methylsilicone rubber, Heat vulcanised, Vinyl methyl phenyl silicone rubber, Heat vulcanised
Monomers: Dichloromethylphenylsilane, Dichloroethenylmethylsilane, Cyclic methylphenylsiloxane, Cyclic methylvinylsiloxane
Material class: Synthetic Elastomers, Copolymers
Polymer Type: silicones
CAS Number:

CAS Reg. No.
158865-52-2

Molecular Formula: $[(C_7H_8OSi).(C_3H_6OSi)]_n$
Fragments: C_7H_8OSi C_3H_6OSi
Additives: Finely divided silica is incorporated as a reinforcer to improve mech. props.
General Information: Vinyl groups cause gum to cure more readily with lower activity peroxides

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.15 g/cm^3	[2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.00045 K^{-1}	[4]	V

Thermal Conductivity:

No.	Value	Note
1	0.25 W/mK	[18,19]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.3 kJ/kg.C	0.3 Btu lb^{-1}°F^{-1} [2]	P

Melting Temperature:

No.	Value	Note
1	-35°C	[4,16]

Glass-Transition Temperature:

No.	Value	Note
1	-86°C	[4]
2	-30°C	[16]

Transition Temperature General: There is a conflict in the literature concerning the transition temps. of silicone rubber with high phenyl substitution. As phenyl substitution rises low temp. props. deteriorate eventually becoming worse than those of dimethyl siloxane rubber [4,9,10,11,12,13,14,15,16]
Transition Temperature:

No.	Value	Note
1	-27°C	Stiffening temp. [4]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18.4 $J^{1/2}$ $cm^{-3/2}$ (9 $cal^{1/2}$ $cm^{-3/2}$) [3]
Solvents/Non-solvents: Sol. aliphatic hydrocarbons, chlorinated hydrocarbons, aromatic hydrocarbons, ketones, esters, ethers. Insol. alcohols, H_2O [1,3,6]. Vulcanised rubber swollen by solvents rather than dissolved
Surface and Interfacial Properties General: Exhibits generally low surface adhesion [5]

Transport Properties:

Transport Properties General: Viscosity 100000 St (approx. pre-cure gum) [6]
Gas Permeability:

No.	Gas	Value	Note
1	O_2	962 cm^3 mm/(m^2 day atm)	0.0011 cm^2 (s GPa)$^{-1}$ [8]
2	N_2	315 cm^3 mm/(m^2 day atm)	0.00036 cm^2 (s GPa)$^{-1}$ [8]
3	H_2	2889 cm^3 mm/(m^2 day atm)	0.0033 cm^2 (s GPa)$^{-1}$ [8]

Mechanical Properties:

Mechanical Properties General: Requires vulcanisation with a reinforcing filler (usually silica) in order to possess acceptable mech. props.
Tensile Strength Break:

No.	Value	Note	Elongation
1	6 MPa	25°, filled [1]	300–400%

Viscoelastic Behaviour: Compression set 30–40% (150°, 22h compression) [1]

Electrical Properties:

Electrical Properties General: Insulating props. inferior to those of dimethyl silicone rubber
Dielectric Permittivity (Constant):

No.	Value	Note
1	3	[7,17]

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	[7]

Optical Properties:

Optical Properties General: Refractive index higher than that of dimethyl silicone [20]
Refractive Index:

No.	Value	Note
1	1.5	[2,20]

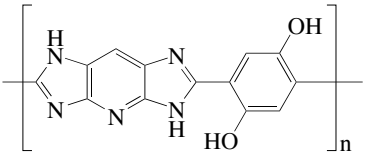
Transmission and Spectra: No transmission below 290 nm [1,5]

Polymer Stability:

Polymer Stability General: Excellent resistance to very high temps. Poor solvent resistance
Thermal Stability General: Usable from -30–315°
Upper Use Temperature:

No.	Value	Note
1	315°C	[1]

Decomposition Details: Oxidation temp. 375° (dry air) [1]
Environmental Stress: Resistant to oxidative degradation, H_2O, weathering, ozone and corona. Unaffected by uv radiation. Very resistant to high energy radiation (radioactivity)
Chemical Stability: Swollen by toluene, aliphatic hydrocarbons and CCl_4. Disintegrates in conc. H_2SO_4. Relatively unaffected by weak alkali, weak acids and alcohols [5,6]
Hydrolytic Stability: Stable in H_2O and aq. solns. at room temp. Damaged by high pressure steam
Biological Stability: Non-biodegradable. If properly vulcanised it is not subject to biological attack
Recyclability: Can be recycled by depolymerisation using steam or by acid catalysis [5]



Applications/Commercial Products:

Processing & Manufacturing Routes: Methylphenyl- and methyl-vinyl-cyclic siloxanes are polymerised together at 150–200° with an alkaline catalyst. There is a large excess of methylphenyl cyclic polysiloxane producing a linear polymer with less than 1% methylvinylsiloxane. Small quantities of hexamethyldisiloxane are used to terminate the siloxane chains. Readily cured by organic peroxides (typically 1–2 parts per 100 rubber) at temps. >100°. Several hours post-cure treatment required to remove residual peroxide
Applications: Used in laboratory research into silicone rubber chemistry. Has good props. at very high temps. but copolymers with dimethylsiloxane have better electrical props. and solvent resistance

PIPD P-50

Synonyms: *Poly[(1,4-dihydrodiimidazo[4,5-b:4′,5′-e]pyridine-2,6-diyl)(2,5-dihydroxy-1,4-phenylene)]. 2,5-Dihydroxy-1,4-benzenedicarboxylic acid polymer with 2,3,5,6-pyridinetetramine*
Monomers: 2,3,5,6-Pyridinetetramine, 2,5-Dihydroxy-1,4-benzenedicarboxylic acid
Material class: Thermoplastic
CAS Number:

CAS Reg. No.	Note
167304-74-7	Poly[(1,4-dihydrodiimidazo[4,5-*b*:4′,5′-*e*] pyridine-2,6-diyl)(2,5-dihydroxy-1,4-phenylene)]
169836-78-6	2,5-dihydroxy-1,4-benzenedicarboxylic acid polymer with 2,3,5,6-pyridinetetramine

Molecular Formula: $(C_{13}H_7N_5O_2)n$
Fragments: $C_{13}H_7N_5O_2$
General Information: Polymer normally produced as high-strength fire-resistant fibres of metallic blue colour.
Morphology: As-spun fibres have crystal hydrate structure, while heat-treated fibres assume a three-dimensional crystal structure with intramolecular and intermolecular hydrogen bonding [1,2]. Monoclinic unit cell, a=13.33Å, b=3.46Å, c=12.16Å [1,2]. The molecular chains deviate slightly from a planar structure [1]. Nematic liquid crystalline polymer solutions are formed in polyphosphoric acid [2,3,4].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d –1.7 g/cm^3	[3]

Transition Temperature General: No reported glass-transition temperature. Exothermic transitions during polymer degradation in air from 450–650°C [5].

Mechanical Properties:

Mechanical Properties General: Heat-treated fibres have improved mechanical properties compared to as-spun fibres [3,4]. Crystal modulus of *ca.* 440 GPa reported [8].

Tensile (Young's) Modulus:

No.	Value	Note
1	150–360 MPa	[3,4,6,7]

Tensile Strength Break:

No.	Value	Note	Elongation
1	2500–5500 MPa	[3,4,6,7]	1.2–2.7%

Compressive Strength:

No.	Value	Note
1	850–1700 MPa	[3,4,6]

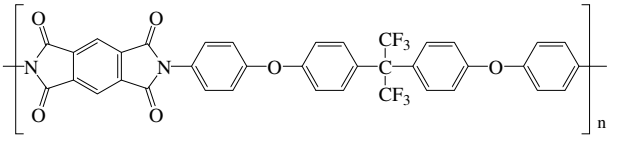
Optical Properties:

Transmission and Spectra: Raman [6,9], cmr [5], x-ray diffraction [2,8] and neutron diffraction [10] data have been reported.

Polymer Stability:

Thermal Stability General: Main polymer degradation in air occurs in range 450–650°C [5].
Flammability: The as-spun fibres with their crystal hydrate structure achieve a fire protection index (FPI) which is higher than that of the heat-treated fibres and other fire-protective polymers [7]. The polymer fibre does not burn even under severe conditions [5]

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by polycondensation of 2,3,5,6-pyridinetetramine trihydrochloride with 2,5-dihydroxyterephthalic acid in polyphosphoric acid [3,4]. Fibres are spun from polymer solution in polyphosphoric acid with coagulation in an aqueous medium [3,4].
Applications: Potential applications for fire protection, body armour, ropes and cables, composite materials for the aircraft industry

Trade name	Details	Supplier
M5	AS (as-spun) and HT (heat-treated) fibre grades	Magellan Systems International

Fragments: $C_{22}H_{10}N_2O_5$
Morphology: Orthorhombic, a 0.631, b 0.402, c (chain axis) 3.258. Space group P2/C [10]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.54 g/cm^3	cryst. [10]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	1.8×10^{-5}–4.5×10^{-5} K^{-1}	in plane, parallel to optic axis, 50–250°, depends on orientation [5]	L
2	2.3×10^{-5}–5.6×10^{-5} K^{-1}	in plane, perpendicular to optic axis, 50–250°, depends on orientation [5]	L
3	7.4×10^{-5}–0.000126 K^{-1}	out of plane, 50–250° [5]	V

Volumetric Properties General: Fractional free volume 0.123 [8]
Equation of State: Tait equation of state parameters have been reported [5]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: CED 918 J cm^{-3} [2]; δ 34.6 J$^{1/2}$ cm$^{-3/2}$ [8]

Transport Properties:

Permeability of Gases: *N*-Methylpyrrolidone D_o 3.3–318 × 10^{-11} cm^2 s^{-1} (30–90°, oriented film, depends on film thickness) [4]. [H_2] 5.92 × 10^{-10}; [CO] 0.087 × 10^{-10}; [CO_2] 1.18 × 10^{-10}; [CH_4] 0.026 × 10^{-10}; [O_2] 0.31 × 10^{-10}; [N_2] 0.045 × 10^{-10} cm^2 (s cm Hg)$^{-1}$ (35°, H_2, CO, CO_2, CH_4 at 10 atm, O_2, N_2 at 2 atm) [9]
Permeability of Liquids: Diffusion constant [H_2O] 9.8–24.9 × 10^{-10} cm^2 s^{-1}, (0.31 eV, 0–23°, depends on thickness and cure conditions, near Fickian process) [7]. Permeability constant [H_2O] 15.1 × 10^{-8} cm^2(s cmHg)$^{-1}$ (50°, H_2O activity 0.5) [8]
Water Absorption:

No.	Value	Note
1	2.5 %	50h, 25°, 75% relative humidity [1]

Mechanical Properties:

Tensile (Young's) Modulus:

No.	Value	Note
1	2260 MPa	ASTM D2370 [6]
2	2100 MPa	[13]
3	2700–5000 MPa	depends on orientation [2]
4	4700 MPa	cold drawn film, parallel to drawing direction [13]
5	1700 MPa	cold drawn film, perpendicular to drawing direction [13]

Tensile Strength Break:

No.	Value	Note	Elongation
1	260 MPa	ASTM D2370 [6]	85%
2	130 MPa	[13]	
3	300 MPa	cold drawn film, parallel to drawing direction [13]	
4	80 MPa	cold drawn film, perpendicular to drawing direction [13]	

Poisson's Ratio:

No.	Value	Note
1	0.3	ASTM D2370 [6]

Complex Moduli: Dynamic tensile modulus 2620 MPa (100 rad s^{-1}, ASTM D2370) [6]
Mechanical Properties Miscellaneous: Residual stress 21–31 MPa (room temp., films cast and cured on Si) [12]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.96	10 kHz	room temp., dry [7]

Optical Properties:

Total Internal Reflection: Birefringence Δ_n (η_{TE}-η_{TM}) 0.080–0.065 (isotropic in-plane films, 3–20 μm) [6]. Relative dispersion of birefringence D_b 0.148 (486–656 nm) [11]

Polymer Stability:

Environmental Stress: Good resistance to degradation by atomic oxygen in low earth orbit [13]. Good resistance to γ radiation, low gas evolution with doses up to 25 MGy [15]. Good resistance to ionising radiation for doses over 50 MGy. Mech. props. are degraded by cross-linking. In oxygen, deterioration of mech. props. due to chain scission occurs at 10–20% the rate of deterioration in air [16]
Chemical Stability: Swollen by *N*-methylpyrrolidone [3]

Applications/Commercial Products:

PMR-II (Second generation) resins P-53

Synonyms: *Polymerisation of Monomeric Reactants Second generation resins. 6FDE-pPDA Addition cured (nadic end-groups). α-[4-(1,3,3aα,4α,7α,7aα-Hexahydro-1,3-dioxo-4,7-methano-2H-isoindol-2-yl)phenyl]-ω-(1,3,3aα,4α,7α,7aα-hexahydro-1,3-dioxo-4,7-methano-2H-isoindol-2-yl)poly[(1,3-dihydro-aα,4α,7α,7aα-hexahydro-1,3-dioxo-4,7-methano-2H-isoindol-2-yl)poly[(1,3-dihydroH-isoindole-5,2-diyl)-1,4-phenylene]. PMR-II*
Monomers: Dimethyl bicyclo[2.2.1]hept-5-ene-2,3-dicarboxylate, 1,4-Benzenediamine, *ar,ar′*-Dimethyl dihydrogen 4,4′-[(2,2,2-trifluoromethyl)ethylidene]bis[1,2-benzenedicarboxylate]
Material class: Thermosetting resin
Polymer Type: polyimide (end capped)
CAS Number:

CAS Reg. No.	Note
70771-19-6	CRU with stereochemically described end-groups

Molecular Formula: $(C_{25}H_{10}F_6N_2O_4)_n$
Fragments: $C_{25}H_{10}F_6N_2O_4$
Molecular Weight: M_n 1829

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	342°C	uncured [2]
2	337°C	uncured [3]
3	362°C	post-cured, air, 343°, 16h [2]
4	366°C	post-cured, air, 341°, 16h [3]

Transport Properties:

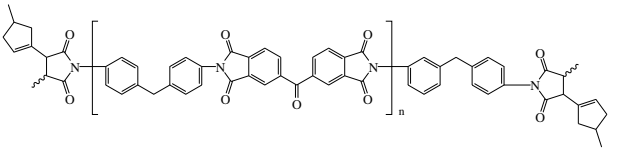
Polymer Solutions Dilute: Viscosity increases from 239–270° before decreasing markedly to a minimum at approx. 325°, after which it increases with increasing temp. [2] [η] 0.1 dl g^{-1} (DMF, 25°) [2]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [2]

Polymer Stability:

Decomposition Details: Shows an average weight loss of 27.2% after heating in air at 371° for 400h [1]. 5% Weight loss in air at 463° [2]. CO_2 is liberated at 361°; other decomposition products include H_2O, trifluoromethane, CO, and SiF_4 formed by reaction of fluorine radicals with any glass surface [2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synth. by reaction of 4,4′-(hexafluoroisopropylidene) diphthalic anhydride dimethyl ester diacid (n moles), *p*-phenylenediamine and nadic acid ester in MeOH in a mole of ratio of n:n+1:2. This yields a viscous gum which is further heated at 210° for 2h [1,2]. Has a processing window of approx. 100° between the onset of melting at 240° and curing at 375° [3]
Applications: Has high temp. applications

PMR-15, Unfilled P-54

Synonyms: *α-[4-[[4-(1,3,3a,4,7,7a-Hexahydro-1,3-dioxo-4,7-methano-2H-isoindol-2-yl)phenyl]methyl]phenyl]-ω-(1,3,3a,4,7,7a-hexahydro-1,3-dioxo-4,7-methano-2H-isoindol-2-yl)poly[(1,3-dihydro-1,3-dioxo-2H-isoindole-2,5-diyl)carbonyl(1,3-dihydro-1,3-dioxo-2H-isoindole-5,2-diyl)-1,4-phenylenemethylene-1,4-phenylene]*
Monomers: Methyl hydrogen bicyclo[2.2.1]hept-5-ene-2,3-dicarboxylate, *ar,ar′*-Dimethyl dihydrogen 4,4′-carbonylbis[1,2-benzenedicarboxylate], 4,4′-Methylenebis[benzenamine]
Material class: Thermosetting resin
Polymer Type: polyimide (end capped)
CAS Number:

CAS Reg. No.	Note
78392-33-3	CRU with stereochemically described end-groups
68845-78-3	CRU with end-groups
37238-52-1	source based

Molecular Formula: $(C_{30}H_{16}N_2O_5)_n$
Fragments: $C_{30}H_{16}N_2O_5$
Additives: Glass fibre, graphite fibre, carbon fibre
Morphology: The effect of MW, composition and pressure on the crystallinity has been reported [1]

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	370°C	post-cure, in air 371°, 25 h [4]
2	330°C	post-cure, 316°, 10 h [5]

Optical Properties:

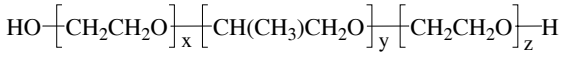
Transmission and Spectra: C-13 nmr spectral data have been reported [2]

Polymer Stability:

Upper Use Temperature:

No.	Value	Note
1	300°C	[5]

Decomposition Details: Exhibits approx. 18% weight loss after heating in air at 371° for up to 300 h at both 1 atm and 4 atm pressure [4]. 5% Weight loss at 383°, 10% weight loss at 425°, 20% weight loss at 467°, 30% weight loss at 482°, when heated in air [5]. Activation energy for thermooxidative degradation of uncured resin 174 kJ mol^{-1} [5]



Applications/Commercial Products:

Processing & Manufacturing Routes: A nadic end-capped PMR resin is heated under pressure at high temp. The nadic end-caps undergo addition polymerisation to yield the desired product [3]
Applications: In polymer matrix composites for high temp. applications

$2 < x < 128$ $16 < y < 67$ $2 < z < 128$

Synonyms: *Polyoxyethylene-polyoxypropylene block copolymer. Methyl oxirane polymers. Polyethylene-polypropylene glycols. EO/PO block polymer. Poly(oxyethylene-block-oxypropylene). Oxirane polymers with methyl oxirane (block, triblock)*
Related Polymers: Polypropylene oxide, Meroxapol
Monomers: Oxirane, Propylene oxide
Material class: Copolymers
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
9003-11-6	generic
106392-12-5	block copolymer

Molecular Formula: $[(C_2H_4O).(C_3H_6O).(C_2H_4O)]_n$
Fragments: C_2H_4O C_3H_6O C_2H_4O
Molecular Weight: M_n 1100-14500

Surface Properties & Solubility:

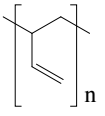
Surface and Interfacial Properties General: Cloud points have been measured with respect to composition [2]. Surface tension vs. concentration, and interfacial tension vs. concentration plots have been reported [2,3]

Transport Properties:

Polymer Solutions Dilute: Bulk viscosity, zero shear viscosity, complex viscosity, storage and loss moduli, and the yield stress value for the gel state have been reported [2,3]

Polymer Stability:

Biological Stability: Mod. toxic by ingestion, intraperitoneal route [1]



Applications/Commercial Products:

Trade name	Supplier
Berol	Berol Kemi AB
Genapol	Hoechst Celanese
Hodag Nonionic	Hodag
Lutrol	BASF
Macol	PPG-Mazer
Pluronic	BASF
Polyglycol	Dow
Synperonic PE	ICI, UK

1,2-Poly(1,3-butadiene) **P-56**

Synonyms: *Vinyl-type butadiene. 1,2-Polybutadiene. 1,2-pb. 1,2-PB*
Monomers: 1,3-Butadiene
Material class: Thermoplastic
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
9003-17-2	atactic form
29406-96-0	isotactic homopolymer
31567-90-5	syndiotactic
36522-63-1	syndiotactic

Molecular Formula: $(C_4H_6)_n$
Fragments: C_4H_6
Tacticity: Atactic, syndiotactic, isotactic forms known
Morphology: 1,2-Syndiotactic (98%) [2]. Orthorhombic [3], a 10.98, b 6.60, c 5.14; 1,2-isotactic form (99%) [2]; rhombohedral, a 17.3, b 17.3, c 6.5 [2]. Morphology of blends with EPDM has been reported [39]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 0.96 g/cm^3	99% isotactic form [1]
2	d 0.96 g/cm^3	98% syndiotactic [1]
3	d 0.89 g/cm^3	[31,32]
4	d 0.885 g/cm^3	95.3% 1,2-polymer [45]

Equation of State: Equation of state information has been reported [25,27,42]

Melting Temperature:

No.	Value	Note
1	126°C	isotactic form [1]
2	156°C	syndiotactic form [1]
3	206°C	99% 1,2-polymer; 0.8% *cis*-1,4-polymer [23]

Glass-Transition Temperature:

No.	Value	Note
1	-15°C	tacticity not specified [2]
2	-7°C	[26]
3	-15°C	1,2-polymer [46]
4	40°C	99% 1,2-polymer, 0.8% 1,4-polymer [23]
5	-12°C	95.3% 1,2-polymer [45]

Transition Temperature General: M_n relationship to T_g has been reported. Other values of T_g have been reported [27]

Deflection Temperature:

No.	Value	Note
1	52.5°C	99% 1,2-polymer, 0.8% *cis*-1,4-polymer [23]
2	56.5°C	99% 1,2-polymer, 0.8% *cis*-1,4-polymer [23]

Surface Properties & Solubility:

Solubility Properties General: High levels of 1,2-polymer give complete miscibility with *cis*-1,4-polyisoprene even at high MW [28]

Solvents/Non-solvents: 94% 1,2-Polymerised form sol. toluene, THF [2]. 99% 1,2-Polymer sol. tetralin (140°); insol. boiling toluene, boiling C_6H_6, boiling xylene [23]. Highly stereoregular polymer has very low solubility [23]

Wettability/Surface Energy and Interfacial Tension: Critical surface tension 25 mN m^{-1} [29]

Transport Properties:

Polymer Solutions Dilute: Temp. dependence of rheological props. has been reported [30,31,32]. Rheological props. of 62% 1,2-polymer have been reported [41]

Polymer Melts: Melt viscosity data have been reported [27]

Permeability of Gases: Permeability of He, Ne, N_2 and CO_2 has been reported [34]. Other permeability data have been reported [33]

Mechanical Properties:

Mechanical Properties General: Props. of mixed polymer compositions [35] and blends [49] have been reported. Storage and loss moduli [43] of the syndiotactic [28] and atactic [27] polymers have been reported. Dynamic mech. parameters of blends with EPDM (see ethylene-propylene elastomers), have been reported [39]

Tensile (Young's) Modulus:

No.	Value	Note
1	51 MPa	99% 1,2-polymer, 0.8% 1,4-polymer [23]

Flexural Modulus:

No.	Value	Note
1	51 MPa	99% 1,2-polymer, ASTM D747 [23]
2	78 MPa	99% 1,2-polymer, ASTM D747 [23]

Tensile Strength Break:

No.	Value	Note	Elongation
1	27.5 MPa	99% 1,2-polymer, ASTM D412 [23]	185%

Flexural Strength at Break:

No.	Value	Note
1	24.5 MPa	99% 1,2-polymer, ASTM D747 [23]
2	31 MPa	99% 1,2-polymer, ASTM D747 [23]

Compressive Modulus:

No.	Value	Note
1	320 MPa	99% 1,2-polymer, 0.8% 1,4-polymer [23]
2	420 MPa	99% 1,2-polymer, 0.8% 1,4-polymer [23]

Tensile Strength Yield:

No.	Value	Note
1	36.5 MPa	99% 1,2-polymer

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.58 MPa	[27]	Average plateau modulus
2	0.81 MPa	[31,32]	Plateau modulus

Viscoelastic Behaviour: Temp. dependence of viscoelastic props. described by the Williams-Landel-Ferry equation has been reported [30,44]. Stress-strain behaviour (95.3% 1,2-polymer) has been reported [45]

Mechanical Properties Miscellaneous: Has high uniaxial extension and shear combined with cyclic straining. Flow behaviour related to polymer processing has been reported [38]. Peel strength of syndiotactic polymer has been reported [28]. Peel strength of blends with EPDM has been reported [39]

Hardness: Rockwell R60 (99% 1,2-polymer, 0.8% 1,4-polymer) [23]

Failure Properties General: Critical recoverable deformation ϵ_e 0.44 [36]

Fracture Mechanical Properties: Extension ratio at break has been reported [50]

Izod Area:

No.	Value	Notch	Note
1	5.95 kJ/m^2	Unnotched	6.02 kg cm cm^{-2}, 99% 1,2-polymer, 0.8% 1,4-polymer, ASTM D256-56 [23]
2	19.767 kJ/m^2	Unnotched	20 kg cm cm^{-2}, 99% 1,2-polymer, 0.8% 1,4-polymer, ASTM D256-56 [23]

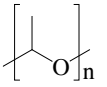
Optical Properties:

Transmission and Spectra: Ir (syndio, iso forms) [7,10,11,17,28,40], uv [13], esr [19], H-1 nmr [17,18] and C-13 nmr [20,24] spectral data have been reported
Total Internal Reflection: Birefringence measurements have been reported [23]

Polymer Stability:

Thermal Stability General: Thermal stability lies in between that of the *cis* and *trans* 1,4 polymerised forms [21]. Syndiotactic form tends to cross-link at temps. above 150° [23]
Decomposition Details: Cyclisation leads to a loss of unsaturation and some *cis*/*trans* isomerisation [21]. Heating in nitrogen (20°/min.) causes decomposition by the liberation of hydrocarbon gases (including cyclic ones) [22]. Thermal degradation causes intramolecular cyclisation yielding cyclohexane rings [47]
Flammability: High vinyl polybutadienes are classed as high volatile loss, low-char polymers; they give slightly greater loss of volatiles than does *cis*-1,4-polybutadiene [48]
Chemical Stability: Stable to H_2O, bases, AcOH and HCl. Oxidised by contact with strong acids and acidified dichromate (syndiotactic form) [23]
Stability Miscellaneous: High energy radiation reduces saturation markedly, possibly also leading to intramolecular cyclisation and cross-linking [37]

Applications/Commercial Products:



Processing & Manufacturing Routes: A range of catalysts, mainly chromium and aluminium, [4,5,6,7,8,9,12,15,16] chiefly give the syndiotactic form. The isotactic form is obtainable using chromium-carbonyl complex [7] as the catalyst
Applications: Used for making transparent bottles and films. High permeability and tear resistance makes it useful for packaging of fresh fruit and fish. Also has adhesive applications

Trade name	Details	Supplier
Budene 1255	soln. polymer containing antioxidant	Goodyear
JSRRB	mainly syndiotactic	Japan Synthetic
Ricon		Advanced Resins

Poly(acetaldehyde) P-57

Synonyms: *Poly(ethanal)*
Monomers: Acetaldehyde
Material class: Synthetic Elastomers
Polymer Type: polyalkylene ether
CAS Number:

CAS Reg. No.	Note
9002-91-9	homopolymer
28265-89-6	isotactic

Molecular Formula: $(C_2H_4O)_n$
Fragments: C_2H_4O
Additives: May be stabilised by polyamides and aromatic amine antioxidants
Tacticity: Stereoblock [15,16] and isotactic forms are known
Morphology: Isotactic form, tetragonal, a 14.63, c 4.79 [7,9]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.14 g/cm^3	[7]

Melting Temperature:

No.	Value	Note
1	-123.3°C	[6]

Glass-Transition Temperature:

No.	Value	Note
1	-30°C	[1,2]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. EtOH, Et_2O, butyl acetate, Me_2CO, AcOH, CCl_4 [15], 2-butanone [6]. Insol. H_2O, petrol, C_6H_6 [14]

Transport Properties:

Polymer Solutions Dilute: [η] 2.4 dl g^{-1} (27.6°) [6]

Mechanical Properties:

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.17–0.18 MPa	25–27 psi, 23°, compressed film [5]	580%

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [5,14,16,18]

Polymer Stability:

Polymer Stability General: Very easily decomposed in the absence of additional stabilisers. Decomposition can be initiated by the presence of a number of different species and proceeds via several different mechanisms [12,19]
Thermal Stability General: Comparatively low thermal stability which may be improved by capping with acetoxy groups [19]
Decomposition Details: Depolymerisation occurs at room temp. (if unstabilised), producing acetaldehyde. Can evaporate completely in a few days or weeks [4]
Chemical Stability: Acidic compds. accelerate the decomposition process [4]
Stability Miscellaneous: Fairly low oxidative stability [5]. May be degraded photolytically in soln. [19]

Applications/Commercial Products:

Processing & Manufacturing Routes: Isotactic polyacetaldehyde is obtained at -75°, using alkali metal alkoxides [10], alkali metals or metal alkyls [11] as initiators. A novel aluminium catalyst has been developed to give a high degree of stereoregularity [17]. Amorph. polymers are obtained when using cationic initiators at temps. below -40° [4]. A number of acidic initiatior are used, as well as alumina [6,8] and silica
Applications: Main uses are in coating and resist applications. Also used as a molluscicide and in photosensitive chemical compositions

Poly(acetylene) P-58

Synonyms: *Poly(ethyne)*
Monomers: Ethyne
Material class: Thermoplastic
Polymer Type: polyacetylene
CAS Number:

CAS Reg. No.	Note
25067-58-7	
73589-68-1	(*E*)-form
26571-64-2	
74373-36-7	(*Z*)-form

Molecular Formula: $[(C_2H_2)]_n$
Fragments: C_2H_2
Morphology: Form I *cis*-form, orthorhombic, a 7.74, b 4.32, c 4.47 (a 7.32, b 4.24, c 2.46); form II *trans*-form, orthorhombic, a 5.62, b 4.92, c 2.59; form III, *trans*-form, monoclinic, a 3.73, b 3.73, c 2.44, γ96–100° [1,2]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.16 g/cm^3	*cis* [1]
2	d 1.2 g/cm^3	*trans*, orthorhombic [1]
3	d 1.27 g/cm^3	*trans*, monoclinic [1]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	9×10^{-5} K^{-1}	calc. [3]	L

Latent Heat Crystallization: ΔH 7.75 kJ mol^{-1} (-37°, *cis* to *trans* conversion) [9]
Thermal Conductivity:

No.	Value	Note
1	2.1 W/mK	*cis* [5]
2	3.8 W/mK	*trans* [5]

Specific Heat Capacity:

No.	Value	Note	Type
1	60 kJ/kg.C	27°, *cis*-form [4]	P

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. any solvent [6]

Mechanical Properties:
Tensile (Young's) Modulus:

No.	Value	Note
1	100000 MPa	*trans* [7]
2	30000–40000 MPa	*cis* [7]
3	25000–33000 MPa	*trans* [21]
4	384300–590500 MPa	*trans* [8]
5	170100–309000 MPa	*cis* [8]

Tensile Strength Break:

No.	Value	Note
1	900 MPa	*trans* [7]
2	600 MPa	*cis* [7]

Tensile Strength Yield:

No.	Value	Elongation	Note
1	15 MPa	1.2%	*cis* [20]

Electrical Properties:
Electrical Properties General: Conductivity can be increased by seven orders of magnitude by iodine doping [25]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.4–3.7	*cis* [24]
2	3.9–4.2	*trans* [24]

Complex Permittivity and Electroactive Polymers: Conductivity 4.4×10^{-5} S cm^{-1} (25°, *trans*-form) [11]; other conductivity values have been reported [11,12]. Band gap 1.2–1.7 eV [15]
Dissipation (Power) Factor:

No.	Value	Note
1	0.01–0.025	-100–150° [10]

Optical Properties:
Transmission and Spectra: Ir [17,18], C-13 nmr [16], epr [19], Raman [14] and x-ray [2] spectral data have been reported

Polymer Stability:
Decomposition Details: Pyrolysis proceeds by facile electron-proton exchanges to form various proton-enriched products [23] and C_6H_6
Environmental Stress: Oxidises gradually in air (15 days) with resulting lower conductivity and tensile props. [22]

Applications/Commercial Products:
Processing & Manufacturing Routes: Produced by Ziegler-Natta polymerisation of acetylene in an inert solvent. Electrically conducting films may be produced by halogen doping with Cl, Br or I [25]
Applications: Highly conducting electrical and optical fibre (often doped). Solar cell and battery applications

Poly(acetylenes) P-59

Related Polymers: Poly(acetylene), Poly(phenylacetylene), Poly (diphenyldiacetylene)

General Information: These are usually brittle materials that cannot be moulded. Physical props. that are dependent upon soln. characteristics cannot be determined because of insolubility. Variability of props. caused by different laboratory preparation techniques [1,4]. Materials tend to show high electrical conductivity, particularly when doped [3]

Polymer Stability:
Environmental Stress: Poly(acetylenes) are readily oxidised at room temp. Doping decreases their susceptibility to oxygen [1]
Stability Miscellaneous: Polyacetylenes are innocuous and should present no health hazard [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Acetylenes undergo both additions and condensation polymerisation with homogeneous and heterogeneous Ziegler-Natta catalysts, transition-metal complexes, free-radical initiators, thermal polymerisation and γ-radiation to form linear or cyclic polymeric products [1,2]
Applications: Major uses of poly(acetylenes) have not yet developed due to their intractable and oxygen-sensitive nature. Costs of producing poly(acetylenes) are very high

Polyacrylamide P-60

Synonyms: *Poly(2-propenamide)*
Related Polymers: Acrylamide copolymer emulsion
Monomers: Acrylamide
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
9003-05-8

Polyacrylamide gels P-61

Synonyms: *Acrylamide gels*
Related Polymers: Polyacrylamide
Monomers: Acrylamide
Polymer Type: acrylic
General Information: A cross-linked polymer which finds extensive use due especially to its equilibrium swelling props. in water or aq.solns.
Morphology: Polyacrylamide gels, particularly those at lower concentrations, contain heterogeneities believed to be due to cross-link clustering. The gels are transparent and flexible at low degrees of cross-linking but become opaque and fragile at higher degrees of cross-linking. The micromorphologies of polyacrylamide hydrogels have been characterised by multifractal studies [4,5,6,8,19]. Microgels have been characterised by electron microscopy [3,9]

Transport Properties:

Transport Properties General: Perhaps the most important property of polyacrylamide gels is their swelling behaviour. This is very much dependent on the composition of the gel and varies tremendously. Swelling pressure increases with the degree of cross-linking (measured by concentration of cross-linking agent) and the concentration of gel. Ageing gels can dramatically affect the swelling because of hydrol., gel-inhomogeneities and structural changes. [2,4,5]. The dynamic polymer-polymer correlation length is weakly dependent on concentration but is temp-independent. The static screening length is also concentration-dependent. At high cross-linking density the two correlation lengths become approx. equal [12]
Permeability of Liquids: Diffusion coefficient ethylene glycol 4.2×10^{10} ms^{-1}, glycerol 3.2×10^{10} ms^{-1}. Diffusion of carbohydrates in soln. has also been reported. Diffusion coefficient increases with increasing temp. [13]
Permeability and Diffusion General: The diffusion of poly(acrylic acid) and rhodamine dye through polyacrylamide gels has been reported [14]
Water Content: Three types of 'water' have been identified in the hydrogels: ordinary, intermediate and bound (non-freezing). The amount of bound water varies with polymer concentration and the presence of salts [22]

Mechanical Properties:

Mechanical Properties General: Mech. props. depend very much on polymer concentration, degree of swelling and network density [18]. Young's modulus of as-prepared gels increases with degree of cross-linking to a maximum of approx. 78 MPa and then decreases. At equilibrium swelling the modulus behaves similarly but the values are somewhat lower. The strain at break for the same gel falls as the degree of cross-linking increases. [2,4,8] Inhomogeneities in a gel can have significant effects on its mech. props. [6,7] Shear modulus follows scaling law at low concentrations but deviates as the concentration increases. [6,16] The incorporation of a rigid rod linear polyelectrolyte, e.g. poly(4″-disodium 2,5-dimethyl-1,1′:4′,1″-terphenyl-3′,2″-disulfonate) in a polyacrylamide gel can improve the mech. strength of the gel and its water-absorbing props. [15] Yield strength increases with increasing monomer concentration. For a given monomer concentration yield strength increases with increasing cross-link ratio [20]

Poisson's Ratio:

No.	Value	Note
1	0.442–0.467	acrylamide:methylenebisacrylamide 5:0.01, total monomer content 27% wt; equili brium swelling in water [11]
2	0.318	27°, acrylamide:methylenebisacrylamide 37.5:1, unswollen
3	0.378	73°, acrylamide:methylenebisacrylamide 37.5:1, unswollen [12]

Tensile Strength Yield:

No.	Value	Note
1	0.00271 MPa	monomer concentration 6% [20]
2	0.01013 MPa	monomer concentration 20% [20]

Mechanical Properties Miscellaneous: The effect of added phosphoric and sulfuric acid on the mech.props. of hydrogels has been studied; tensile strength decreases as the acid/polyacrylamide ratio increases [21]

Electrical Properties:

Complex Permittivity and Electroactive Polymers: Proton-conducting hydrogels have ben made by doping with phosphoric and sulfuric acid [21]

Polymer Stability:

Chemical Stability: Microgels are stable in polar solvents and aq. KCl soln. [3]

Applications/Commercial Products:

Processing & Manufacturing Routes: The gels can be made by one of four methods [1]. Three-dimensional polymerisation involves a free-radical polymerisation using an initiator such as persulfate and a cross-linking agent. Perhaps the most widely used cross-linking agent for polyacrylamide gels is *N,N′*-methylenebisacrylamide (MBAA). The network density can be varied by changing the amount of MBAA used. A second method is cross-linking of water-soluble polymers using multivalent cations such as $Cr^{3\oplus}$. Gels may also be made by radiation cross-linking or by hydrolysis of polyacrylamide chains to yield acrylamide/acrylic acid copolymers. Gel spheres of particle size 200–1500μm may be synth. by suspension polymerisation of aq. monomer solns. suspended in an organic matrix. [10] The preparation of microgels by precipitation polymerisation has been reported. Particle size (0.06–1.0μm) and distribution controlled by solvent selection [3]
Applications: Used in agriculture (soil improvement, hydroponics); in medicine; in paint and coatings industry, and in adhesives

Poly(acrylic acid) P-62

Synonyms: *Poly(2-propenoic acid). PAA. Poly[1-(carboxy)ethylene]*
Related Polymers: Poly(ethylene-*co*-acrylic acid)
Monomers: Acrylic acid
Material class: Polyelectrolyte
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
9003-04-7	sodium salt
25608-12-2	potassium salt
9003-03-6	ammonium salt
9003-01-4	

Molecular Formula: $(C_3H_4O_2)_n$
Fragments: $C_3H_4O_2$
Molecular Weight: The MW varies from 1000 to 5000000
General Information: Poly(acrylic acid) is a clear brittle solid, which cannot be moulded on heating. It dissolves in water and alcohol and behaves as a polyelectrolyte. When prepared in dilute aq. soln. it can be used as prepared, or it can be dried to obtain a powdery white solid. It is advisable not to attempt to dry completely as this will result in cross-linking to yield a product which will be difficult to dissolve. If required freeze-drying methods can be used for complete drying. Salt solns. have high expanded molecular coils and therefore high viscosities. Salts of poly(acrylic acid) can absorb water many times in excess of their weight. Clear brittle solid, soluble in water and alcohol to behave as polyelectrolyte. Salt solns. have high expanded molecular coils and, therefore, high viscosites
Tacticity: Tacticity of the polymer cannot be measured directly. Isotactic samples have been prepared by hydrol. of esters having the appropriate tacticity

Volumetric & Calorimetric Properties:

Equation of State: Equation of state information has been reported
Glass-Transition Temperature:

No.	Value	Note
1	106–150°C	allyl acrylate comonomer

Transition Temperature General: T_g increases with formation of anhydride

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. H_2O, MeOH, EtOH, 2-propanol, dioxane, DMF, ethylene glycol, AcOH (atactic), aq. dioxane (isotactic). Insol. Me_2CO, Et_2O, C_6H_6, aliphatic hydrocarbons (atactic), dioxane (isotactic)

Transport Properties:

Polymer Solutions Dilute: Theta temp. 29° (dioxane). Entropy parameter -0.310. Specific viscosity varies with conc. and follows Huggins equation up to 0.5% concentration. In ionising solvents, viscosity rises with dilution to a max., then decreases at very low concentration
Polymer Solutions Concentrated : Solns. of 3% and more are thixotropic. At low shear rate, viscosity increases with concentration. Viscosity also increases with increasing neutralisation. Theta temp. 30° (dioxane)
Water Content: Linear polymer absorbs water rapidly on exposure to moist air
Water Absorption:

No.	Value	Note
1	8 %	equilibrium, 30°, 50% relative humidity
2	42 %	equilibrium, 30°, 50% relative humidity, Na salt

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.442	20°, 65% in H_2O

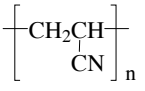
Total Internal Reflection: dn/dc 0.137 (25–65°, H_2O); 0.174 (25°, H_2O, dioxane (50:50); 0.09 (25°, dioxane); 0.088 (25°, 0.1 *M* HCl)

Polymer Stability:

Polymer Stability General: Dry polymer is stable but takes up water on exposure to moisture. High MW polymer is stable to degradation by shear, oxidation or conformational changes
Thermal Stability General: Decomposes slowly above 250°
Decomposition Details: On heating loses water above 100°, forming the anhydride. Stable to 200° in vacuum, then above 250° liberates CO_2, and decomposes rapidly above 400°
Chemical Stability: Polymer is a weak acid (pK_a 4.75). Readily neutralised with metal hydroxides

Applications/Commercial Products:

Processing & Manufacturing Routes: Linear polymers can be prepared in acidic 20–30% soln. by free radical polymerisation. Higher concentrations result in uncontrolled exotherms and cross-linked polymers. Because of high heats of polymerisation reaction it is not simple to control polymerisation reaction. Polymerisation of pure acid can be hazardous, as the temp. can rise to values at which the polymer decomposes to generate gaseous product. In general the manufacturer will provide products in a form that does not require further processing
Applications: Thickeners in cosmetics, creams, lotions, hair preparations, pigments, polishing agents and emulsions. Drilling mud additives, ion exchange resins, flocculating agents, paper making, scale inhibitors, detergents, dispersants, sludge conditioners for water treatment, wrap sizes for nylon, adhesives, medical applications, e.g. sustained release tablets for oral



administration. Commercially sodium, potassium, and ammonium salts are used

Polyacrylonitrile P-63

Synonyms: *PAN. Poly(2-propenenitrile)*
Related Polymers: SAN, ABS, Nitrile rubber, ASA, Acrylic fibres, Modacrylic fibres, Acrylonitrile-methyl acrylate copolymer, Poly(acrylonitrile-*co*-vinylidene chloride), Acrylonitrile methyl acrylate copolymer, Injection moulding, Polymethacrylonitrile, Acrylonitrile-butadiene-isoprene terpolymer, Butadiene-acrylonitrile copolymers, Poly(vinylidene chloride-*co*-acrylonitrile), Poly(vinyl chloride-*co*-acrylonitrile), Polycarbonate/acrylic-styrene-acrylonitrile alloy, Poly(methyl methacrylate-*co*-acrylonitrile-*co*-butadiene-*co*-styrene)
Monomers: Acrylonitrile
Material class: Thermoplastic
Polymer Type: acrylonitrile and copolymers
CAS Number:

CAS Reg. No.	Note
31631-89-7	syndiotactic
25014-41-9	
29436-44-0	isotactic

Molecular Formula: $(C_3H_3N)_n$
Fragments: C_3H_3N
Molecular Weight: MW 185000; 1100000–1600000
Morphology: The molecular struct. of PAN fibres has been reported [3]. Conformational study has been reported [11]. Orthorhombic, a 10.6 Å, b 11.6 Å, c 5.04 Å (stretched film) [43]. Syndiotactic PAN may assume a *trans-trans* conformn. and a *trans-trans* conformn. including a *gauche-gauche* conformn. [67]. PAN exists mainly in the isotactic form [78] with the molecule itself arranged in an irregular helical conformn. [79,80]. Heterogeneous PAN contains three phases: crystalline, quasi-crystalline and amorph. [81,82]. The relative proportion of each phase depends on the method of synth. PAN is a very poorly crystalline material. However, single crystals may by grown from 105–150° using a film formation crystallisation technique [68]. PAN synth. by radiation-induced bulk polymerisation has, below 50°, a morphology similar to that of polyethylene. Above 70°, PAN synth. by this method comprises large lamellar crystals that contain a large number of growing polymer chains [70]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 0.2–0.4 g/cm^3	[5]
2	d 1.1685 g/cm^3	flotation method [57]
3	d 1.14–1.17 g/cm^3	
4	d^{29} 1.17–1.18 g/cm^3	flakes

Thermal Expansion Coefficient:

No.	Value	Type
1	6.6×10^{-5} K^{-1}	L

Equation of State: Mark-Kuhn-Houwink parameters have been reported [12]. Mark-Houwink-Sakurada parameters have been reported [16,33]
Thermodynamic Properties General: Studies on heat capacity have been reported [17]. C_p 63.09 J mol^{-1} K^{-1} (0°) [62]. 86.18 J mol^{-1} K^{-1} (97°) [62].
Latent Heat Crystallization: Enthalpy of reaction 3.05 kJ g^{-1} (Courtelle). [60] ΔH 9.508 kJ mol^{-1} (0°), 16.681 kJ mol^{-1} (97°) [62]. ΔS 67.22 J mol^{-1} K^{-1} (0°), 89.53 J mol^{-1} K^{-1} (97°) [62]
Thermal Conductivity:

No.	Value
1	0.26 W/mK

Specific Heat Capacity:

No.	Value	Note	Type
1	1.285 kJ/kg.C	0.307 kcal g^{-1} °C^{-1} [73]	P

Melting Temperature:

No.	Value	Note
1	320°C	[44]
2	369°C	in N_2 [65]
3	317°C	[79,97]
4	326°C	[84]

Glass-Transition Temperature:

No.	Value	Note
1	105°C	[21,98]
2	70.5°C	[58]
3	97°C	[91]

Transition Temperature General: T_m is continually lowered as H_2O content increases, until a critical point when further addition of H_2O causes no further lowering of T_m [23]. T_m in air is obscure at a heating rate of 40° min^{-1} or lower [65]. PAN decomposes before its T_m

Transition Temperature:

No.	Value	Note	Type
1	97°C	approx. [7]	First transition temp.
2	167–177°C	[7]	High-temp. transition

Surface Properties & Solubility:

Solubility Properties General: Miscible with poly(*N*-vinyl-2-pyrrolidone) [1]. Compatible with poly(butyl methacrylate) [2], but incompatible with PVC [30,31]. Compatibility with mixtures of poly(vinyl acetate) and cellulose acetate has been reported [36]. Incompatible with poly(methyl methacrylate) in dilute soln. [37]. Partially miscible with poly(styrenesulfonic acid) [77]

Cohesive Energy Density Solubility Parameters: δ_d 9.11; δ_p 7.9; δ_h 3.3 [56]. δ 25.9–31.5 $J^{1/2}$ $cm^{-3/2}$ [64], 42.3 $J^{1/2}$ $cm^{-3/2}$ (11.9 $cal^{1/2}$ $cm^{-3/2}$) [66], 51.2 $J^{1/2}$ $cm^{-3/2}$ (12.2 $cal^{1/2}$ $cm^{-3/2}$)

Solvents/Non-solvents: Sol. DMF, ethylene carbonate [20], dimethylthioformamide, dimethylacetamide, DMSO, propiolactone, *m*-nitrophenol, *p*-nitrophenol, maleic anhydride, conc. sulfuric acid, nitric acid, dimethyl sulfone, conc. aq. solns. of lithium and zinc chloride [92,93]. Amorph. sol. propylene carbonate, formamide (above room temp.). Insol. Me_2CO [19], diethylformamide, aliphatic hydrocarbons, aromatic hydrocarbons, chlorinated hydrocarbons, diethyl sulfone

Wettability/Surface Energy and Interfacial Tension: The relationship between critical surface tension and refractive index has been reported [13]

Transport Properties:

Transport Properties General: The transport of H_2O in glassy PAN follows two modes: simple dual mode sorption at low activity sorption, and clustering at higher pressures [99]

Polymer Solutions Dilute: Intrinsic viscosity 0.727 dl g^{-1} (30°, DMF), 0.704 dl g^{-1} (45°, DMF) [19], 2.01 g cm^{-3} (23.1°, DMF) [69]. Specific viscosity 0.15 dl g^{-1} (25°, DMF) [21]. Van der Waals molar volume 32.6 cm^3 mol^{-1} [66]. Viscosity of PAN in DMF at a constant concentration increases with temp. [74]. Other viscosity studies have been reported [75]

Permeability of Gases: The correlation between temp. parameters and dimension of permeable gas molecules has been reported [25]. Permeability of He, Ne, Ar, Kr, O_2, N_2 and CO_2 has been reported [28]. Permeability of O_2, CO_2 and H_2O has been reported [45]. Has the lowest permeability of any plastic

Permeability of Liquids: Permeability [H_2O] 2.45 g (cm s cmHg)$^{-1}$ (25°) [71]. The diffusion coefficient of sulfuric acid through a PAN rope has been reported [15]

Water Content: Studies on sorbed H_2O at the polymer surface near 0° have been reported [49]

Gas Permeability:

No.	Gas	Value	Note
1	CO_2	0.052 cm^3 mm/(m^2 day atm)	0.008 × 10^{-11} cm^2 (s cm Hg)$^{-1}$, 25° [71]
2	O_2	0.013 cm^3 mm/(m^2 day atm)	0.002 × 10^{-11} cm^2 (s cm Hg)$^{-1}$, 25° [71]
3	He	34.8 cm^3 mm/(m^2 day atm)	53 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
4	Ne	1.09 cm^3 mm/(m^2 day atm)	1.67 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
5	Ar	0.0066 cm^3 mm/(m^2 day atm)	0.01 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
6	Kr	0.002 cm^3 mm/(m^2 day atm)	0.003 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
7	N_2	0.0105 cm^3 mm/(m^2 day atm)	0.016 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
8	O_2	0.0183 cm^3 mm/(m^2 day atm)	0.028 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25°
9	CO_2	0.118 cm^3 mm/(m^2 day atm)	0.18 × 10^{-12} cm^2 (s cm Hg)$^{-1}$, 25° [94]
10	He	11.16 cm^3 mm/(m^2 day atm)	0.71 × 10^{-10} cm^2 (s cm Hg)$^{-1}$, 35° [100]
11	N_2	0.002 cm^3 mm/(m^2 day atm)	2.9 × 10^{-15} cm^2 (s cm Hg)$^{-1}$, 35° [100]
12	O_2	0.035 cm^3 mm/(m^2 day atm)	5.4 × 10^{-14} cm^2 (s cm Hg)$^{-1}$, 35° [100]
13	Ar	0.0118 cm^3 mm/(m^2 day atm)	1.8 × 10^{-14} cm^2 (s cm Hg)$^{-1}$, 35° [100]
14	CO_2	0.1838 cm^3 mm/(m^2 day atm)	2.8 × 10^{-13} cm^2 (s cm Hg)$^{-1}$, 35° [100]

Mechanical Properties:

Mechanical Properties General: The relationship between elastic modulus and the thermal expansion coefficient has been reported [51]. Elastic modulus decreases with increasing temp. [95]

Tensile (Young's) Modulus:

No.	Value	Note
1	7000 MPa	[98]

Elastic Modulus:

No.	Value	Note
1	236000 MPa	syndiotactic [72]

Compressive Strength:

No.	Value	Note
1	76–130 MPa	[98]

Impact Strength: The correlation between notched Izod impact strength and dynamic mech. modulus has been reported; PAN has a low notched Izod impact strength [55]

Failure Properties General: Creep recovery is more complete at lower temps. and recovery is mainly instantaneous. At higher temps. and strains, creep induces permanent structural changes which are not recoverable on heating [50]. Fails by ductile failure at temps. well below T_g [61]

Electrical Properties:

Electrical Properties General: An electropolymerised film has both electrical insulating and conducting props. [26]. Tan δ remains constant with increasing temp. until T_g is reached, then it increases [57,63]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	5	100 kHz	30° [57]
2	4.2	1 MHz	film
3	5.5	1 kHz	film
4	6.5	60 Hz	film [90]

Complex Permittivity and Electroactive Polymers: Activation energy for electrical conductivity 1.17, 3.41 eV [39]
Magnetic Properties: Paramagnetic data have been reported [40]
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	<0.27	100 kHz	max. [57]
2	0.033	1 MHz	film [90]
3	0.085	1 kHz	film [90]
4	0.113	60 Hz	film [90]

Optical Properties:

Optical Properties General: Relationship between struct. and refractive index has been reported [46]
Refractive Index:

No.	Value	Note
1	1.514	[56]
2	1.518	25° [91]

Transmission and Spectra: Ir [4,42], Raman [8,47], C-13 nmr [35], reflection [48] and H-1 nmr [53,54] spectral data have been reported

Polymer Stability:

Polymer Stability General: Heat resistance may be increased by heating in boiling DMF for 60–90h. However, similar heating at 20–40h decreases heat resistance [41]
Thermal Stability General: Thermal anal. has been reported [32,34]
Decomposition Details: Initial decomposition temp. 300°.10% Weight loss occurs at 340° and 50% weight loss at 590° [21]. Shows 30% weight loss below 400° [22] but is more stable than other vinyl polymers such as polystyrene, polyacrylic acid, and polyacrylamide. Pyrolysis at 600° prod. a max. of 18.2 g of hydrogen cyanide per 100 g of polymer [27]. The effects of pyrolysis below 300° on the dielectric props. have been reported [38]. Initial decomposition temp. 260°, max. decomposition temp. 345° [57]. Activation energy of thermal degradation 125.6 kJ mol^{-1} (30 kcal mol^{-1}) [57], 71.5 kJ mol^{-1} [59]. Temp. range for decomposition 550–790° with 79% weight loss in this range [59]. Heating PAN in an inert atmosphere up to 800° produces three dimensional cross-linked heterocyclic products which have electrical conductivity [76]. Heating in oxygen at approx. 150° produces an insol. ladder polymer [87]. Subsequent heating up to approx. 3000° prod. carbon fibres. Char oxidation (Courtelle) -1.27 (in air), -7.15 (in O_2) [60]. Activation energy of oxidative thermal degradation 134.4 kJ mol^{-1} (32.1 kcal mol^{-1}) [65]. Char residue at 600° 57.7% [97]
Flammability: Fl. p. 331° [97]. Limiting oxygen index 15.3% (ignition of wick at bottom), 17.8% (ignition of wick at top) [96]. Oxygen index 20.2% [73,97]. 18.2% (Courtelle, ASTM D2863-77) [60]. Ignition temp. 460° [73]. Flash ignition temp. 208–212° (Courtelle) [60]; self-ignition temp. 495–500° (Courtelle, ASTM D1929-68) [60].
Environmental Stress: Has good weather resistance and excellent resistance to photodegradation [86]
Chemical Stability: Resistant to common solvents, oils and chemicals. Has excellent resistance to ozonolysis
Hydrolytic Stability: Attacked by strong bases in soln. whereas weak bases cause only colouration [9]. Decomposition by potassium hydroxide increases with an increase in base concentration, temp. and time, with greatest increase in reaction occurring at 30 min. [18]. May be hydrated by conc. sulfuric acid. Reacts with hydroxylamine [85]
Biological Stability: PAN filaments are degraded by *Cladosporium cladosporioides* [24]. PAN film loses some mechanical props. when immersed for 1 year in a pseudo-extracellular fluid [29]
Recyclability: PAN fibre or textile waste may be recovered by chemical conversion to poly(acrylic acid) [88]
Stability Miscellaneous: Laser or γ-irradiation causes intense chain fragmentation yielding radicals [14]. Annealing at 210° in argon causes changes in physical props. but no weight loss [52]

Applications/Commercial Products:

Processing & Manufacturing Routes: May be synth. by photopolymerisation using a binary catalyst (8-acryloyloxyquinoline polymer and carbon tetrabromide) [6]; by aq. polymerisation at 40–50° using a peroxodisulfate-thiourea redox system [10]. At monomer concentrations of 6 mol l^{-1} in DMF or ethylene carbonate, precipitation may occur during radical polymerisation [20]. Max. bulk polymerisation rate is strongly dependent upon temp. and initiator concentration [33]. Amorph. PAN may be synth. using an organomagnesium catalyst [83, 101]. Synth. commercially by bulk, emulsion, suspension, slurry, or soln. polymerisation. Bulk processes can suffer from polymer precipitation and autocatalytic behaviour. Cannot be melt processed into films or sheeting owing to degradation
Applications: May be thermally converted into carbon fibre used in advanced composites. Applications due to excellent oxygen and CO_2 barrier props. in packaging laminations. Fibres used in blood cell filters. Other uses as catalyst support for Ti and Zr complexes; in preformed trays and in xerography. Its use in bottles for carbonated beverages was prohibited in 1977 by the FDA

Trade name	Details	Supplier
PAN	A-425	Solvay
Solton	S6, S10	Solvay

Poly(L-alanine) fibre P-64

Synonyms: *PLA fibre*
Related Polymers: Proteins
Monomers: L-Alanine
Material class: Fibres and Films, Proteins and polynucleotides
CAS Number:

CAS Reg. No.	Note
25191-17-7	homopolymer

Molecular Formula: $(C_3H_7NO_2)_n$
Morphology: Undergoes α to β transition at approx. 60°. The greater the β-form content, the more silky the fibre. [1] The α-form content may be increased by using a slow spin speed. The fibre is crystalline only at the surface and contains a large proportion of the β-form. The core of the fibre may contain unoriented amorph. poly (L-alanine) in the α-helical conformn. [7]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26–1.27 g/cm^3	stretched fibre [1]

Transport Properties:

Polymer Solutions Dilute: η 3.84 [1]
Water Absorption:

No.	Value	Note
1	8.7%	20°, 80% relative humidity [1]
2	16%	20°, 100% relative humidity [1]

Mechanical Properties:

Mechanical Properties General: Tenacity 3.5 g den^{-1} (6% elongation) [1], 4.34 g den^{-1} (stretched fibre, dry) (9.3% elongation) [1], 2.75g den^{-1}(stretched fibre, wet) (11.9% elongation), 3.82 g den^{-1} [2], 2.8 g den^{-1} (20.3% elongation) [5]. Tensile modulus 102 g den^{-1} [1]

Polymer Stability:

Decomposition Details: Details of the effects of oxidative and optical degradation of the surface struct. have been reported [4]
Chemical Stability: Effect of solvents have been reported [8]

Applications/Commercial Products:

Processing & Manufacturing Routes: Poly(L-alanine) in dichloroacetic acid or 92% nitric acid at -10° [5] is spun into H_2O at 60 ° [2,3]. The resultant fibre is stretched twice its length in H_2O at 80°, then wound through a hot roller at 110°. The fibre is then washed and treated with boiling water to set it into the β-form. [1,7] Other syntheses have been reported [6]
Applications: Synthetic silk

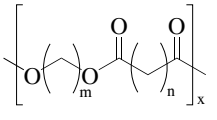
Poly(alkyl 2-cyanoacrylates) P-65

Related Polymers: Poly(methyl 2-cyanoacrylate), Poly(ethyl 2-cyanoacrylate), Poly(isobutyl 2-cyanoacrylate), Poly(allyl 2-cyanoacrylate)
Material class: Thermoplastic, Gums and resins
Polymer Type: acrylic, acrylonitrile and copolymers
General Information: Poly(alkyl 2-cyanoacrylates) have been thoroughly reviewed [1,2,3,4]. The interest in these polymers stemmed from a search for acrylic polymers with improved props. and the adhesive props. were discovered serendipitously. Commercial products are unpolymerised monomer; these are low viscosity liquids with good wetting props. which undergo an almost instantaneous polymerisation when in contact with nucleophilic or basic substances via an anionic polymerisation pathway which has no defined end point. The polymers so produced have high MW, which can approximate to living polymerisation, and because of the polar cyano and carbonyl functions have excellent adhesive props., bonding to a range of materials. Kinetics of polymerisation have been reported [5,6] and the polymerisation reaction is initiated by a range of bases such as hydroxide (fast) or amines (slower). Acids terminate and inhibit polymerisation. Cyanoacrylates used as adhesives have several advantages [2] over other adhesives systems. The system requires no mixing of different components; approaches 100% conversion of monomer with a very rapid cure time (in most cases cure is complete within minutes up to 24h). The adhesive bond is strong and many materials can be bonded: metals, other polymers to similar or different materials. The polymers are hard, colourless and amorph. Generally T_g and polarity decrease with increasing alkyl group size [7]. Solubility in organic solvents increases with increasing alkyl group size. The disadvantages of cyanoacrylate adhesives include brittleness and low toughness. Heat resistance is poor, and metal-metal bonds are degraded by moisture. As the polymerisation is catalysed on the material's surface, use as a gap filling adhesive is limited. Commercial materials are susceptible to degradation on storage, and by heat, light, and moisture. Often stabilised with acidic gases. Thickeners such as poly(methyl methacrylate), [9] are used to increase viscosity and to improve bonding. Toughness is improved by addition of copolymers such as ABS or EVA and phthalates are used as plasticisers to improve ageing
Miscellaneous: Bonding props. are improved through proper surface preparation. May also be used to join acidic surfaces such as wood, by surface treatment with base, or addition of curing agents such as crown ethers. [3] Caffeine has been used as a surface treatment to initiate bulk polymerisation [2]

Applications/Commercial Products:



Processing & Manufacturing Routes: Alkyl cyanoacrylates may be prepared from cyanoacetate esters and a halomethyl ester, or more commonly by the base catalysed Knoevenagel condensation of cyanoacetate and formaldehyde. The monomer thus formed spontaneously polymerises, is purified and is heated to 150–300° to induce retropolymerisation. The monomer is then stabilised by addition of acid and radical inhibitors
Applications: Due to the rapid polymerisation and low cure time necessary, adhesives are used on assembly lines to bond materials such as electronic components, electric motors, sports goods, lenses, camera equipment, aircraft interiors, computer housings and medical equipment. Excellent for bonding plastic materials such as polyethylene, though metal-metal bonds tend to degrade. Also suitable for medical applications, as a surgical adhesive for wound repair. Also used in drug delivery systems, where they are used in coating of colloid nanoparticles, where polymerisation occurs at the colloid interface. Also used as photoresists in electronics manufacture

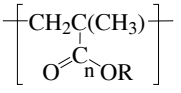
Polyalkylene dicarboxylates, General P-66

Related Polymers: Poly(ethylene sebacate), Poly(ethylene succinate), Poly(tetramethylene adipate), Poly(decamethylene seba-

cate), Poly(decamethylene adipate), Poly(ethylene adipate), Poly(ethylene azelate), Polybutylene succinate
Material class: Thermoplastic
Polymer Type: saturated polyester
General Information: Biodegradable polymers, biopolymers.

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: Melting points for a range of polyalkylene dicarboxylates reported [2].

Polymer Stability:
Biological Stability: Biodegradable via enzymatic hydrolysis; biodegrades in soil, seawater, compost and freshwater. Polybutylene succinate adipate degrades faster than polybutylene succinate.



Applications/Commercial Products:
Processing & Manufacturing Routes: Polycondensation data reported [2]. Processing by any conventional method that can be applied to polyolefines but with some modification [2].
Applications: Biodegradable bags (compost, garbage, packaging), rope, tape, packaging film.

Trade name
Bionolle

Poly(alkyl ether methacrylate) P-67

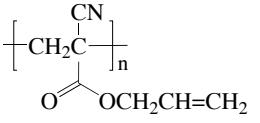
R = CH_2CH_2OMe (2-methoxyethyl)
= CH_2CH_2OEt (2-ethoxyethyl)
= $CH_2CH_2OCH_2CH_2CH_3$ (2-propoxyethyl)
= $CH_2CH_2OCH_2CH_2CH_2CH_3$ (2-butoxyethyl)

Synonyms: *Poly(2-methoxyethyl methacrylate). Poly(2-ethoxyethyl methacrylate). Poly(2-propoxyethyl methacrylate). Poly(2-butoxyethyl methacrylate)*
Related Polymers: Polymethacrylates, General
Monomers: 2-Methoxyethyl methacrylate, 2-Ethoxyethyl methacrylate, 2-Propoxyethyl methacrylate, 2-Butoxyethyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
36561-33-8	2-ethoxyethyl
26677-80-5	2-butoxyethyl

Volumetric & Calorimetric Properties:
Equation of State: Mark-Houwink constants for the 2-methoxyethyl ester have been reported [3]
Thermodynamic Properties General: Thermal expansivity has been reported [1]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Cohesive energy 49.3–60 kJ mol^{-1} (2-ethoxyethyl) [1]. δ 18.4–20.3 $J^{1/2}$ $cm^{-3/2}$ (2-ethoxyethyl) [1]
Wettability/Surface Energy and Interfacial Tension: Contact angle (2-methoxyethyl) 48° (air), 78° (Me_2CO), 74° (dodecane) [2]. Interfacial tension 21.6–24.2 mN m^{-1} (solid/H_2O, 2-methoxyethyl) [2]
Surface Tension:



No.	Value	Note
1	68–74.2 mN/m	γ_d 47.0–52.4; γ_p 21.0–21.8, 2-methoxyethyl [2]
2	71.1 mN/m	20°, 2-methoxyethyl hydrogel, 2% wt H_2O [2]

Transport Properties:
Polymer Solutions Dilute: Molar volumes 80.26 cm^3 mol^{-1} (25°, 2-methoxyethyl, amorph.) [1], 100.72 cm^3 mol^{-1} (25°, 2-propoxyethyl, amorph.) [1]. Theta temps. 64° (butanol, 2-methoxyethyl) [4], 38° (butanol, 2-ethoxyethyl) [4], 17° (butanol, 2-butoxyethyl) [4]

Poly(allyl cyanoacrylate) P-68

Synonyms: *Allyl cyanoacrylate polymer*
Related Polymers: Poly(alkyl 2-cyanoacrylates), Poly(methyl cyanoacrylate), Poly(ethyl cyanoacrylate), Poly(isobutyl cyanoacrylate)
Monomers: Allyl 2-cyanoacrylate
Material class: Thermoplastic, Gums and resins
Polymer Type: acrylic, acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
30209-88-2

Molecular Formula: $(C_7H_7NO_2)_n$
Fragments: $C_7H_7NO_2$
Molecular Weight: 182000
General Information: Unsaturated side chain allows potential for crosslinking and somewhat anomalous props. Crosslinking occurs at high temp.
Morphology: Amorph.

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: Thermodynamic parameters have been reported [4]
Specific Heat Capacity:

No.	Value	Note	Type
1	1.216 kJ/kg.C	0.166 KJ mol^{-1}, -23°	p
2	1.476 kJ/kg.C	0.194 KJ mol^{-1}, 25° [4]	P
3	1.623 kJ/kg.C	0.223 KJ mol^{-1}, 77° [3]	p

Glass-Transition Temperature:

No.	Value	Note
1	90°C	dynamic mechanical analysis [1]
2	115°C	[5]
3	170°C	fully cross-linked [5]
4	119.7°C	differential scanning calorimetry

Transition Temperature General: Low T_g may be due to water content [1]
Vicat Softening Point:

No.	Value	Note
1	78°C	[2]

Surface Properties & Solubility:

Solubility Properties General: Incompatible with poly(methyl 2-cyanoacrylate [3]. Solubility parameter δ 11.5 $J^{1/2}cm^{-3/2}$ [6]

Transport Properties:

Polymer Solutions Dilute: [η] 0.16 dl g^{-1} (1% in C_6H_6)
Water Content: 4.9%
Water Absorption:

No.	Value	Note
1	4.9 %	[1]

Mechanical Properties:

Mechanical Properties General: Increasing temp. increases storage modulus, probably due to temp. induced cross-linking
Flexural Modulus:

No.	Value	Note
1	1751 MPa	254 kpsi, ASTM D790 [2]

Tensile Strength Break:

No.	Elongation
1	10 % [2]

Miscellaneous Moduli:

No.	Value	Note	Type
1	2500 MPa	25° [1]	storage modulus

Impact Strength: 5.9 KJ m^{-2} (23°, 24h, ASTM D950); 3.8 KJ m^{-2} (100°, 24h); 1.6 KJ m^{-2} (150 °, 5h) [7]
Mechanical Properties Miscellaneous: Tensile shear strength 12.7 MPa (23°, 24h); 29.1 MPa (100°, 24h); 3.2 Mpa (150°, 5h) [7] 20.82 Mpa (3120 psi, steel-steel, ASTM D1002 [2], 6.55 Mpa (950 psi, Al-Al, ASTM D1002 [2]. Lap shear strength 22 Mpa [2]; 15.8 MPa; 17.2 MPa (100°, 24h); 7.8 Mpa (150°, 24h) [5]. Loss factor [1] and dynamic mechanical props. have been reported [5]

Electrical Properties:

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.8	1 MHz	ASTM D150 [2]

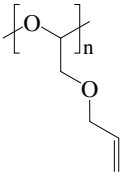
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.02	1 MHz	ASTM D150 [2]

Polymer Stability:

Thermal Stability General: Better thermal stability than other alkyl cyanoacrylates due to cross-linking [1]
Decomposition Details: Decomp. onset 127° (N_2). Lower than other alkyl cyanoacrylates but retains mechanical props. to high temps.
Environmental Stress: As with other cyanoacrylates, poor resistance to moisture. Unsuitable for use in situations of high heat, high impact, moisture or outdoor use
Chemical Stability: Stable to oils
Hydrolytic Stability: Degrades in aqueous soln. releasing formaldehyde

Applications/Commercial Products:



Processing & Manufacturing Routes: Spontaneous polymerisation of allyl 2-cyanoacrylate monomer catalysed by base. Cure times longer than for lower homologues. see poly(alkyl cyanoacrylates)
Applications: Instant one pot adhesive

Trade name	Supplier
Powerbond	Permabond

Poly(1-allyloxy-2,3-epoxypropane) P-69

Synonyms: *Poly[[(2-propenyloxy)methyl]oxirane]*
Monomers: (2-Propenyloxymethyl)oxirane
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.	Note
25639-25-2	homopolymer

Molecular Formula: $(C_6H_{10}O_2)_n$

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 1.048 g/cm^3	[5]

Glass-Transition Temperature:

No.	Value	Note
1	-74°C	by calorimetry [5]
2	-78°C	by dilatometry [5]

Transition Temperature General: Has no T_m [5]
Vicat Softening Point:

No.	Value	Note
1	285°C	polyethylenepolyamine cured [2]

Transport Properties:
Transport Properties General: $[\eta]_{inh}$ 4.6 dl g^{-1} (toluene, 30°). [5]
Reduced viscosity 2.6–3.2 dl g^{-1} (cyclohexanone, 50°) [6]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note
1	68.6 MPa	700 kg cm^{-2}, polyethylenepolyamine cured [2]

Flexural Strength at Break:

No.	Value	Note
1	156.9 MPa	1600 kg cm^{-2}, polyethylenepolyamine cured [2]

Compressive Strength:

No.	Value	Note
1	186.3 MPa	1900 kg cm^{-2}, polyethylenepolyamine cured [2]

Hardness: Brinell hardness 40 kg mm^{-2} (polyethylenepolyamine cured) [2]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.478	30° [5]

Transmission and Spectra: H-1 nmr and C-13 nmr spectral data have been reported [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Synth. by cationic polymerisation [7] of allyl glycidyl ether with boron trifluoride etherate at room temp. for 1.5 h. [1] Also synth. by $FeCl_3$ catalysis in the absence of air [3]; by bulk polymerisation using metal caprylates [4]; by soln. polymerisation in C_6H_6 at 50° using a diethylzinc-sulfur catalyst. [5] Polymerisation with diethyl zinc-nitromethane catalyst yields a rubbery solid [6]
Applications: As a curing agent for acrylates; in adhesives and coatings. Used as a reactive diluent in other epoxy resin compositions

Poly(alpha olefin) P-70

Synonyms: *PAO. Poly(α-olefin). Poly(1-decene) oligomeric. Poly-alphaolefin oligomer*
Related Polymers: Poly(1-decene)
Monomers: 1-Decene
Material class: Fluids
Polymer Type: polyolefins
CAS Number:

CAS Reg. No.	Note
68037-01-4	Poly(1-decene) oligomer
25189-70-2	Poly(1-decene)
17438-89-0	1-decene dimer
14638-82-5	1-decene trimer
54545-42-5	1-decene tetramer
75818-30-3	1-decene pentamer
75818-31-4	1-decene hexamer

Molecular Formula: $(C_{10}H_{20})_n$
Fragments: $C_{10}H_{20}$
Molecular Weight: MW 400–600
General Information: Clear liq. with a barely perceptible odour. Oligomers are used as synthetic lubricants

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d^{16} 0.818 g/cm^3	ASTM D1298 [1]

Surface Properties & Solubility:
Solvents/Non-solvents: Insol. H_2O [6]

Transport Properties:
Polymer Melts: Viscosity index 137 (ASTM D2270) [1]. Viscosity 0.039 St (100°, ASTM D445) [1]. Pour point -70° (ASTM D97) [1]
Volatile Loss and Diffusion of Polymers: NDACk volatility 12% (250°, 1h, DIN 51581) [1]
Water Content: 11 ppm (ASTM D1744) [1]

Electrical Properties:
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	2.102	1–1000 kHz	23° [1]

Optical Properties:
Transmission and Spectra: H-1 nmr, C-13 nmr and Raman spectral data have been reported [7]
Volume Properties/Surface Properties: Clear liq., colour 0.5 (max., ASTM D1500) [1]

Polymer Stability:
Environmental Stress: Oxidation occurs above 192° [1] and props. have been reported [8]. The principal products of oxidation are H_2O and CO_2 [9]

Applications/Commercial Products:
Processing & Manufacturing Routes: Linear α-olefins are prod. by catalytic oligomerisation of ethylene with $AlEt_3$ or nickel-based catalysts. α-Olefins are then oligomerised using cationic initiators (BF_3, boron trifluoride/alcohols, $AlCl_3$, $TiCl_4$ and trialkyl aluminium, and $AlBr_3$) at low temps.
Applications: Synthetic lubricant used in lubricant formulation for industrial oils, transformer oils, compressor oils, hydraulic fluids, transmission fluids, gear oils, crankcase fluids, and heat transfer fluids. Also used in multipurpose greases for industrial applications

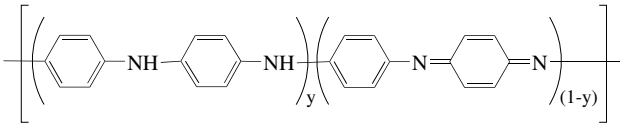
Poly(anhydrides) P-71
Related Polymers: Poly(oxyisophthaloyl), Poly(oxycarbonyl-1,4-phenylene methylene-1,4-phenylene carbonyl), Poly(oxycarbonyl-1,4-phenylene isopropylidene-1,4-phenylene carbonyl)
General Information: The polyanhydride of an aromatic dicarboxylic acid was first prepared in 1909 [9] and aliphatic polyanhydrides were first synth. in 1932 [10]; they possessed fibre-forming props. but low melting point and hydrolytic stability. It was reported that certain aromatic polyanhydrides had excellent film and fibre-forming props. due to the accumulation of phenylene nuclei along the polymer chain [3]. Research in to this class of polymers was revitalised by researches at MIT in the early 1980's in developing biodegradeable polymeric biomaterials of potential use for drug delivery [1]

Volumetric & Calorimetric Properties:
Transition Temperature General: T_m and T_g values have been reported for a range of poly(anhydrides) [3]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Cohesion energies of a series of poly(anhydrides) have been reported [6]
Solvents/Non-solvents: Sol. common organic solvents [1]. Highly aromatic polymers are sol. in polar organic solvents



Polymer Stability:
Decomposition Details: Decomposition rate decreases with increasing aromaticity of the polymer backbone
Hydrolytic Stability: Good hydrolytic stability for aromatic polyanhydrides, aliphatic polyanhydrides are known to decompose on standing [1,7]
Biological Stability: Good biocompatibility [1]

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by intramolecular dehydrochlorination of a diacid chloride and a dicarboxylic acid; or melt-polycondensation with a mixed anhydride; or interfacial polycondensation [1,2,4,5,8,13]
Applications: Potential as biodegradeable materials for medical applications, temporary scaffolds and barriers, medical sutures, bottles and bags, microspheres and microcapsules

CAS Reg. No.
25233-30-1

Molecular Formula: $[(C_{12}H_{10}N_2).(C_{12}H_8N_2)]_n$
Fragments: $C_{12}H_{10}N_2$ $C_{12}H_8N_2$
General Information: Polyaniline may exist in a number of forms [19] and chemical struct. depends upon the method of synth. [1,2,3,4,5,6]. The quinoid-benzenoid-diimine form is an insulator. Redox switching between forms has been studied [20]
Morphology: Orthorhombic, a 7.65, b 5.75 c 10.22 [7]

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. DMF. Spar. sol. CH_2Cl_2, dioxane [8]

Mechanical Properties:
Tensile Strength Break:

No.	Value	Note	Elongation
1	50 MPa	cross-linked [9]	14%
2	10 MPa	cross-linked [9]	4%
3	52 MPa	rigid [9]	33%
4	7 MPa	rigid [9]	20%

Elastic Modulus:

No.	Value	Extension	Note
1	1150 MPa	14%	cross-linked [9]
2	60 MPa	4%	cross-linked [9]
3	1310 MPa	33%	rigid [9]
4	60 MPa	20%	rigid [9]

Electrical Properties:

Electrical Properties General: Conduction in polyaniline can be accounted for in terms of electron flow by the assistance of proton transfer [10,11,13]. Emeraldine is the conducting form [19]. Electrochemical methods allow formation of conducting films at the electrode and doped conductive forms are known [21]

Surface/Volume Resistance:

No.	Value	Note	Type
3	0.00071×10^{15} Ω.cm	250° [14]	S

Complex Permittivity and Electroactive Polymers: Electrorheological fluids with polyaniline particles have been studied. [23] Oriented films show high electrical anisoptropy with the highest conductivity in the stretch direction. Conductivities greater than 6000 S cm^{-1} have been reported. [27] The effects of monomer concentration and substrate resistance on redox props. have been reported [28]

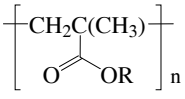
Magnetic Properties: Oriented films behave as highly one-dimensional metallic systems with no Curie-type behaviour even at low temps. (below -263°) [27]

Optical Properties:

Transmission and Spectra: Ir [8,15,16], uv [7], H-1 nmr [30] and epr [12,13,30] spectral data have been reported

Applications/Commercial Products:

Processing & Manufacturing Routes: Chemical and electrochemical methods of synth. can be employed [1,8,17,18,19]. Chemical synth. can prod. polymer contaminated with oxidative agents used in synth. Graft copolymerisation on polyacrylamide [24] and conducting soluble copolymers [25] have been made. Conducting composites of polyaniline have been reviewed [26] Conducting films may be synth. by oxidation of aniline with ammonium persulfate at -30° in the presence of lithium chloride. Films are cast from *N*-methylpyrrolidone soln. [27]



Applications: Modified electrodes, corrosion inhibitor for semiconductors in photoelectrochemical assemblies, microwave absorbers, and electromagnetic shields. Oriented films have potential applications in electrical devices (lightweight batteries, sensors, etc.)

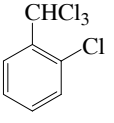
Poly(arylalkyl methacrylates) P-73



R = CH_2Ph (benzyl)

= $CHPh_2$ (diphenylmethyl)

= CPh_3 (triphenylmethyl)

= $CHCH_3$ (1-phenylethyl)
Ph

= CH_2CH_2Ph (2-phenylethyl)

=  (1-(o-chlorophenyl)ethyl

= $CHCH_2Ph$ (1,2-diphenylethyl)
Ph

= $CH_2CH_2CH_2CH_2Ph$ (4-phenylbutyl)

= $CH_2CH_2OCPh_3$ (triphenylmethoxyethyl)

Synonyms: *Poly(arylalkyl 2-methyl-2-propenoate). Poly(benzyl methacrylate). Poly(diphenylmethyl methacrylate). Poly(triphenylmethyl methacrylate). Poly(1-phenylethyl methacrylate). Poly(1-o-chlorophenylethyl methacrylate). Poly(1,2-diphenylethyl methacrylate). Poly(triphenylmethoxyethyl methacrylate). Poly(2-phenylethyl methacrylate). Poly(4-phenylbutyl methacrylate)*

Related Polymers: Polymethacrylates, General, Poly(aryl methacrylates)

Monomers: Benzyl methacrylate, Diphenylmethyl methacrylate, Triphenylmethyl methacrylate, 1-Phenylethyl methacrylate, 1-(*o*-

Chlorophenylethyl) methacrylate, 2-Phenylethyl methacrylate, 1,2-Diphenylethyl methacrylate, 4-Phenylbutyl methacrylate, Triphenylmethoxyethyl methacrylate
Material class: Thermoplastic
Polymer Type: acrylic
CAS Number:

CAS Reg. No.	Note
25085-83-0	benzyl
27497-74-1	triphenylmethyl

Tacticity: For polymerisations carried out in C_6H_6 using AIBN the isotactic content of the polymer increases in the order: benzyl > diphenylmethyl > triphenylmethyl (< 5%, 25% and 40% respectively) [1]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d^{20} 1.179 g/cm^3	benzyl, amorph.
2	d^{25} 1.168 g/cm^3	diphenyl, amorph.
3	d^{25} 1.129 g/cm^3	1-phenylethyl, amorph.
4	d^{25} 1.269 g/cm^3	1-(*o*-chlorophenylethyl)
5	d^{25} 1.147 g/cm^3	1,2-diphenylethyl, amorph. [2]

Thermal Expansion Coefficient:

No.	Value	Note	Type
1	0.0005 K^{-1}	benzyl, M_n 400000, $T > T_g$ [4]	V
2	0.00051 K^{-1}	2-phenylethyl, $T > T_g$ [4]	V

4	0.00018 K^{-1}	2-phenylethyl, $T < T_g$ [4]	V

Equation of State: Mark-Houwink constants have been reported [1,5,8,9]
Glass-Transition Temperature:

No.	Value	Note
1	54°C	benzyl, M_n 400000 [4]
2	26–56°C	2-phenylethyl [4,5]
3	10°C	4-phenylbutyl [5]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Cohesive energy 61100–63500 J mol^{-1} (benzyl) [2]. δ 20.3 J$^{1/2}$ cm$^{-3/2}$ [2], 20.1–20.5 J$^{1/2}$ cm$^{-3/2}$ [2], 38.9 J$^{1/2}$ cm$^{-3/2}$ (9.29 cal$^{1/2}$ cm$^{-3/2}$ [6]
Surface Tension:

No.	Value	Note
1	36 mN/m	benzyl, 20° [7]

Transport Properties:

Polymer Solutions Dilute: Molar volumes (van der Waals, 25°) 98.5 cm^3 mol^{-1} (benzyl, amorph.), 142.7 cm^3 mol^{-1} (diphenylmethyl, amorph.), 108.7 cm^3 mol^{-1} (1-phenylethyl, amorph.), 117.8 cm^3 mol^{-1} (1-(*o*-chlorophenylethyl), 147.7 cm^3 mol^{-1} (1,2-diphenylethyl, amorph.); molar volumes (glassy, 25°) 149.5 cm^3 mol^{-1} (benzyl, amorph.), 216 cm^3 mol^{-1} (diphenylmethyl, amorph.), 285.3 cm^3 mol^{-1} (triphenylmethyl), 168.5 cm^3 mol^{-1} (1-phenylethyl, amorph.), 177.1 cm^3 mol^{-1} (1-(*o*-chlorophenylethyl), amorph.), 232.2 cm^3 mol^{-1} (1,2-diphenylethyl, amorph.) [2,3]. Intrinsic viscosity 0.285 dl g^{-1} (30°, THF, 4-phenylbutyl, MW 143000), 2.98 dl g^{-1} (30°, THF, 4-phenylbutyl, MW 3130000), 0.159 dl g^{-1} (30°, THF, 2-phenylethyl, MW 59000), 1.55 dl g^{-1} (30°, THF, 2-phenylethyl, MW 1180000) [5]. Intrinsic viscosity increases with increasing MW. Theta temps. 73.2° (cyclohexanone, benzyl, VM method) [9], 83.5° (cyclopentanol, benzyl, A method) [10], 45° (3-heptanone, diphenylmethyl) [1], 27.5° (1-chloroheptane, 2-phenylethyl) [5], 23.0° (1-chloroundecane, 4-phenylbutyl) [5], 47° (mesitylene, triphenylmethoxyethyl) [11]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.568	20°, benzyl [2]

Polymer Stability:

Stability Miscellaneous: Electron beam or γ-irradiation cause scission with rapid degradation of the polymer [12]

Poly(benzoyl-*p*-phenylene) P-75

Synonyms: *Poly(benzoyl-1,4-phenylene). 2,5-Dichlorobenzophenone homopolymer. Poly(2,5-benzophenone)*
Monomers: 2,5-Dichlorobenzophenone
Material class: Thermoplastic
CAS Number:

CAS Reg. No.	Note
150385-13-0	poly(benzoyl-1,4-phenylene)
150347-09-4	2,5-dichlorobenzophenone homopolymer

Molecular Formula: $(C_{13}H_8O)n$
Fragments: $C_{13}H_8O$
General Information: High-strength amorphous polymer with photoluminescent and electroluminescent properties. Prod. as yellow powder.
Tacticity: Polymer produced using bipyridine as co-ligand has either less head-to-tail units in polymer [1] or less head-to-head units restricting conjugation [2] compared to polymer produced without bipyridine.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d1.21 g/cm^3	[3]

Glass-Transition Temperature:

No.	Value	Note
1	149–234°C	T_g increases when bipyridine is co-ligand in production process [1,2,4]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. $CHCl_3$, CH_2Cl_2, hexane, *sym*-dichloroethane [3,4], dioxan [5], THF (polymer prepared with bipyridine) [4].

Transport Properties:

Transport Properties General: Has high melt viscosity, with chains highly extended in the melt [3].

Mechanical Properties:

Mechanical Properties General: Has very high strength at r.t. but is very brittle at low temperatures [6].

Tensile (Young's) Modulus:

No.	Value	Note
1	9600 MPa	Parmax 1000, 22°C [6]
2	8000 MPa	Parmax 1200, 22°C [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	188 MPa	Parmax 1000, 22°C [6]	0.9%
2	203 MPa	Parmax 1200, 22°C [6]	4%

Compressive Strength:

No.	Value	Note
1	367 MPa	Parmax 1000, 22°C [6]
2	351 MPa	Parmax 1200, 22°C [6]

Electrical Properties:

Electrical Properties General: For polymers prepared with bipyridine co-ligand, electroluminescence is exhibited in blue region of spectrum with λ_{max} *ca.* 446nm [7,8]. LED devices have been developed with the polymer as emissive layer; turn-on voltage *ca.* 12V. The estimated band gap is 2.74eV [8].

Optical Properties:

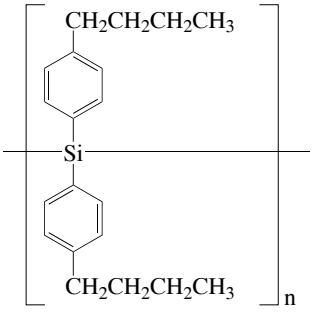
Optical Properties General: Polymer (bipyridine ligand process) exhibits uv absorption band centred in the region of 350–380nm [4,5,7,8]. There is a slight red shift on going from solution to film [7]. Photoluminescence for same polymer film occurs in blue region with λ_{max} 433nm [7,8]. For polymer produced without bipyridine, both absorption and photoluminescence occurs at shorter wavelength [4,8].

Transmission and Spectra: Pmr [9], cmr [2, 9], ftir [4], uv and photoluminescence [4,5,7,8] and electroluminescence [7,8] spectral data have been reported.

Polymer Stability:

Thermal Stability General: The polymer is very stable in both air and nitrogen with decomposition (5% weight loss) not occurring on heating until *ca*. 500°C [1,10,11].

Applications/Commercial Products:



Processing & Manufacturing Routes: Prod. by polymerisation of 2,5-dichlorobenzophenone with Ni(0), (generated *in situ* from $NiCl_2$ and Zn) and triphenylphosphine in a suitable solvent such as dimethylformamide or dimethylacetamide [4,8,9,10,11]. The addition of 2,2′-bipyridine as a co-ligand in preparation results in formation of polymer with different physical and optical properties [1,2,4].
Applications: Polymer and composites have possible applications in aircraft and automotive parts, in medical equipment and semiconductor components. Sulfonated derivatives may find application in proton-conducting membranes for fuel cells.

Trade name	Details	Supplier
Parmax 1000	poly(benzoyl-*p*-phenylene) homopolymer	Mississippi Polymer Technologies
Parmax 1200	copolymer with *ca*. 15% 1,3-phenylene units	Mississippi Polymer Technologies

Poly[bis(4-butylphenyl)silane] P-76

Synonyms: *Poly[bis(4-butylphenyl)silylene]. Bis(4-butylphenyl)-dichlorosilane homopolymer. PBPS*
Material class: Thermoplastic
Polymer Type: polysilanes

CAS Number:

CAS Reg. No.	Note
107999-72-4	poly[bis(4-butylphenyl)silylene]
111939-58-3	bis(4-butylphenyl)dichlorosilane homopolymer

Molecular Formula: $(C_{20}H_{26}Si)n$
Fragments: $C_{20}H_{26}Si$
General Information: Conductive thermochromic polysilane exhibiting photoluminescence and electroluminescence. Prod. as white solid.
Morphology: A disordered conformation is stable at r.t. and normal pressure, which is converted to a *trans*-planar conformation on heating [1,3].

Volumetric & Calorimetric Properties:

Transition Temperature General: At 87–90°C there is an endothermic transition from the disordered form to a *trans*-planar conformation [1,2,3].

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. toluene, THF, hexane, $CHCl_3$ [1,2].

Electrical Properties:

Electrical Properties General: Hole transport predominates, although electron transport has been detected [5]. Stable LED devices with PBPS as the emissive layer have been produced, with electroluminescence in near-UV region with λ_{max} at *ca*. 407nm and with turn-on voltages of *ca*. 18V [1,3,6,9]. Improved LED performance is achieved with lower molecular-weight batches of polymer [7]. Band gap for *trans*-planar conformation (predominates for electroluminescence) is smaller than for disordered conformation [1]. Ionisation potential *ca*. 5.5eV. Hole mobility is increased when the polymer is doped with the electron-acceptor C_{60}-fullerene [8].

Optical Properties:

Optical Properties General: In THF solution absorption occurs with λ_{max} at 390nm. Films cast from soln. exhibit with time a decrease in absorption at 390nm and a blue shift with λ_{max} increasing at 315nm. The absorption centred at 390nm increases in magnitude on increasing the temperature. Similar changes occur with the photoluminescence band with a blue shift of about 10nm (410 to 400nm). These changes are attributed to a change in conformation in solution and on heating [1].
Transmission and Spectra: Pmr [2], ir [2], uv and photoluminescence [1,3] and electroluminescence [1,3,6,9] spectral data have been reported.

Applications/Commercial Products:

Processing & Manufacturing Routes: Prod. by Wurtz dehalogenation coupling of bis(4-butylphenyl)dichlorosilane with Na in a solvent such as toluene [2].
Applications: Potential applications for durable polysilane-based LEDs and transistors.

Poly(1,2-bis(2,3-epoxyprop-1-oxy)benzene) P-78

Synonyms: *Poly(2,2′-(1,2-phenylenebis(oxymethylene)bisoxirane))*
Monomers: 1,2-Bis(2,3-epoxypropoxy)benzene
Material class: Thermosetting resin
Polymer Type: epoxy
CAS Number:

CAS Reg. No.	Note
63298-90-8	homopolymer
66485-75-4	copolymer with 1,3-benzenediamine
62570-75-6	copolymer with 4,4′-sulfonylbis(benzeneamine)
84241-79-2	copolymer with aniline
62570-77-8	copolymer with 3,3′-diaminodiphenylsulfone
66485-77-6	copolymer with 2,6-diaminopyridine

Molecular Formula: $(C_{12}H_{14}O_4)_n$
Fragments: $C_{12}H_{14}O_4$
General Information: Reaction of monomer with amines gives structures predominantly containing rings [6,8]. Props. depend on the curing agent and cure time and temp.

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.299 g/cm^3	*m*-phenylenediamine cured [2]

Glass-Transition Temperature:

Poly[9,9-bis(2-ethylhexyl)fluorene] P-79

Synonyms: *Poly[9,9-bis(2-ethylhexyl)-9H-fluorene-2,7-diyl]. 2,7-Dibromo-9,9-bis(2-ethylhexyl)-9H-fluorene homopolymer. PF2/6*
Material class: Thermoplastic
Polymer Type: polyfluorene
CAS Number:

CAS Reg. No.	Note
188201-14-1	Poly[9,9-bis(2-ethylhexyl)-9*H*-fluorene-2,7-diyl]
188201-16-3	2,7-Dibromo-9,9-bis(2-ethylhexyl)-9*H*-fluorene homopolymer
460089-72-9	(*R*,*R*)-form

Molecular Formula: $(C_{29}H_{40})_n$
Fragments: $C_{29}H_{40}$
General Information: Stable blue light-emitting photoluminescent and electroluminescent polymer with high hole transport mobility and with liquid crystalline properties. The chiral (*R*,*R*)-form has been prepared [1].
Morphology: Helical conformation of polymer chains with almost hexagonal unit cell after annealing above glass-transition temperature or in liquid crystal phase followed by cooling, a=17.1, b=17.0, c=40.8Å [2,3].

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	80°C	approx. [4,5]

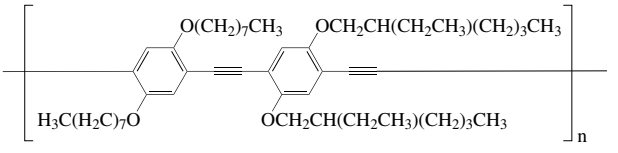
Transition Temperature General: Transition on heating from hexagonal to nematic phase in the region of 140–165°C [4].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. THF, toluene, $CHCl_3$, CCl_4 [4,13].

Electrical Properties:
Electrical Properties General: Several LED devices with PF2/6 as polarised blue light emitter have been reported, with light turn-on voltages of 4–13V [5,6,7,8,9,10].

Optical Properties:
Optical Properties General: Blue light photoluminescence occurs with λ_{max} 415–420nm Polarised electroluminescence from LED devices with λ_{max} peaks in region 425–475nm and polarisation ratios up to 15 [5,6]. Bands at longer wavelength giving rise to blue-green emission are due to fluorenone defects in polymer [10]. Circularly polarised photoluminescence produced by chiral (*R*,*R*)-form [1]. Refractive indices for aligned and unaligned films have been reported [11].
Transmission and Spectra: Cmr [12], ir [10], uv and photoluminescence [1,5,7,8,9,10,12,13,14], electroluminescence [5,6,7,8,9,10,12] and x-ray [2,3,4,14] spectral data have been reported.

Polymer Stability:
Thermal Stability General: Thermally stable up to 300°C in nitrogen for a range of molecular weights [4].
Decomposition Details: Decomposition (5% weight loss) at 422°C [7].



Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. mainly by Ni(0)-catalysed Yamamoto coupling of 2,7-dibromo-9,9-bis(2-ethylhexyl)fluorene monomer [6,12,15].
Applications: Main potential application is for polarised electroluminescence devices used as backlights in liquid crystal displays.

Poly[(2,5-bis(2-ethylhexyloxy)-1,4-phenylene ethynylene)-*co*-(2,5-dioctyloxy-1,4-phenylene ethynylene)] P-80

Synonyms: *Poly[[2,5-bis[(2-ethylhexyl)oxy]-1,4-phenylene]-1,2-ethynediyl[2,5-bis(octyloxy)-1,4-phenylene]-1,2-ethynediyl]. EHO-OPPE*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
174592-87-1	poly[[2,5-bis[(2-ethylhexyl)oxy]-1,4-phenylene]-1,2-ethynediyl[2,5-bis(octyloxy)-1,4-phenylene]-1,2-ethynediyl]
173428-83-6	

Molecular Formula: $(C_{48}H_{72}O_4)_n$
Fragments: $C_{48}H_{72}O_4$
General Information: Photoluminescent and electroluminescent polymer with enhanced solubility in organic solvents. Prod. as yellow solid.

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	90–100°C	[1]

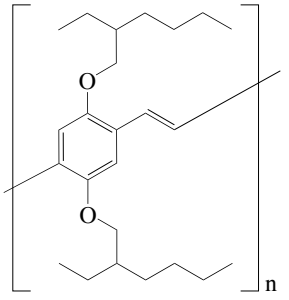
Transition Temperature General: Cross-linking transition above 135°C [1].

Surface Properties & Solubility:
Solubility Properties General: Nematic mesophases obtained in 1,2,4-trichlorobenzene solvent [1].
Solvents/Non-solvents: Sol. toluene, xylene, 1,2,4-trichlorobenzene, decahydronaphthalene, $CHCl_3$, THF [1].

Electrical Properties:
Electrical Properties General: Charge transport in EHO-OPPE is ambipolar with high hole and electron mobility at low field at r.t. [2]. LED devices using blends with a polyamine ether have been reported [3].

Optical Properties:
Optical Properties General: Exhibits strong photoluminescence with main emission in region of 470–510nm (in $CHCl_3$) and with a red shift for films to 500–555nm [4]. Polarised emission of yellow-green light occurs in oriented blended films in ultrahigh molecular weight polyethylene [5]. A sensitiser such as 7-diethylamino-4-methylcoumarin enhances the absorption and transfer of light with subsequent polarised emission from polymer [6]. The refractive indices and third-order nonlinear optical susceptibilities have been reported [7].
Refractive Index:

No.	Value	Note
1	1.76	(film, 550nm) [4]



Transmission and Spectra: Pmr [1,4], uv and photoluminescence [1,4] and x-ray diffraction [4] spectral data have been reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Pd-catalysed coupling reaction of 1,4-diethynyl-2,5-dioctyloxybenzene and 1,4-bis(2-ethylhexyloxy)-2,5-diiodobenzene [1,4].
Applications: Potential applications for liquid crystal displays and light-emitting diodes.

Poly[2,5-bis(2′-ethylhexyloxy)-1,4-phenylene vinylene] P-81

Synonyms: *Poly[[2,5-bis[(2-ethylhexyl)oxy]-1,4-phenylene]-1,2-ethenediyl]. BEH-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
160894-98-4	
191917-70-1	*E*-form

Molecular Formula: $(C_{24}H_{38}O_2)_n$
Fragments: $C_{24}H_{38}O_2$
General Information: Photoluminescent and electroluminescent polymer. Prod. as red solid

Volumetric & Calorimetric Properties:
Glass-Transition Temperature:

No.	Value	Note
1	117–120°C	[2,4]

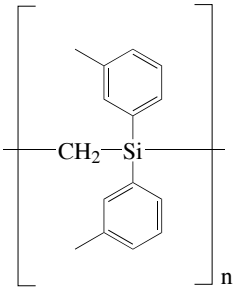
Transition Temperature General: Thermal transitions in region of 55–80°C; isotropic transition at 200°C [1].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. toluene, xylene, chlorobenzene, THF, $CHCl_3$, CH_2Cl_2 [3,4].

Electrical Properties:
Electrical Properties General: Conductivity of polymer increased to *ca.* 1 S cm^{-1} by doping with iodine [3]. Photovoltaic devices of blends with electron acceptors such as perylenediimides reported [5].

Optical Properties:
Optical Properties General: Exhibits strong photoluminescence with λ_{max} values in region of 550–620nm. Spectral line narrowing relating to lasing applications has been studied [6,7].
Transmission and Spectra: Pmr [1,8], cmr [4], Raman [7], uv and photoluminescence [7,8,9,10] and electroluminescence [8] spectral data have been reported.

Polymer Stability:
Thermal Stability General: Polymer is unstable on heating in air, with onset of thermooxidative degradation at *ca.* 77°C [2].
Decomposition Details: Decomposition temp. (5% weight loss) in nitrogen at *ca.* 360°C [1,2,4].



Applications/Commercial Products:
Processing & Manufacturing Routes: Several methods for prod. of polymer have been reported, including the Gilch method from 1,4-

bis(halomethyl)-2,5-bis(2′-ethylhexyloxy)benzene and *tert*-BuOK [3,11], the Heck reaction of 1,4-dibromo-2,5-bis(2′-ethylhexyloxy)benzene and ethylene [8], and by Siegrist polycondensation from 2,5-bis(2′-ethylhexyloxy)-4-methylbenzaldehyde [1].
Applications: Polymer has potential applications for lasers and in light-emitting diodes and photovoltaic cells.

Poly[[bis(3-methylphenyl)silylene]methylene] P-82

Synonyms: *Poly[(di-m-tolylsilylene)methylene]. PDmTSM*
Related Polymers: Polycarbosilanes, Poly[[bis(4-methylphenyl)silylene]methylene]
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
170891-62-0

Molecular Formula: $(C_{15}H_{16}Si)n$
Fragments: $C_{15}H_{16}Si$
General Information:
Tacticity: A transition to isotropic state has been suggested [1]
Morphology: Slightly yellow crystalline solid. Wide angle X-ray diffraction analysis exhibited two peaks with strong intensities, suggesting the presence of two types of configuration of tolyl groups in each lattice structure. Observed *d* spacing: PDpTSM (10.5 and 11.2′) > PDmTSM (10.4 and 11.1′) > PDPSM (10.2′), which follows the decreasing steric hindrance of the aryl groups on the backbone [1]
Identification: For $C_{30}H_{32}Si_2$ (monomer): Found: C, 79.03; H, 7.02; Calc: C, 80.30; H, 7.19 [1]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: See [1]
Melting Temperature:

No.	Value	Note
1	316–321°C	[1,2]

Glass-Transition Temperature:

No.	Value	Note
1	113–148°C	[1,2] A clear glass-transition was not observed, presumably because of its high degree of crystallinity

Surface Properties & Solubility:

Solubility Properties General: Soluble in limited solvents such as diphenyl sulfone at temperatures above 250°C, or slightly soluble in hot diphenyl ether [1]

Transport Properties:

Transport Properties General: A similar tendency was observed for PDmTSM as PDpTSM. The melt viscosity of the polymer indicated that the molecular weight is modifiable by varying the monomer:catalyst ratio when solution polymerisation is employed [1]
Melt Flow Index:

No.	Value	Note
1	24–1300 g/10 min	at 350°C [1,2]

Mechanical Properties:

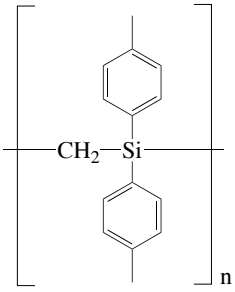
Mechanical Properties General: Thermally too unstable to be processed in an ambient atmosphere to ascertain its mechanical properties. The degree of crystallinity by X-ray data was found to be $37 \pm 3\% - 50 \pm 3\%$ [2]

Optical Properties:

Transmission and Spectra: Ir [1,2], nmr [1,2], gc [2] and ms [1,2] spectra reported.

Polymer Stability:

Thermal Stability General: Thermostability is comparable to that of PDPSM when conducted under nitrogen, but highly thermally unstable in air compared with PDPSM. This thermal instability may be explained by high sensitivity of the tolyl group toward oxidative decomposition [1,2]
Decomposition Details: Thermogram shows a well-defined double endothermic peak. The polymer exhibited this in the second heating scan also, although the shapes of the peaks were appreciably different from those in the first scan.
Exhibits a gain in weight accompanied with a violent exothermic reaction in the early stage of thermal decomposition in air. This thermal instability of the tolyl-substituted polymer can be explained by high sensitivity of the tolyl groups toward oxidative decomposition. Analysis of pyrolysed products of PDArSMs suggests that these polymers undergo radical cleavage of Si-aryl bonds to provide network materials, which can be precursors for Si-containing ceramics.
Weight percentage of residue after heating to 800°C is 52% in nitrogen and 27% in air.
TG-MS shows that when heated up to 800°C at a heating rate of 10°C/min, the major compound is toluene and the minor ones benzene, xylene and dimethylbenzenes [1,2]



Applications/Commercial Products:

Processing & Manufacturing Routes: Synthesised by ring-opening polymerisation of corresponding 1,1,3,3-tetraaryl-1,3-disilacyclobutanes (yields 38–93%), by bulk polymerisation or precipitation polymerisation [1,2,3,4]
Applications: Provide network materials, which can be precursors for Si-containing ceramics [2]

Poly[[bis(4-methylphenyl)silylene]methylene] P-83

Synonyms: *Poly[(di-p-tolylsilylene)methylene]. PDpTSM*
Related Polymers: Polycarbosilanes, Poly[[bis(3-methylphenyl)silylene]methylene]
Polymer Type: polycarbosilanes
CAS Number:

CAS Reg. No.
170891-63-1

Molecular Formula: $(C_{15}H_{16}Si)n$
Fragments: $C_{15}H_{16}Si$
Morphology: White-slightly yellow crystalline solid [1]. Wide angle X-ray diffraction analysis exhibited two peaks, suggesting the presence of two types of configuration of tolyl groups in each lattice structure. Observed *d* spacings:
PDpTSM (10.5 and 11.2) > PDmTSM (10.4 and 11.1) > PDPSM (10.2) which follows the decreasing steric bulkiness of the aryl groups on the backbone.
Identification: For $C_{30}H_{32}Si_2$ (monomer): Found: C, 78.54; H, 6.80; Calc: C, 80.30; H, 7.19 [1]

Volumetric & Calorimetric Properties:
Thermodynamic Properties General: See [1]
Melting Temperature:

No.	Value	Note
1	329–330°C	[1,2]

Glass-Transition Temperature:

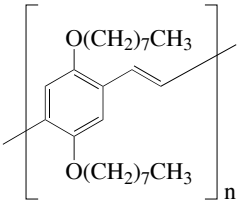
No.	Value	Note
1	131–160°C	[1,2] Strongly affected by the preparation conditions

Surface Properties & Solubility:
Solubility Properties General: Soluble in limited solvents such as diphenyl sulfone at temperatures above 250°C, or slightly soluble in hot diphenyl ether. This solubility characteristic of poly(diarylsilylmethylene)s is similar to that of poly(oxydiarylsilylene)s. Poly[oxydi(*p*-tolyl)silylene] is insoluble in common solvents, although poly[oxyphenyl(*p*-tolyl)silylene] is reasonably soluble [1]

Transport Properties:
Transport Properties General: Melt viscosity was measured to obtain insight into the molecular weight of the polymer, and the results indicated that its molecular weight is modifiable by varying the monomer/catalyst ratio when solution polymerisation is employed [1]
Melt Flow Index:

No.	Value	Note
1	170–5200 g/10 min	at 350°C [1,2]

Mechanical Properties:
Mechanical Properties General: Thermally too unstable to be processed in an ambient atmosphere to ascertain its mechanical properties. The degree of crystallinity by X-ray data was found to be $41 \pm 3\%$



Optical Properties:
Optical Properties General: Wide angle x-ray diffraction analysis exhibited two peaks [1]
Transmission and Spectra: Ir [1,2], nmr [1,2], gc [2], ms [1,2] spectra reported

Polymer Stability:
Thermal Stability General: The thermostability of PDpTSM was comparable to that of PDPhSM when the measurement was conducted under nitrogen, whereas PDpTSM was found to be highly thermally unstable in air compared with PDPhSM. This thermal instability may be explained by high sensitivity of the tolyl group toward oxidative decomposition [1,2]
Decomposition Details: The thermogram of PDpTSM shows one major endothermic peak and a minor one. Decomposition begins around 300°C. Exhibits a gain in weight accompanied by a violent exothermic reaction in the early stage of thermal decomposition in air. This thermal instability of the tolyl-substituted polymer can be explained by high sensitivity of the tolyl groups toward oxidative decomposition. Analysis of pyrolysed products of PDArSMs suggests that these polymers undergo radical cleavage of Si-aryl bonds to provide network materials, which can be precursors for Si-containing ceramics.
Weight percentage of residue after heating to 800°C was 53% in nitrogen and 29% in air.
TG-MS showed that when the PDpTSM is heated up to 800°C at a heating rate of 10°C/min. The major compound is toluene and the minor ones benzene, xylene and dimethylbenzenes [1,2].

Applications/Commercial Products:
Processing & Manufacturing Routes: PDpTSM has been synthesised by ring-opening polymerisation of corresponding 1,1,3,3-tetraaryl-1,3-disilacyclobutanes; also by bulk polymerisation and precipitation polymerisation in 88–93% yields [1,2,3]
Applications: Provide network materials, which can be precursors for Si-containing ceramics [2]

Poly[2,5-bis(octyloxy)-1,4-phenylene vinylene] P-84

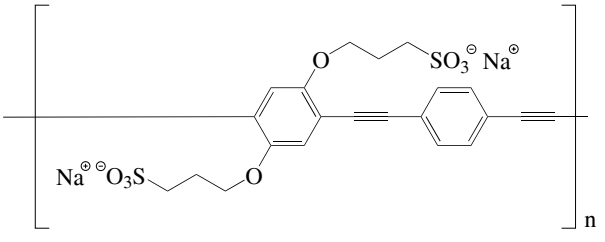
Synonyms: *Poly[[2,5-bis(octyloxy)-1,4-phenylene]-1,2-ethenediyl]. DOO-PPV*
Material class: Thermoplastic
Polymer Type: poly(arylene vinylene)
CAS Number:

CAS Reg. No.	Note
133069-19-9	
171757-86-1	*E*-form

Molecular Formula: $(C_{24}H_{38}O_2)_n$
Fragments: $C_{24}H_{38}O_2$
General Information: Photoluminescent and electroluminescent polymer. Prod. as red solid.
Morphology: Formation of a lamellar mesophase in the region of 160–240°C reported [1].

Volumetric & Calorimetric Properties:
Transition Temperature General: Isotropic transition above liquid crystalline phase at *ca.* 300°C [1].

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. THF, $CHCl_3$ [1,2]. Poor solubility in toluene below 50°C [2].



Optical Properties:
Optical Properties General: Exhibits photoluminescence with λ_{max} in the region of 580–630nm. Of the PPV polymers it is particularly suitable for use in laser devices, its films showing high optical gain and low internal optical losses [3,4,5]. The optical gain mechanism is attributed to superradiance [6].
Transmission and Spectra: Pmr [7], cmr [7], ir [7,8,9], Raman [8], uv and photoluminescence [1,2,7,8,9], esr [7] and x-ray diffraction [1] spectral data have been reported.

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. mainly by Gilch method from 1,4-bis(halomethyl)-2,5-bis(octyloxy)benzene with *tert*-BuOK [7,8,9].
Applications: Main application is in development of lasers.

Poly[(2,5-bis(3-sulfopropoxy)-1,4-phenylene ethynylene)-(1,4-phenylene ethynylene) disodium salt] P-85

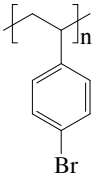
Synonyms: *Poly[[2,5-bis(3-sulfopropoxy)-1,4-phenylene]-1,2-ethynediyl-1,4-phenylene-1,2-ethynediyl disodium salt]. PPE-$SO_3^{\ominus}$. PPESO3*
Monomers: 1,4-Diethynylbenzene
Material class: Thermoplastic
Polymer Type: poly(arylene ethynylene)

CAS Number:

CAS Reg. No.	Note
439279-76-2	Poly[[2,5-bis(3-sulfopropoxy)-1,4-phenylene]-1,2-ethynediyl-1,4-phenylene-1,2-ethynediyl disodium salt]
433334-80-6	

Molecular Formula: $(C_{22}H_{18}Na_2O_8S_2)_n$
Fragments: $C_{22}H_{18}Na_2O_8S_2$
General Information: Water-soluble polyelectrolyte exhibiting strong fluorescence in soln. Prod. as light yellow fibres.

Surface Properties & Solubility:
Solvents/Non-solvents: Sol. H_2O, MeOH, aq. EtOH [1,2]



Optical Properties:
Optical Properties General: The intense yellow-green fluorescence in water with λ_{max} at *ca.* 530 nm [1,2,3] exhibits a red shift compared to that in MeOH, indicating the presence of monomer in MeOH and aggregation in water [1,2]. There is also a red shift on going from solution to film [1,2,4]. The fluorescence is strongly quenched by cationic cyanine dyes [5], methyl viologen and metal complexes [1,2].
Transmission and Spectra: The UV and photoluminescence spectral data have been reported [1,2,4] as well as pmr and FT-IR data [1].

Applications/Commercial Products:
Processing & Manufacturing Routes: Prod. by Pd-catalysed Sonogashira coupling reaction of 1,4-bis(3-sulfopropoxy)-2,5-diiodobenzene with 1,4-diethynylbenzene [1,6].
Applications: The fluorescence superquenching effect with cationic quenchers can be utilised for analysis of different enzymes, sugars and DNA [3,7,8].

Polybutadiene P-87

Synonyms: *Poly(1,3-butadiene). Butadiene rubber. Emulsion polymerised polybutadiene*
Related Polymers: *cis*-1,4-Polybutadiene, Styrene-butadiene copolymers, Butadiene-acrylonitrile copolymers, Butadiene-pentadiene copolymers, Blends of polybutadiene and styrene-butadiene block copolymers, 1,2-Polybutadiene, Carbon black filled polybutadiene
Monomers: 1,3-Butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-17-2

General Information: 1,2 Polymer may be atactic, isotactic or syndiotactic and is thermoplastic. The elastomeric *trans*-1,4-polymer is semicrystalline, the *cis*-1,4-polymer is most widely used with good low temp. props. Props. also vary with cross-linking and vulcanisation and fillers
Miscellaneous: Polymer struct. can be complex due to the nature of the diene monomer. Polymerisation may take place only at the 1,2 double bond to give the 1,2 polymer with pendant vinyl groups. 1,4 Polymerisation yields a polymer with a *cis* or *trans* double bond in varying compositions. The polymerisation method and conditions influence the composition of the product and hence props.

Volumetric & Calorimetric Properties:
Density:

No.	Value	Note
1	d 0.913 g/cm^3	71% 1,4-*trans*, 10% 1,4-*cis*, 19% 1,2 [4]
2	d 0.893 g/cm^3	54% 1,4-*trans*, 26% 1,4-*cis*, 20% 1,2 [5]

Equation of State: Simha-Somcynsky equation of state parameters have been reported [12]
Thermodynamic Properties General: PVT behaviour of emulsion polymerised material has been reported [9]

Surface Properties & Solubility:
Cohesive Energy Density Solubility Parameters: Solubility parameter 17.2 J$^{1/2}$ cm$^{-3/2}$ [2,3]
Solvents/Non-solvents: Sol. hydrocarbons, THF, higher ketones, higher aliphatic esters. Insol. alcohol, lower ketones and esters, nitromethane, propionitrile, H_2O [6,7,8]

Mechanical Properties:
Mechanical Properties General: Mech. property data for a range of microstructs. have been reported [11,12]

Optical Properties:
Refractive Index:

No.	Value	Note
1	1.518	25°, 71% 1,4-*trans*, 10% 1,4-*cis*, 19% 1,2 [5]
2	1.516	25°, 54.5% 1,4-*trans*, 25.4% 1,4-*cis*, 20.1% 1,2 [5]

Polymer Stability:
Polymer Stability General: Oxidative degradation leads to cross-linking and hardening of vulcanisates [14]
Decomposition Details: Thermal analysis has been reported [15,16,17]

Applications/Commercial Products:
Processing & Manufacturing Routes: Emulsion polymerisation yields a high *trans* polymer, where free-radical polymerisation prevents control. Low manufacture cost, mostly made and used for toughening other polymers. Also synth. using a neodymium catalyst system [18] or by a stereoselective polymerisation process using a Ni complex-$AlEt_2Cl$ catalyst to give low (MW <11800) MW polymer [19]
Applications: Used in automotive tyres

Trade name	Details	Supplier
Afdene	1,4-*cis* and -*trans*	Lehmann and Voss
Bindene	1,4-*cis* and -*trans*	Goodyear
Budene	1,2 and 1,4 polymer, various grades	Goodyear
Buna CB	1,4 polymer, various grades	Bayer Inc.
Calprene	1,4 polymer	Repsol Quimica
Cariflex butadiene rubber		Shell Chemicals
Cisdene 1203		American Synthetic Rubber Corporation
Diene, diene 35AC, Diene, 70AC		Firestone
Duragen	1,4-*cis* and -*trans*	General Tyre and Rubber Co.
Finaprene	1,4 polymer	Petrafina
Intene	1,4 polymer	Enichem
JSRRB	1,2 polymer	Japan Synthetic
Petcis	1,4-*cis* and -*trans*	Petkum Petrokimya
Ricon	1,2 polymer	Advanced Resins
SKB		Soviet Origin
Solprene	1,4-*cis* and -*trans*	Negramex
Taktene	1,4-*cis* and -*trans*	Polysar
Tufdene	1,4-*cis* and -*trans*	Asaki
Unidene	1,4-*cis* and -*trans*	International Synthetic Rubber

cis-1,4-Polybutadiene P-88

Synonyms: *cis-Polybutadiene*
Related Polymers: Polybutadiene, 1,2-Polybutadiene
Monomers: 1,3-Butadiene
Material class: Synthetic Elastomers
Polymer Type: polybutadiene
CAS Number:

CAS Reg. No.
9003-17-2

General Information: Exhibits good heat resilience, low temp. props. and low heat build up
Morphology: Crystallisation induced by strain and temp. has been reported. [49] Crystalline at low temps. but amorph. above -3° [55]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.01 g/cm^3	[1]

Equation of State: Tait and Simba-Someynsky equation of state parameters have been reported [31]
Thermodynamic Properties General: Low heat build up in general
Latent Heat Crystallization: Entropy of fusion ΔS_m 33.5 J mol^{-1} K^{-1} (98% *cis*) [2]. Heat of fusion ΔH_m 2.5 kJ mol^{-1} (98% *cis*) [5]
Specific Heat Capacity:

No.	Value	Note	Type
1	0.369 kJ/kg.C	-223° [22,23]	P
2	0.897 kJ/kg.C	-123° [22,23]	P
3	1.96 kJ/kg.C	27° [22,23]	P
4	2.21 kJ/kg.C	77° [22,23]	P

Melting Temperature:

No.	Value	Note
1	2°C	98–99% *cis*/high *cis* [1,49]

Glass-Transition Temperature:

No.	Value	Note
1	-102°C	high *cis* [3,22,23]
2	-95°C	98–99% *cis* [4]
3	-106°C	[5,9]
4	-114°C	[10]

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: Solubility parameter 16.9 J$^{1/2}$ cm$^{-3/2}$ (1,4-*cis*) [6,7]
Solvents/Non-solvents: Sol. hydrocarbons, THF, higher ketones, higher aliphatic esters. Insol. alcohol, lower ketones and esters, nitromethane, propionitrile, H_2O [11,13]. Theta solvents heptane -1° (97% *cis*); propyl acetate 35.5° (97% *cis*) [14]; 3-pentanone 0° (94.6% *cis*) [15]; diethyl ketone 213° (94% *cis*); propylene oxide 146° (94% *cis*) [16]; diethyl ketone 14°, 208° (93% *cis*) [16]; propylene oxide 35°, 141° (93% *cis*) [16]; heptane/hexane 5–20° (90% *cis*) [18]; 5-methyl-2-hexanone 12.6° (90% *cis*) [19]; 2-pentanone 59.7° (90% *cis*) [19]. Forms supercritical fluids in 0.27 wt % CO_2 (MV 5000, 19.3 MPa)

Surface Tension:

No.	Value	Note
1	32 mN/m	critical surface tension of spreading [8]

Transport Properties:

Polymer Solutions Dilute: Mark-Houwink equation parameters have been reported [17,24]. Williams-Landel-Ferry equation parameters have been reported [32]. Unperturbed dimension values have been reported [24,27,29]

Gas Permeability:

No.	Gas	Value	Note
1	H_2	2766 cm^3 mm/(m^2 day atm)	3.16×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [20]
2	N_2	424 cm^3 mm/(m^2 day atm)	4.84×10^{-13} cm^2 (s Pa)$^{-1}$, 25° [20]
3	O_2	1252 cm^3 mm/(m^2 day atm)	1.43×10^{-13} cm^2 (s Pa)$^{-1}$, 25° [20]
4	CO_2	9104 cm^3 mm/(m^2 day atm)	1.04×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [20]
5	He	2145 cm^3 mm/(m^2 day atm)	2.45×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [21]
6	Ne	1260 cm^3 mm/(m^2 day atm)	1.44×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [21]
7	Ar	2696 cm^3 mm/(m^2 day atm)	3.08×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [21]
8	N_2	1260 cm^3 mm/(m^2 day atm)	1.44×10^{-12} cm^2 (s Pa)$^{-1}$, 25° [21]

Mechanical Properties:

Mechanical Properties General: Mech. props. of a range of polybutadiene structs. have been reported [42,43,44,48]. Possesses low tensile strength and low shear strength

Viscoelastic Behaviour: Viscoelastic behaviour for a range of *cis*-1,4-polybutadienes has been reported [37,38]

Fracture Mechanical Properties: Fatigue crack propagation has been reported [45]

Electrical Properties:

Complex Permittivity and Electroactive Polymers: Electrical conduction (96–100% *cis* content) has been reported [55]

Optical Properties:

Transmission and Spectra: Ir spectral data have been reported [25]

Polymer Stability:

Polymer Stability General: Oxidative degradation of polybutadiene leads to cross-linking and to hardening of vulcanisates, unlike polyisoprene, which softens as a result of chain scission [51]

Upper Use Temperature:

No.	Value	Note
1	100°C	[34]

Decomposition Details: Decomposition onset 325°. 50% Wt loss 407° (vacuum) [36]. Low *trans* contents yields 4-vinyl-1-cyclohexene (dimer), 1,3-butadiene, cyclopentene and 1,3-cyclohexadiene on pyrolysis [39]. Pyrolysis at 450–530° yields monomer in an amount proportional to the temp. Activation energy 37.5 kcal mol^{-1} [40]. Mechanism of decomposition [41] and thermal analysis have been reported [52,53,54]

Flammability: Are high-volatile-loss, low-char polymers with slightly lower volatile loss on pyrolysis than high vinyl polybutadienes [47]

Stability Miscellaneous: High energy radiation increases radical concentration linearly with radiation up to 100 Mrad. Unsaturation decreases markedly. *Cis-trans* isomerisation occurs and some conjugated double bonds are formed. Yield of cross-linking for *cis*-1,4 higher than for *trans*-1,4 but lower than for 1,2 isomer. Stress-strain props. of radiation cross-linked polybutadiene have been reported [50]

Applications/Commercial Products:

Processing & Manufacturing Routes: High *cis* content produced by Ziegler-Natta catalysis using Ti, Co or Ni catalysts. Processing and props. depend on the catalyst, which affects branching MW and vinyl content

Applications: Used in automotive tyres, usually as blends with natural or SB rubbers. Also used in high-impact polystyrene

Poly(1,3-butadiene-*co*-acrylonitrile), Carbon black filled P-89

Synonyms: *Nitrile rubber, carbon black filled. NR, carbon black filled. NBR, carbon black filled*
Related Polymers: Nitrile rubber, Isoprene copolymer, Nitrile rubber, Mineral filled, Nitrile rubber, PVC blends, Nitrile rubber, Nitrile rubber, carboxylated, Nitrile rubber, Hydrogenated, Nitrile rubber, Ethylene copolymer
Monomers: 1,3-Butadiene, Acrylonitrile
Material class: Composites, Synthetic Elastomers, Copolymers
Polymer Type: acrylonitrile and copolymers, polybutadiene
CAS Number:

CAS Reg. No.
9003-18-3

Molecular Formula: $[(C_4H_6).(C_3H_3N)]_n$
Fragments: C_4H_6 C_3H_3N
Morphology: Dynamic mech. measurements indicate short-range mobility of nitrile rubber unaffected by addition of carbon black ($\leq$ 50% loading); no structural changes apparent, although indications that limited number of small crystallites may be formed [26]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.06–1.33 g/cm^3	0–96 phr carbon black [25]

Thermodynamic Properties General: Thermal conductivity [1,14] and its variation with temp. [15] have been reported. Heat of combustion has been reported [30]
Thermal Diffusivity: 0.065–0.165 mm^2 s^{-1} [13]
Glass-Transition Temperature:

No.	Value	Note
1	-28°C	33% acrylonitrile, Hycar 1002 [27]

Transition Temperature General: T_g of nitrile rubber unaffected by addition of carbon black reinforcing agent ($\leq$50% filler) [26]

Surface Properties & Solubility:

Wettability/Surface Energy and Interfacial Tension: Surface energy and other surface characteristics, and their effect on nitrile rubber reinforcement, have been reported [21]

Transport Properties:

Transport Properties General: Rheological characterisation, involving effect of filler on nitrile rubber, has been reported. Capillary, compressional and rotational-shearing disk (Mooney) viscometry, and stress-relaxation methods empolyed; branching and gel content have effect on measurements [22]
Polymer Melts: Capillary rheometry studies have been reported (125°, apparent shear rates 2.9–2900 s^{-1}); steady-shear viscosity, dynamic complex viscosity and viscosity obtained from tensile stress-strain behaviour found to be significantly different from each other (in contrast to unfilled materials); no appreciable effect of pressure on viscosity is observed; data obtained indicate presence of particulate struct., probably consisting of carbon black surrounded with bound rubber [11]

Mechanical Properties:

Mechanical Properties General: Activation energy of deformation has been reported [18]. Poisson's ratio has been reported [8]. Flexural and compressive strength have been reported [14]. Creep modulus has been reported [10]. Loss tangent decreases with increasing surface area of filler [28]. Dynamic mech. measurements have been used to investigate effect of carbon black on chain mobility and struct. of nitrile rubber containing 30–50% acrylonitrile (-170–150°, 2–20 kHz); sound velocity and damping factor measured as function of temp.; mech. spectra do not seem to be significantly affected by addition of carbon black ($\leq$50% loading); thermal coefficients of sound velocity and damping factor, and position of T_g, remain unchanged when reinforcing agent added; indications that short-range mobility of chain elements unaffected by presence of filler particles [26]. Correlations have been reported between dynamic mech. props. and surface props. (surface energy and other characteristics) [21], and with wet-skid behaviour and adhesion [23]. Comprehensive study of tensile and shear behaviour of various carbon black-filled (40phr) nitrile rubbers (with different cross-linked contents and gel contents) has been reported. Results from tensile stress-strain experiments show a strain-time correspondence for filled systems up to yield point, shear curve produced from dynamic measurements (small deformations, frequencies of 0.1 to 100 rad s^{-1}) different from former curve, even when conversion (tensile to shear) factor applied, which can be explained by anisotropic nature of carbon black aggregate density in tensile measurements [17]

Tensile (Young's) Modulus:

No.	Value	Note
1	13.7 MPa	1.4 kgf mm^{-2}, 40% acrylonitrile [24]

Tensile Strength Break:

No.	Value	Note	Elongation
1	0.1–0.31 MPa	1.1–3.2 kgf mm^{-2}, 100°, 40% acrylonitrile [24]	310–700%

Complex Moduli: Dynamic Young's modulus has been reported [28]
Viscoelastic Behaviour: Variation of stress relaxation with temp. has been reported [5]. Viscoelastic props. correlated with surface

props. (wet-skid behaviour/adhesion) have been reported [23]. Stress-relaxation measurements have been reported; sudden jump in relaxation time attributed to formation of rubber-filled network [22]. A comprehensive study of the non-linear viscoelastic behaviour of nitrile rubbers (33% acrylonitrile content) containing 40 phr carbon black has been reported; filled elastomers exhibit strain softening with extrusion, and strain hardening with extension; ultimate props. of filled elastomers are insensitive to bulk viscoelastic behaviour [27]. Model has been reported to describe the linear viscoelastic behaviour of carbon black filled vulcanised nitrile rubber; gives satisfactory representation of experimental results over full range of strain amplitudes, frequencies and temps. studied, and also provides method for describing temp.-dependent deformation at different filler loadings [20]
Mechanical Properties Miscellaneous: Resilience 20% (approx., 40% acrylonitrile) [24]. Compression set 22% (40% compression, 22h, 70°; 30 mins. recovery, room temp., 40% acrylonitrile) [24]
Hardness: 45–78 (IHRD, -30°, 40% acrylonitrile) [24], IHRD hardness 52–72 (surFace area, 20–150 m^2 g^{-1}) [28]
Failure Properties General: Tear strength 5.2 kg mm^{-1} (40% acrylonitrile) [24]
Fracture Mechanical Properties: Tearing energy and J-integral measurements have been reported for nitrile rubbers at various carbon-black loadings (0–60 phr). Carbon black has only moderate effect on critical tearing energy due to high T_c of unfilled vulcanisate (4.973 kN m^{-1}); change in crack-tip morphology (crystal formation) has effect on T_c; T_c goes through maximum (6.978 kN m^{-1}) at approx. 40 phr loading; reasonably good correlation between carbon black morphology (particle size, aggregate size and struct.) and T_c at 40 and 60 phr loadings, although compound- and loading-dependent. T_c 4.194–5.777 kN m^{-1} (20 phr); 5.144–6.978 kN m^{-1} (40 phr); 3.816–5.11 kN m^{-1} (60 phr); true modulus 732–1818 kPa (20–60 phr); modulus shows only moderate correlation with carbon black morphology [19]
Friction Abrasion and Resistance: Wear resistance has been reported [3]. Internal friction 87 kP (60 Hz, 40% acrylonitrile) [24]. Wet-skid behaviour (using British pendulum skid-tester) has been investigated μ_A (adhesive) 0.1 (approx.) [23]

Electrical Properties:

Electrical Properties General: Dissipation factor for material containing 20–50% acrylonitrile has been reported [28]. Other values of volume resistivity have been reported [4]
Surface/Volume Resistance:

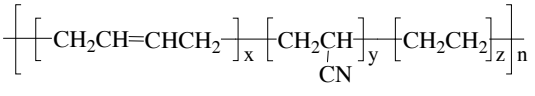
No.	Value	Note	Type
1	$1 \times 10^{-7} \times 10^{15}$ Ω.cm	approx. [7]	S

Static Electrification: Electrical conductivity has been reported [12,14]. DC electrical conductivity (35–130°) temp. coefficient of resistance 0 [29]. Dielectric constant shows anomalous dispersion with frequency, which increases with carbon content, particularly in low-frequency region; dielectric loss also increases with increase in carbon content and shows maximum at approx. 0.5 MHz, with value of this maximum increasing with increase in carbon concentration [9]. There is no interaction between the NBR rubber and the carbon black [9]. Earlier electrical study of copolymers containing 0–96 phr carbon black had examined dc conductance, dielectric constant and loss tangent; results obtained differ significantly for coarse and fine fillers; variations in dielectric constant indicate likelihood of chain formation; dc conductance decreases (initially) on addition of coarse blacks, while fine blacks show rapid increase in conductance; transients are observed for conductance which are ascribed to presence of particles of carbon black with perfectly conducting graphite core inside semiconducting sheath, the whole being surrounded by ionic atmosphere; maximum ac lossfactor appears at approx. 200 kc. [25] DC conductivity $0.329–1.350 \times 10^9$ (0–40 phr); DC dielectric loss 5.900–24.5 (100 Hz, 0–40 phr); 0.590–2.45 (1 kHz, 0–40 phr), 0.059–0.245 (10000 Hz, 0–40 phr) [9]. Electrical conduction has been investigated in NBR composites, containing 100 phr carbon (fast extruding furnace) black, subjected to different extents of pre-extension network struct. of rubber does not give particularly good dispersion of filler within NBR matrix and this leads to smaller effect of filler on conductivity upon pre-extension; conductivity 7×10^{-5}–0.01 Ω^{-1} cm^{-1} [29]

Polymer Stability:

Thermal Stability General: Heat resistance has been reported [14]
Flammability: Flammability, oxygen index, ignition temp. and heat flux intensity have been reported [30]. Flammability of vulcanised rubber decreases in presence of fillers; ignition and self-ignition temps. increase by 30–40° with increasing filler content (to 50%) [30]
Chemical Stability: Resistance to organic acids and EtOH has been reported [6] Chemical resistance has been reported [14]
Stability Miscellaneous: Radiation resistance has been reported [2]

Applications/Commercial Products:



Trade name	Supplier
Nysynblak	Copolymer Rubber

Poly(1,3-butadiene-*co*-acrylonitrile-*co*-ethylene) P-90

Synonyms: *Poly(NBR-co-ethylene). Modified hydrogenated acrylonitrile-butadiene copolymer. Poly(1,3-butadiene-co-propenenitrile-co-ethene). Poly(NR-co-ethylene). Poly(nitrile rubber-co-ethylene*
Related Polymers: NR, Carboxylated, Poly(1,3-butadiene-*co*-acrylonitrile), NR, PVC, NR, Mineral filled, NR, Hydrogenated, NR, Carbon black filled, NR, Isoprene copolymer
Monomers: 1,3 Butadiene, Acrylonitrile, Ethylene
Material class: Copolymers, Synthetic Elastomers
Polymer Type: acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
26835-20-1

Molecular Formula: $[(C_4H_6)_x(C_3H_3N)_y(C_2H_4)_z]_n$
Fragments: C_4H_6 C_3H_3N C_2H_4
Additives: Carbon black
General Information: A modified hydrogenated nitrile rubber developed in order to extend the low-temp. service range of hydrogenated rubber [3]
Miscellaneous: Modifications of nitrile rubber with copolymers containing ethylene and a softening monomer, such as vinyl esters, alkyl (meth)acrylates or acrylonitrile, have been reported [1].: give mixtures with improved workability, providing vulcanisates with good oil and ageing resistance, with reduced costs [1]

Volumetric & Calorimetric Properties:

Glass-Transition Temperature:

No.	Value	Note
1	-47–-39°C	modified hydrogenated nitrile rubber [3]

Transition Temperature General: Modified hydrogenated nitrile rubber shows improvement in T_g of up to -10° [3]
Brittleness Temperature:

No.	Value	Note
1	-45–40°C	33% acrylonitrile, ASTM D746 [1]

Mechanical Properties:

Mechanical Properties General: Changes in mechanical props. of vulcanisates containing terpolymers with 33% acrylonitrile have been reported. Tensile strength (and extension), 100% modulus and hardness (Shore A) measured after ageing at room temp. for 70h, (ASTM D471), and after contact with oil (70h 121°, ASTM D573) and MeOH (70h, 64°, ASTM D471) [1]
Tensile Strength Break:

No.	Value	Note	Elongation
1	31.4 MPa	320 kg cm^{-2} room temp.	160%
2	17 MPa	174 kg cm^{-2}, 100° [3]	160%
3	13.6–16.9 MPa	29–41% acrylonitrile [1]	360–470%

Miscellaneous Moduli:

No.	Value	Note	Type
1	3.6–19 MPa	29–41% acrylonitrile [1]	100%

Mechanical Properties Miscellaneous: Significant improvements in cold flexibility (Gehman torsional stiffness ASTM D1053-92) and temp. reduction (ASTM D1329-79)) have been reported for modified hydrogenated nitrile rubber [3]. Dynamic mechanical anal. confirms extension of rubbery plateau modulus by approx. -10° for modified hydrogenated nitrile rubber. This correlates with reduction of T_g by approx.-10° [3]
Hardness: Hardness (JIS A) 90 (room temp., 6% butadiene, 37% acrylonitrile) 85 (100°, 6% butadiene, 37% acrylonitrile) [2]. Shore A57–A76 (29–41% acrylonitrile) [1]
Friction Abrasion and Resistance: Abrasion resistance has been reported [2]

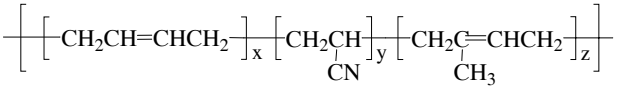
Polymer Stability:

Polymer Stability General: Displays good resistance to ageing [1]
Upper Use Temperature:

No.	Value	Note
1	-40–150°C	[3]

Chemical Stability: Has good resistance to oil [1]. Modified hydrogenated nitrile rubbers show greater resistance to ASTM oils 1, 2 and 3, oil swell, 168h, 150°, than do unmodified elastomers [3]

Applications/Commercial Products:



Processing & Manufacturing Routes: Vulcanisates are prepared from a blend mixture of nitrile rubber with e.g. carbon monoxide-ethylene-vinyl acetate terpolymer, ZnO, sulfur, carbon black, stearic acid and mercaptobenzothiazyl sulfide [1]. Modified hydrogenated nitrile rubber is prepared by emulsion copolymerisation of mixture of acrylonitrile, butadiene and alkyl acrylate, followed by hydrogenation using a selective homogeneous catalyst; raw terpolymer cured using a peroxide formulation (15 min, 170°) [3]
Applications: Potential applications of modified hydrogenated nitrile rubber in automotive and related industries on account of improvements in low-temp. service range

Monomers: Acrylonitrile, 1,3-Butadiene, 2-Methyl-1,3-butadiene
Material class: Synthetic Elastomers, Copolymers
Polymer Type: acrylonitrile and copolymers
CAS Number:

CAS Reg. No.
25135-90-4

Molecular Formula: $[(C_4H_6)_x.(C_3H_3N)_y.(C_5H_8)_z]_n$
Fragments: C_4H_6 C_3H_3N C_5H_8
General Information: Vulcanised material displays improved tensile strength, good low temp. props. and rebound (resilience), good resistance to compression set, and improved retention of props. with ageing, in comparison with acrylonitrile/isoprene or acrylonitrile/butadiene rubbers [4]
Morphology: Degree of crystallinity 15% (27% butadiene), 18% (15% butadiene) [1]
Miscellaneous: Oil-resistant rubber fibres with good strength have been reported [1]

Transport Properties:

Polymer Solutions Dilute: Intrinsic viscosity 0.9 dl g^{-1} (DMF, 30°, 27 mol% butadiene), 0.7 dl g^{-1} (DMF, 30°, 15 mol% butadiene) [1]

Mechanical Properties:

Mechanical Properties General: Blends containing 29% acrylonitrile and 55% butadiene lose 3.1% of their tensile strength after heating at 80° for 72h [2]
Tensile Strength Break:

No.	Value	Note	Elongation
1	22.6 MPa	230 kg cm^{-2}, 29% acrylonitrile, 55% butadiene [2]	680%
2	30.4 MPa	310 kg cm^{-2}, 27% butadiene [1]	510%
3	35.5 MPa	362 kg cm^{-2}, 15 mol% butadiene [1]	515%
4	24.5 MPa	250 kg cm^{-2}, butadiene/isoprene (50/50) [4]	620%
5	22.7 MPa	232 kg cm^{-2}, butadiene/isoprene (75/25) [4]	700%
6	20.1 MPa	205 kg cm^{-2}, butadiene/isoprene (50/50), after 168h, 100° [4]	
7	22.9 MPa	234 kg cm^{-2}, butadiene/isoprene (75/25), after 168h, 100° [4]	

Miscellaneous Moduli:

No.	Value	Note	Type
1	1.5 MPa	15 kg cm^{-2} 27 mol% butadiene [1]	100% modulus
2	1.2 MPa	12 kg cm^{-2}, 15 mol% butadiene [1]	100% modulus
3	3.4 MPa	35 kg cm^{-2}, 27 mol% butadiene [1]	300% modulus
4	3.4 MPa	35 kg cm^{-2}, 15 mol% butadiene [1]	
5	2.9 MPa	30 kg cm^{-2}, 29% acrylonitrile, 55% butadiene [2]	300% modulus

Mechanical Properties Miscellaneous: Tensile set 18% (room temp., 27% mol% butadiene), 190% (room temp., 15 mol% butadiene), 5% (max., 27 mol% butadiene), 28% (50°, 15 mol% butadiene) [1]. Terpolymers containing 15 and 27 mol% butadiene are stable for 35 min at 75° and 350% elongation, or for 120 min. at 80° and 40 min at 100°, both at 200% elongation [1]. Rebound (resilience) 42% (butadiene/isoprene (50/50)), 45.5% (butadiene/isoprene (75/25)) [4]
Hardness: Shore A20 (raw polymer, 27 mol% butadiene), A23 (raw polymer, 15 mol% butadiene); A43 (aged for 7 days at room temp., 27 mol% butadiene); A80 (aged for 7 days at room temp. 15 mol% butadiene) [1]. Spring A61 (butadiene/isoprene (50/50), A60 (butadiene/isoprene(75/25) [4]

Polymer Stability:

Thermal Stability General: Thermal stability has been reported [3]
Chemical Stability: Resistance to C_6 and oil has been reported [3]. Rubber fibres are oil-resistant [1]

Applications/Commercial Products:

Processing & Manufacturing Routes: Synth., by conventional emulsion polymerisation of mixture of three comonomers at 5° [4]. Also synth. by terpolymerisation in the presence of $EtAlCl_2$/acrylonitrile prereaction mixture and vanadium oxychloride, in hexane at @10° [1]. Vulcanised using a mixture of $BaSO_4$, sulfur, zinc oxide, benzothial disulfide, 2,5-di-*tert*-amylhydroquinone and stearic acid; compounding systems can also include carbon black [4]; vulcanisation is carried out at 145° for 35 min [1], or at 150° for 5 min [4]
Applications: Used in printing rolls, industrial rolls, diaphragms, rubber threads

Poly(1,3-butadiene-*co*-acrylonitrile), Mineral filled P-92

Synonyms: *NBR, mineral filled. NR, mineral filled. Nitrile rubber, mineral filled*
Related Polymers: Nitrile rubber, Nitrile rubber, Isoprene copolymer, Nitrile rubber, Hydrogenated, Nitrile rubber, Ethylene copolymer, Nitrile rubber, Carbon black filled, Nitrile rubber, PVC blends, Nitrile rubber, Carboxylated
Monomers: 1,3-Butadiene, Acrylonitrile
Material class: Synthetic Elastomers, Copolymers, Composites
Polymer Type: acrylonitrile and copolymers, polybutadiene
CAS Number:

CAS Reg. No.
9003-18-3

Molecular Formula: $[(C_4H_6).(C_3H_3N)]_n$
Fragments: C_4H_6 C_3H_3N

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.81 g/cm^3	glass/fibreglass filled, 43.5% copolymer [16]

Volumetric Properties General: The thermal expansion coefficients of kaolin and chalk filled [2] and asbestos, flax and cotton filled [10,14,30] material have been reported
Thermodynamic Properties General: Thermal conductivity [17] of silica filled [3] material has been reported. Thermally diffusivity has been reported
Latent Heat Crystallization: Heat of combustion of kaolin, chalk, silica gel, magnesium hydroxide and aluminium hydroxide filled material has been reported [19]

Thermal Conductivity:

No.	Value	Note
1	0.628–0.657 W/mK	23–241°; virgin material; glass/fibreglass filled; 43.5% copolymer content [16]
2	0.615–0.649 W/mK	282–492°; 'mixture'; glass/fibreglass filled, 43.5% copolymer content [16]
3	0.582–1.887 W/mK	21–893°; 'char' material (after pyrolysis) glass/fibreglass filled, 43.5% copolymer content [16]

Specific Heat Capacity:

No.	Value	Note	Type
1	1.2–1.35 kJ/kg.C	0.288–0.323 cal $g^{-1\circ} C^{-1}$, 60–728°; virgin material; glass and fibreglass filled, 43.5% copolymer content [12]	P
2	1.39–1.56 kJ/kg.C	0.333–0.374 cal $g^{-1\circ} C^{-1}$, 322–728°; virgin material; glass and fibreglass-filled, 43.5% copolymer content [12]	P
3	0.81–1.36 kJ/kg.C	0.195–0.324 cal $g^{-1\circ} C^{-1}$, 60–728°; 'char' material (after pyrolysis); glass and fibreglass filled, 43.5% copolymer content [12]	P
4	1.18–1.32 kJ/kg.C	0.315–0.282 cal $g^{-1\circ} C^{-1}$, 322–728°; 'mixture'; glass and fibreglass filled, 43.5% copolymer content [12]	P

Transition Temperature General: T_g of kaolin and chalk [2], and MoS_2 and silica-filled material [20] has been reported

Surface Properties & Solubility:

Solubility Properties General: Equilibrium swelling studies of pyrogenic-silica filled material in trichloroethylene and C_6H_6 have been reported. Volume-fraction measurements show an increase in effective cross-links generated by filler; no significant differences observed between type of filler (surface area, surface modification), although type of copolymer (acrylonitrile content) has an effect [28]

Surface and Interfacial Properties General: Soln. absorption studies of nitrile rubber on silicas have been reported for trichloroethylene and C_6H_6. Soln. absorption behaviour is not a reliable guide to the reinforcement props. of the fillers [28,36]

Wettability/Surface Energy and Interfacial Tension: Satisfactory wettability of polymer molecules and hydrated silica (filler) particles indicated by permeability studies of toluene in filled nitrile rubber [21]; permeability decreases with increasing filler loadings [21]. Adhesive props. of silica, calcium carbonate and magnesium carbonate filled material have been reported [26]

Transport Properties:

Transport Properties General: Moisture-absorption characteristics have been investigated for chrysotile-asbestos-reinforced nitrile rubber (70% filler content): results obtained for as- produced samples (calendered sheets), cured using sulfur and peroxide, and sulfur-cured material which had been heat cycled; diffusivity data obtained 0.003–0.026 $mm^2 h^{-1}$ (faces open), 0.12–1.61 $mm^2 h^{-1}$ (long sides open), 0.21–1.64 $mm^2 h^{-1}$ (short sides open) (all for relative humidities 97–33%). Diffusivity is essentially independent of relative humidity and is much higher through the edges of a sample than through the faces (related to fibrous nature). Sulfur cured samples not significantly influenced by heat treatment, and change of curing agent for as-calendered material does not significantly affect diffusivity. Studies important in connection with applications of rubber composites as gaskets, where moisture content has direct relevance to tensile strength and thermal props., such as thermal expansion and thermal conductivity [30]

Polymer Solutions Dilute: Viscosity of glass-filled material has been reported [9]

Permeability of Liquids: Permeation of toluene in nitrile rubber and effects of incorporation of hydrated silica as reinforcing filler have been investigated. Breakthrough time, i.e. elapsed time between initial contact at outside surface and time of detection of chemical at inside surface of material (ASTM F739-85) increases with increasing filler content up to limit of 50 phv, beyond which a plateau appears; such a decrease in permeability indicates good wettability between polymer molecules and filler particles [21]

Gas Permeability:

No.	Gas	Value	Note
1	H_2	288.9 cm^3 mm/(m^2 day atm)	4.4×10^{-10} cm^2 (s cmHg)$^{-1}$, 24h [31]
2	H_2O	198.9 cm^3 mm/(m^2 day atm)	3.03×10^{-10} cm^2 (s cmHg)$^{-1}$, 24h [31]

Mechanical Properties:

Mechanical Properties General: Effects of amount and type (grade) of silica filler on mechanical props. (tensile strength, 300% modulus, Shore hardness, compression set) of heat-resistant and carboxylated nitrile rubbers have been reported [7,23]. Measurements of tensile strength (elongation at break) as function of hydrated silica filler loadings have been reported; improvements observed with increasing filler content (0–60 phr); effects even greater with higher-acrylonitrile content copolymers (e.g. 40%) and carboxylated nitrile rubbers [21]. Prolonged exposure of nitrile rubbers containing various mineral fillers (clay, silica, TiO_2, MoS_2) to γ-irradiation leads to huge increases in tensile strength (around 1500%) and corresponding complete loss of elongation (-100% change) [1]. Effect of silane-based coupling agent on tensile strength of silica-filled nitrile rubber has been reported. Addition of small quantities of γ-mercaptopropyltrimethoxysilane (0.1–1.6 phr silica (5–80 phr)) results in significant improvements in tensile strength; correlations can be made with corresponding improvements in tear strength; comparative studies carried out with styrene-butadiene and natural rubber show improvements in tensile strength greatest for nitrile rubber system; some dependency on method of mixing displayed [34]. Other mechanical props. have been reported [22,24]. Elastic modulus of Kevlar-filled material has been reported [22]. Dynamic endurance of chalk and kaolin filled material has been reported [27]

Tensile Strength Break:

No.	Value	Note	Elongation
1	1.5–23 MPa	nitrile rubber, 30% acrylonitrile; 0–60 phr hydrated silica filler [21]	350–770%
2	8.2–20 MPa	10–35 phr pyrogenic silica filler [25]	660–680%
3	4–22 MPa	0–80 phr silica [34]	

Complex Moduli: Real and imaginary complex shear moduli of silica, kaolin and limestone filled material have been reported [11]

Viscoelastic Behaviour: Effects of silicate filler on dynamic mechanical props./viscoelastic behaviour of nitrile rubbers have been reported; influence of morphology of filled polymers also reported [7]. Stress-relaxation behaviour (in tension) for nitrile rubber vulcanisates containing short jute fibres (10–20 phr) has been reported; effects of strain level, bonding system, fibre orientation and content, temp. and prestraining on rate of stress relaxation have been considered; results indicate existence of relaxation mechanism at very short times (<200 s) [33]. Nature of

relaxation process unresolved, although influence of bonding agent indicates involvement of fibre/rubber interface [33]; in general, incorporation of short fibres increases rate of stress relaxation (compared to unfilled systems); orientation has only marginal effect, while prestraining decreases rate considerably-'stress softening' effect. Generally jute fibres in the presence of a bonding agent impart optimum stress relaxation behaviour to the composites [33]

Mechanical Properties Miscellaneous: Stiffness reinforcement (initial modulus) and stress-strain hysteresis (loading (100% extension)/unloading) measurements have been reported for (pyrogenic) silica-filled vulcanised (γ-irradiated) nitrile rubbers; little differences observed for the reinforcing effects of various fillers (e.g. surface area/surface modification), although acrylonitrile content plays important role in extent of filler reinforcements [28]. Temp. dependence of dynamic mechanical props. of nitrile rubbers (glass-bead filled) has been investigated. Theory developed to explain changes in relative modulus of such composite systems at or around T_g, i.e. jump in modulus near T_g, and subsequent decrease at $T > T_g$; magnitude of jump increases with filler concentration, as does temp. dependence above T_g; reduced (mechanical) damping also increases, at $T > T_g$, with increasing temp.; modulus and damping changes dependent on particle size of filler, with both tending to increase as particle size decreases; such props. dependent on nature of surface of filler particles [29] . Dynamic storage modulus of silica filled material has been reported [25]

Hardness: Shore A48–A60 (10–35 phr pyrogenic silica filler) [25]

Failure Properties General: Addition of small quantities of γ-mercaptopropyltrimethoxysilane (0.1–1.6 phr silica (5–80 phr)) results in enhancement of tear strength (5000–26000 Nm^{-2} (0–80 phr silica); correlations can be made with corresponding improvements in tensile strength. Tear energy measurements on (pyrogenic) silica-filled vulcanised (γ-irradiated) nitrile rubbers have been reported. Tear energy increases with increasing filler content; no significant differences observed with type of filler used; i.e. surface area, surface modification etc [28]. Temp. dependence of the tear strength of silk-fibre-reinforced nitrile rubber composites has been reported. Strength decreases with increasing temp. for both filled and unfilled samples, with filled samples displaying higher strengths at all temps.; decrease in tear strengths of composites at elevated temps. less than that of unfilled vulcanisates; retention of strength at higher temps. is highest for composites with longitudinally oriented rather than transversely orientated fibres [32]. Comparative studies carried out with styrene-butadiene and natural rubber show improvements in (tear) strengths greatest for nitrile rubber systems [34]

Fracture Mechanical Properties: Tensile fatigue resistance of asbestos, flax and cotton filled material has been reported [10]

Electrical Properties:

Electrical Properties General: Dielectric constant of silica-filled material shows anomalous dispersion with frequency. It decreases with increasing silica content. Dielectric loss decreases with increasing silica content in low-frequency region, while displaying little change in high-frequency region. Relaxation times, obtained from theoretical analysis of data, suggest no interactions between filler and rubber [35]. Resistivity of metal-filled material has been reported [6]

Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3–16	500 Hz–10 GHz	10–40 phr silica [35]

Magnetic Properties: Magnetic permeability at room temp. (0.1 MHz-10 GHz) has been reported. Elastic-magnetic materials, filled with powdered nickel/zinc or manganese/zinc ferrites, can be considered as porous magnetic materials in which pores are filled with rubber; polar nature of nitrile rubber gives material with somewhat greater initial magnetic permeability and greater losses in region of dispersion of μ_0) than is case for non-polar rubbers [5]

Optical Properties:

Volume Properties/Surface Properties: Colour brown (silica filled) [28]. Opacity increases with increasing filler content [28]

Polymer Stability:

Thermal Stability General: Oxidative thermal degradation od asbestos filled material has been reported [8]. Studies of the effects of silica fillers on the thermal stability of heat-resistant and carboxylated nitrile rubbers have been reported [23]

Decomposition Details: Heat of decomposition 552 $J\,g^{-1}$ (132 $cal\,g^{-1}$) (glass/fibreglass-filled, 43.5% copolymer content) [12]

Flammability: Flammability, oxygen index, ignition temp. and heat flux intensity of kaolin, chalk, silica gel, magnesium hydroxide and aluminium hydroxide filled material have been reported [19]

Chemical Stability: Resistance to organic acids and EtOH of kaolin filled material has been reported [4]. Studies of the effects of silica fillers on fuel/oil resistance of heat-resistant and carboxylated nitrile rubbers have been reported [23]; chemical resistance of nitrile rubber improves on incorporation of hydrated silica filler [21]; nitrile rubbers with high acrylonitrile content (e.g. 40%) show even greater resistance, as do carboxylated nitrile rubbers [21]

Stability Miscellaneous: Prolonged exposure to γ-irradiation causes hardening and embrittlement in variously filled (clay, silica, TiO_2, MoS_2) material [1].

Applications/Commercial Products:

Trade name	Details	Supplier
MXBE-350	Glass powder (15.5%) and fibreglass, (41.0%) filled; copolymer (43.5%)	Fiberite Corp.

Poly(1,3-butadiene-*co*-acrylonitrile)/polyvinyl, Chloride blends P-93

Synonyms: *Nitrile rubber/polyvinyl chloride blends. NBR/PVC blends. NR/PVC blends. PVC/NBR blends. Nitrile rubber/PVC blends*
Related Polymers: Nitrile rubber, Nitrile rubber, Isoprene copolymer, Nitrile rubber, Carboxylated, Nitrile rubber, Ethylene copolymer, Nitrile rubber, Carbon black filled, Nitrile rubber, Hydrogenated, Nitrile rubber, Mineral filled
Monomers: Vinyl chloride, Acrylonitrile, 1,3-Butadiene
Material class: Blends, Copolymers, Synthetic Elastomers
Polymer Type: PVC, acrylonitrile and copolymerspolybutadiene
Morphology: Morphological struct. depends on composition and nitrile content. PVC may be present in crystalline form [40]. Other morphological studies have been reported [51]

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.301 g/cm^3	70% PVC, 32% acrylonitrile [32]
2	d 1.26–1.301 g/cm^3	30% wt butadiene-acrylonitrile [52]

Volumetric Properties General: Density increases with increasing PVC content [53]
Thermodynamic Properties General: Relationship between C_p and temp. has been reported [26]. Coefficient of linear thermal expansion has been reported [53]
Glass-Transition Temperature:

No.	Value	Note
1	45°C	75% PVC, 34% acrylonitrile [61]
2	-4°C	25% PVC, 34% acrylonitrile [61]
3	41.1°C	75% PVC, 28% acrylonitrile [61]
4	-28°C	30% acrylonitrile, Hycar VT380 [44]
5	36°C	70% PVC, 32% acrylonitrile [52,56]

Transition Temperature General: T_m [21], T_g [17,48], deflection [14] and softening [14,28] temps., and brittleness temps. [13,34] have been reported
Transition Temperature:

No.	Value	Note	Type
1	-57°C	75% PVC, 31% acrylonitrile [56]	T_β

Surface Properties & Solubility:

Solubility Properties General: Blends of PVC with nitrile rubber containing 31% acrylonitrile are compatible wheras they are compatible when acrylonitrile content is 44% [56]
Cohesive Energy Density Solubility Parameters: Cohesive energy of nitrile rubber components has been reported [30].δ 17.78 J$^{1/2}$ cm$^{-3/2}$; 8.69 cal$^{1/2}$ cm$^{-3/2}$, 130°, 75% PVC, 34% acrylonitrile) [66]. Interaction parameter -4.6 J cm^{-3} (-1.1 cal cm^{-3}, 75% PVC, 34% acrylonitrile) [61]
Wettability/Surface Energy and Interfacial Tension: Surface energy has been reported [30]

Transport Properties:

Transport Properties General: Melt flow index has been reported [60]
Polymer Melts: Melt viscosity has been reported [9]
Permeability of Gases: Water vapour permeability has been reported [36]. Other gas permeability data have been reported [5,16]. Permeability of He, CO_2, O_2 and N_2 decreases with increasing acrylonitrile content [53]
Permeability of Liquids: Permeability of 1,1,2,2-tetrafluoroethane has been reported [36]. Increasing PVC content decreases permeability to ASTM fuel C and to ASTM fuel C/MeOH mixture. Permeability to the latter mixture may also be decreased by increasing acrylonitrile content [29]
Gas Permeability:

No.	Gas	Value	Note
1	[ethylene oxide]	929 cm^3 mm/(m^2 day atm)	1 mg mm in^{-2} min^{-1}, 2.2 mm thick [4]
2	[CO_2]	94559 cm^3 mm/(m^2 day atm)	14.4×10^{-8} cm^2] (s cmHg)$^{-1}$, ASTM D1434 [43]
3	[N_2]	1969.9 cm^3 mm/(m^2 day atm)	0.3×10^{-8} cm^2 (s cmHg)$^{-1}$, ASTM D1434 [43]
4	[O_2]	19699.8 cm^3 mm/(m^2 day atm)	3.0×10^{-8} cm^2 (s cmHg)$^{-1}$, ASTM D1434 [43]

Mechanical Properties:

Mechanical Properties General: Other values of tensile modulus [15], tensile strength [2,5,12,13,22,28,32,34], flexural strength [28] and dynamic elastic modulus [7] have been reported. Shear modulus decreases with increasing temp. [52] Young's modulus reaches a max. at nitrile rubber content of approx. 20% and thereafter decreases [42]. Tensile storage and loss moduli [35] and their variation with temp. [51] have been reported

Tensile (Young's) Modulus:

No.	Value	Note
1	851.3 MPa	75% PVC, 31% acrylonitrile [56]
2	14 MPa	25% PVC, 31% acrylonitrile [56]

Tensile Strength Break:

No.	Value	Note	Elongation
1	18–30 MPa	film, ASTM D882 [43]	250–500%
2	28.7 MPa	297 kg cm^{-2}, 10% PVC, hydrogenated [45]	460%
3	7.7 MPa	25% PVC, 31% acrylonitrile [56]	1470%
4	15.7 MPa	160 kg cm^{-2}, 62.5% PVC [16]	372%
5	26.9 MPa	3.9 kpsi, 70% PVC [50]	
6	24.7 MPa	3.59 kpsi, 75% PVC [54]	84%
7	31.1 MPa	75% PVC, 31% acrylonitrile [56]	230%
8	10.7–11.3 MPa	[47]	162–131%
9	18.3–23.7 MPa	hydrogenated [47]	211–240%
10	15.7 MPa	160 kg cm^{-2}, 62.5% PVC [16]	372%

Elastic Modulus:

No.	Value	Note
1	165 MPa	24 kpsi, 80% PVC [50]
2	122.7 MPa	17.8 kpsi, 70% PVC [50]

Miscellaneous Moduli:

No.	Value	Note	Type
1	10.6–11.1 MPa	[47]	100% modulus
2	9.4–10.9 MPa	hydrogenated [47]	100% modulus
3	1580 MPa	229 kpsi, 23°, 75% PVC [54]	torsional modulus
4	3.9 MPa	0.56 kpsi, 120°, 75% PVC [54]	torsional modulus

Impact Strength: Impact strength 20.7 kJ m^{-2} (90% PVC), 8.3 kJ m^{-2} (90% PVC, 25 months ageing) [24]. Other values of impact strength have been reported [2,8,28]. Charpy impact strength shows a maximum at approx. 20% acrylonitrile [62]
Viscoelastic Behaviour: Stress-strain curves [1, 21,50,56] (hydrogenated) [62] have been reported. Creep compliance is increased by a decrease in acrylonitrile content [55]. Stress relaxation data have been reported [31]
Hardness: 66 (JIS, 10% PVC, hydrogenated) [45] Shore D43-D44 [47], A79-A81 (hydrogenated) [47]. Microhardness decreases with increasing nitrile rubber content [42] Other values of hardness have been reported [13,27,28,34,60].
Failure Properties General: Tear resistance 69–73 kN m^{-1} [47], 70 kN m^{-1} (hydrogenated) [47]. Other values of tear strength have been reported [12,13,22,32].
Fracture Mechanical Properties: Rupture energy 105.1 J cm^{-3} (15250 in lb in^{-3}, 70% PVC) conversion (10020 in lb in^3, 80% PVC) [50]. Details of resistance to crack growth [13] at low temp. have been reported [20]. Hydrogenated material containing 10% PVC shows no cracks by bending at a 180° angle after 10 cycles of 72 h of immersion in peroxide containing gasoline and one week of drying in vacuum [45]
Friction Abrasion and Resistance: Coefficient of friction against steel and polyamide has been reported [11]. Abrasion resistance has been reported [13,27]. Internal friction increases with increasing temp. [52]

Electrical Properties:

Electrical Properties General: Dissipation factor has been reported [7,15,21]. The relationship between dielectric permittivity and frequency has been reported [64]. Dielectric loss data have been reported [31]. Volume resistivity has been reported [10,49]
Static Electrification: Other electrical conductivity data have been reported [17]. Activation energy of electrical conduction 0.61 eV (field intensity 100000 V m^{-1}. Activation energy increases above T_g, and with iodine doping [41]

Optical Properties:

Optical Properties General: Optical props. have been reported [54]
Transmission and Spectra: Nmr [19], uv [42], ir [33,40,41,46,47,56,59], H-1 nmr [37], C-13 nmr [44] and thermally stimulated depolarisation current spectral data have been reported [38]. Radiothermoluminesence glow curve has been reported [58]
Volume Properties/Surface Properties: Haze and transparency are dependent upon composition of blend [54]

Polymer Stability:

Polymer Stability General: Resistance to ageing has been reported [1]
Thermal Stability General: Heat resistance has been reported [2]. Thermal stability of hydrogenated polymer is reduced with increasing acrylonitrile content [63]. Resistance to low temps. has been reported [32]. Blends containing hydrogenated nitrile rubber have better resistance to hot air ageing at 100° for 7 days [47]
Decomposition Details: Thermal decomposition details have been reported [18]. Degradation temp. 440° (33.6% PVC) [32]. Thermal oxidative degradation details have been reported [18,33,34]
Flammability: Fire resistance [12] and flammability [25] have been reported
Environmental Stress: Resistance to weathering has been reported [3,6,27]. Resistance to photooxidative ageing [34] and ozone [12,13,32] has been reported. Uv irradiation causes degradation leading to loss of mech. props. [57]
Chemical Stability: Resistance to oil [2], grease [2], acids [2], alkalis [2], oxidising acids [2], aromatic solvents [2], petroleum solvents [3], oil (carboxylated) [27] and fuel [27,29,47] has been reported. Blends of PVC with nitrile rubber and hydrogenated nitrile rubber have similar resistance to ageing (45°, 7 days) with ASTM fuel C. Mech. props. are lost [29,47]
Hydrolytic Stability: Resistance to water [5] and sea water [39] has been reported
Stability Miscellaneous: Corrosion resistance has been reported [23]

Applications/Commercial Products:

Trade name	Details	Supplier
Breon		Aceto
Bur-a-Loy	various grades	Mach-1 Compounding

Polybutadiene, Carbon black filled P-94

Related Polymers: Polybutadiene
Monomers: 1,3-Butadiene
Material class: Composites
Polymer Type: polybutadiene
Additives: Carbon black
General Information: The incorporation of carbon black into the solid rubber by milling, or at the polymerisation stage, improves physical props. Rubbers with a higher degree of branching have a greater affinity for carbon black [3,8]. Pretreatment (e.g. heat treatment, polymer modification) of the carbon black can have a marked effect on the improvements gained in the filled polymer [5]
Morphology: Addition of carbon black to polybutadiene increases the amorph. portion of the polymer. The three characteristic structs. (two amorph. blocks and one pseudocrystalline) found in an SKD type polybutadiene are present in a filled rubber after the mixing process. There is an increase in both amorph. parts and a decrease in the pseudocrystalline part [4,7]
Miscellaneous: The adsorption props. of polybutadiene on carbon black have been studied using nmr and by swelling and weighing (before and after washing with a 'good' solvent) [9,11]

Surface Properties & Solubility:

Surface and Interfacial Properties General: Hess adhesion index for carbon black 8.4 MPa (86 kg cm^{-2}, untreated), 12.25 MPa (125 kg cm^{-2}, devolatilised), 5.5 MPa (56 kg cm^{-2}, oxidised), 1.86 MPa (19 kg cm^{-2}, graphitised) [5]

Mechanical Properties:

Mechanical Properties General: The relationship between deformation and temp. has been reported [7]. Rubbers filled with carbon black of a smaller particle size have higher moduli, ie. better reinforcement. Tensile stress-strain studies on various unvulcanised polybutadienes with carbon black fillers of different

particle sizes have been reported [8]. Emulsion polymerisation in the presence of carbon black gives products which have significantly increased tensile strength and elongation. The contribution of entanglements to the mech. props. of the filled polymer has been reported. [2,3] The surface treatment of carbon black prior to its incorporation in the polymer can have a marked effect on the physical props. of the filled rubber. [5] A linear relationship between the storage modulus of filled and unfilled polymer at temps. above T_g has been reported [6]

Tensile Strength Break:

No.	Value	Note	Elongation
1	17–21 MPa	173–210 kg cm^{-2}, modified carbon black [5]	695–810%

Miscellaneous Moduli:

No.	Value	Note	Type
1	0.82–1.1 MPa	varying rubber type and carbon black particle size [8]	50% modulus
2	1.33–1.86 MPa	varying rubber type and carbon black particle size [8]	100% modulus
3	2.27–3.4 MPa	varying rubber type and carbon black particle size [8]	200% modulus
4	0.98–2.1 MPa	10–21 kg cm^{-2}, modified carbon black [5]	200% modulus

Hardness: Shore A46-A52 (modified carbon black) [5]

Electrical Properties:

Electrical Properties General: Resistivity decreases rapidly after approx. 45 phr carbon black added. The temp. dependence of resistivity depends very much on the loading. At low loadings the resistivity/temp. variation is similar to that of the unfilled rubber; it decreases exponentially with increasing temp. At higher loadings, however, resistivity increases to a maximum then decreases. The temp. at which the max. occurs depends on the loading and on the particle size of the filler (higher temp. for finer filler) [10]. Resistance $29 \times 10^{12}\Omega$ (1 kV, filler particle radius 26.5 nm, loading 50 phr) , $67 \times 10^{6}\Omega$ (1 kV, filler particle radius 14 nm, loading 50 phr), $50 \times 10^{6}\Omega$ (1 kV, filler particle radius 11.3 nm, loading 50 phr), $12 \times 10^{12}\Omega$ (6 kV, filler particle radius 26.5 nm, loading 50 phr), $20 \times 10^{6}\Omega$ (6 kV, filler particle radius 14 nm, loading 50 phr) , $14 \times 10^{6}\Omega$ (6 kV, filler particle radius 11.3 nm; loading 50 phr) [10]

Optical Properties:

Transmission and Spectra: Ir and nmr spectral data have been reported [1,4]

Applications/Commercial Products:

Processing & Manufacturing Routes: Carbon black may be introduced into the rubber by milling, although polymerisation in the presence of carbon black has been reported [3]. The behaviour on milling of various types of polybutadiene with carbon black filler has been reported [12]

Trade name	Supplier
Ameripol synpol E-BR	Ameripol Synpol
Taktene 1359	Polysar

Polybutadiene/styrene-butadiene block copolymer blends P-95

Synonyms: *Polyblend. Blends of polybutadiene and styrene-butadiene di-block copolymers. B/SB*

Related Polymers: Styrene-butadiene block copolymers, Polybutadiene

Monomers: 1,3-Butadiene, Styrene

Material class: Copolymers, Blends

Polymer Type: polybutadiene, polystyrene

General Information: These blends have been less well studied than the corresponding blends containing polystyrene

Morphology: Morphological studies of SBS triblock/polybutadiene blends have been reported [1,2,3,6]. The effects of blending homopolymer and block copolymers on the morphological struct. have been examined using electron microsopy [1,6] and stress relaxation and dynamic mech. techniques. [1,2,6] Dynamic mech. studies show the presence of a new transition near -40°, intermediate between the T_g values for styrene and butadiene blocks of SBS [1,2,3]. This was originally believed to result from some form of change in the microphase, resulting from entanglement coupling mechanisms [2]. Later work [1], using high and low MW polybutadiene, confirmed intermediate loss peak can be attributed to slippage of untrapped entanglements of polybutadiene chains for low MW homopolymer, whereas in the case of high MW material, transition results from crystallisation and melting of poly(*cis*-)butadiene chains [1]. Complementary electron microscopy investigations show that low MW homopolymer is solubilised into the butadiene domains of the SBS triblocks, whereas high MW polybutadiene is present in a separate phase [1]. Studies using electron microscopy on polybutadiene/$(SB)_x$ radial block copolymer blend systems reveals existence of a polybutadiene continuum containing discrete, spherical polystyrene domains [3,6]

Miscellaneous: Block copolymers are neither compatible nor incompatible with relevant homopolymers. On the molecular scale, they behave like mixtures of homopolymers, even though the mobility of sequences of the latter is restricted by chemical bonds. Each corresponding homopolymer blends into the phase of its own kind (which already exists in the block copolymer), thus altering the size, but not the nature, of this phase. On this basis, there can be no truly compatibilising effect of a block copolymer on a mixture with homopolymers. The effect of the block copolymer is of a colloidal nature, which results in finer and finer dispersions of one phase in the other. [5] Blends containing both polybutadiene and polystyrene with styrene-butadiene block

copolymers have been reported [8,9,10,11]. Addition of copolymers leads to 'compatibility' of otherwise 'incompatible' homopolymers. The emulsifying ability of copolymer leads to polyblends showing microphase rather than macrophase separation; this effect depends on factors such as MW and composition of copolymer, MW of homopolymer(s) and blend composition [1]

Volumetric & Calorimetric Properties:

Thermodynamic Properties General: C_p increases as function of temp. and homopolymer content; deviations found at higher temps. (above approx. 200°) [7]
Specific Heat Capacity:

No.	Value	Note	Type
1	2.67–2.85 kJ/kg.C	127–237°, 22 wt% polybutadiene [7]	P
2	2.695–2.88 kJ/kg.C	127–237° 33 wt% polybutadiene [7]	P

Transition Temperature General: Blending with SBS triblock copolymers results in changes in primary glass-transition temp. of polybutadiene component (phase). This leads to a shift to lower temp. upon incorporation of low MW homopolymer, as consequence of plasticisation by latter. The same transition in blends containing high MW material is split into a doublet on account of presence of homopolymer in separate phase [1,3,6]. T_g of polystyrene enriched domain increases whereas T_g of polybutadiene enriched domain decreases with increasing polybutadiene content [7]
Deflection Temperature:

No.	Value	Note
1	85°C	deflection of 0.254 mm [8,11] or 10 mil [9]
2	98°C	deflection of 1.52 mm [8,11] or 60 mil [9], polystyrene/polybutadiene/SBS (72.5/15/12.5) triblock; S/B in triblock, 9/11-12/8; M_n 225000–250000 [8,9,11]

Surface Properties & Solubility:

Solvents/Non-solvents: Sol. toluene [6], C_6H_6 [1,2]

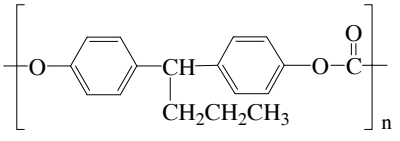
Mechanical Properties:

Mechanical Properties General: Storage modulus and loss modulus have been reported [1,2,4,6]. Addition of diblock [10] and triblock [8,9,11] copolymers improves compatibility and leads to systems with useful props., e.g. high-impact strength
Flexural Modulus:

No.	Value	Note
1	1765 MPa	256 kpsi, polystyrene/polybutadiene/SB diblock (75/12.5/12.5); S/B in diblock, 2/3-3/2 [10]
2	1916 MPa	278 kpsi, polystyrene/polybutadiene/SBS tri block (72.5/15/12.5); S/B in triblock, 9/11-12/8, M_n 225000–250000 [9]
3	1912 MPa	19500 kg cm^{-2}, polystyrene/polybutadiene/SBS triblock (72.5/15/12.5); S/B in triblock, 9/11-12/8, M_n 225000–250000 [8,11]

Viscoelastic Behaviour: A secondary loss maximum (transition) located between T_gs of polybutadiene and polystyrene blocks is ascribed to motions of untrapped entanglements [3,6]
Fracture Mechanical Properties: Craze plasticity has been reported [12]
Izod Notch:

No.	Value	Notch	Note
1	496 J/m	Y	9.3 ft lb in^{-1} PS/PBD/diblock (75/12.5/12.5); S/B in diblock, $^2/_3$–$^3/_2$ [10]
2	402 J/m	Y	7.54 ft lb in^{-1}) [9]



Applications/Commercial Products:

Processing & Manufacturing Routes: Prepared by soln. blending in C_6H_6 or toluene [1,2,6]. Films can be obtained by spin casting [1,2] or pressing of homogeneous blends (after evaporation to dryness) between Teflon-coated plateus [6]. Various methods for preparation and processing of 3-component systems (styrene and butadiene homopolymer plus diblock [10] or triblock copolymers) [8,9,11] have been reported [8,9,10,11]
Applications: Three component polymer blends (polystyrene/polybutadiene/diblock or triblock copolymers) have potential applications as high-impact polymeric materials

Poly[1,1-butane bis(4-phenyl)carbonate] P-96

Synonyms: *Poly[oxycarbonyloxy-1,4-phenylenebutylidene-1,4-phenylene]. Poly(4,4′-dihydroxydiphenyl-1,1-butane-co-carbonic dichloride)*
Monomers: 4,4′-Dihydroxydiphenyl-1,1-butane, Carbonic dichloride
Material class: Thermoplastic
Polymer Type: polycarbonates (miscellaneous)

CAS Number:

CAS Reg. No.
31670-30-1

Molecular Formula: $(C_{17}H_{16}O_3)_n$
Fragments: $C_{17}H_{16}O_3$

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.17 g/cm^3	25° [1]
2	d 1.17 g/cm^3	20°, amorph. [2]

Melting Temperature:

No.	Value	Note
1	150–170°C	[1]
2	158–170°C	amorph. [2]

Glass-Transition Temperature:

No.	Value	Note
1	123°C	[1]

Mechanical Properties:

Mechanical Properties General: The general shape of the tensile stress-strain curve consists of a viscoelastic region up to the yield point, followed by a stress drop and then necking behaviour (at approx. constant stress); finally the stress increases to the break point [3]

Tensile (Young's) Modulus:

No.	Value	Note
1	1470 MPa	15000 kg cm^{-2}, amorph. [3]

Tensile Strength Break:

No.	Value	Note	Elongation
1	59 MPa	6 kg mm^{-2} [3]	140%

Tensile Strength Yield:

No.	Value	Note
1	44.1 MPa	4.5 kg mm^{-2} [3]

Electrical Properties:

Electrical Properties General: Dielectric constant and dissipation factor do not vary with temp. until approaching T_g
Dielectric Permittivity (Constant):

No.	Value	Frequency	Note
1	3.3	1 kHz	25–100° [1]

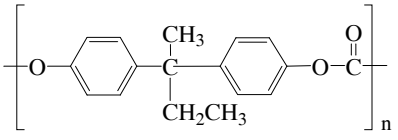
Dissipation (Power) Factor:

No.	Value	Frequency	Note
1	0.00052	1 kHz	25–100° [1]

Optical Properties:

Refractive Index:

No.	Value	Note
1	1.5792	25° [1]



Applications/Commercial Products:

Processing & Manufacturing Routes: The main synthetic routes are phosgenation and transesterification. The most widely used phosgenation is interfacial polycondensation in a suitable solvent; soln. polymerisation is also carried out in the presence of pyridine [4]. A slight excess of phosgene is introduced to a soln. or suspension of the aromatic dihydroxy compound in aq. NaOH at 20–30°, in an inert solvent (e.g. MeCl). Catalysts are used to achieve high MWs [1,4]. In transesterification the dihydroxy compound and a slight excess of diphenyl carbonate are mixed in the melt (150–300°) in the absence of O_2, with elimination of phenol. Reaction rates are increased by alkaline catalysts and the use of a medium-high vacuum in the final stages [1,4]

Poly(butyl acrylate) P-100

Synonyms: *Poly[1-(2-butoxycarbonyl)ethylene]. Poly(butyl 2-propenoate)*
Monomers: Butyl acrylate
Material class: Natural elastomers
Polymer Type: acrylic
CAS Number:

CAS Reg. No.
9003-49-0
141-32-2

Molecular Formula: $(C_7H_{12}O_2)_n$
Fragments: $C_7H_{12}O_2$
Molecular Weight: The MW can range from 1000–5000000
Additives: Soap-urea, activated thiol, soap-sulfur, lead thiourea, thiourea, trithiocyanuric acid, diamine and carbon black, sodium stearate, ammonium benzoate, ammonium adipate. Antioxidants include Agelite, Stalite S, sodium alkyl sulfates and phosphates
General Information: A tacky, rubbery polymer. Its tackiness decreases with increase in MW. It is a constituent of butyl rubber and a useful impact modifier for polyolefins. It is usually used as copolymer with olefins and vinyl monomers to produce useful commercial products

Volumetric & Calorimetric Properties:

Surface Properties & Solubility:

Cohesive Energy Density Solubility Parameters: δ 18 J$^{1/2}$ cm$^{-3/2}$. CED 38.7–41.3 kJ mol^{-1}
Plasticisers: Thiokol TP-759, Plastolein 9720, Admex 760
Solvents/Non-solvents: Sol. aromatic hydrocarbons, chlorinated hydrocarbons, THF, esters, ketones, glycolic esters, phosphorus trichloride, butanol, turpentine. Insol. MeOH, EtOH, cyclohexyl acetate, EtOAc
Surface Tension:

No.	Value
1	28 mN/m

Transport Properties:

Permeability of Gases: Medium permeability to gases
Water Absorption:

No.	Value	Note
1	0.3 %	24h

Mechanical Properties:

Failure Properties General: Fair to good tear resistance
Friction Abrasion and Resistance: Has good abrasion resistance

Electrical Properties:

Electrical Properties General: Has reasonable insulation props.

Optical Properties:

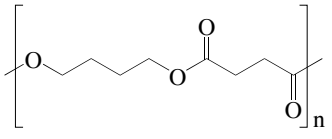
Refractive Index:

No.	Value	Note
1	1.474	25°

Polymer Stability:

Polymer Stability General: Degrades only slowly under extreme conditions. Unlike polymethacrylates it does not depolymerise on heating to high temps.
Thermal Stability General: Stable up to approx. 300°. Good heat ageing props. Decomposes only under extreme heat
Decomposition Details: Decomposition temp. 300–500°. Decomposition products include butene, butanol and CO_2
Flammability: Highly flammable
Environmental Stress: Unaffected by oxygen, ozone and uv light. Stability to uv is improved by addition of uv absorbents
Chemical Stability: Heating in extreme oxygen conditions results in hydroperoxides formed from free radicals
Hydrolytic Stability: Very resistant to hydrol. by acids or alkalis

Applications/Commercial Products:



Processing & Manufacturing Routes: Emulsion polymerisation is the preferred industrial method for the preparation of acrylic polymers. It is usually rapid and gives high MW polymer in a system of low viscosity. The safety hazard and expense of flammable solvents are eliminated. A study of the mechanism of emulsion polymerisation has been reported. [1] Soln. polymerisation is applied to produce sol. polymer, used as prod. The viscosity of the polymer prepared under a constant set of conditions varies with the nature of the solvent due to varying degrees of chain transfer activity in different solvents. Bulk and suspension polymerisation is also used resulting in cross-linked polymer. Stearic acid, TE-80 and Vanfone AP2 are added as processing aids
Applications: Used in architectural paints; coatings and lacquers; radiation-curable systems; applications in the paper, leather and textile industries; adhesives and sealing compounds

Polybutylene succinate P-101

Synonyms: *Polytetramethylene succinate*
Monomers: Succinic acid, Butane-1,4-diol
Material class: Thermoplastic
Polymer Type: saturated polyester
Molecular Formula: $(C_8H_{12}O_4)n$
Fragments: $C_8H_{12}O_4$
Additives: The use of bamboo husk as reinforcing agent has been reported [4].
General Information: Biodegradable polymer.
Morphology: Crystalline parameters reported for monofilaments [2].

Volumetric & Calorimetric Properties:

Density:

No.	Value	Note
1	d 1.26 g/cm^3	[3]

Thermodynamic Properties General: Heat of combustion: 5,640 cal g^{-1}, Bionolle #1000 series [3].

Tensile Strength Break:

No.	Value	Note	Elongation
1	5.5–6.5 MPa	Monofilament [1]	
2	4.5–5.5 MPa	Multifilament [1]	
3	20.6–56.9 MPa	at 210–580kgf cm^{-2}, Bionolle #1000 series [3]	50–700%

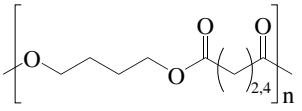
Tensile Strength Yield:

No.	Value	Note
1	32.4–39.2 MPa	at 330–400kgf cm^{-2}, Bionolle #1000 series [3]

Polymer Stability:

Biological Stability: Biodegradable via enzymatic hydrolysis; degradation (in monofilaments) found to proceed preferentially in amorphous regions, details including weight and tensile strength loss on soil burial reported [2]. Biodegradation details reported [3].

Applications/Commercial Products:



Processing & Manufacturing Routes: Good spinnability.
Applications: Mulch film, packaging film, bags, 'flushable' hygiene products, agricultural films, traffic cones, synthetic paper, household goods and industrial trays.

Monomers: 1,4-Benzenedicarboxylic acid, 1,4-Butanediol
Material class: Thermoplastic
Polymer Type: PBT and copolymers, polyester
CAS Number:

CAS Reg. No.	Note
26062-94-2	
24968-12-5	
30965-26-5	from dimethyl terephthalate
59822-52-5	from terephthaloyl chloride

Molecular Formula: $(C_{12}H_{12}O_4)_n$
Fragments: $C_{12}H_{12}O_4$
Molecular Weight: MW 30000–80000
Additives: Glass fibre, carbon fibre, flame retardants, mica, glass beads, talc, kaolin, Wollastonite, barium sulfate. Glass fibre is the principal additive, providing enhanced physical props. proportional to the amount added (30% is the most common, but up to 55% is available). Glass fibre increases strength, modulus, heat distortion temp. and fatigue resistance. Carbon and aramid fibres are also used. Aramid fibre reinforcement does not enhance mech. props., but fibres give excellent wear resistance and near-isotropic props. (characteristics that are not obtained with glass and carbon fibres). Warping is improved by replacing part of the semi-crystalline material with appropriate amorph. polymers, or by using mixed fillers including glass spheres and mica. Addition of PET to PBT enhances gloss and surface appearance. Mineral fillers enhance electrical props., minimise warping and improve modulus under load. Flame retardants include halogenated aromatic compounds, particularly bromo derivatives, in combination with antimony oxide; copolycarbonate of tetrabromobisphenol A and decabromodiphenyl ether. Non-dripping flammability is increased by the addition of PTFE or fumed colloidal silica. Elastomers are added as impact modifiers to increase impact strength. Colourants may be added. Dyes are avoided as they migrate and bleed. Hydroxybenzotriazoles give uv stability. Sterically hindered phenols give thermo-oxidative stability. Bis-epoxides, alkylene bis-fatty acid amides and carbodiimides give chemical and hydrolytic stability. Carbon black and uv stabilisers improve resistance to outdoor ageing
Morphology: α form: triclinic a 0.483, b 0.596, c 1.162, α 99.9°, β 115.2°, γ 111.3° [8]; a 0.483, b 0.605, c 1.145, α 100.5°, β 117°, γ 110.8° [9]; a 0.488, b 0.594, c 1.165, α 98.9°, β 116.6°, γ 110.9° [11]; a 0.483, b 0.594, c 1.159, α 99.7°, β 115.2°, γ 110.8° [12]; a 0.487, b 0.596, c 1.171, α 100.1°, β 116.6°, γ 110.3° [13]; a 0.486, b 0.596, c 1.165, α 99.7°, β 116.0°, γ 110.8° [22]. β Form: triclinic a 0.495, b 0.567, c 1.295, α 101.7°, β 121.8°, γ 99.9° [12]; a 0.496, b 0.580, c 1.30, α 101.9°, β 120.5°, γ 105.0° [22,23]; a 0.463, b 0.588, c 1.306, α 103.3°, β 119.8°, γ 104.4° [46]. 1	7390 MPa	[10]	Bulk modulus
2	880 MPa	[10]	Shear modulus

Viscoelastic Behaviour: Stress-strain curves have been reported [11,16,51]. Stress relaxation and creep behaviour have been reported [52,88]
Mechanical Properties Miscellaneous: T-Peel strength 18 kg m^{-1} (1 lb in^{-1}, 23°, ASTM D1876-61T) [6]. Compressibility [31] and bulk and surface compression props. have been reported [49]
Fracture Mechanical Properties: Tensile shear strength 10.3 MPa (1500 psi, 0°, ASTM D1002-64), 13.8 MPa (2000 psi, 23°, ASTM D1002-64), 11 MPa (1600 psi, 70°, ASTM D1002-64), 4.1 MPa (600 psi, 120°, ASTM D1002-64) [6]
Friction Abrasion and Resistance: Coefficient of friction has been reported [69]

Electrical Properties:

Electrical Properties General: Variation of dissipation factor [79] with temp. has been reported [7,14,36,39,68]. Variation of dielectric constant with temp. has been reported [36,56,68]. Volume resistivity has been reported [68]
Dielectric Permittivity (Constant):

No.	Value	Note
1	3.1	[49]

Dielectric Strength:

No.	Value	Note
1	20 $kV.mm^{-1}$	[68]

Complex Permittivity and Electroactive Polymers: The variation of complex relative permittivity of Valox 315 (-170–175°, 0.1 Hz–3 MHz) has been reported in graphical form [82]
Static Electrification: Conductivity [54] and its relation to temp. [56] has been reported
Dissipation (Power) Factor:

No.	Value	Note
1	>0.04	min., 60–150° [68]

Optical Properties:
